A waking man is not at liberty to think, or not to think, no more than he is at liberty, whether his body ſhall touch any other or no: but whether he will remove his contemplation from one idea to another, is many times in his choice; and then he is, in reſpect of his ideas, as much at liberty, as he is in reſpect of bodies he reſts on. He can at pleaſure remove himſelf from one to another.

Yet ſome ideas to the mind, like ſome motions to the body, are ſuch, as in certain circumſtances it cannot avoid, nor obtain their abſence, by the utmoſt effort it can uſe: thus a man on the rack is not at liberty to lay by the idea of pain, and entertain other contemplations.

Where-ever thought is wholly wanting, or the *power* to act or forbear according to the direction of thought, there neceſſity takes place. This, in an agent capable of volition, when the beginning or continuation of any action is contrary to the preference of his mind, is called *compulſion*; when the hindering or ſtopping any action is contrary to his volition, it is called *reſtraint*. Agents that have no thought, no volition at all, are in every thing neceſſary agents.

POWER, in mechanics, denotes a force, which being applied to a machine, tends to produce motion; whether it actually produce it or not. See MACHINE.

In the former caſe, it is called a *moving power*; in the latter, a *ſuſtaining power*.

If the *power* be a man, or a brute, it is called an *animate power*; if the air, water, fire, gravity, or elaſticity, an *inanimate power*; See MECHANICS.

Attractive POWER. See the article ATTRACTIVE.

Conſpiring POWER. See the article CONSPIRING.

Repelling POWER. See the article REPELLING.

POWER is alſo uſed in mechanics, for any of the ſix ſimple machines; *viz.* the *lever*, *balance*, *ſcrew*, *axis in peritrochio*, *wedge*, and *pully*; which are particularly called the *mechanic powers*. See MECHANIC *power*.

See alſo each *power* under its proper article, LEVER, BALANCE, *&c.*

POWERS, in pharmacy, the reſult of a combination or union of the eſſential oils with the ſpirit of a plant; wherein, it is ſuppoſed, are contained all the principal virtues thereof: whence the name.

The *powers* of ſcabious and mullein are prepared by beating and incorporating the expreſſed juices of theſe plants when green, with lard, and expoſing them ſeveral days to the ſun: ſuch beating and inſolation being ſeveral times repeated at due diſtances.

POWER, in the feodal juriſprudence, a right which the lord has to re-unite to his fief, a dependent fee held of him, when the vaſſal has alienated it, upon reimburſing the money given for it, with the legal coſts. See FEE.

The lord is to exerciſe his *power* over the fee, within a year after he has notice of the fall; otherwiſe he loſes it.

The word is alſo uſed for the right a lord has to ſeize a dependent fee, to compel the payment of all dues, ſervices, *&c.*

POWERS, *potentiæ*, is alſo uſed among the fathers, *&c.* for the ſixth order in the hierarchy of angels, reckoning from Seraphim. See HIERARCHY and SERAPHIM.

Theſe they ſuppoſe to be the ſpirits who bridle and reſtrain the *power* of the devils; preſide over inferior cauſes; and prevent contrary qualities from diſturbing the œconomy of the world. See ANGEL.

POWER, in optics.---The POWER *of a glaſs* is uſed by ſome for the diſtance of the convexity from its ſolar focus. See FOCUS.

POWER, in arithmetic, the produce of a number, or other quantity, multiplied into itſelf. See NUMBER.

Thus the produce of the number 3, multiplied by itſelf, *viz.* 9, is the ſecond *power* of 3; the factum of 9, multiplied by 3, *viz.* 27, is the third *power*; and the product of 27, again multiplied by 3, *viz.* 81, is the fourth *power*; and ſo on to infinity. ---In reſpect hereof, the firſt number, 3, is called the *root*, or *firſt power*. See ROOT.

The ſecond *power* is called the *ſquare*; with reſpect to which, 3 is the ſquare-root. See SQUARE.

The third *power*, 27, is called the *cube*; with reſpect to which, the 3 is the cube-root. See CUBE.

The fourth *power*, 81, is called the *biquadrate*, or *quadrato-quadratum*; with reſpect to which, 3 is the biquadratic root. See BIQUADRATIC.

The number which ſhews how oft the root is multiplied into itſelf, to form the *power*; or how oft the *power* is to be divided by its root, to come at the root, is called the *exponent of the power*. See EXPONENT.

The moderns, after Des Cartes, are contented to diſtinguiſh moſt of their *powers* by the exponents; as, *firſt*, *ſecond*, *third*, &c.

The particular names of the ſeveral *powers* were introduced by the Arabs; viz. *ſquare*, *cube*, *quadrato-quadratum* or *biquadrate*, *ſurdeſolid*, *ſquare of the cube*, *ſecond ſurdeſolid*, *quadrato-quadrato quadratum*, *cube of the cube*, *ſquare of the ſurdeſolid*, *third ſurdeſolid*, &c.

The names given by Diophantus, followed by Vieta and Oughtred, are, the *ſide* or *root*, *ſquare*, *cube*, *quadrato-quadratum*, *quadrato-cubus*, *cubo-cubus*, *quadrato-quadrato-cubus*, *quadrato-cubo-cubus*, *cubo-cubo-cubus*, &c.

The characters wherewith the ſeveral *powers* are denoted, both in the Arabic and Carteſian notation, are as follow:

	2	4	8	16	32	64	128	256	512	1024
Arab.	R	*q*	*c*	*bq*	*ſ*	*qc*	*Bſ*	*tq*	*bc*	*ſq*
Carteſ.	a	a^2	a^3	a^4	a^5	a^6	a^7	a^8	a^9	a^{10}

Hence, to raiſe a quantity to a given *power* or dignity, is the ſame as to find the factum ariſing upon its being multiplied a given number of times into itſelf: *e. gr.* to raiſe 2 to the 3d *power*, is the ſame as to find the factum 8; whoſe factors are 2, 2, 2. See SQUARE, CUBE, *&c.*

Powers of the ſame degree are to one another in the ratio of the roots as manifold as their exponent contains units: thus, ſquares are in a duplicate ratio; cubes in a triplicate ratio; quadrato-quadrata, or fourth *powers*, in a quadruple ratio. See RATIO.

The *powers* of proportional quantities are alſo proportional to one another. See PROPORTION.

From a given power to extract the root, or *ſide*, is the ſame as to find a number, *e. gr.* 2, which multiplied any number of times, *e. gr.* twice, produce the given *power*, *e. gr.* the 3d *power*, or 8. See ROOT and SIDE.

To multiply or divide any power by another of the ſame root, 1°. For multiplication, add the exponents of the factors; the ſum is the exponent of the factum. Thus:

$$\begin{array}{lccccc} \text{Factors}\left\{\right. & x^3 & y^m & y^m & a^m & x^n \\ & x^4 & y^m & y^n & a^r & x^s \\ \hline \text{Prod.} & x^7 & y^{2m} & y^{m+n} & a^{m+r} & x^{n+s} \end{array}$$

2°. For diviſion, ſubtract the exponent of the *power* of the diviſor, from the exponent of the dividend; the remainder is the exponent of the quotient. Thus:

$$\begin{array}{lllllll} \text{Divid.} & x^7\Big(& x^3 \;\Big\| & y^{m+n}\Big(& y^m \;\Big\| & a^m\, x^n\Big(& a^{m-r}\;{}^{n-s} \\ \text{Diviſ.} & x^4 & & y^n & & a^r\, x^s & \quad x \end{array}$$

M. de la Hire gives us a very odd property common to all *powers*: M. Carre had obſerved with regard to the number 6, that all the natural cubic numbers, 8, 27, 64, 125, whoſe root is leſs than 6, being divided by 6, the remainder of the diviſion is the root itſelf: and if we go farther, 216, the cube of 6 being divided by 6, leaves no remainder; but the diviſor 6, is itſelf the root. Again; 343, the cube of 7, being divided by 6, leaves 1; which, added to the diviſor 6, makes 7 the root, *&c.*

M. de la Hire, on conſidering this, has found that all numbers, raiſed to any *power* whatever, have diviſors, which have the ſame effect with regard thereto, that 6 has with regard to cubic numbers.

For the finding of theſe diviſors, he diſcovered the following general rule:

If the exponent of the *power* of a number be even, *i. e.* if the number be raiſed to the 2d, 4th, 6th *power*, &c. it muſt be divided by 2; the remainder of the diviſion, in caſe there be any, added to 2, or to a multiple of 2, gives the root of this number, correſponding to its *power*, *i. e.* the 2d, 6th, *&c.* root.

If the exponent of the *power* be an uneven number, *i. e.* if the number be raiſed to the 3d, 5th, 7th, *&c. power*; the double of this exponent will be the diviſor, which has the property mentioned.

Thus is it found in 6, double of 3, the exponent of the *power* of all the cubes: thus, alſo, 10 is the diviſor of all numbers raiſed to the 5th *power*, &c.

Commenſurable in POWER. See COMMENSURABLE.

POWER, of an hyperbola, in conics, is the ſquare of the right line CI, or AI. (*tab. conics*, *fig.* 20.)

The *power* of the hyperbola is the fourth part of the ſquare of the conjugate ſemiaxis; or the fixteenth part of the ſquare of the conjugate axis. See HYPERBOLA.

POWER *of the county*. See POSSE *comitatus*.

POX, in medicine, a diſeaſe, whereof phyſicians admit ſeveral kinds: as, *ſmall pox*, *French pox*, *chicken pox*, *ſwine pox*, &c.

Small POX, *variolæ*, is a contagious diſeaſe appearing on the cutis, which it covers with puſtules, or ulcerous eruptions, that leave eſchars behind them. Or, it is a general eruption of particular puſtules tending to ſuppuration, and attended with a fever. See PUSTULE, SUPPURATION, and FEVER.

The origin of the diſeaſe is uncertain: we find no mention of it before the Arab phyſicians.---It bears a great reſemblance to the meaſles; ſo that for the two or three firſt days it is difficult to diſtinguiſh them. they both ariſe from an impure blood, and corrupt humours; with this difference, that in the *ſmall pox* the peccant matter is more thick and viſcid; in the meaſles more ſubtile, hot, and bilious; and neither of them are known to return after having paſſed them once. See MEASLES.

Dolæus ſays, that the cauſe of the *ſmall pox* is brought into the world with us, and lies hid till it find an opportunity of burſting forth: he adds, that there is ſcarce one in many thouſands that eſcapes it all his life.

Dr. Drake obſerves, that the *ſmall pox*, not being founded in any permanent habitual diſpoſition, has its period within a limited time neceſſary for the extruſion of the peccant matter out of the pores of the skin. For the ſalt ſerum of the blood being in this diſeaſe, by an accidental fever, thrown out in great quantities on the glands of the skin, acts much after the manner of the lepra Arabum; but when the blood is deſpumated, the ſcales dry, and fall off. So that he thinks it would be no great impropriety to call the *ſmall pox*, a temporary, critical *lepra*. See LEPROSY.

The *ſmall pox* are of two kinds: the *diſtinct*, where the puſtules ſtand apart; and the *confluent*, where they run into one continued cake.

The diſtinct, or *regular ſmall* Pox, Sydenham obſerves, begin with a ſhuddering and chillineſs, which is ſucceeded by an intenſe heat, violent pain of the head and back, vomiting, drowſineſs, eſpecially in children, and ſometimes epileptic fits; which ſhew the *pox* to be ready to burſt forth, and that they will be mild.

The eruptions are uſually on the fourth day; upon which the feveriſh ſymptoms vaniſh, except that adults are prone to ſweat. The puſtules firſt appear in the face, then the neck, *&c.* They are at firſt reddiſh, by degrees ſwell and grow whiter; on the eleventh day the ſwelling and inflammation of the face vaniſh, and the puſtules begin to wither. If ever this kind kill, it is on the fourteenth or fifteenth day.

The ſymptoms of the *diſtinct ſmall pox*, as enumerated by Dr. Shaw, are, 1. A pain in the head, back, and ſcrobiculum cordis. 2. A fever, which decreaſes as the eruptions increaſe, with redneſs of the eyes. 3. Nauſea and retchings. 4. Little reddiſh ſpots, or beginning puſtules, appearing on the neck, face, breaſt, *&c.* about the third or fourth day incluſive, from the beginning of the illneſs. 5. Reſtleſſneſs. 6. About the ſeventh or eighth day, other little red ſpots uſually appear between the growing puſtules. 7. The puſtules about the ninth day are at their ſtate; being then generally as big as a large pea, the matter in them well concocted, of a whitiſh colour inclined to yellow; at which time, 8. The patient is uſually light-headed and feveriſh. 9. About the tenth day the puſtules begin to dry on the face. 10. And about the fifteenth they appear ſhrunk, and begin to ſcale off; and now the danger is eſteemed to be over.

The *diſtinct* kind is here conſidered unattended with a looſeneſs, and other ſymptoms, which ſometimes happen in it, as well as in the other.

The confluent, or *flux ſmall* Pox have the ſame ſymptoms with the *diſtinct*, only in a more violent degree: they uſually come out on the third day; not ſeparate, as in the *diſtinct* kind, but ſpread into one another; and at length appear all like one whitiſh pellicle, over the whole skin. After the eighth day, the pellicle darkens. In adults this kind is attended with a ſalivation; in children with a diarrhœa. The ſalivation frequently ſucceeds immediately after eruption; the diarrhœa later. The *confluent* kind uſually kill on the eleventh day.

The ſymptoms of the *confluent* kind, according to Dr. Shaw, are, 1. Violent pain in the head, back, and ſcrobiculum cordis. 2. Nauſea and retching, with a fever, which rather increaſes than decreaſes after the eruption. 3. In children a diarrhœa, which uſually precedes the eruption, and attends the diſtemper throughout. 4. A ptyaliſmus in adults, and but ſeldom a diarrhœa. 5. Deliria, convulſions, hoarſeneſs, difficulty of breathing, fixedneſs of the eyes, and reſtleſſneſs; which may alſo in a leſſer degree attend the *diſtinct* ſort. 6. The ſpots are here more red, thick, and cloſe, than in the *diſtinct*; and the ſpaces between them more inflamed and ſwelled; purple or livid ſpots alſo often appear in theſe ſpaces: whence the *ſmall pox with purples*. At other times in theſe ſpaces, or on the heads of the eruptions, appear bladders full of clear water, vulgarly called the *white hives*. Laſtly, theſe eruptions are frequently depreſſed in the middle, and there turn black; whence the *blatk ſmall pox*.

The eruptions often riſe and ſink in the progreſs of the diſtemper. They uſually firſt appear about the fourth or fifth day, and come to their ſtate about the fifteenth.

Morton divides the diſeaſe into four ſtages: the *apparatus* or preparation, from the time of the firſt infection to the eruption of the puſtules. The *eruption*, which comprehends three ſtates; *eruption*, *maturation*, and *declenſion*, wherein the puſtules are firſt incruſtated with a ſcab, then wither and dry off.

When the eruptions are very round, diſtinct, encompaſſed with a red margin, *&c.* they are ſaid to be *benign*; otherwiſe *malignant*.

There are four degrees of malignancy: *viz.* when the puſtules are univerſally confluent; particularly confluent; diſtinct, but very ſmall and coherent; and diſtinct, with petechiæ and miliary eruptions. See PETECHIÆ, *&c.*

Dr. Freind, Dr. Cade, *&c.* recommend purging and phlebotomy after an imperfect criſis of the *ſmall pox*; *i. e.* where the fever remains after the puſtules decline: many oppoſe it: indeed reaſon ſeems on its ſide; but preſcription is againſt it. Alſaharavius, in the firſt ſtage of the *ſmall pox*, preſcribes phlebotomy, even to a ſwooning, and great quantities of cold water to be drank. In the malignant *ſmall pox*, Dr. Liſter found the blood, when cold, exceſſively tender and friable, ſo as the ſofteſt feather would eaſily divide its globules. Etmuller ſays there is nothing to be more regarded than the breath and voice; where theſe are good, it is an excellent ſign. He adds that horſe-dung is an admirable medicine, in that it promotes ſweat, ſaves the throat, *&c.*

A method of managing the *ſmall pox*, lately introduced from abroad, is by inoculating them. *For the reaſon, proceſs, and advantages whereof*, ſee INOCULATION.

Why the *ſmall* Pox ſcarce ever viſit a perſon above once, is a famous problem; long canvaſſed, and with little ſucceſs! Dr. Drake accounts for it very plauſibly from the alteration made in the skin by that diſeaſe. For the diſtention the glands and pores of the skin ſuffer therein is ſo great, that they ſcarce ever recover their tone again, ſo as to be able any more to arreſt the matter in its courſe outwards long enough, or in quantity enough, to create thoſe ulcerous puſtules which are the diagnoſtics of the diſeaſe. For though the ſame feveriſh diſpoſition ſhould ariſe again in the blood, yet the paſſages through the skin being more open, the matter will never be ſtopped, ſo as to exhibit the appearance of the *ſmall pox*.

Accordingly we find, that in perſons ſeverely handled with this diſeaſe, the face (which is uſually the fulleſt, from the extraordinary obſtruction the matter meets with by the great conſtipation of the pores) ſeldom returns to its former dimenſions; which inlargement he accounts for from the dilatation of the areolæ of the glands and pores of the skin, not from any augmentation of the ſubſtance itſelf.

What confirms this hypotheſis, is, that nurſes, *&c.* who attend perſons ſick of the *ſmall pox*, are frequently a little affected with it, and have now-and-then two or three eruptions: that they have no more, ſeems to follow from the free courſe of the matter through the ſkin. With this, too, agrees that conſtant obſervation, that people of coarſe ſkins, in whom the pores are largeſt, are always more favourably treated by this diſtemper than others; and that it conſtantly leaves fine ſkins coarſer than it found them.

This ſolution would ſeem more probable, were it not that ſome have ſo very few of theſe eruptions, perhaps not above twenty or thirty; which cannot fairly be allowed ſo far to inlarge the pores of the ſkin, as to prevent any return.

Others hold, that in a genuine eruption, the cauſe of the diſtemper is ſo far evacuated, as ſcarce to leave a poſſibility of a return; and that if part of the original cauſe did remain behind, it might, when the air favours it, or when by other accidents it is ſecreted from the blood, appear in the form of eruptions, and ſo prove to be the meaſles, chicken *pox*, *&c.*

It may, indeed, be objected, that theſe laſt-mentioned often happen before the *ſmall pox*: but whatever be the cauſe of the *ſmall pox*, the ſeparating power muſt be in ſuch a determined proportion, or it will fail to cauſe a regular *ſmall pox*, and ſo acting proportionably, may produce any of the other diſtempers juſt mentioned.

The *occaſional cauſes* of the *ſmall* Pox may be, 1. Some alteration in the air; ſince they happen moſt frequently about the ſpring-ſeaſon; and both in Europe, and elſewhere, are more epidemical and mortal at particular times. 2. From fear; which appears more evident, than eaſy to explain. 3. From ſurfeits, as by eating any thing too chilling to the blood, as cucumbers, oranges, *&c.* in hot ſeaſons; or when the body is heated by motion, the drinking of cold liquors. 4. From too plentiful feeding. 5. From any over-heating the blood, or too ſuddenly cooling it after it is heated, whereby a ſudden check is given to perſpiration; and this more eſpecially, if the air favours ſuch an eruption.

As to *prognoſtic ſigns* of the *ſmall* Pox; 1. The ſooner they appear in the ſpring, and the more the air is diſpoſed to favour the diſtemper, the more fatal they prove. 2. The confluent ſpecies both in adults and children, is dangerous; and the more ſo, if attended with a ſuppreſſion of urine, nauſea, retching, delirium, purple ſpots, cryſtallines, bloody urine, *&c.* after the eruption; but the blackneſs of them is not dangerous before the criſis. 3. Diarrhœas in the confluent kind are not ſo bad in children as in adults. 4. A ptyaliſmus is a regular attendant of the confluent kind in adults from the ſixth or ſeventh day till after the criſis; and is ſo neceſſary, that if it ſtop ſuddenly, and return not for twenty-four hours, the patient is ſuppoſed to be in great danger. 5. A quincy here is highly dangerous. 6. The eruptions ſwelling, and ſinking ſuddenly, are bad ſigns. 7. The danger is not over till about the twentieth day in the confluent ſpecies. But if the eruptions be diſtinct, few, round, plump, riſe full, and grow up ſharp at the top; if the ſickneſs, vomiting, *&c.* go off, or remit upon the appearance of the eruptions, and the patient be under no dreadful apprehenſions; the danger is uſually over about the tenth day in the diſtinct kind. Convulſions attending the firſt ſymptoms of the *ſmall pox* in children, are ſaid to foreſhew the appearance of eruptions within twelve hours; which then generally prove diſtinct, and the patient does well. The *ſmall pox* ſucceeding a debauch in liquors, or happening upon an irregular courſe of life, is uſually mortal.

Chicken Pox, a cutaneous diſeaſe, frequent in children, wherein the ſkin is covered with puſtules like thoſe of the *ſmall pox* as to figure and magnitude; and only diſtinguiſhable therefrom, in that thoſe of the *ſmall pox* appear with a redneſs and inflammation, and thoſe of the *chicken pox* whiter, reſembling veſiculæ full of a ſerous humour; which in three days time burſt, and dry away, without any danger, and uſually without any fever.

The *chicken pox* and *ſwine pox* ſeem to be the *ſmall pox* in a leſs degree, though they ſometimes precede, and ſometimes ſucceed the *ſmall pox*. The puſtules appear to be of the ſame kind; only in the *ſwine pox* they are much larger, and in the *chicken pox* ſomewhat leſs than in the *ſmall pox*. There commonly appear five or ſix, ſometimes twenty or thirty, on the face, and but very few on the body.

The patient is very little indiſpoſed, either before, at, or after their appearance; though the ſudden ſinking of them often cauſes ſome diſorder; but it is preſently relieved by a little ſack and ſaffron, or a doſe of treacle-water.

Grown perſons ſeldom keep within doors for either; and upon that account the eruptions may continue the longer, becauſe the cold air is ſuppoſed to hinder their ripening; ſo that it is ſometimes three weeks or a month before they totally diſappear.

French Pox, a contagious diſeaſe, contracted by a poiſonous humour, uſually in coition; and manifeſting itſelf in ulcers and pains. See VENEREAL *diſeaſe*.

The French call it *mal de Naples*, the Neapolitan diſeaſe, becauſe firſt obſerved among the ſoldiery at the ſiege of Naples under Charles VIII. The Italians call it *mal Franceſe*, and we the *French diſeaſe*, becauſe firſt caught by the French. The Spaniards call it *las bubas*, or *ſarva des Indias*, becauſe firſt brought from the Weſt-Indies. Trev.

POYNING'*s law*, an act of parliament made in Ireland under Henry VII. whereby all the ſtatutes of force in England were made of force in Ireland; which before that time they were not.--- Nor are any now in force there, made in England ſince that time.

The law took its name from Sir Edward Poyning, lord lieutenant of that kingdom at the time of its making.

POZZOLANA, a reddiſh kind of earth, uſed in Italy for ſand. See SAND.

The beſt is found about Pozzuoli, Baiæ, and Cumæ, in rhe kingdom of Naples, from the firſt of which places it takes its name.

Pozzolana, mixed with lime, makes the beſt morter in the world. See MORTER.--- It hardens and petrifies in water: it penetrates black flints, and whitens them. It is of particular ſervice in making moles, and other buildings, in maritime places. Agricola takes it to be of an aluminous and ſulphurous nature. See Vitruvius, Pliny, de Lorme, *&c.* who ſet a great value on it.

PRACTICAL *arithmetic*,	See	ARITHMETIC.
PRACTICAL *geometry*,		GEOMETRY.
PRACTICAL *mathematics*,		MATHEMATICS.
PRACTICAL *muſic*,		MUSIC.
PRACTICAL *philoſophy*,		PHILOSOPHY.

PRACTICE, in arithmetic, PRACTICA *Italica*, or *Italian uſages*; certain compendious ways of working the rule of proportion, or golden rule; eſpecially where the firſt term is 1, or unity. See GOLDEN *rule*.

They were thus called from their expediting of *practice* and buſineſs; and becauſe firſt introduced by the merchants and negotiants of Italy. See RULE.

The moſt uſeful of theſe *practices* are as follow:--- 1. Since the uſe of the rule of three is to find a fourth proportional to three given numbers, divide the firſt and ſecond, or the firſt and third, by ſome common number, if that can be done exactly; and work with the quotients in their ſtead: as in the following example:

Price of 3 ℔ is 9 ſh. What is the price of 7 ℔?
3) 1 3 3
—
facit 21 ſhil.

Price of 14 ℔ is 26 ſhil. What is the price of 7 ℔.
7) 2 2) — 1
facit 13 ſhil.

2. If the firſt term be 1, and the ſecond an aliquot part of a pound, ſhilling, or penny; divide the third by the aliquot part: the quotient is the anſwer. Note, To find the aliquot part; thoſe who cannot do it otherwiſe, may ſee the table of aliquot parts of a pound under the article ALIQUOT.

E. gr. If 1 ell coſt 10 ſhil. What coſt 957 ells?
facit l. 478 : 10 *s.*

3. If the firſt or third number be 1; the other not exceeding large; and the middle term a compound, *i. e.* conſiſt of ſeveral denominations; it may be wrought without reduction thus:

Price of 1 ℔ is 3 *s.* 8 *d.* 3 *q.* What is the price of 5 ℔?
5
—
facit 18 *s.* 7 *d.* 3 *q.*

For 4 farthings making a penny, 5 times 3 farthings make 3 *d.* 3 *q.* and 12 pence making 1 ſhilling, five times eight pence make 3 *s.* 4 *d.* which, with 3 *d.* from the place of farthing, make 3 *s.* 7 *d.* Laſtly, five times 3 ſhillings make 15 ſhillings, and with the 3 ſhillings from the place of pence, 18 *s.* The price required therefore is 18 *s.* 7 *d.* 3 *q.*

4. If the middle term be not an aliquot, but an aliquant part, reſolve the aliquant part into its aliquot parts; divide the middle term by the ſeveral aliquots, the ſum of the quotients is the anſwer. To find the aliquot parts contained in an aliquant, ſee the table of aliquant parts of a pound under the article ALIQUANT.

For an inſtance of this rule:

If 1 ell coſt 15 ſhil. What coſt 124 ells?
$\frac{1}{2}$ $\frac{1}{2}$)62
$\frac{1}{4}$ 31
—
facit 93 *l.*

5. If the firſt or ſecond term be 1; and in the former caſe, the ſecond or third, in the latter the firſt, be reſolvible into factors; the whole operation may be performed in the mind without writing down any figures; as in the following example.

Price of 1 ℔ is 24 ſhil. What is the Price of 20 ℔?
4 4
6 —
80
6
facit 48 : 0 *s.*---24 *l.*

6. Where one of the given numbers is 1, we have ſeveral compendious uſages, to ſave multiplication and diviſion. *E. gr.* If 9 ℔ coſt 20 ſhil. What does 1 ℔ coſt?

It is obvious the ſum required is had by adding to the tenth part of 20 *s.* *viz.* 2 *s.* the ninth part of the tenth, *viz.* 3 *d.* $\frac{1}{2}$, and $\frac{2}{9}$ of a penny; the anſwer therefore is 2 *s.* 3 *d.* $\frac{1}{2}$ and $\frac{2}{9}$.

Again: If 5 ℔ coſt 64 ſhil. What coſt 1 ℔?

Since 5 is half of 10, the double of the tenth part of the given price, *viz.* 10 *s.* 9 *d.* $\frac{2}{4}$ *q.* is the ſum required.

Again: If 1 ℔ coſt 18 *d.* What will 19 ℔ coſt?

Since 19=20—1; from the given price doubled, and increaſed by a cypher, *viz.* 360, ſubtract the ſimple 18; the remainder is 342 *d.*=28 *s.* 6 *d.* the ſum required.

7. If two terms of the ſame denomination differ by an unit, we have a peculiar kind of compend, which will be clear from the following examples. *E. gr.* If 5 ℔ coſt 30 *s.* What wil 4 ℔ coſt?

Since the price of 4 ℔ is one fifth part ſhort of that of 5 ℔, divide the given price 30 by 5; the quotient 6 being ſubtracted from the dividend, the remainder, *viz.* 24 *s.* is the ſum required.

Again: If 8 ℔ coſt 24 *s.* What coſt 9 ℔?

Since the price of 9 ℔ exceeds that of eight by one eighth part; divide the given price 24 by 8; and add the quotient 3 to the dividend; the ſum 27 is the anſwer.

8. Sometimes one may uſe ſeveral of theſe compends or *practices* in the ſame queſtion. *E. gr.* If 100 ℔ coſt 30 *s.* 4 *d.* What coſt 50 ℔?

50) 2. 2
—
facit. 15 *s.* 2 *d.*

Again: 60 ℔ coſt 4 *s.* What coſt 2520?
6 42

PRAGMATIC * *ſanction*, in the civil law, is defined by Hottoman, a reſcript, or anſwer of the ſovereign, delivered by advice of his council, to ſome college, order, or body of people, upon their conſulting him on ſome caſe of their community.

* The word is formed from the Greek *πραγμα*, *negotium*, buſineſs.--- It is ſometimes alſo called abſolutely *pragmatic*, *το πραγματικον*.

The like anſwer given to any particular perſon, is called ſimply *reſcript*, *reſcriptum*. See RESCRIPT.

The term *pragmatic ſanction* is chiefly uſed among the modern writers, for that famous ordonnance of Charles VII. of France, publiſhed in 1268. containing a regulation of eccleſiaſtical diſcipline, conformable to the canons of the council of Baſil; and ſince uſed by the Gallican church, as a barrier againſt the enterprizes and encroachments of the court of Rome.

The ſcope of the *pragmatic ſanction* was, to regulate the form of elections made by the clergy; to declare the collations to belong to ordinaries, the prevention alone reſerved to eſtabliſh prebends; to aſſign a third of the benefices to graduates; to aboliſh reſervations, annates, and other like grievances.

Pope Pius II. obtained an abrogation of this ſanction from Louis XI. on which occaſion the court of Rome, tranſported with joy, dragged the *pragmatic* through the ſtreets, whipping it all the way, as Xerxes anciently did the Helleſpont.

But the parliament oppoſed this abrogation with a great deal of vigour, and refuſed its conſent to the laſt. So that maugre all the efforts of Rome, the *ſanction* ſtill held in force; till the concordat paſſed between pope Leo X. and Francis I. in 1515. when the *pragmatic ſanction* was aboliſhed. See CONCORDAT.

The parliament of Paris again oppoſed the innovation, and refuſed to confirm the concordat; and was not brought to give its conſent at laſt, till after repeated orders of the king; together with a ſecret reſolution taken, always to judge conformably to the tenor of the *pragmatic ſaction*.

PRAGMATICAL, PRAGMATICUS, a term ſometimes uſed in the ſame ſenſe as *practical*, *mechanical*, or *problematical*.

Stevinus, in his hydroſtatical elements, calls certain mechanical or practical experiments, which he undertakes to inſtruct his reader how to make, by the name of *pragmatical* examples: and in the like ſenſe is the word ſometimes uſed by other naturaliſts.

PRATIQUE *, or PRATTIC, in commerce, a negotiation or communication of commerce, which a merchant-veſſel obtains in the ports it arrives in, and the countries it diſcovers.

* The word is French, and ſignifies, literally, *practice*.

Hence to obtain *pratique*, is to obtain a liberty to frequent a port, to go aſhore, buy and ſell, *&c.* We could never have any *pratique* with the inhabitants of Nova Zembla.

PRATIQUE is particularly uſed for a licence to traffick, granted to the maſter of a ſhip in the ports of Italy, upon a bill of health; that is, a certificate that the place whence he came, is not annoyed with any infectious diſeaſe.

PRAXEANS, a ſect of heretics, ſo called, from their author Praxeas.

This hereſiarch was of Aſia, and lived in the ſecond century. He was at firſt a diſciple of Montanus, but quitted him, and ſoon after ſet up a ſect of his own; teaching, that there was no plurality of perſons in the godhead; and that it was the Father himſelf that ſuffered on the croſs. Which ſentiment was afterwards adopted by the Monarchici, Sabellians, and Patripaſſians, See SABELLIAN, PATRIPASSIAN, *&c.*

PRAYER, in theology, a petition put up to God, either for the obtaining of ſome future favour, or the returning of thanks for a paſt one. See WORSHIP.

Divines diſtinguiſh three kinds of *prayer*:

Vocal, which is cloathed in words and ſounds to be uttered with the mouth. See VOCAL.

Mental, which is only formed or conceived in the mind, and not delivered in words. See MENTAL.

Ejaculatory, which is a ſhort, ſudden flight, without ſtudy, order, or method.

Myſtic divines, again, diſtinguiſh *prayer* into *active* and *paſſive*. See ACTIVE and PASSIVE.

Among us, *prayer* is frequently conſidered under the diviſions of *preconceived* and extemporary.

Under the firſt come all ſet forms, whether public or private, by which the mind is directed in the order, manner, expreſſion, *&c.* of its petitions. See LITURGY.

The ſecond is that where the mind is left to itſelf, its own conduct, both as to matter, manner, words, *&c.*

The Romaniſts alſo prefer *prayers* to ſaints, the virgin, the angel Gabriel, *&c.* See SAINT, OFFICE, AVE *Mary*, &c.

PREACHING *, in theology, the declaration, or promulgation of the word of God, in public, by a perſon authorized, and in a place appointed for the purpoſe. See SERMON, PRIEST, GOSPEL, *&c.*

* The word is derived from the Hebrew *paraſch*, *expoſuit*, he expounded.

Anciently, none but biſhops were allowed to *preach*: now, not only prieſts, but deacons, are qualified. See BISHOP and DEACON.

Biſhop Wilkins has delivered the art of *preaching*, in a treatiſe called *Eccleſiaſtes*, or the preacher. See ECCLESIASTES.

The religious of the order of St. Dominic aſſume the quality of *preaching-brothers*, friers-predicant, or predicants. See DOMINICAN.

PREADAMITE, PRÆADAMITA, a denomination given to the inhabitants of the earth, conceived, by ſome people, to have lived before Adam.

Iſaac de la Pereyra, in 1655. publiſhed a book to evince the reality of *Preadamites*, by which he gained a conſiderable number of proſelytes to the opinion: but the anſwer of Demarets, profeſſor of theology at Groningen, publiſhed the year following, put a ſtop to its progreſs; though Pereyra made a reply.

His ſyſtem was this: The Jews he calls *Adamites*, and ſuppoſes them to have iſſued from Adam; and gives the title *Preadamites* to the Gentiles, whom he ſuppoſes to have been a long time before Adam.

But this being expreſly contrary to the firſt words of Geneſis, Pereyra had recourſe to the fabulous antiquities of the Egyptians and Chaldeans, and to ſome idle rabbins, who imagined there had been another world before that deſcribed by Moſes.

He was apprehended by the inquiſitors in Flanders, and very roughly uſed, though in the ſervice of the Dauphin. But he appealed from their ſentence to Rome; whither he went in the time of Alexander VII. and where he printed a retractation of his book of *Preadamites*.

PREAMBLE, in law, the beginning of an act of parliament, *&c.* ſerving, as it were, for a key, to open the intent of the makers of the act, and the miſchiefs intended to be prevented or remedied thereby. See ACT.

PREBEND, PRÆBENDA, the portion a prebendary receives for his maintenance out of the eſtate of a cathedral or collegiate church. See PREBENDARY.

The term *prebend* is uſually confounded with *canonicate*, or *canonica*; yet there is a real difference. A *prebend* is properly a right which an eccleſiaſtic has in a cathedral, or collegiate church where he officiates, to receive certain eccleſtical revenues, and to enjoy certain dues, either in money or in kind; (ſo called *à præbendo*, q. d. *afforded* or *allowed* him; not *à præbendo auxilium* or *conſilium epiſcopo*) whereas *canonica* is a mere title, or ſpiritual quality, which a perſon enjoys independent of any præſtation, or any temporal revenue: ſo that the *prebend* may ſubſiſt without the canonicate; but the canonicate is inſeparable from the *prebend*.

For it is not to the *prebend* that the right of ſuffrage, and other ſpiritual rights are annexed, but to the canonicate; and when the *prebend* is joined to the canonicate; it becomes ſpiritual by virtue of the cannoicate to which it is attached. See CANONICA.

Anciently the pope created canons with a right of having place in the choir, a deliberative voice in the chapter, and an expectation of the firſt *prebend* that ſhould become vacant; but this was prohibited by the council of Trent: yet the pope ſtill confers the canonicate without any *prebend*, when he would confer a dignity in a church, for the obtaining whereof, it is required the candidate be a canon.

This they call a canonicate *ad effectum*, and ſometimes *jus ventoſum*, which is no more than an empty title, conferred purely to qualify a man for a dignity reſtrained to the capacity of canon.

In ſome churches there are *double prebends*, and in others *ſemi-prebends*.

Originally the *prebend* was only a livery, or portion of things neceſſary to life, given daily; at preſent the rents and profits of the church are divided into fixed portions, called *prebends*, which are enjoyed independently. The nomination to *prebends* is in the king. In France it is one of the honorary rights of the king, on his joyful acceſſion to the crown, to nominate to the firſt *prebends* vacant by death in the cathedral and collegiate churches.

Prebends are either *ſimple*, or with *dignity*.--The latter are ſuch as, beſide their *prebends*, have ſome juriſdiction annexed to them.

Theological, or *divinity* PREBEND is a *prebend* appropriated to a doctor in divinity, in each cathedral and collegiate church throughout France, for preaching on ſundays, and making a public lecture thrice a week.

Preceptorial PREBEND, is that *prebend* whoſe revenues are deſtined for the ſupport of a preceptor or maſter, who is obliged to inſtruct the youth of the place *gratis*.

The canonicate is not here neceſſary to the *prebend*.

Panorm. obſerves, that in the cathedral church of Chartres there are *prebends* appropriated to laymen, and for the ſubſiſtence of ſome perſons of birth and diſtinction.

PREBENDARY, PRÆBENDARIUS, an eccleſiaſtic who enjoys a prebend. See PREBEND.

Prebendaries and canons of cathedral and collegiate churches have this in common, that they have each a portion of the revenues of the church for their ſubſiſtence; the one under the title of *præbenda*, prebend; the other under the title of *canonica*, or *canonicate*; and have each places, and voices in the chapter: but they differ in this, that the former receives his portion or prebend in conſideration of his officiating and ſerving in the church; but the latter without any ſuch conſideration, merely by his being received into the cathedral or college, *per aſſignatum ſtallum in choro, & locum in capitulo*. See CANON, *&c*.

Golden PREBENDARY *of Hereford*, called alſo *præbendarius epiſcopi*, is one of the twenty-eight minor *prebendaries*, who has, *ex officio*, the firſt canon's place that falls.

He was anciently confeſſor of the biſhop and cathedral, and had the altarages; on which account he was called the *golden prebendary*.

PRECARIÆ, or PRECES, in our ancient law-books, days works, which the tenants of certain manors are bound to give their lords, in harveſt-time.

Theſe, in ſome places, are corruptly called *bind-days*, for *biden-days*, from the Saxon, *biddan*, to pray.

Magna PRECARIA was a great or general reaping-day.

The lord of the manor of Harrow in Middleſex had, 21 *Ric.* 2. a cuſtom, that by ſummons of his bailiff on a general reap-day, then called *magna precaria*, the tenants ſhould do one hundred ninety-nine days work for him; every tenant that had a chimney ſending a man.

PRECARIOUS, in commerce, an appellation given to a kind of trade carried on between two nations at war, by the intervention of a third at peace with them both.

Thus the Engliſh hold a *precarious* commerce with the Spaniards by means of the Portugueſe; when the two former nations being at war, the third lends its veſſels, its colours, and name, to continue their trade.

PRECARIOUS, in juriſprudence, is applied to a fund or ſtock, of which a perſon has not the full propriety, whereof he cannot diſpoſe abſolutely, and which is moſt of it borrowed.

PRECE *partium*, in law, the continuance of a ſuit by conſent of both parties. See CONTINUANCE.

PRECEDENCE, PRECEDENCY, or PRÆCEDENCY, a place of honour which a perſon is intitled to in companies; either ſitting, or walking. See RANK.

Precedency is either of *courteſy*, or *de jure*, of right.

The former is that which is due to age, to eſtate, *&c.* which is regulated by cuſtom and civility.

The latter is ſettled by authority, and where broken in upon, gives an action at law. See NOBILITY.

The point of *precedency* is thus ordered by the heralds:---After the king, the princes of the blood, *viz.* the ſons, grandſons, brothers, and nephews of the king, take place; then the great officers of the church and crown, *viz.* the archbiſhop of Canterbury; then the lord chancellor, or lord keeper of the great ſeal; next, the archbiſhop of York; the lord high treaſurer; the lord preſident of the privy-council; the lord privy-ſeal: next, dukes, then marquiſes, dukes eldeſt ſons, earls, marquiſes eldeſt ſons, dukes younger ſons, viſcounts, earls eldeſt ſons, marquiſes younger ſons, biſhops, barons, viſcounts eldeſt ſons, earls younger ſons, barons eldeſt ſons, privy-counſellors, judges, maſters in chancery, viſcounts younger ſons, barons younger ſons, knights bannerets, baronets, knights of the bath, knights batchelors, colonels, ſerjeants at law, doctors, eſquires, lieutenant colonels, majors, captains, batchelors of divinity, law, *&c.* maſters of arts, gentlemen, yeomen, tradeſmen, mechanics.

Note, That great officers of court, of what degree ſoever they are, take place above all others of the ſame degree or order of nobility; *viz.* the maſter of the horſe, lord great chamberlain of England, lord high conſtable of England, lord marſhal of England, lord admiral of England, lord ſteward, and lord chamberlain of his majeſty's houſhold.--- So the ſecretaries of ſtate, if peers, take place of all of that degree, except the great officers aforeſaid.--- Dukes, marquiſes, earls, barons, *&c.* not having any of the ſaid offices, nor being deſcended of the blood-royal, take place according to the ſeniority of their creation.--- The ladies take place, or *precedency*, according to the degree of quality of their huſbands.

PRECEDENT, in law, frequently denotes an original, authentic inſtrument, or writing; ſerving as a form to draw others by. See ORIGINAL, *&c.*

Hence *precedent-books*, *&c.* full of draughts of deeds, conveyances, *&c.* for attornies.

PRECENTOR *, PRÆCENTOR, a dignitary in cathedral churches, popularly called the *chantor*, or *maſter of the choir*. See CHANTOR.

* The *præcentor* is ſo called, from the Latin *præ*, and *cano*; becauſe he is ſuppoſed to lead the choir, and *ſing before* the reſt.

PRECEPT, PRÆCEPTUM, in law, a command in writing, ſent by a chief juſtice, juſtice of peace, or other like officer, for the bringing of a perſon, record or other matter, before him.

PRECEPT is alſo uſed for the command, or incitement, whereby one man ſtirs up another to commit felony, theft, *&c.*---Bracton ſpeaks of three diverſities of offending in murder; *viz. præceptio, fortia, conſilium.*

Præceptio, is the inſtigation uſed before-hand; *fortia*, the aſſiſtance in the fact; *conſilium*, the advice either before or after. See MURDER, ABETTOR, *&c.*

PRECEPTORIAL *prebend.* See the article PREBEND.

PRECEPTORY, PRÆCEPTORIA, *commandry*; a kind of benefice held by the more eminent among the ancient knights-templars, who were created by the grand maſter, with the title of *præceptores templi*, i. e. *maſters of the temple*. See TEMPLAR.

Stephens, *de juriſd. lib.* 4. ſays, the *preceptories* were only a kind of cells, all ſubordinate to their principal manſion, the temple in London. See TEMPLE.

Of theſe *preceptories*, Dugdale ſays, he finds ſixteen recorded, as anciently belonging to the templars in England, *viz.* Creſſing Temple, Balſhal, Shengay, Newland, Yevely, Witham, Temple-Bruere, Willington, Rotheley, Ovenington, Temple-Comb, Trebigh, Ribſtane, Mount St. John, Temple-Newſum, and Temple-Hurſt. But there were more. See COMMANDRY.

PRECES. See the article PRECARIÆ.

PRECESSION, PRÆCESSIO, in aſtronomy, a term applied to the equinoxes, which, by a very ſlow inſenſible motion, change their place, going backwards, or weſtward, *i. e. in antecedentia*, as aſtronomers call it, or contrary to the order of the ſigns. See EQUINOX.

It is ſhewn, in the new aſtronomy, that the pole, the ſolſtices, the equinoxes, and all the other points of the ecliptic, have a retrograde motion; and are continually moving from eaſt to weſt, or from aries towards piſces, *&c.* by means whereof the equinoctial points are carried further and further back, among the preceding ſigns of ſtars, at the rate of about 50 ſeconds each year; which retrograde motion is called the *preceſſion*, *receſſion*, or *retroceſſion of the equinoxes*,

Hence, as the fixed ſtars remain immoveable, and the equinoxes go backward, the ſtars will ſeem to move more and more eaſtward with reſpect thereto; whence the longitudes of the ſtars, which are reckoned from the firſt point of aries, or the vernal equinox, are continually increaſing. See LONGITUDE and STAR.

Hence it is that the conſtellations have all changed the places aſſigned them by the ancient aſtronomers: in the time of Hipparchus, and the oldeſt aſtronomers, the equinoctial points were fixed to the firſt ſtars of aries and libra; but the ſigns are now no longer in the ſame points; and the ſtars which were then in conjunction with the ſun when he was in the equinox, are now a whole ſign, or 30 degrees, to the eaſt thereof: thus the firſt ſtar of aries is now in the portion of the ecliptic called *taurus*; and the firſt ſtar of taurus now reſides in gemini; and gemini is advanced into cancer, *&c.* See SIGN and CONSTELLATION.

The equinoxes will have made their revolution weſtward, and will be returned to aries again; or the conſtellations will have made theirs eaſtward, and will again fall into their former places, with regard to the equinoxes, in 25816 years, according to Tycho; in 25920, according to Ricciolus, and in 24800, according to Caſſini.

The ancients, and even ſome among the moderns, have taken the equinoxes to be immoveable; and aſcribed that change of diſtance of the ſtars herefrom, to a real motion of the orb of the fixed ſtars, which they ſuppoſed to have a ſlow revolution about the poles of the ecliptic; ſo as that all the ſtars perform their circuits in the ecliptic, or its parallels, in the ſpace of 25920 years; after which they ſhould all return again to their former places.

This period the ancients called the *Platonic*, or *great year*; and imagined, that at its completion every thing would begin as at firſt; and all things come round in the ſame order they have already done. See *Platonic* YEAR.

The phyſical cauſe of the *preceſſion* of the equinoxes, Sir Iſaac Newton demonſtrates, does ariſe from the broad ſpheroidal figure of the earth; which again ariſes from the earth's rotation around its axis. See EARTH.

PRECIOUS, or PRETIOUS *ſtone*, called alſo *gem* and *jewel*, is a ſtone extraordinarily hard, durable, tranſparent, and of a beautiful colour or water. See STONE and GEM.

Of theſe we may diſtinguiſh three kinds:

1. Such as are intirely tranſparent; which again may be divided into ſuch as are either colourleſs, as the *diamond*; or coloured, as the *emerald*:--- which diviſion of coloured gems may be ſubdivided into thoſe of one colour, as the *ruby*; and thoſe with ſeveral, as the *amethyſt*.
2. Brilliant, or ſhining, as the *Bohemian granate*.
3. Semi-tranſparent, as *opal*. See OPAL.

Biſhop Wilkins divides *precious* ſtones into *more* and *leſs tranſparent*.

The *leſs tranſparent* he diſtinguiſhes by their colours; into red, as the ſardian and cornelian; pale, fleſhy colour, like that of a man's nail, as the onyx; bluiſh, as the turquois; pale purple, as the chalcedony; and thoſe of various colours, as opal and cat's eye.

The *more tranſparent* he diſtinguiſhes into ſuch as are colourleſs, as the diamond and white ſapphire; and coloured, which are either red, as the ruby, carbuncle, and granate; yellow, as the chryſolite and topaz; green, as the emerald, ſmaragd, and beryl; bluiſh, as the ſapphire; and purple or violaceous, as the amethyſt and hyacinth.

Dr. Woodward divides *precious* ſtones ſomewhat more preciſely, into *opake*, *ſemi-opake*, and *tranſparent*.

The *opake* are either of one colour, as the turquois; or of various colours, as lazuli, and jaſper.

Semi-opake either have their colours *permanent*, as the agat, chalcedony, onyx, ſardonyx, cornelian, and beryl; or their colours *vary* according to the poſition of the light, as the oculus cati, and opal.

Tranſparent ſtones are either *with colours*; as the topaz and hyacinth, yellow, or partaking thereof; granate, ruby and amethyſt, red; ſapphire, water-ſapphire, and aquemarine, blue; and emerald, or chryſolite, green, or partaking thereof:--- or *without colours*, as the cryſtal, pſeudo-diamond, white ſapphire, and diamond.

The natural hiſtory, characters, properties, &c. *of each ſtone, ſee under its proper article,* DIAMOND, CORNELIAN, RUBY, TURQUOIS, ONYX, EMERALD, CHRYSOLITE, *&c.--- For the medicinal virtues of* precious *ſtones, or gems, in the general, ſee* GEM.--- *The origin and formation of* precious *ſtones, ſee under* STONE.--- *For the art of engraving on* precious *ſtones, ſee* ENGRAVING.--- *The art of cutting them, ſee under* LAPIDARY. *Moſaic work of* precious *ſtones, ſee* MOSAIC.

PRECIPE, or PRÆCIPE *quod reddat*, a writ of great diverſity both as to form and uſe; extending as well to writs of right, as to other writs of entry and poſſeſſion.

It is ſometimes called a *writ of right cloſe*, as when it iſſues out of the court of chanceryclose; ſometimes a *writ of right patent*, as when it iſſues out of chancery patent, or open, to any lord's court, for any of his tenants deforced, againſt his deforceor. See WRIT.

PRECIPITANT, PRÆCIPITANS, in chymiſtry, a term applied to any liquor, which, being poured on a diſſolution, ſeparates what is there diſſolved, and makes it *precipitate*, i. e. fall to the bottom of the veſſel. See DISSOLUTION.

Thus oil of tartar, and the volatile ſpirit of ſal armoniac, are *precipitants* with regard to the diſſolution of gold in aqua regalis; and common water is a *precipitant* with regard to the diſſolution of jalap in ſpirit of wine. See PRECIPITATION.

PRECIPITANT is alſo uſed in medicine, for a remedy which ſeparates and precipitates any heterogeneous matter contained in the maſs of blood; and by this means abates any irregular fermentations, efferveſcences, or the like diſorders, which that matter had excited.

Among the number of *precipitants*, are ranked harts-horn, crabs-eyes, ivory, bezoard, barks of oak, and guaiacum, iron, quinquina, chalk, *&c.*

PRECIPITATE, PRÆCIPITATUS, in chymiſtry, a ſubſtance which having been diſſolved in a proper menſtruum, is again ſeparated from its diſſolvent, and thrown down to the bottom of the veſſel, by the pouring in of ſome other liquor. See PRECIPITANT.

The chymiſts make various *precipitates* of mercury, which are of various colours, as the precipitants vary; *viz. white, red, yellow, green, &c.* See MERCURY.

White, called alſo *ſweet* PRECIPITATE, is prepared of mercury diſſolved in ſpirit of nitre, and precipitated with ſalt-water, or ſpirit of ſalt, into a white powder.

If, in lieu of the former precipitants, hot urine be poured on the diſſolution, we have a *pale roſe-coloured precipitate*.

To make the *red* or *corroſive* PRECIPITATE, they take the diſſolution of mercury made in ſpirit of nitre; evaporate all the humidity over a gentle fire, till nothing remains but a white maſs; which, by increaſing the fire, they rubify, or raiſe to a red colour.

Green PRECIPITATE is made with mercury, copper, and acid ſpirits;--- *yellow precipitate* with mercury, and oil of vitriol.

But theſe three laſt are improperly called *precipitates*, becauſe not procured by PRECIPITATION. See PRECIPITATION.

PRECIPITATION, PRÆCIPITATIO, an operation in chymiſtry; being a kind of ſeparation, whereby a body diſſolved and ſuſpended in any menſtruous liquor, is detached therefrom, and falls down to the bottom of the veſſel. See OPERATION.

Precipitation is either *ſpontaneous*, or *artificial*.

Spontaneous PRECIPITATION is, when the particles of the diſſolved body ſeparate of themſelves from their diſſolvent.

Artificial PRECIPITATION is, when ſome other body, called a *precipitant*, is added to procure this ſeparation. See PRECIPITANT.

There is alſo a *total precipitation*, wherein the diſſolved parts are all ſeparated, and ſunk to the bottom; and a--- *partial precipitation*, wherein ſome of the parts diſſolved are ſtill ſuſpended in the fluid, and do not fall down.

To account for the operation of PRECIPITATION: It may be obſerved, that a fluid menſtruum may be made to ſuſtain a body ſpecifically heavier than itſelf, either by making the reſiſtance, ariſing from the coheſion of the parts of the fluid, equal to the exceſs of ſpecific gravity of thoſe bodies above that of the menſtruum. See MENSTRUUM.

Or, by the heavy body's being joined to ſome lighter one; ſo that the two together only make one whole, equal in weight to the fluid.

In the firſt caſe, the reſiſtance, we know, is ſtill proportional to the ſurface of the corpuſcles; ſo that the ſurface being diminiſhed, the reſiſtance is weakened: the proportion therefore of the tenacity of the menſtruum, to the gravity of the corpuſcles, being thus deſtroyed, a *precipitation* muſt enſue.

Precipitation, then, may be effected two ways, on this foundation; *viz.* either by the dropping in a liquor ſpecifically lighter, or ſpecifically heavier. In the former caſe, the gravity of the menſtruum, which is always proportional to the compound gravities of both, will by this mixture become lighter: thus, the menſtruum being diluted, the force of coheſion is alſo weakened, ſo as to become unable any longer to ſuſtain the bodies; ſo hydrometers, which are eaſily ſuſtained in water, upon pouring in a good deal of any burning ſpirits, ſink to the bottom of the glaſs.

And this agrees not only with the laws of mechanics, but with experiments: thus ſpirit of ſal armoniac does very plentifully precipitate the filings of metals, diſſolved in acid menſtruums; though it be abundantly lighter than any of them.

The ſame thing is done quicker by ſpirit of wine, whoſe gravity is known to be almoſt the leaſt of any liquor.

By this ſpirit alſo, all ſalts, which are ſuſpended in water, are precipitated, and ſo unite into cryſtals. So, if you drop diſtilled vinegar in the ſcoria of antimony diffuſed in water, it falls to the bottom, and affords the golden ſulphur.

After the ſame manner, water, vinegar, *&c.* make a *precipitation* from acids, though more ſparingly: nay, acids themſelves, being poured upon others, which are heavier, will precipitate whatever is ſwimming in them. Thus ſpirit of ſalt precipitates either lead, copper, or tin, diſſolved in oil of vitriol: ſo little need is there of alkalies in this buſineſs, though the chymiſts have unanimouſly contended for them as abſolutely neceſſary.

In the ſecond caſe, *precipitation* will ſucceed by the addition of a heavier liquor to the menſtruum. For the particles of this liquor, what with their weight, and what with the impetus they acquire in their deſcent, carry down and ſink all the ſolid corpuſcles they meet with in their way; ſo that the corpuſcles being thus forced down, and kept there by this adventitious liquor, cannot mount up into their former ſituation.

To try the truth of this reaſoning by experiments; not only acid ſpirits, but even mere water, will be found to precipitate tinctures of vegetables extracted by ſpirit of wine: and the very ſame tinctures, extracted with water or wine, are precipitated very copiouſly by acid ſpirits, which are heavier.

Metals, when diſſolved in ſpirit of ſal armoniac, are precipitated with oil of vitriol, or ſpirit of nitre. When ſuſpended in aqua fortis, they are precipitated with oil of vitriol, or bezoartic ſpirit of nitre.

As to bodies ſuſpended by means of their union with other lighter ones: this is properly the caſe of diſſolved metals; and to this may the laſt caſe of *precipitation* be reduced. Here, the particles of a metal being ſeparated by a diſſolvent, and rendered imperceptible by their extreme littleneſs, only float, becauſe united to very light particles of the acid ſpirit, which keeps them ſuſpended; though the great ſurface they have, both on account of their ſmallneſs, and of their union with the acids, frequently contributes to the effect.

Now, as they are in a forced equilibrium with the fluid wherein they ſwim; and as the cauſes that ſuſtain them, are only accidental; they muſt of courſe be precipitated to the bottom, when the acid or menſtruum abandons them; from whatever cauſe it be: it is even ſometimes ſufficient, that the quantity of the fluid, wherein they are ſuſtained, be diminiſhed. For then ſeveral of the metallic particles, though ſtill joined to their acid, coming to meet and unite, aſſume a ſmaller ſurface, with regard to their maſs; thus, being no longer held up by the largeneſs of their ſurfaces, they ſubſide to the bottom.

When the menſtruum abandons a diſſolved body; if that body be lighter than the menſtruum, the contrary to *precipitation* will enſue, *i. e.* the body will riſe: thus camphor being mixed in oil of olives, and the whole diſſolved, the camphor riſes firſt, *&c.*

If it happen, that the particles, when abandoned by the diſſolvent, are equally heavy with the ſuſtaining fluid, they will neither riſe nor fall; only ſeveral of them now reuniting, form little maſſes, ſufficient to ſpoil the limpidneſs and tranſparency of the fluid; as is the caſe in reſin diſſolved in ſpirit of wine, and water poured over them: where the water uniting cloſely with the ſpirit of wine, makes it let go the greateſt part of the reſinous particles.

Thus is effected what we call an *imperfect precipitation*; which, in reality, is no more than a diſpoſition to precipitate.

If in this caſe the aqueous particles of the fluid be hid, and, as it were, abſorbed among the groſs moleculæ of the diſſolved matter; it forms what they call a *coagulum*. See COAGULATION.

Sometimes, when the liquors are poured one on another, the ſalts with which they abound, being put into motion by their attractive force, they run mutually to embrace one another; and becauſe they do not recoil far back after the congreſs, they are at length ſo united, as to become like a ſolid, there being very little phlegm remaining, as is very obſervable in tartarum vitriolatum.

In theſe experiments there happens ſuch a conflict and effervescence, as evaporates almoſt all the moiſture, with which the ſalts are diluted. And upon this depends the rationale of chymical coagulation, a thing of very great conſequence in the buſineſs of *precipitation*. Nor can we account for oil of tartar's precipitating bodies diſſolved in acids, any otherwiſe than from its making a kind of coagulum with theſe corpuſcles, and thereby becoming too heavy for, and exceeding the tenacity of, the menſtruum.

Such are the general principles of *precipitation*.

PRECIPUT*, *q. d. precipuate*, in the French juriſprudence, an advantage belonging to any one, in a thing to be divided; or a portion taken off, and ſet by, in his favour, ere the diviſion be made.

* The word is formed from the Latin *præcipuus*, chief, principal.

In noble partition, the eldeſt has always the principal fief, or manor, for his *preciput*.---In which view, the *preciput* coincides with the right of primogeniture. See PRIMOGENITURE.

PRECISION, PRÆCISIO, in the ſchools, the ſame with *abſtraction*. See ABSTRACTION.

PRECONISATION, a propoſition or declaration, which the cardinal patron makes in the conſiſtory at Rome, of a perſon nominated by ſome prince to a prelature, by virtue of letters whereof he is the bearer; which the pope complying with, gives his collation. See COLLATION.

The date of the bulls is diſpatched on the ſame day with the *preconiſation*. See BULL.

PRECONTRACT, PRÆCONTRACTUS, a contract made before, or prior to another: chiefly uſed in relation to marriages. See CONTRACT.

PRECORDIA, or PRÆCORDIA, *&c.* the parts about the heart; *e. gr.* the pericardium, the diaphragm, the hypochondria, and even the heart itſelf, with the lungs, ſpleen, *&c.* See HEART.

The word is alſo ordinarily uſed for the fore-part of the region of the thorax. See THORAX.

Pliny, and ſome other authors, uſe it for all the viſcera or entrails: *Præcordia vocamus uno nomine exta in homine.* See VISCERA.

One of the principal differences between men and brutes conſiſts in this; that there is a greater correſpondence and communication between the head and heart of the former than the latter: which correſpondence is effected by means of a greater number of nerves, ſent from the brain to the heart and *precordia*; brutes only receiving nerves to the *precordia* by the branches of the par vagum; and man, likewiſe, by the intercoſtal pair. The reaſon, Dr. Willis well obſerves, is, that brutes being void of diſcretion, and but little ſubject to paſſions, need not, like man, a double paſſage for the ſpirits, the one for the ſervice of the vital functions, the other for the reciprocal impreſſion of the affections. See NERVE, SPIRIT, BRAIN, *&c.*

PRECURSOR, PRÆCURSOR, *fore-runner*, in theology, a perſon who goes before any one to notify his coming.

The term is peculiarly applied to St. John Baptiſt, who is ſtyled the *precurſor* of Jeſus Chriſt, from what is ſaid of him by St. Luke; *Thou, child, ſhalt* go before *the face of the Lord, to prepare his way.*

PREDECESSOR, a perſon who has preceded another in the ſame office or employ. See ANCESTOR.

PREDESTINARIAN, a perſon who adheres to the doctrine of abſolute predeſtination. See PREDESTINATION.

St. Auguſtin is looked on as the founder of the ſect of *predeſtinarians*; he being the firſt of the fathers that ſeems to have aſſerted the doctrine in ſuch expreſs terms; though the Janſeniſts and Jeſuits are ſtill greatly divided about the real doctrine of St. Auguſtin, in this article; each interpreting him conſiſtently with their own ſcheme. See JANSENISM, *&c.*

Father Sirmond contends for an ancient ſect of *predeſtinarians*, or *predeſtinatians*, *prædeſtinatiani*, cotemporary with St. Auguſtin himſelf, and who had their riſe in Africa, in the monaſtery of Adrumetum; from a miſunderſtanding of St. Auguſtin's doctrine. It is added, that the opinion ſpread thence throughout the Gauls; where one of them, a prieſt, named Lucidus, was condemned by Fauſtus biſhop of Rheggio; and his ſentence confirmed by two councils.

The doctrine was again broached in the ninth century, by Godeſchalcus a Benedictine; who, as Hincmar in a letter to Pope Nicolas, ſays, maintained with the antient *predeſtinarians*, who had been already anathematized, that God *predeſtinated* ſome to eternal life, and others to eternal death; that God did not will all people to be ſaved; that Jeſus Chriſt did not die for all, but only the elect, or thoſe that are ſaved, *&c.* See GRACE, *&c.*

This doctrine was again condemned in a ſynod held at Mentz: but the Janſeniſts, particularly the friends of Meſſ. de Port-Royal, and among the reſt, the preſident Mauguin, have refuted F. Sirmond; and ſhewn, that the hereſy of the *predeſtinarians* is a mere chimæra; adding, that St. Fulgentius, St. Proſper, and the other diſciples of St. Auguſtin, only looked on it as an imaginary hereſy, invented by the enemies of St. Auguſtin's doctrine, to traduce it.

In effect, the chief evidences father Sirmond produces to the contrary, are the prieſts of Marſeilles, who are ſuſpected of ſemi-pelagianiſm. See SEMI-PELAGIAN.

PREDESTINATION, PRÆDESTINATIO, in theology, a judgment, or decree of God, whereby he has reſolved, from all eternity, to ſave a certain number of perſons, hence named elect. See ELECT.

Others define *predeſtination*, a decree to give faith in Jeſus Chriſt, to a certain number of men; and to leave the reſt to their own malice and hardneſs of heart. See FAITH.

The Remonſtrants define *predeſtination* more laxly and generally, the decree of ſaving believers, and damning unbelievers. See ARMINIAN.

The greateſt difficulties wherewith the modern theology is clogged, turn on the article of *predeſtination*: both the Romiſh and Reformed churches are divided about it: the Lutherans ſpeak of it with horror; the Calviniſts contend for it with the greateſt zeal; the Moliniſts and Jeſuits preach it down as a moſt dangerous doctrine; the Janſeniſts aſſert it as an article of faith: the Arminians, Remonſtrants, and Pelagians, are all avowed enemies of *predeſtination*. See JANSENIST, MOLINIST, CALVINISM, PELAGIAN, *&c.*

Thoſe ſtrenuous patrons of Janſeniſm, the Port-Royaliſts, teach, that God *predeſtinates* thoſe who he foreſees will co-operate with his grace to the end. Du Pin adds, that men do not fall into ſin, becauſe not *predeſtinated*; but they are not *predeſtinated*, becauſe God foreſaw their ſins. See ELECTION, REPROBATION, *&c.*

PREDESTINATION is alſo uſed for a concatenation of ſecond cauſes appointed by providence, in virtue whereof, things are brought to paſs by a fatal neceſſity; contrary to all appearances, and maugre all oppoſition. See FATE and DESTINY.

The Turks are great *predeſtinarians*; they eſteem the lighteſt accident predetermined; and on this account, are much more daring in battle, and run greater riſques of their lives, than they would otherwiſe do. See MAHOMETANISM.

PREDETERMINATION, PRÆDETERMINATIO, in philoſophy and theology.---- The ſchoolmen call that concurrence of God, which makes men act, and determines them in all their actions both good and evil, *phyſical predetermination*, or *premotion*. See PREMOTION and ACTION.

Divines hold, that God has no part in ſin; inaſmuch as he only affords his concurrence to the phyſical part of human actions, not to the *moral* part. See LIBERTY and NECESSITY.

Phyſical predetermination, or *premotion*, if there be any ſuch thing, is that action of God, whereby he excites a ſecond cauſe to act; or by which, antecedently to all operation of the creature, or before it could operate in conſequence either of the order of nature or reaſon, he really and effectually moves and occaſions it to produce all its actions: that is, whatever the creature does or acts, is really done and acted by the agency of God on the creature, who is all the time paſſive. So that without ſuch *predetermination* of God, all creatures muſt remain in an eternal ſtate of inactivity; and with ſuch *predetermination*, it is impoſſible but they ſhould do what they are thus put upon doing.

It is ſtrongly controverted, whether or no ſuch a *phyſical predetermination* be neceſſary to the action of natural cauſes? The Scotiſts maintain the negative; urging, that all natural cauſes are, of their own nature, determined to a certain action; whence it ſhould ſeem needleſs to call in a new *predetermination* of God, *e. gr.* to fire, to make it warm the hand. For if an object be, by the courſe of divine providence, applied to fire; what need a ſecond application of the fire, to make it warm the object applied thereto? ſince beings are not to be multiplied unneceſſarily. See CAUSE.

And ſuch *predetermination* ſome philoſophers hold ſtill leſs requiſite to produce the acts of the will: at leaſt, ſay they, the human mind muſt be allowed the common power and privilege of a ſecond cauſe; and therefore be intitled to produce its own acts, as well as other ſtrictly natural agents. See WILL.

The Thomiſts, on the other hand, ſtand up ſtrenuouſly for the *phyſical predetermination*: one of their principal arguments is drawn from the ſubordination of ſecond cauſes to the firſt. Where there are ſeveral ſubordinate agents, ſay they, the lower agents do not act, unleſs firſt moved and determined thereto by the firſt; this being the very eſſence of ſubordination.

Again, the like they argue from the dominion of God over all his creatures: it is of the eſſence of dominion, ſay they, to apply and direct things ſubject thereto, to its own operations; and this, if the dominion be only mortal, morally; but if it be alſo phyſical, phyſically. And that this is the caſe in reſpect of God and his creatures, is confeſſed. See GOD.

PREDIAL *tithes*, *decimæ* PRÆDIALES, are tithes paid of things which grow from the ground only; as corn, hay, fruit, *&c.* See TITHE.

PREDIATORY *debt*. See the article DEBT.

PREDICABLE, PRÆDICABILE, in logic, a general quality, or epithet, which may be predicated of, or applied to, ſeveral ſubjects.

Thus animal is *predicable* both of man and beaſt: man is *predicable* of Peter and James: triangle is *predicable* of an hundred different kinds of figures; as right angles, ſcalanes, iſoſceles's, *&c.* See PREDICATE.

The ſchoolmen reduce the *predicables* to five claſſes, *viz. genus*, *ſpecies*, *proprium*, *differentia*, and *accidens*; under one or other of which all that can be *predicated* of any ſubject, is included. See GENUS, SPECIES, PROPER, *&c.*

A *predicable* is alſo called *univerſale logicum*, as having reſpect to other particular, and inferior, or ſubject things; thus animal is an univerſal, with regard to man and beaſt.

It is called a *logical univerſal*, to diſtinguiſh it from a metaphyſical one; which is a common being, conſidered in itſelf, and therefore denominated univerſal in eſſendo; whereas the logical one is only univerſal as to our conception and application. See UNIVERSAL.

Among the ſchoolmen, *predicable* is uſually defined, *unum*, *aptum* prædicari *de multis*, *univoce*, *&* *diviſim*: or, ſomewhat more clearly, a *predicable* is a nature which may be predicated univocally of all things to which it is common; and which, as it is dividually multiplied in all its ſubordinates, may be aptly predicated of them all.

Thus, when the appellation of *virtue* is attributed to juſtice, prudence, temperance, fortitude, charity, *&c.* the ſame reaſon may be given why each is diſtinguiſhed by ſuch name; as being all founded in a mediocrity, and being agreeable to right reaſon, which is the character of virtue.

Hence, if there be ſeveral things called by ſome common name; but the reaſon of ſuch name is not the ſame in all, but different; theſe do not come under the number of *predicables*. As in the inſtance, *canis*, dog, which is both applied to a domeſtic animal, diſtinguiſhed by its barking; to a conſtellation of the heavens; and to a ſea-fiſh.

The way by which the mind comes to form ſuch *predicables*, or univerſals, is this: among thoſe things which fall under our obſervation, we find ſome characters and properties common to ſeveral, and others peculiar to each: what we find common, we conſider apart; and thus form an univerſal equally applicable to all. See GENERAL.

PREDICABLY, PRÆDICABILITER, is uſed in the ſchools in oppoſition to *predicamentally*.--- Thus, matter is ſaid to be united to form *predicably*, or *per accidens*; to exclude the notion of a predicamental accident.

PREDICAMENT, PRÆDICAMENTUM, in logic, a claſs, or order of beings, or ſubſtances, ranged according to their natures; called alſo *category*, and ſometimes *categorema*. See CATEGORY, CATEGOREMA, POSTPREDICAMENT, *&c.*

The word *prædicamentum* was firſt introduced by Boethius, in lieu of the Greek *κατηγορια*; and is uſed among the ſchool-writers with a good deal of latitude and variety: for it either ſignifies the act of *predicating*, or a common *predicate* itſelf; or, the genus or baſis of any category; or, the collection of ſeveral common predicates diſpoſed in a certain order:--- which laſt is its moſt uſual acceptation.

Hence ſome define *predicament*, a ſeries of predicates traced from the genus, or higheſt term, through all the inferior genera and ſpecies.---Thus, a ſeries of *ſubſtance* drawn from *ſubſtance* through *body*, *living*, *animal*, *man*, to *Peter*, is called the *predicament* of ſubſtance.

The uſual definition among logicians is, that *predicament* is a natural order, or ſcheme, of ſome more general or univerſal thing, and of all that is contained under the ſame; that is, all the ſubordinate genera, ſpecies, and individuals.

The properties of a *predicament*, *ex parte vocis*, i. e. of the term or word whereby the *predicament* or *predicamental* ſeries is denoted, the logicians hold, are, that it be *one*, *ſimple*, *preciſe*, and *concinnous*.

Vox una, & ſimplex, rebus concinna locandis.

The conditions requiſite *ex parte rei*, or of the thing to be ranged in a *predicament*, are contained in the following verſe:

Entia per ſeſe, finita, realia, tota.

i. e. it muſt be a *poſitive being*, in excluſion of non-entities, negations, privations, impoſſibilities, *&c.* and a being *per ſe*, to exclude accidental things, factitious things, *&c.* and *finite*, that is, of a limited nature and extent, to exclude God and other tranſcendentals: *real*, ſince its intention is for the better and more commodious diſpoſing of things in their places, to be the more diſtinctly known and conceived; and *whole*, or complete, as not being in the relation of a component part, or as only acceſſary to ſome other.

PREDICAMENTAL *accident*. See the article ACCIDENT.

PREDICATE, PRÆDICATUM, in logic, that part of a propoſition which affirms or denies ſomething of the ſubject. See PROPOSITION.

Thus, in, *God made the world*; *made the world* is the *predicate*; *God*, the ſubject. See SUBJECT.

A *predicate*, ſay the ſchoolmen, is properly a name *predicated* or ſpoken of another, as its ſubject: as *man*, in the propoſition, *Peter is a man.*

It is a celebrated rule or law of *predicates*, that nothing is eſteemed to be abſolutely ſpoken or affirmed of another, unleſs it be affirmed thereof in ſuch manner, or by ſuch an affirmation, as wants nothing either in the ſubject, *predicate*, or copula, to make it true.

This alſo is a noted property of a *predicate*, that it contains, in ſome meaſure, its own ſubject: thus, metal contains gold, copper, iron, *&c.* of which it is *predicated.*

The word *predicate* is ſometimes uſed indifferently with *attribute*; but the more accurate writers make a diſtinction. Every *predicate* is indeed an attribute, ſince whatever is *predicated* of a thing, is attributed to it: ſo, if animated be *predicated* of man, it is alſo attributed to him: but every attribute is not a *predicate*: thus ſoul, learning, *&c.* are attributed to man, but not *predicated* of him. See ATTRIBUTE.

PREDICATING, in logic, is properly the act of affirming or denying ſomewhat of ſomething.--- As, *Man is not a ſtone*; *body is a ſubſtance.* The thing thus predicated, is called *predicate.* See PREDICATE.

In the doctrine of univerſals, or predicables, to *predicate* is to ſpeak or declare a thing truly; directly, and affirmatively. Thus man is *predicated* of ſeveral, *i. e.* it is truly and directly affirmed that theſe ſeveral are men; as when I ſay, *Socrates is man*, *Plato is man*, *Ariſtotle is man*, &c. See PREDICABLE.

The things *predicated* of others are reducible to three claſſes: *genera*, as animal, of man, *&c.* *forms*, as whiteneſs, of a ſwan, *&c.* and *equals*, of things of equal extent, as ſpecies, difference, proprium, *&c.*

The ſchoolmen diſtinguiſh ſeveral ways of *predicating*; as, 1. *In quod tantum*, which is to *predicate* eſſentially, both as to the thing and the manner; as, *Juſtice is a virtue.* 2 *In quale tantum*, which is to *predicate* accidentally, both as to the thing and the manner; as *Peter is learned.* And, 3. *In quale quid*, or *in quale poſt quid*, which is to *predicate* both eſſentially and accidentally, as, *Man is rational.*

PREDICTION, PRÆDICTIO, divination, prophecy, or foretelling of what is to come; either by divine revelation, by art and human invention, or by conjecture. See DIVINATION, REVELATION, *&c.*

Divines labour hard to make the *predictions* in the old Teſtament tally with the events in the New. See PROPHECY.

The *predictions* of oracles were all dark and ambiguous. See ORACLE.

PREDOMINANT, PRÆDOMINANS, that which prevails, appears moſt, or has ſome ſuperiority or aſcendance over another thing.

Thus we ſay, bitterneſs is the *predominant* quality among taſtes, or that which is moſt perceived. It is a rule, that ſugar is never to *predominate* in confections, nor pepper in ragouſts.

PRE-EMPTION, PRÆEMPTIO, a privilege anciently allowed the king's pourveyor, of having the choice and *firſt buying* of corn and other proviſions for the king's houſe; but taken away by the *ſtat.* 19 Car. 2. See POURVEYOR.

PREENING, in natural hiſtory, the action of birds, cleaning, compoſing and dreſſing their feathers, to enable them to glide more eaſily through the air. See FEATHER.

For their uſe herein, nature has given them an admirable piece of furniture; *viz.* two peculiar glands, which ſecrete an unctuous matter into an oil-bag, perforated; out of which the bird, on occaſion, draws it with his bill. See Oil-bag.

PRE-ESTABLISHED *harmony.* See the article Harmony.

PRE-EXISTENCE, Præexistentia, the ſtate of a thing actually in being before another. See Existence.

The ancient Pythagoreans and Platoniſts all aſſerted the *pre-exiſtence* of human ſouls, *i. e.* that they were in being before they were joined to our bodies. See Metempsychosis, and Transmigration.

Origen alſo held the eternal *pre-exiſtence* of ſouls. See Soul.

The orthodox believe, that God created the world out of nothing; and not of a *pre-exiſtent* matter. See World, *&c.*

Some perſons have held mankind *pre-exiſtent* to Adam. See Pre-adamite.

PREFACE *, Præfatio, an advertiſement in the beginning of a book to inform the reader of the deſign, order, method, *&c.* obſerv'd therein; of what is neceſſary to receive its full effect, and falicitate the underſtanding thereof. See Book.

* The word is formed from the Latin *præ* and *fari,* q. d. to ſpeak before.

There is no part of writing that requires more art, or that fewer authors ſucceed in, than *prefaces.* *Prefacing* is, in effect, a particular ſpecies of writing, and has its peculiar character and taſte to diſtinguiſh it from all others. It is neither argumentation, diſcourſe, narration, nor apology.

Preface *of the maſs.*—The Romaniſts call that part of their maſs which precedes the conſecration, and which is to be rehearſed in a peculiar tone, *preface.* See Mass.

The uſe of *prefaces* in the church, they contend, is very ancient; and conjecture, from ſome paſſages of St. Cyprian, *&c.* that it was in uſe in the times of the apoſtles.

The *preface* to the maſs anciently had, and ſtill has, very different names in different churches. In the Gothic, or Gallican rite, it is called *immolation;* in the Mozarabic rite, *illation;* anciently among the French, it was called *conteſtation;* in the Roman church alone, it is called *præfatio, preface.*

PREFECT, Præfectus, in ancient Rome, was one of their chief magiſtrates, who governed in the abſence of the kings, conſuls, and emperors. See Proprefect.

His power was ſomewhat different at different times; but was always greateſt under the emperors. His principal care was the government and adminiſtration of the city of Rome.

He took cognizance of all crimes committed in the city, or within an hundred miles thereof. He judged capitally and finally, no appeal lying from him; and even by the 62d novel, he preſided in the ſenate, taking place before all the patricii and conſulares, *&c.*

He had the ſuperintendence of the proviſions, policy, buildings, and navigation.

There is ſtill a *prefect* of modern Rome, who is a kind of governor; differing little from the ancient *prefectus,* except that his authority only extends to 40 miles round the city, whereas that of the *prefect* of ancient Rome reached 100 miles round.

PREFECT *of the pretorium,* Præfectus *prætorii,* was the chief or leader of the pretorian bands, or cohorts, deſtined for the emperor's guard. See Pretorian.

The pretorian legion, according to Dion, conſiſted of ten thouſand men. Suetonius refers the inſtitution of *præfectus prætorii* to Auguſtus. It is added, that he was uſually taken from among the Roman knights.

By the favour of the emperors, his authority grew very conſiderably; inſomuch that he became the arbiter and ſupreme judge of all affairs.

To reduce this extravagant authority, Conſtantine divided the *prefecture* of the pretorium into four *prefectures;* and each of theſe he again ſubdivided into civil and military departments; though the name was only reſerved to him who was inveſted with the civil authority; and that of *comes belli* given him who had the command of the cohorts. See Count.

Thus the office of *prefect* of the pretorium, which, in its origin, and till the time of Conſtantine, was military, and ſucceeded to that of *magiſter equitum,* now commenced a purely civil magiſtrature; and at length became the prime dignity of the empire.

The ſucceeding emperors, following Conſtantine's diviſion, divided the empire into four *prefectures prætorii,* as into four dioceſes, *viz.* the Gauls, Illyria, Italy, and the Eaſt. See Diocese.

The provinces whereof theſe dioceſes conſiſted, had their particular governors; as the head of whom was the *prefect,* who, though he had not the command of the army, yet had the power of the ſword, decided ultimately of all cauſes, and had all the marks and honours of ſovereignty.

Juſtinian created a fifth *prefect* of the pretorium for the government of Egypt, which had been torn off from the dioceſe of the Eaſt by the invaſion of the Vandals during the empire of that prince.

Under Auguſtus, the officer ſent to govern Egypt with a proconſular authority, was called *præfectus Auguſtalis.*

PREGNANCY, the ſtate of a woman when ſhe has conceived, or is with child. See Conception.

The ſame ſtate, with a view to the bearing of the child in the womb, is called *geſtation.* See Gestation.

Hence alſo the act of *impregnating.* See Generation, Flower, Seed, *&c.*

PREGNANT.—*Negative* pregnant, in law. See Negative.

PREJUDICE, Præjudicium, a falſe notion or opinion of any thing, conceived without a due previous examination thereof. See Falshood, Opinion, *&c.*

Prejudice, q. d. pre-judgment, does not import a judgment merely as prior to another in reſpect of time, but as being prior thereto in reſpect of knowledge or of ſufficient attention to the thing; the prepoſition *præ* expreſſing an anticipation, not ſo much of time, as of knowledge and due attention. See Error.

Hence *prejudice* is alſo called among the ſchoolmen, *anticipatio, & præventa cognitio,* a preconceived opinion, *&c.* See Judgment, Truth, Fallacy, Sense, *&c.*

PREJUDICIAL *action.* See the article Action.

PRELATE *, Prælatus, an eccleſiaſtical ſuperior, raiſed to ſome eminent and ſuperior dignity of the church. See Dignitary.

* The word comes from the Latin *prælatus,* of *præ,* before, and *fero,* I bear, carry.

Patriarchs, primates, archbiſhops, biſhops, generals of religious orders, certain croſiered and mitred abbots, and even deans and archdeacons, are ranked among the number of *prelates.*

Prelate *of the garter* is the firſt officer of that noble order, and ancient as the inſtitution itſelf. See Garter.

William de Edynton, then biſhop of Wincheſter, was the firſt *prelate* at the erection of the order; and it has been continued in that ſee ever ſince.

It is an office of great honour, but has neither ſalary nor fees; only a convenient lodging allowed in Windſor-caſtle; and as oft as the *prelate* comes thither, (by the ſovereign's command) he is to have court-livery allowed for himſelf and ſervants.

PRELIMINARY *, or Præliminary, ſomething to be examined, diſpatched, or determined, ere an affair can be treated of thoroughly, and to purpoſe.

* The word is formed from the Latin, *præ,* before, and *limen,* threſhold.

Preliminaries of peace take up the greateſt part of treaties. They conſiſt in examining of powers, qualities of princes, ranks of embaſſadors, *&c.*

PRELUDE, Præludium, in muſic, a ſymphony uſed by way of introduction or preparation to what follows.

A *prelude* is uſually a flouriſh, or an irregular air, which the muſician plays off-hand, to ſee if his inſtrument be in tune; and to lead him into the piece to be played.

PREMISES, Premisses, Præmissæ, in logic, the two firſt propoſitions of a ſyllogiſm. See Syllogism.

When a ſyllogiſm is in form, the two *premiſes* being granted, the concluſion cannot be denied. See Conclusion.

The *premiſes,* ſays Chauvin, are properly the parts of the antecedent of an argument, when complex; and are called *præmiſſæ,* becauſe premiſed to the concluſion. See Antecedent, *&c.*

Thus in the argument, *Every man is an animal, Peter is a man,* therefore *Peter is an animal:* the propoſitions, *Every man,* &c. and *Peter,* &c. are the *premiſes.* See Proposition.

Premiſes are the principles of our reaſonings; as being clear, evident, and demonſtrative propoſitions, from the relations whereof to one another, we draw or infer new truths, propoſitions, *&c.* See Reasoning, Principle, Axiom, *&c.*

The *premiſes* are either *equal,* where neither ſuffices alone for the drawing a concluſion, as in the inſtance above; or *unequal,* the one *major,* greater, from which alone the concluſion is drawn; the other *minor,* or leſs, which only ſerves in applying the antecedent to the conſequent. See Consequent.

In the common practice of the ſchools, however, every ſyllogiſm, or formal argument, of what kind ſoever, is ſaid to have a major and a minor, how equal ſoever the *premiſes* may be. See Major, and Minor.

Premises, in law, the lands, *&c.* mentioned in the preamble or beginning of a deed, leaſe, conveyance, or the like.

PREMIUM, or Præmium, literally denotes a reward, or recompence.

Among merchants it is taken for that ſum of money, *viz.* 8 or 10 *per cent.* which is given to an inſurer, for inſuring the ſafe return of any ſhip or merchandize. See Policy *of inſurance.*

Premium is alſo uſed in the money and paper-trade, for what is given for a thing above *par.*

Thus, lottery-tickets, *&c.* are ſaid to bear ſo much, *e. gr.* 10 or 20 *s. premium,* when they are ſold for ſo much beyond the prime coſt, at which the government iſſued them.

PREMONSTRANTES, or Præmonstratenses, a religious order of regular canons inſtituted in 1120. by S. Norbert; and thence alſo called *Norbertines.*

The firſt monaſtery of this order was built by Norbert in the Iſle of France, three leagues to the weſt of Laon; and by him called *Præmonſtre, Præmonſtratum,* whence the order itſelf was denominated; though, as to the occaſion of that name, the writers of that order are divided.

The order was approved by Honorius II. in 1126. and again by ſeveral ſucceeding popes. At firſt the abſtinence from fleſh was rigidly obſerved. In 1245. Innocent IV. complained of its being neglected, to a general chapter. In 1288. their general, William, procured leave of pope Nicolas IV. for thoſe of the order to eat fleſh on journeys. In 1460. Pius II. granted them a general permiſſion to eat meat, excepting from Septuageſima to Eaſter.

The religious of this order are cloathed in white, with a ſcapulary before the caſſock. Out of doors, they wear a white cloak and white hat; within, a little camail, and at church a ſurplice, *&c.*

In the firſt monaſteries built by Norbert, there was one for men, and another for women, only ſeparated by a wall. In 1137. by a decree of a general chapter, this practice was prohibited, and the women removed out of thoſe already built, to a greater diſtance from thoſe of the men.

PREMOTION, PRÆMOTIO, in the ſchools, the action of God co-operating with the creature, and determining him to act. See PREDETERMINATION, and ACTION.

Phyſical premotion, according to Alvarez, Lemos, *&c.* is a complement of the active power, whereby it paſſes from the firſt act to the ſecond; *i. e.* from a complete and next power, to action. It is an influence or participation of the virtue of the firſt cauſe, which makes the ſecond cauſe actually active. See CAUSE.

PREMUNIENTES, in law, writs diſpatched to each biſhop to call them to parliament, warning them to bring with them the deans and archdeacons, one proctor for each chapter, and two for the clergy of his dioceſe. See CONVOCATION.

PREMUNIRE *, PRÆMUNIRE, a term uſed both for an offence, for a writ granted thereupon, and for the puniſhment thereof.

* The word is a corruption of the Latin, *præmonere*, q. d. to forewarn, or bid the offender take care; of which a reaſon may be drawn from the words of the ſtatute 27 *Edw.* III. and the form of the writ, *Præmunire facias præfatum præpoſitum, & J. R. procuratorem, &c. quod tunc ſint coram nobis.*

Theſe will all be underſtood from one: anciently, then, the church of Rome, on pretence of her ſupremacy, and the dignity of St. Peter's chair, took upon her the diſpoſal of moſt of the biſhopricks, abbeys, and other eccleſiaſtical benefices of worth, by mandates, or bulls, called *expectative graces*, and *proviſiones*, before they become void. See PROVISION, and EXPECTATIVE.

Edward III. not brooking ſo intolerable an encroachment, made ſeveral ſtatutes againſt thoſe who drew the king's people out of the realm, to anſwer to things properly belonging to the king's court; and another to reſtrain the privilege of the pope.

The pontiff, however, ſtill perſiſted in his pretenſions; and the conflux of people from England to Rome, to ſue for them, was as great as ever.

This occaſioned Richard II. to make ſeveral ſtatutes of the like import with thoſe of Edward III. particularly one, where he aſſigned their puniſhment to be this; *That they ſhould be out of the king's protection, attached by their bodies*, i. e. *impriſoned during life*; *and loſe their lands, goods and chattels*; which is ſince called the *penalty of a* premunire.

Henry IV. made new ſtatutes againſt other abuſes of this kind not fully obviated in thoſe of his predeceſſors; adding certain new caſes, and laying on them the ſame penalty.

By later ſtatutes, the like penalty of *premunire* is laid on ſome other offenders; as, *e. gr.* by that 1 *Eliz.* on him who denies the king's ſupremacy a ſecond time.—By 13 *Eliz.* on thoſe who aſſert the pope's authority, or refuſe the oath of ſupremacy; on ſeditious talkers of the inheritance of the crown; and ſuch as affirm the king or queen to be a heretic.—And by ſtatute 13 *Car.* 2. on thoſe who affirm, that the parliament begun November 1640. is not yet diſſolved; or that there is any obligation in an oath or covenant, *&c.* to endeavour a change of government either in church or ſtate; or that the houſes of parliament have a legiſlative authority without the king.

PREMUNIRE is now chiefly uſed for the puniſhment appointed by the ſtatutes above-mentioned.—Thus, when it is ſaid a man for an offence *ſhall incur a* premunire, it is meant, he ſhall incur the penalty appointed by the ſtatute 16 *Ric.* 2. commonly called the *ſtatute of* premunire.

PRENDER *, in law, a power or right of taking a thing before it is offered. See RENDER.

* The word is formed from the French, *prendre*, to take.

Such a thing *lies in* render, *but not in* prender. *Coke's Rep. part* 1. Sir John Peter's caſe.

PRENDER *de baron* is an exception to diſable a woman from purſuing an appeal of murder againſt the killer of her former huſband, taken from her having married a ſecond. See APPEAL.

PRENOMEN, PRÆNOMEN, among the Romans, a proper name, or name prefixed to the general name of the family; as, Caius, Lucius, Marcus, *&c.* See NAME.

The *prenomen* anſwers to our Chriſtian name, Peter, Paul, *&c.*

It was not introduced among the Romans till long time after the *nomen.* See NOMEN.

The name of the family was given by the Romans to their children the day after their birth; but the *prenomen* was not given them till they took the virile habit. See VIRILE.

Varro reckons up thirty *prænomina* among the Romans. The uſual ones may be reduced to eighteen.

The Greeks had no *prænomina*: they had but one name.

PRENOTION, PRÆNOTIO, or PRÆCOGNITIO, a notice, or piece of knowledge preceding ſome other, in reſpect of time. See NOTION.

Such is the knowledge of the antecedent; which muſt precede that of the concluſion. See KNOWLEDGE, PREJUDICE, *&c.*

PREPARANTIA, or PRÆPARANTIA *vaſa*, in anatomy, the ſpermatic veſſels; being two arteries, and as many veins of the teſticles: thus called by the ancients, from an opinion, that the ſeed began to be prepared herein. See SPERMATIC *veſſels*, SEED, and GENERATION.

PREPARATION, PRÆPARATIO, *apparatus*, in mathematics, makes one of the parts or branches of a demonſtration. See DEMONSTRATION.

If it be a propoſition in geometry that is to be demonſtrated, the *preparation* conſiſts in certain lines to be drawn in the figure: if a propoſition in arithmetic, in ſome computation to be made to come the more eaſily at the demonſtration.

PREPARATION, in chymiſtry and pharmacy, is applied to the ſeveral manners of managing the materia medica, and of diſpoſing it to ſerve the ſeveral purpoſes.

There are various *preparations* of mercury, antimony, and other drugs to purify them, ſublime, calcine, edulcorate them, *&c.* See MERCURY, *&c.*

Crude antimony is uſed in ſudorific decoctions; though, when it has undergone a certain *preparation*, it becomes a violent vomitive. See ANTIMONY.

PREPARATORY *torture*. See the article TORTURE.

PREPARED *antimony*. See the article ANTIMONY.

PREPARED *opium*. See the article OPIUM.

PREPENSED, PRÆPENSUS, in law, denotes *fore-thought*.

In which ſenſe we ſay, *prepenſed malice*, &c.

If, when a man is ſlain upon a ſudden quarrel, there were malice *prepenſed* formerly between them, it makes it murder; and, as it is called in ſome ſtatutes, *prepenſed murder*. See MURDER.

PREPOSITION, PRÆPOSITIO, in grammar, one of the parts of ſpeech or diſcourſe. See SPEECH.

The *propoſition* is an indeclinable particle, which yet ſerves to govern the nouns that follow it. Such are *per*, *pro*, *propter*, *in*, *with*, *through*, *from*, *by*, &c. See PARTICLE.

They are called *prepoſitions*, becauſe *præpoſitæ*, placed before the nouns they govern. See NOUN.

F. Buffier does not allow the *prepoſition* to be a part of ſpeech, but merely a modificative of a part of ſpeech, *viz.* of the noun; ſerving only to modify or circumſtantiate it. See MODIFICATIVE.

PREPOSITUS *villæ* is ſometimes uſed for the chief officer of the king, in a town, manor, or village.

In ancient records, the *prepoſitus villæ* was no more than the bailiff of the lord of the manor. See BAILIFF.

Prepoſitus villæ is ſometimes alſo uſed, in later writers, for the conſtable of a town, or petty conſtable. See CONSTABLE.

PREPOSITUS *eccleſiæ*. See the article CHURCH *reve*.

Quatuor homines PREPOSITI, in Crompton, *&c.* denote four men of each town, which are to appear before the juſtices of the foreſt in their circuit.

PREPUCE, PRÆPUTIUM, in anatomy, the *fore-skin*; a prolongation of the cutis of the penis, covering the glans, or extremity of the yard.—See *tab. anat.* (*ſplanch.*) *fig.* 10. *lit. cc.* See alſo PENIS, and GLANS.

Dr. Drake obſerves, that nature does not ſeem more various in any part of her works than in the *prepuce*; for the figure and proportion whereof there does not ſeem any ſtandard.

Hence, probably, aroſe the neceſſity of circumciſion, ſo generally practiſed throughout the oriental parts; not out of a view to religion, but to cleanlineſs, and to prevent diſeaſes, which a detention of the mucus of the *ſub-preputial* glands might breed in thoſe hot countries. For even here, the ſame author adds, he has known ſome, who, having large *prepuces*, called *filbert-prepuces*, have been frighted at the appearance of a mucus oozing out upon a mere plenitude from between the *prepuce* and glans: which, it is probable, the great legiſlator of the Jews might have a view to in the firſt inſtitution of circumciſion. See CIRCUMCISION.

The skin of the *prepuce* is double; at the connexion of the internal skin, to the other part, are ſeveral oval and roundiſh glandules placed irregularly about the joining of the glans to the corpora cavernoſa, and on the glans itſelf.

Their uſe is to ſeparate a liquor to render the agitation of the *prepuce* on the glans eaſy. When this liquor becomes rancid, as upon old age, or venereal contacts, it excoriates the glans and *prepuce*; and even ſometimes contracts the latter, and renders it neceſſary to be divided, to afford a paſſage to the glans. See PHIMOSIS, and PARAPHIMOSIS.

PREROGATIVE, PRÆROGATIVA, a privilege, or pre-eminence, which one perſon has over another. See PRIVILEGE, *&c.*

The word is borrowed from the appellation of a century in ancient Rome, which gave the firſt vote, or ſuffrage, in the *comitia*, or aſſemblies for the election of magiſtrates; *quaſi* prærogati; becauſe firſt asked, or their ſuffrage firſt required. See SUFFRAGE, and CENTURY.

Their vote was called *omen prærogativum*, becauſe the reſt uſually gave their votes the ſame way. See OMEN.

PREROGATIVE *of the king*, PRÆROGATIVA *regis*, is that power, pre-eminence, and privilege, which the king hath over, not only other perſons, but over the ordinary courſe of the common law, in right of his crown.

Such are theſe, that the king may pardon a perſon condemned to die: that the king's perſon is ſubject to no man's ſuit; his poſſeſſions cannot be taken from him by any violence, or wrongful diſſeizin: his goods and chattels are ſubject to no tribute, toll, or cuſtom, nor diſtrainable, *&c.* See KING.

PREROGATIVE *court* is a court belonging to the archbiſhop of Canterbury, wherein all wills are proved, and all adminiſtrations granted, that belong to the archbiſhop by his *prerogative*; that is, where the party at his death had bona notabilia, five pounds or upwards, out of the dioceſe where he died, and within the archbiſhop's province. See PROBATE, BONA NOTABILIA, *&c.*

All citations and decrees of this court run in the name of the archbiſhop. See ARCHBISHOP.

This court, for the province of Canterbury, is kept in the common-hall in Doctors Commons, in the afternoon, next day after the arches. See ARCHES.

The judge is attended by the regiſter, who ſets down the decrees and acts of court; and keeps records, *&c.* all original wills and teſtaments of parties dying, having bona notabilia.

The place is uſually called the *prerogative office*, now kept in Dean's court; where, for a moderate fee, one may have a copy of any ſuch will. See WILL.

The archbiſhop of York hath alſo the like court, called his *exchequer*.

PRESAGE, PRÆSAGIUM, an augury, or ſign of ſomething to come. See AUGURY.

The Romans judged of future events by certain ſigns, which their ſuperſtition, or the artifice of their prieſts, had invented. Their moſt celebrated *preſages* were founded on the flight of birds, or the entrails of victims: all night-birds paſſed for birds of ill *preſage*. See VICTIM, *&c.*

It is a popular error, that comets *preſage* misfortunes. See COMET.

Cloſe weather, and a ſouthern wind, *preſage* rain. See WEATHER, *&c.*

PRESBYTA, πρεσϐυτης, in optics, a term applied to perſons in whom the configuration of the cryſtalline of the eye is too flat, ſo that they ſee diſtant things clearly, but thoſe near at hand confuſedly. See VISION.

The reaſon is, that in near objects, the viſual rays paſſing the retina before they unite, there can be no diſtinctneſs, ſince the diſtinct baſe falls too far off beyond the retina. See CRYSTALLINE, and RETINA.

This defect is helped only with convex-glaſſes, or ſpectacles; which will make the rays converge ſooner, and, if they are well fitted, fall exactly on the retina. See CONVEX, and SPECTACLE.

The word is formed from the Greek, πρεσβυς, *ſenex*; becauſe old people are naturally ſubject to this defect; time, and the friction of the eye-lids, *&c.* gradually wearing the ball flat.

Presbytæ are oppoſed to *myopes*, in whom the cryſtalline is too round. See MYOPES.

If the diſtance between the retina and the cryſtalline be too ſmall, the perſon will likewiſe be a *presbyta*. See CRYSTALLINE, *&c.*

PRESBYTER, a *prieſt*, or perſon in prieſts orders. See PRIEST.

He is thus called, from the Greek, πρεσϐυτερος, *elder*, of πρεσϐυς, *old*; becauſe, anciently, none were ordained but ſuch as were advanced in years. See ELDER, AGE, *&c.*

The great diſpute between the retainers to the Geneva and the Roman diſcipline, is about the ſameneſs or difference of *preſbyters* and biſhops, in the times of the apoſtles. See BISHOP, and EPISCOPACY.

The *presbyteral* character is held indelible. See CHARACTER.

PRESBYTERIANS, a name aſſumed by the Calviniſts of Great Britain. See CALVINISM.

The *presbyterians*, as to doctrine, agree with the church of England: their chief difference lies in the point of diſcipline, *viz.* who ſhall appoint the governors of the Church, and what ſubordination there ſhall or ſhall not be between them. See HIERARCHY.

The *presbyterians* allow of no hierarchy, no ſubordination in the perſons of their miniſters; biſhops and prieſts, they maintain, in the times of the apoſtles, were the ſame; and therefore, though they allow epiſcopacy as now ſettled in the church of England to be very ancient, yet they deny it to be *jure divino*. See BISHOP, and EPISCOPACY.

In lieu of a ſeries of miniſters one over another, in quality of prieſts, biſhops, and archbiſhops, their polity conſiſts in a ſeries of aſſemblies, or ſynods: thus every miniſter is to be obedient to the claſſis under which he lives; and that claſs to a ſynod, provincial, claſſical, or œcumenical. See CLASS, SYNOD, PRESBYTERY, *&c.*

The power of ordination, with them, reſides in a claſſis; and none are admitted to adminiſter the ſacrament, but thoſe ordained by the impoſition of hands of other miniſters.

They make uſe of deacons to take care of their poor; and in the government of the church, call in lay-elders; whence their name, from the Greek, πρεσϐυτερος, ſignifying *ſenior*, *elder*. See ELDER.

This is now the reigning diſcipline in the church of Scotland; as it was, during the inter-regnum, in England.

PRESBYTERY, PRESBYTERIUM, πρεσϐυτεριον, an aſſembly of the order of the presbyters, or prieſts, with lay-elders, for the exerciſe of church diſcipline. See PRESBYTERIAN.

The kirk, or church of Scotland, is divided into ſixty-nine *preſbyteries*, each conſiſting of a number of pariſhes, not exceeding 24, nor leſs than twelve.

The miniſters of theſe pariſhes, with one ruling elder choſen half-yearly, conſtitute a *presbytery*; who, meeting in their chief town, whence the *presbytery* is denominated, chuſe a moderator, or rather prolocutor, half-yearly.

They determine all appeals from kirk ſeſſions, *i. e.* from the ſeveral parochial aſſemblies; but can try nothing at the firſt inſtance cognizable before a kirk ſeſſion. See KIRK *ſeſſion*.

They compoſe all differences between miniſters and people; for which end they hold *presbyteral* viſitations in each pariſh, where they examine the regiſters of the kirk ſeſſions, *&c.*

They inquire into repairs of churches; ſee that the glebe, *&c.* ſuffer no dilapidations; appoint ſchools in the pariſhes; and ſee that the funds be not miſapplied.

It is they alone can exclude from the communion, licenſe probationers, ſuſpend, depoſe, and, in effect, determine all eccleſiaſtical matters within their diſtrict. From the *presbytery* there lies an appeal in all caſes to provincial ſynods. See SYNOD.

PRESBYTERY, *presbyterium*, is ſometimes alſo uſed for the choir of a church, becauſe anciently appropriated to the presbyters. See CHURCH, and CHOIR.

In oppoſition to the *nave*, or body of the church, which was for the people. See NAVE, *&c.*

PRESCIENCE, in theology, *previſion*, or *fore-knowledge*; that knowledge which God has of things to come.

The doctrine of predeſtination is founded on the *preſcience* of God, and on the ſuppoſition of all futurity's being preſent to him. See PREDESTINATION.

Human reaſon can ſcarce reconcile the *preſcience* of God with the free-agency of man. See LIBERTY, and NECESSITY.

How are we to admire the depth of the *preſcience* and wiſdom of God, who, in giving the firſt motion to matter, foreſaw all the poſſible combinations this firſt impreſſion might undergo during infinite ages! Malebr.

PRESCRIPTION, PRÆSCRIPTIO, in law, a right or title acquired by uſe and time.

Preſcription is a ſort of title introduced for aſſuring the property of effects in favour of perſons who have poſſeſſed them a certain time; and to keep off any who would diſquiet them, or recover the thing poſſeſſed, after the term fixed by the laws. See POSSESSION.

Tourreil calls *preſcription* a penalty impoſed by the laws upon negligence; and adds, that poſſeſſors who have no other title to plead but *preſcription*, are only legal uſurpers.

In effect, however, the law of *preſcription* does not puniſh the indolence of proprietors; but only interprets their ſilence for their conſent; preſuming, that a man who neglects to aſſert his right for a long ſeries of years, gives it up.

There are ſome of the lawyers who doubt, whether time and unjuſt *preſcription* be any legitimate means of acquiring: others, more favourable, call it the *patroneſs of mankind*; as being a general preſumption under which the law will have men live in peace.

In the common law, *preſcription* is uſually underſtood of a poſſeſſion from time immemorial, or beyond the memory of man; as, when my anceſtors, or his from whom I have an eſtate, have enjoyed and uſed it all the time whereof any memory remains.

But in the civil law, and even in our common law, there are *preſcriptions* of a much ſhorter date. *Preſcription* of forty years excludes all actions whatever. *Reform. Leg. Eccleſ.*

The cuſtom of Paris allows of a *preſcription* of ten years, if the parties be preſent; and twenty, if abſent, in favour of peaceable poſſeſſors of an inheritance, if they have any title, however controverted; and of thirty years in favour of thoſe who poſſeſs without any title at all.

In Normandy, a *preſcription* of forty years peaceable poſſeſſion is equivalent to a title, to immoveables; and for moveables, and perſonal actions, a *preſcription* of thirty years ſuffices.

In Romiſh countries, *preſcription* does not avail againſt the church, if ſhort of an hundred years. In France, *preſcription* of twenty years is admitted againſt all crimes, except duelling, which was excluded by a declaration of the year 1679. In matters of adultery, five years ſuffice, *i. e.* provided there have been a diſcontinuance of proſecution all that time.

By our ſtatutes, a judge or clerk convicted of falſe entering pleas, *&c.* may be fined within two years; but, thoſe elapſed, he *preſcribes* againſt the puniſhment of the ſtatute.

The crime of maintenance or embracery, whereby perjury is committed by a jury, muſt be proſecuted within ſix days; otherwiſe the parties *preſcribe*. See JURY.

There is no *preſcribing* againſt a man's lord; no *preſcription* avails to take off any ſervitude or tenure: a title is always required there.

The author of the hiſtory of the inquiſition obſerves, that no time of *preſcription* avails in matters of hereſy; even death itſelf does not ſecure the ſuſpected from the reſearches of that tremendous court. See INQUISITION.

Preſcription, in medicine, the act or art of aſſigning a proper and adequate remedy to a diſeaſe; from an examination of the ſymptoms thereof, and an acquaintance with the virtues and effects of the materia medica. See Remedy, and Disease.

The methodus præſcribendi is the laſt, finiſhing piece of furniture of a phyſician, and is the reſult of all the reſt; joined with a ready, preſent thought. See Medicine, and Physician.

To *preſcribe* with judgment, elegance, *&c.* a moderate acquaintance with pharmacy, *i. e.* with the forms and preparations of medicines, is required. See Pharmacy.

The merits of a bill or *preſcription* conſiſt in its being conciſe, pertinent, efficacious, and agreeable; in the beſt and ſuitableſt materials being pitched on; thoſe aſſembled in the moſt judicious proportions, made up in the beſt and moſt convenient form, and applied in the juſteſt doſe; a due regard being ſtill had to the non-naturals regimen, intervals of application, *&c.* Sydenham excelled in *preſcription*. See Dose, Diet, *&c.*

Preſcription is either *officinal*, or *extemporaneous*; the former conſiſts in ordering the medicines which the apothecaries keep by them ready prepared according to their diſpenſatory. See Officinal, and Dispensatory.

Extemporaneous is that which the phyſician frames of himſelf, *pro re nata*, according to the circumſtances of the patient, to be made up by the apothecary according to the phyſician's bill. See Extemporaneous.

PRESENCE, Præsentia, a term of relation, uſed in oppoſition to *abſence*; and ſignifying the exiſtence of a perſon in a certain place, or the ſtate of a perſon conſidered as co-exiſting with another. See Co-existence.

In this ſenſe, an obligation is ſaid to be paſſed in *preſence* of a notary and witneſſes. At the breaking open a ſeal of a minor, or an abſent perſon, the *preſence* of a ſubſtitute is neceſſary.

The ſchoolmen hold, that *preſence*, in ſpeaking of bodies, denotes not only a co-exiſtence, but a ſort of contact.

They diſtinguiſh two kinds of *preſence*; the one *virtual*, in which ſenſe a ſpirit, or mind, is ſaid to be *preſent* to a body when it acts thereon; the other *corporeal*, which conſiſts in a phyſical contact.

The treaſurers, *&c.* of France have what they call a *right of preſence*, a certain ſum due on their actual attendance in their offices; to oblige them to be more aſſiduous in their function.

A perſon abſent in the ſervice of the king, or a community, is reputed as *preſent*.

The Roman catholics believe the real *preſence* of Jeſus Chriſt in the euchariſt, both in body and ſoul. See Transubstantiation.

PRESENT, Præsens, in grammar, the firſt tenſe, or inflexion of verbs; expreſſing the time *preſent*, or that which now is. See Tense.

It is a particular piece of addreſs in eloquence, to make uſe of the *preſent* for a paſt tenſe, in order to expreſs a paſt action with the more force and warmth.—Thus, the fleet *is* no ſooner in full ſea, than the heavens *begin* to lour, the winds *riſe*, the waves *daſh* againſt each other, thunder *rolls*, and lightning *glares* on all ſides; the ſhips *loſe* their maſts and rudders, and *are* driven impetuouſly againſt the rocks.

PRESENTATION, Præsentatio, in the canon law, the act of a patron, nominating and offering his clerk to the biſhop or collator, to be inſtituted in a benefice of his gift, which is void. See Patron, Collation, *&c.*

The *preſentation* muſt be tendered to the biſhop within an hundred eighty-two days after the living is vacant, elſe it lapſes to the biſhop; and if the biſhop do not collate in half a year more, it lapſes to the archbiſhop; and from him in a like time to the king, who may ſtay as long as he pleaſes; for *nullum tempus occurrit regi.*

By ſome cuſtoms, a lay-patron has only four months time to make his *preſentation* in; and if he have preſented a perſon incapable, he may vary it, and make a new *preſentation* within the four months. See Benefice.

The word is formed from the ancient phraſe, *præſentare ad eccleſiam*, which originally ſignified the patron's ſending, or placeing a perſon in a church; and which itſelf is formed from *repræſentare*, which, Selden obſerves, is uſed in the council of Lateran, and elſewhere, for *præſentare*. See Parson.

Presentation *of the virgin* is a feaſt of the Romiſh church held on the twenty-firſt of November, in memory of the holy virgin's being preſented by her parents in the temple, to be there educated. See Virgin.

It is pretended, that there were young women brought up in the temple of Jeruſalem; which ſome endeavour to prove from the ſecond book of Maccabees, *Sed & virgines quæ concluſæ erant, procurrebant ad* Oniam; which is the ſentiment of Eutochius on this paſſage. And Lyranus adds, that other more ancient authors obſerve, that young women were educated till marriage, either in the temple, or at leaſt in buildings contiguous thereto.

Emanuel Comnenus, who began to reign in 1143. makes mention of this feaſt in his conſtitution. Some even imagine it to have been eſtabliſhed in the eleventh century among the Greeks; and think they ſee evident proofs of it in ſome homilies of George of Nicomedia, who lived in the time of Photius: ſo that it ſeems a miſtake in ſome modern critics to refer its inſtitution to Gregory XI. in 1372.

Some take it to have been inſtituted in memory of the ceremony practiſed among the Jews for their new-born females; correſponding to the circumciſion on the eighth day for males. See Circumcision.

Presentation *of our lady* alſo gives the title to three orders of nuns. See Religious.

The firſt, projected in 1618. by a maid named *Joan of Cambray*. The habit of the nuns, according to the viſion ſhe pretended to have, was to be a grey gown of natural wool, *&c.* but this project was never accompliſhed.

The ſecond was eſtabliſhed in France about the year 1627. by Nic. Sanguin, biſhop of Senlis. It was approved by Urban VIII. This order never made any great progreſs.

The third was eſtabliſhed in 1664. when Fred. Borromeo, being apoſtolical viſitor in the Valteline, was intreated by ſome devout maids at Morbegnobourg to allow them to live in community in a retired place; which he granted, and erected them into a congregation, under the title of *congregation of our lady*. They live under the rule of St. Auguſtin.

PRESENTEE, in the canon law, a clerk preſented by a patron to a collator. See Presentation.

PRESENTMENT, in law, a denunciation or information of the jurors themſelves, or of ſome other officer, as a juſtice, conſtable, ſearcher, ſurveyor, *&c.* of an offence, inquirable in the court whereto it is preſented. See Jury, *&c.*

Aſſiſe of darrein **Presentment**. See the article Assise.

PRESENTS, Præsentia, *free-gifts* or *gratuities*; eſpecially thoſe given by the clergy, or the ſtates of a realm, to a king. See Benevolence.

They are ſo called, becauſe given into the hands of a perſon preſent; by which they are diſtinguiſhed from *munera*, gifts, which are ſent to the party, or delivered by the intervention of a third perſon.

Thus the XVIIIth law, *de verb. ſignif. Abſentibus res donari dicantur, munera autem mitti; &* præſentia *offerri.*

There is no accoſting the eaſtern princes without making them fine *preſents*. Kings uſually make rich *preſents* to embaſſadors ſent to their courts.

PRESEPE, or Præsepe, in aſtronomy, a name given to three nebulous ſtars in the breaſt of the ſign Cancer, or the Crab; two of them of the ſeventh, the third of the ſixth magnitude.—their longitudes, latitudes, *&c.* ſee among thoſe of the other ſtars in Cancer.

PRESERVATIVE, or Præservative, in medicine, a remedy taken by way of precaution: or to ſecure a man from a diſeaſe that threatens him. See Remedy.

The principal *preſervatives*, according to Boerhaave, are abſtinence, quiet, drinking of warm water; and after this, a gentle and continued motion till the firſt apperance of ſweat; then a profuſe ſleeping, the body well covered.

By ſuch means, craſs humours are diluted, the veſſels are relaxed, and noxious marter excreted. He adds, that the beſt defence againſt the force of external cold is to leſſen the winter's cloathing late in the ſpring, and to increaſe the ſummer's cloathing ſoon in autumn.

In time of plague, *preſervatives* are very neceſſary againſt the contagion of the air, *&c.*—See Plague, and Contagion.

Generous wines, cardiacs, and ſudorifics, are *preſervatives.*

Dr. Alprunus tells us, he made inciſions with a lancet in inguine dextro & ſiniſtro, and put in ſetons, to give paſſage to the venom; which proved an excellent *preſervative* againſt the plague that raged at Prague in 1680.

Dr. Wenceſlaus Dobr. Zensky de Nigro Ponte gives us an univerſal *preſervative* againſt infection in all diſeaſes. Whoever, ſays he, in converſing with patients of any kind, would *preſerve* himſelf from infection, muſt, while he is within the ſphere of their effluvia, never ſwallow his ſpittle, but ſpit it out: for he conceives it to be the ſpittle that firſt imbibes the infection. See Saliva.

PRESERVING *of timber.* See the article Timber.

PRESIDENT, Præses, an officer created, or elected, to *preſide* over a company, or aſſembly; ſo called in contradiſtinction to the other members, who are termed *reſidents.*

Lord **President** *of the council* is the fourth great officer of the crown; as ancient as the time of king John, when he was ſtyled *conciliarius capitalis.* See Council.

His office is to attend on the king, to propoſe buſineſs at the council-table, and to report to the king the ſeveral tranſactions there.

PRESIDIAL, a tribunal, or bench of judges, eſtabliſhed in the ſeveral conſiderable cities of France, to judge ultimately, or in the laſt reſort, of the ſeveral cauſes brought before them by way of appeal from the ſubaltern judges.

The *preſidials* make one company with the officers of the bailliages and ſeneſchauſſees, where they are eſtabliſhed.

The edict of 1551. eſtabliſhes *preſidials* under theſe two conditions; firſt, that they may judge definitely, and without appeal, to the ſum of 250 livres, or 10 livres *per annum.* And, 2. to the ſum of 1500 livres by proviſion.

When they judge in the former caſe, they are obliged to pronounce it with theſe words, *par jugement dernier*; in the ſecond, *par jugement préſidial.*

When they judge finally of appeals from inferior judges, they may not pronounce the ſentence or appeal, *au neant*, void; that form only belonging to the ſovereign courts: but are to pronounce ſimply, that *it has been well or ill-judged.*-----To judge *preſidially* and finally, they muſt be at leaſt ſeven in number.

PRESS, Prælum, in the mechanic arts, a machine made of iron or wood; ſerving to ſqueeze or compreſs any body very cloſe. See Machine, and Compression.

The *ordinary preſſes* conſiſt of ſix members or pieces; *viz.* two flat, ſmooth planks, between which the things to be preſſed are laid; two ſcrews, or worms, faſtened to the lower plank, and paſſing through two holes in the upper; and two nuts in form of an S, ſerving to drive the upper plank, which is moveable, againſt the lower, which is ſtable, and without motion.

Presses *uſed for expreſſing of liquors* are of various kinds; ſome, in moſt reſpects the ſame with the common *preſſes*, excepting that the under plank is perforated with a great number of holes, to let the juice expreſſed run through into a tub, or receiver, underneath.

Others have only one ſcrew, or arbor, paſſing through the middle of the moveable plank; which is made to deſcend into a kind of ſquare box, full of holes on all ſides, through which the juices flow in proportion as the arbor is turned, by means of a little lever applied thereto.

Press *uſed by joiners*, to keep cloſe the pieces they have glued, eſpecially panels, *&c.* of wainſcot, is very ſimple; conſiſting of four members. *viz.* two ſcrews and two pieces of wood, four or five inches ſquare, and two or three feet long, whereof the holes at the two ends ſerve for nuts to the ſcrews.

Press *uſed by inlayers* reſembles the joiners preſs, except that the pieces of wood are thicker, and that only one of them is moveable; the other, which is in form of a treſſel, being ſuſtained by two legs, or pillars, jointed into it, at each end.

This *preſs* ſerves them for ſawing and cleaving the pieces of wood required in marquetry, or inlaid work. See Marquetry.

Founders Press is a ſtrong ſquare frame, conſiſting of four pieces of wood firmly joined together with tenons, *&c.*

This *preſs* is of various ſizes, according to the ſizes of the moulds; two of them are required to each mould, at the two extremes whereof they are placed; ſo as that by driving wooden wedges between the mould and the ſides of the *preſſes*, the two parts of the mould wherein the metal is to be run, may be preſſed cloſe together. See Foundery.

Printing Press is a very complex machine, ſerving to *preſs* the ſheet of paper upon the forms, which the workman has firſt ſmeared or *beat* over with ink; ſo as that the characters, or types, whereof the forms are compoſed, may leave their marks or impreſſions thereon. See Printing.

The parts of this *preſs* are the two *cheeks*; ſee Cheek; the four planks, *viz.* the *cap*, *head*, *ſhelves*, and *winter*, the *back* of the *preſs*, where the ink is placed, the *ſpindle* with its *nut*, the *hoſe* with its *books*, the *platten-plate* with its *plug*, the *carriage*, the *coffin*, *gallows*, *tympan* and its *joints*, &c. Laſtly, the *handle*, to bring the *plank* on which the *coffin* is fixed backwards and forwards; and the *bar* to work the ſpindle, and preſs the *platten* on the forms.

See the form and uſe of theſe ſeveral parts deſcribed under the article Printing *preſs.*

Meſſenger of the Press. See the article Messenger.

Rolling Press is a machine uſed for the taking off prints from copper-plates.

It is much leſs complex than that of the letter-printers. See its deſcription and uſe under the article *rolling preſs* Printing.

Press, in coining, is one of the machines uſed in the ſtriking of money; differing from the balance, in that it has only one iron bar to give it motion, and preſs the moulds or coins; is not charged with lead at its extreme, nor drawn by cordage. See Coining.

Binders Press, or *cutting* Press, is a machine uſed equally by book-binders, ſtationers and paſtboard-makers; conſiſting of two large pieces of wood, in form of cheeks, joined by two ſtrong wooden ſcrews; which being turned by an iron bar, draw together, or ſet aſunder, the cheeks, as much as is neceſſary for the putting in of the books, or paper, to be cut.

The cheeks are placed flat on a wooden ſtand, in form of a cheſt, into which the cuttings fall. A-ſide of the cheeks are two pieces of wood, of the ſame length with the ſcrews; ſerving to direct the cheeks, and prevent their approaching or opening unequally upon turning the ſcrew.

Upon the cheeks is the ſhaft or fuſt, to which the cutting-knife is faſtened by a ſcrew, which has its key to diſmount it on occaſion, to be ſharpened.

The ſhaft conſiſts of ſeveral parts; among the reſt, a wooden ſcrew or worm, which catching within the nuts of the two feet that ſuſtain it on the cheeks, bring the knife to the book or paper, which is faſtened in the *preſs* between two boards. This ſcrew, which is pretty long, has two directories, or pieces of wood, which, both as to their form and effect, reſemble thoſe of the ſcrews of the cheeks. To make the ſhaft ſlide ſquare and even on the cheeks, ſo that the knife puſhed along by the workman may make an equal paring; that foot of the ſhaft where the knife is not fixed, has a kind of groove, directed by a thread faſtened along one of the cheeks. Laſtly, the knife is a piece of ſteel, ſix or ſeven inches long, flat, thin and ſharp; terminating at one end in a point like that of a ſword; and at the other in a ſquare form, which ſerves to faſten it to the ſhaft. See Book *binding*.

Press, in the woollen manufactory, is a large wooden machine, ſerving to preſs cloths, ſerges, rateens, *&c.* thereby to render them ſmooth and even, and to give them a gloſs. See Cloth, *&c.*

This machine conſiſts of ſeveral members; the principal whereof are the *cheeks*, the *nut*, and the *worm* or *ſcrew*, accompanied with its bar, which ſerves to turn it round, and make it deſcend perpendicularly on the middle of a thick wooden plank, under which the ſtuffs to be preſſed are placed. See Pressing.

The calender is alſo a kind of *preſs*, ſerving to preſs or calender linens, ſilks, *&c.* See Calender.

PRESSING, in the manufactures, the action of violently ſqueezing a cloth, ſtuff, linen, *&c.* in a *preſs*, to render it even, ſmooth, poliſhed, and gloſſy. See Cloth, *&c.*

This, in the ſilken and linen manufactures, they properly call *calendering*. See Calender.

There are two manners of *preſſing*; the one *hot*, the other *cold*.

Method of PRESSING *cold.*---After the ſtuff has had all its preparations, *i. e.* has been ſcoured, fulled, and ſhorn, (ſee Fulling and Sheering) it is folded ſquare, in equal plaits; and a skin of velum, or fine ſmooth paſtboard, put between each plait. Over the whole is laid a ſquare wooden plank; and in this condition it is put in the preſs; which is driven tight down by means of the ſcrew turned full upon it, by the hands aſſiſted with levers.

After it has lain a ſufficient time under the preſs, they take it out, remove the paſtboards or velums; and lay it up to keep. It may be obſerved, that ſome do not uſe a preſs with a ſcrew in *preſſing cold*; but content themſelves with laying the ſtuff on a firm table, after plaiting and paſtboarding it as before; covering the whole with a wooden plank, and loading this with a weight, greater or leſs, as is judged neceſſary.

Method of PRESSING *hot.*---The ſtuff having received all its preparations, as before, it is ſprinkled a little with water, ſometimes with gum-water ſpurted over it with the mouth; then plaited equally; and between each two plaits are put leaves of paſtboard; and between every ſixth and ſeventh plait, as well as over the whole, an iron or braſs plate, well heated in a kind of furnace for the purpoſe.

This done, it is laid upon the preſs; and a ſcrew brought forcibly down upon it, by means of a long iron bar.

Under this preſs are laid five or ſix pieces one over another, at the ſame time; all furniſhed with their paſtboard and iron plates. When the plates are well cold, they take the ſtuffs from under the preſs, remove the paſtboards and plaits, and ſtitch it a little together, to keep it in the plaits.

This manner of *preſſing* woollen ſtuffs is very pernicious, and was only invented by the manufacturers to cover the defects of the ſtuffs, and excuſe their not giving them all the ſhearings, dyes, and preparations, that are neceſſary to render them perfect. Accordingly it has been frequently prohibited.

Pressing *to death.* See the article Paine *fort & dure.*

PRESSION, or Pressure, in the Carteſian philoſophy, an impulſive kind of motion, or rather endeavour to move, impreſſed on a fluid medium, and propagated through it. See Motion, Fluid, and Cartesian.

In ſuch a *preſſion* the Carteſians ſuppoſe the action of light to conſiſt; ſee Light. And in the various modifications of this *preſſion* by the ſurfaces of bodies, whereon that medium is thus preſſed, they ſuppoſe the various colours to conſiſt, *&c.* See Colour.

But Sir Iſaac Newton has taught us better: for if light, *e. gr.* conſiſted only in a *preſſion*, propagated without actual motion, it could not agitate and warm ſuch bodies as reflect and refract it, as we actually find it does; and if it conſiſted in an inſtantaneous motion, or one propagated to all diſtances in an inſtant, as ſuch *preſſion* ſuppoſes, there would be required an infinite force to produce that motion every moment in every lucid particle.

And if light conſiſted either in *preſſion*, or in motion propagated in a fluid medium, whether inſtantaneouſly, or in time, it muſt follow, that it would inflect itſelf *ad umbram*; for *preſſion* or motion in a fluid medium cannot be propagated in right lines beyond any obſtacle which ſhall hinder any part of the motion; but will inflect and diffuſe itſelf every way into thoſe parts of the quieſcent medium, which lie beyond the ſaid obſtacle.

Thus the force of gravity tends downwards, but the *preſſion* which ariſes from that force of gravity, tends every way with an equable force; and with equal eaſe and force is propagated in crooked lines as in ſtrait. Waves on the ſurface of water, while they ſlide by the ſides of any large obſtacle, do inflect, dilate, and diffuſe themſelves by degrees into the quieſcent water lying beyond the obſtacle. The waves, pulſes, or vibrations of our air, in which ſounds conſiſt, do manifeſtly inflect themſelves, though not ſo much as the waves of water; for the ſound of a bell, or of a cannon, can be heard over a hill, which intercepts the ſonorous object from our ſight; and ſounds will be propagated as eaſily through crooked tubes as through ſtrait.

But light is never obſerved to go in curve lines, nor to inflect itſelf *ad umbram*. For the fixed ſtars do immediately diſappear on the interpoſition of any of the planets, as well as ſome parts of the ſun's body by the interpoſition of the moon, Venus, or Mercury.

PRESSURE *of the air*. See the article AIR.

Moſt of the effects anciently aſcribed to the fuga vacui, are now accounted for from the weight and *preſſure* of the air. See VACUUM.

The *preſſure* of the air on the ſurface of our earth, is balanced by a column of water of the ſame baſe, and about thirty-five feet high; or one of mercury of about twenty-nine inches. See TORRICELLIAN *experiment*, and BAROMETER.

The *preſſure* of the air on every ſquare inch on the ſurface of the earth is computed to be about fifteen pounds avoirdupois. See BATHING.

PRESSURE *of fluids*. See the article FLUID.

PREST *, a duty in money, paid by the ſheriff upon his accounts in the exchequer, for money left or remaining in his hands.

* The word is French, *preſt*, where it ſignifies ready.

PREST-MONEY is a ſum of money which binds thoſe who receive it, to be ready at command, at all times appointed: chiefly underſtood in the liſting of ſoldiers.

PREST-SAIL, in the ſea language, is when a ſhip carries all the ſail ſhe can poſſibly croud.

This is ſometimes done in giving chace, *&c.* but it is a dangerous experiment, leſt the ſhip overſet, or bring her maſts by the board; in which latter caſe ſhe becomes an eaſy prey.

Auditors of the PREST. See the article AUDITOR.

PRESTATION-MONEY, a ſum of money paid yearly by archdeacons, and other dignitaries, to their biſhop, *pro exteriori juriſdictione*.

PRESTATION, PRÆSTATIO, was alſo anciently uſed for other payments: *Et quieti ſint de* præſtatione *muragii*, Chart. Hen. 7. —Sometimes alſo for *pourveyance*.

PRESTER †, a meteor, conſiſting of an exhalation thrown from the clouds downwards with ſuch violence, as that by the colliſion it is ſet on fire. See METEOR.

† The word is Greek, πρηϛηρ, the name of a kind of ſerpent, called alſo *dipſas*, to which this meteor is ſuppoſed to bear a reſemblance.

The *preſter* differs from the thunder-bolt in the manner of its inflammation; and in its burning and breaking every thing it touches with greater vehemence. See THUNDER-BOLT.

PRESTER *John*, or *Jean*, an appellation given the emperor of the Abyſſinians; becauſe anciently the princes of this country were really prieſts, and the word *jean* in their language ſignifies *king*.

It was the French who firſt made him known in Europe under this title. His empire was anciently of vaſt extent; at preſent it is confined to ſix kingdoms, each about the bigneſs of Portugal.

The name *Preſter John* is altogether unknown in Ethiopia, and took its riſe hence, that the people of a province where this prince uſually reſides, when they requeſt any thing, ſay, *Jeancoi*, i. e. my king. His proper title is, *The Grand Negus*.

There is alſo a *Preſter John* of Aſia, mentioned by M. Polo the Venetian. His juriſdiction is in the country of Cangingu, between China, Sifan, and Thibet; a kingdom mightily valued by the Chineſe for its policy, and the number of its fortified cities; though they have uſually the utmoſt contempt for foreign countries.

Some ſay this latter is ſo called from a Neſtorian prieſt, mentioned by Albericus, towards the year 1145. to have mounted the throne. Others, that he takes the name from a croſs which he bears in his hand as a ſymbol of his religion.

PRESTIMONY, PRÆSTIMONIA, in the canon law, a term about which authors are much divided.—It is derived *à præſtatione quotidiana*, and is by ſome defined a kind of benefice ſerved by a ſingle prieſt: in which ſenſe, *preſtimony* is the ſame with a presbyterial chapel. See BENEFICE.

Others will have *preſtimony* to be the incumbency of a chapel, without any title or collation; ſuch as are moſt of thoſe in caſtles, where prayers or maſs are ſaid; and which are mere oratories unendowed.—Whence alſo the term is applied in the Romiſh church to certain perpetual offices beſtowed on canons, religious, or others, for the ſaying of maſſes, by way of augmentation of their livings.

Others, again, will have *preſtimony* to be a leaſe or conceſſion of any eccleſiaſtical fund, or revenue belonging to a monaſtery, to be enjoyed during life.

Du Moulin makes *preſtimony* a profane benefice, which, however, has a perpetual title, and an eccleſiaſtical office with certain revenues attached to it; which the incumbent is allowed to ſell, and which may be poſſeſſed without tonſure: ſuch as the lay churchwardens of Notre-dame. He adds, that in propriety the canonries of chapels are benefices of this nature.

Upon the whole, the ſureſt opinion ſeems to be this, that *preſtimony* is a fund or revenue appropriated by the founder for the ſubſiſtence of a prieſt, without being erected into any title of benefice, chapel, prebend, or priory; and which is not ſubject either to the pope, or to the ordinary; but whereof the patron, and thoſe who have a right from him, are the collators, and nominate and confer, *pleno jure*.

PRESUMPTION, PRÆSUMPTIO, in law, a ſuſpicion, or conjecture founded on a veriſimilitude.

Preſumption is of three ſorts.—1. *Violent*, which many times is allowed a full proof; as if one be killed in a houſe, and a man is ſeen to come out of the houſe with a bloody ſword, and no other perſon was at that time in the houſe; this, though but a *preſumption*, is a proof.—2. *Probable*, which has but a ſmall effect.—3. *Light*, or *temerarious*, which is of no prevalency at all.

In caſes of a charter, or feoffment, if all the witneſſes to the deed be dead; the violent *preſumption* that ſtands for a proof, gives continual and quiet poſſeſſion: *Stabit* præſumptio, *donec probetur in contrarium*. Coke on Lit.

PRESUMPTION was alſo anciently uſed for *intruſion*. See INTRUSION.

PRESUMPTIVE *heir*, the next relation, or heir at law, to a perſon; who is to inherit from him *ab inteſtato*; and who, it is preſumed, will be heir: nothing but a contrary diſpoſition of the teſtator being able to prevent him. See HEIR.

PRETENCE, in heraldry. See the articles INESCUTCHEON, and ESCUTCHEON *of pretence*.

PRETENSED, or PRETENDED *right*, in law, is where one is in poſſeſſion of lands and tenements, which another, who is out, claims and ſues for.—Here the *pretenſed right* is in him who ſo claims or ſues.

PRETER *naturam*, in medicine, *&c.* See the article NATURE.

PRETER, or PRETERIT, PRÆTERITUS, *paſt*, in grammar, an inflexion of verbs, expreſſing the tenſe or time paſſed. See VERB.

Preter, or *preterit*, is a general name that comprehends all the inflections correſponding to the ſeveral tenſes, or ſeveral circumſtances and relations of the time paſt; all which the Latins, *&c.* diſtinguiſh by particular inflections or terminations of the verb; which make the proper notion of tenſes. See TENSE.

The modern languages, particularly the Engliſh, in lieu of different terminations of the verbs themſelves, have uſually recourſe to thoſe of their auxiliaries and participles. See VERB, and PARTICIPLE.

The *preter*, or paſt time, is ſubdivided by grammarians into *preter-imperfect*; as, *e. gr. I had, I thought*; in the Latin, *Habebam, cogitabam*; in the French, *J'avois, je penſois*;—the *preter-perfect*, as, *I have had, I have thought, habui, cogitavi, j'ai eu, j'ai penſé*;—and *preter-pluperfect*, as, *I had thought, I had had, habueram, cogitaveram, j'eus eu, j'eus penſé*.

The Engliſh have properly but two caſes or kinds of the *preter* tenſe: *viz.* the *preter* time of the imperfect action; as, *I was at ſupper then*, but had not yet done it: and the *preter* time of the perfect action, as, *I had then ſupped*, and it was then done.—The *preter* tenſe is ofteneſt formed of the preſent tenſe, by adding *ed*; as, *I burned*.

The French have a particular caſe of the *preter-perfect*, which F. Buffier calls the *preterit ſimple*, in oppoſition to the former, called the *preterit compoſite*; others call it the *preter it indefinite*, becauſe expreſſing a thing done indeterminately; as, *j'ecrivis hier*. This anſwers to the aoriſtus of the Greeks; and in the diſtinction of this from the compound *preterit* does one of the greateſt niceties in the practice of the French language conſiſt. See AORISTUS.

In the paſſive voice, the Latins, French, *&c.* have recourſe to participles and auxiliaries, like the Engliſh, to form their *preter* tenſes; as, *I was loved, amatus eram, j'etois aimé*, &c.

PRETERIT, PRÆTERITUS, in the Roman juriſprudence.—*Infans* PRÆTERITUS in that of whom the father has forgot to make mention in his teſtament; which renders it intirely null. See TESTAMENT.

Exheredation of his ſon is allowed in a father, but never *preterition*.

PRETERITION, or PRETERMISSION, in rhetoric, a figure whereby, in pretending to paſs over a thing untouched, we make a ſummary mention thereof. See PARALEPSIS.

I will not ſay he is valiant, he is learned, he is juſt, &c.

The moſt artful praiſes are thoſe given by way of *preterition*. See RETICENCY.

PRETERNATURAL *rains*. See the article RAIN.

PRETEXT, or PRETENCE, a colour, motive, or cauſe, either real, or apparent. See COLOUR.

PRETEXTA, or PRÆTEXTA, among the Romans, was a long white gown, or toga, having a band or border of purple at bottom. See TOGA.

It was worn by children of quality till the age of puberty, *i. e.* by boys till ſeventeen, at which time they laid it aſide, and aſſumed the virile gown. Girls wore it till marriage. See VIRILE.

It took its name *pretexta*, according to Godwyn, *quod ei purpura* prætexta *erat*, becauſe guarded about with purple ſilk.

The *pretexta*, at firſt, was a robe of ſtate, or ceremony, worn only by the chief magiſtrates, and the prieſts; nor was it lawful for ſuch who wore this gown to be arraigned, or ſentence to paſs againſt them, till it was pulled off.

In continuance of time it was permitted to noblemens children; and, at length, even to all Roman children in general.

PRETIOUS. See the article PRECIOUS.

PRETIUM *ſepulchri*, in old law-books, *&c.* thoſe goods accruing to the church wherein a corps is buried.

In the Iriſh canons, *lib.* 19. *cap. 6.* it is ordered, that along with every body that is buried, there go his cow, horſe, apparel, and the furniture of his bed; none of which may be diſpoſed of otherwiſe than for the payment of debts, *&c.* as being familiars and domeſtics of the deceaſed. See Heriot, Mortuary, *&c.*

PRETOR, Prætor, an eminent magiſtrate, or miniſter of juſtice, in ancient Rome. See Judge and Justice.

In the firſt ages of the commonwealth, all the great magiſtrates were ſtyled *pretors*; afterwards the title was beſtowed on all the principal officers of the army: at laſt, *pretor* became reſtrained to a particular magiſtrate.

About the year of Rome 388. the people ſoliciting to have one of the conſuls always choſen from among themſelves, the ſenators granted it, on condition that a new magiſtracy ſhould be erected, to be filled wholly from among the patricians: ſuch was the origin of the *preture*, *prætura*; which, Livy obſerves, was firſt diſcharged by Spurius Furius; and whoſe office was to look to the adminiſtration of juſtice and equity between man and man; much in quality of a lord chief juſtice, or lord chancellor, or rather both in one.

But buſineſs increaſing in proportion as the empire was inlarged, a ſecond *prætor* was created, to take cognizance of the affairs of foreigners reſiding at Rome: upon which the former was diſtinguiſhed by the title of *prætor urbanus*, or *major*; and the latter by that of *prætor peregrinus*, or *minor*.

The number, in after-times, was much increaſed: under the reign of Auguſtus there were twelve *pretors*, and afterwards eighteen; two whereof were called *prætores cereales*, as being charged with the providing of corn and grain; and two others *prætores fidei commiſſarii.*—In the code, *l.* 1. *t.* 39. we find a law of the emperors Valentinian and Marcian, which reduces the *pretors* to three.

The office of the *pretor*, or *prætor urbanus*, was to render juſtice in the city: he had a power to interpret the laws, to ſupply and reform them; and even to make new ones, when the public good required it. See Civil *law*.

In the inſtitutes, the edicts of the *pretors* are called *jus honorarium*; whence it ſhould ſeem, they had only the force of laws out of reſpect to that eminent magiſtrature; the buſineſs of the *pretor* being rather to look to the obſervation of the old laws, than to make new ones. See Edict.

Some are of opinion, he had not the *jus gladii*, the power of the ſword; the cognizance of criminal matters being the ſpecial province of the prefect of Rome. See Prefect.

But others are of another ſentiment. In the general, it is very difficult to fix preciſely how far his power extended. When he walked, he was preceded by ſix lictors; and was cloathed with the robe called *trabea*.

His authority, like that of the other magiſtrates, was very much weakened and reduced under the emperors. In the Digeſt and Code is a title *de officio prætoris*.

Pretor was alſo a title among the Romans, given the governor of a province, who had ſerved the office of *pretor*. See Propretor.

Whence provinces governed by *pretors*, or reſtrained to thoſe who had diſcharged that office, were called *pretorian provinces*. See Province.

PRETORIAN *guards*, Prætoriæ *cohortes*, were the ſoldiers of the emperor's guard; ſo called, as ſome imagine, from their place or ſtation in the palace or court called *prætorium*. See Pretorium.

Their inſtitution is owing to Scipio Africanus, who firſt eſtabliſhed a company of the braveſt men in his army, picked out for the purpoſe, to be his guard, and never to ſtir from his ſide in battle. See Guard.

Their number was at length increaſed, as Dion tells us, to ten thouſand. They were commanded by an officer created by Auguſtus, called *præfectus prætorii*. See Prefect.

PRETORIUM, Prætorium, among the Romans, the place, hall, or court, wherein the pretor of a province lived, and wherein that magiſtrate ſat to adminiſter juſtice to the people. See Pretor.

There were of theſe *pretoriums* in all the cities of the Roman empire.—The ſcripture mentions that of Jeruſalem under the name of *judgment-hall*; and there are ſtill ſome remains of one at Niſmes in Languedoc.

Pretorium was alſo the tent or pavilion of the general of the Roman army; wherein councils of war, *&c.* were held. See Tent, and Pavilion.

From the time of Auguſtus, the emperor's tent in the camp was diſtinguiſhed by the title of *prætorium Auguſtale*.

Pretorium was alſo a place in Rome where the pretorian guards were lodged. See Pretorian.

Some will have the *pretorium* to be properly the tribunal of the *præfectus prætorii*; or an auditory deſtined for the rendering of juſtice in the emperor's palace. See Prefect.

This they argue from St. Paul's epiſtle to the Philippians; and from this place called *prætorium*, they will have the guards to have been denominated *prætoriani*, becauſe aſſembled here for the emperor's ſafety.

Others will not allow the *pretorium* to be any tribunal, or ſeat of juſtice, but merely the imperial guard-houſe.

Perizonius has an expreſs diſſertation to prove, that the *pretorium* was no court of juſtice in St. Paul's time; but the camp or place where the *pretorian* guards were quartered. He adds, that the name *pretorium* was not given to places where juſtice was adminiſtred till long time after; when the office of the *præfectus prætorii* was converted into a civil function.

PREVARICATION, Prævaricatio, in the civil law, is where the informer colludes with the defendant, and ſo makes only a feigned proſecution.

Sylvius, in his comments on Cicero, *pro Cluentio*, gives us the difference between the three terms, *calumniari*, *prævaricari*, and *tergiverſari*. He who in his accuſation forges faults never committed, is ſaid *calumniari*: he who undertakes one's ſuit, and either will not add reaſons in behalf of his client, or not anſwer the objections of his adverſary, when he is able, is ſaid *prævaricari*: and he who deſiſts in his accuſation, and lets the ſuit drop, *tergiverſari*.

Prevarication, in our law, is when a man falſly and deceitfully ſeems to undertake a thing, with intention that he may deſtroy it: *e. gr.* where a lawyer pleads booty, or acts by colluſion, *&c.*

Prevarication is alſo uſed for a ſecret abuſe committed in the exerciſe of a public office, or of a commiſſion given by a private perſon.

PREVARICATOR, Prævaricator, in the univerſity of Cambridge, is a maſter of arts, choſen at a commencement, to make an ingenious, ſatirical ſpeech, reflecting on the miſdemeanors of the principal members. See Terræ *filius*.

PREVENTION, Præventio, in the canon, *&c.* law, the right which a ſuperior perſon or officer has to lay hold of, claim, or tranſact an affair, prior to an inferior one, to whom otherwiſe it more immediately belongs.

The word is chiefly uſed in ſpeaking of the pope's *preventing* the ordinary collators; and of the royal judges *preventing* ſubaltern ones. See Collation, Judge, Jurisdiction, *&c.*

The Roman canoniſts maintain, that the pope, who is the ſource of all juriſdiction, has not tranſmitted it privatively to the ordinary collators; but that he may ſtill not only collate concurrently with them, but alſo *prevent* them by uſing his original power as head of the church. See Expectative, and Provision.

Theſe *preventions* are grown odious in ſeveral countries, where they do not now obtain without a world of modifications and reſtrictions; and the civil power in France always judges in favour of the ordinary collators. See Premunire.

The pope has no *prevention* to the prejudice of lay-patrons; but by the concordat he has reſerved to himſelf the right of conferring elective benefices by *prevention*, and even cathedral and collegiate dignities. See Concordat.

If the proviſions of the pope, and collations of the ordinary, bear date on the ſame day, the Ultramontane canoniſts give the preference to the pope; the French to the ordinary.

The cardinals have a particular indulgence not to be *prevented* by the pope within ſix months.

PRIAPEIA, in poetry, a name given to certain obſcene epigrams, and other pieces, compoſed on the god Priapus; whereof we have many inſtances in the Greek Catalecta. See Priapus.

PRIAPISM, πριαπισμος, in medicine, a continual and painful erection or tenſion of the yard. See Erection, and Penis.

The term is derived from *Priapus*, a heathen god, whom the poets and painters repreſent with a yard always ſtiff and erect. See Priapus.

As ſatyrs are uſually painted after the ſame manner, the diſeaſe is alſo called *ſatyriaſis*, or *ſatyriaſmus*.

Some, however, diſtinguiſh between the *ſatyriaſis* and *priapiſmus*; in that the latter is without any effuſion, or deſire of coition; but the former attended with both.

The immediate cauſe of a *priapiſm* is the heat, pungency, or acrimony of the ſemen, accompanied with a convulſion of the muſcles of the part, which compreſſing the veins and cavernous bodies, prevent the return of the blood.

The more remote cauſes are too hot, ſharp, ſtimulating foods; cantharides are alſo found to perform the ſame effect, but with much more violence. There are inſtances of people, eſpecially old men, who, making uſe of cantharides to enable them to ſatisfy their paſſions the better, have been ſeized with a *priapiſm*, which has been followed with univerſal convulſions, and even death. See Cantharides.

PRIAPUS, πριαπος, a term ſometimes applied to the genital parts of men, *viz.* the penis, and teſtes. See Genital.

The name took its riſe from *Priapus*, a fabulous deity, particularly adored at Lampſacus, the place of his birth; who, for the extraordinary ſize of his parts, was exceedingly revered by the women; inſomuch that the ſcripture ſeems to tell us, king Aſa dethroned his mother Maachah, becauſe ſhe had conſecrated a grove to Priapus, and preſided at his ſacrifices.

PRICE, Pretium, the value of a thing. See Value.

PRICE *current*, in commerce, a weekly account of the current value of moſt commodities. See Current.

PRICK *poſt*, in building. See Post.

PRICKED *wine*. See the article Wine.

PRICKING, in the ſea-language.—To PRICK *the plat*, or chart, is to make a point therein, near about where the ſhip is now, or is to be at ſuch a time; in order to find the courſe they are to ſteer. See COURSE, CHART, *&c.*

PRIER *age*. See the article AGE.

PRIER *aid*. See the article AID.

PRIEST, *ſacerdos*, a perſon ſet apart for the performance of ſacrifice, and other offices and ceremonies of religion. See SACRIFICE, RELIGION, *&c.*

Thus the falſe gods and goddeſſes of the heathens had their *prieſts*; *prieſts* of Mars, of Bacchus, of Hercules, of Iſis; and ſome of them their prieſteſſes. See PONTIFF, *&c.*

The Jews had two orders, *viz.* *prieſts* and *levites*, who ſerved in the temple. See LEVITE, *&c.*

The Mahometans have their *prieſts* called *ſcheik* and *muphti*; and the Indians and Chineſe their *bramins* and *bonzas*. See MUPHTI, BRACHMAN, *&c.*

PRIEST, PRESBYTER, in the Chriſtian church, is a perſon inveſted with holy orders; in virtue whereof, he has a power to preach, pray, adminiſter the ſacraments, *&c.* and, in the Romiſh church, alſo, to bleſs, abſolve, *&c.* See ORDERS.

By the canons, a man muſt be twenty-four years of age ere he be admitted to the prieſthood; anciently thirty years were required. See ORDINATION.

The holy ſcripture uſually confounds the title of *prieſt*, *preſbyter*, with that of *biſhop*, *epiſcopus*; and does not ſeem to give any ſuperiority to the one over the other: and yet the abſolute equality among all the *prieſts* in the government of the church has few inſtances, but what are conteſted. See PRESBYTER.

Blondel and Salmaſius maintain with a world of reaſon, that in the primitive church, the *prieſts* governed with perfect equality, and without any other pre-eminence beſide that of age; and yet to conſult the fathers and tradition, the *presbyterian* form of government would ſcarce ſeem to have been known among the ancients. See PRESBYTERIAN.

In effect the primitive writers ſpeak of nothing but epiſcopacy; and of that too, frequently in ſuch terms, as if they eſteemed it of apoſtolical inſtitution. See EPISCOPACY, and BISHOP.

As, in the ancient church, the deacons had the management and adminiſtration of the revenues of the church, their authority grew apace, and in a little time they were got above the *prieſts*. St. Jerom uſed his utmoſt endeavours to prove, that deacons were originally inferior to *prieſts*; and the council of Nice decided the queſtion in favour of the latter. See DEACON.

Indeed, an order of deacons having been inſtituted without any other function than to aſſiſt the *prieſt* at the altar; theſe have made no difficulty of owning the ſuperiority of the *prieſts*. Add to this, that the order of a deacon being now become neceſſary to arrive at that of a *prieſt*, there is no room to diſpute the precedency: but the deacons who had retained their function, had the diſpoſal of the revenues, and paid the *prieſts* their penſions, ſtill maintained the ſuperiority. Upon which, the ſixth council in Trullo pronounced once more on the diſpute, and gave the pre-eminence to the *prieſts*.

Arch PRIEST, ſee the article ARCH *prieſt*.

Cardinal PRIEST, ſee the article CARDINAL.

High PRIEST, ſee the article PONTIFEX.

Regular PRIEST, ſee the article REGULAR.

PRIESTS *of the oratory*, ſee the article ORATORY.

PRIEST'*s cap*, in fortification, ſee BONNET *à pretre*.

PRIMA *naturalia*, in phyſics, atoms or the firſt particles whereof natural bodies are primarily compoſed; called alſo *minima naturalia*, which ſee: ſee alſo PARTICLE, ATOM, *&c.*

Tria PRIMA, in chymiſtry, ſee the article TRIA.

PRIMÆ *viæ*, in medicine, the firſt paſſages of the chyle; including the œſophagus, ſtomach, inteſtines, and their appendices. See CHYLE, *&c.* ſee alſo VIÆ.

PRIMAGE, a duty at the water-ſide appointed by a ſtatute of Henry VIII. to be paid to the maſter and mariners of the ſhip, by the merchants whoſe goods are loaded or unloaded.

It is paid to the maſter for the uſe of his cables and ropes, in moving the goods; and to the mariners for their ſervice and aſſiſtance.

This is different, in different places; in ſome 12 d. per tun, in others, a peny per pound; in others, ſix-pence per bale or pack. See DUTY, and CUSTOM.

PRIMARY *planet*, a planet which revolves round the ſun as a centre. See PLANET.

Such are Saturn, Jupiter, Mars, the Earth, Venus, and Mercury; thus called in oppoſition to ſecundary planets, or ſatellites. See SATURN, VENUS, *&c.*

Some authors reſtrain the *primary planets* to the ſuperior ones, *viz.* Saturn, Jupiter and Mars; but very impertinently.

PRIMARY *affections*,	See the articles	AFFECTION,
PRIMARY *collateral points*,		COLLATERAL,
PRIMARY *dials*,		DIAL,
PRIMARY *motion*,		MOTION,
PRIMARY *place*,		PLACE,
PRIMARY *qualities*,		QUALITY.

PRIMATE, PRIMAS, an archbiſhop, inveſted with a juriſdiction over ſeveral archbiſhops or biſhops. See ARCHBISHOP.

Father Sirmond derives the origin of *primates* hence; that the large provinces having been divided and ſubdivided by the emperors, the firſt diviſions were called firſts, others ſeconds, others thirds, *&c.* and the title *primate* given to the metropolitan, *i. e.* to the biſhop of the city which was the capital of the province, ere the diviſion was made. See METROPOLIS, and METROPOLITAN.

This metropolitan *primate* had ſome juriſdiction over the biſhops of the inferior provinces; and was alſo called *patriarch*. See PATRIARCH.

The term *primate* is Latin, and ſignifies the firſt, or preſident of a ſociety; the Greek word correſponding to it is ἔξαρχος, *exarch*. See EXARCH.

Thoſe who hold for a ſtrict eccleſiaſtical hierarchy, maintain a *primate* to be he who has ſeveral metropolitans under him; as a patriarch has ſeveral *primates*. Yet it is pretty evident from hiſtory, that *primates* were at firſt confounded with patriarchs: thus Socrates, enumerating ten patriarchs, does not make any diſtinction thereof from *primates*.

In Africa, after the diſtinction was made, the *primates* were not at all ſubject to the patriarch: thus the biſhop of Carthage, who was *primate*, paid no obedience to the biſhop of Alexandria, who was patriarch.

Nor, to be a *primate*, was it neceſſary to have metropolitans for ſuffragans: each province of Africa, except thoſe which compoſed the dioceſe of Alexandria, had its *primate*; this quality being given to age.

In France, the ſubdiviſion of provinces gave occaſion to the erection of *primates*: thus Aquitaine, *e. gr.* being divided into two provinces, the archbiſhop of Bourges became *primate* of the Aquitaines, becauſe Bourges was the capital of the firſt.

Thus alſo the diviſion of England into two provinces, Canterbury and York, in 1152. gave occaſion to the introduction of *primacies* among us; Canterbury, which was the metropolis before, thence giving the title of *primate of all England* to its prelate, though the archbiſhop of York ſtill claims that of *primate of England*. And accordingly, the firſt has ſome juriſdiction over all England, relating to adminiſtrations, *&c.* which the latter has only within his own province. See PROVINCE.

PRIME, PRIMUS, the firſt in order, degree, or dignity, among ſeveral things of the ſame or like kind.

Thus we ſay, *prime miniſter*, *prime mover*, *prime coſt*, &c. See MINISTER, MOBILE, *&c.*

PRIME, or PRIME *minute*, in geometry, denotes the ſixtieth part of a degree. See DEGREE.

PRIME is ſometimes alſo uſed for the tenth part of an unit. See DECIMAL.

In weights, it is uſed for the twenty-fourth part of a grain. See GRAIN.

PRIME *number*, in arithmetic, a number which can only be meaſured by unity; or whereof: is the only aliquot part: ſuch are 5, 7, 11, 13, *&c.* See NUMBER.

Prime numbers inter ſe, among themſelves, are thoſe which have no common meaſures beſides unity; thus 12 and 19 are *prime numbers inter ſe*.

PRIME *figure*, in geometry, is that which cannot be divided into any other figures more ſimple than itſelf. See FIGURE.

Such is a triangle among planes; and the pyramid in ſolids.—For all planes are made of the firſt, and all bodies or ſolids compounded of the ſecond.

PRIME *vertical* is the vertical circle which paſſes through the poles of the meridian. See VERTICAL.

PRIME *verticals*, in dialing, or PRIME *vertical dials*, are thoſe projected on the plane of the *prime* vertical circle, or on planes parallel thereto. See DIAL.

Theſe are what we likewiſe call direct, erect, north or ſouth dials.—But ſince every plane hath that pole raiſed or depreſſed thereon, which lies open to it; therefore this plane (if a direct ſouth) hath the ſouth pole elevated, and conſequently the ſtyle (whoſe height muſt be the complement of the latitude of the place) will point downwards. Wherefore to find the hour's diſtance from the meridian upon this plane, the proportion is, As the radius is to the ſine of the ſtyle's height, or co-latitude; ſo is the tangent of the hour, or angle at the pole, to the tangent of the ſeveral hours diſtance from the meridian. By this canon, the hours requiſite for the plane, as alſo the half-hours, quarters, *&c.* being calculated and ſet in a table; the dial is deſcribed after the ſame manner, as the horizontal dial. North direct erect dials are but the backſide of the ſouth, becauſe lying in the ſame azimuth with it; therefore it is no more but turning the ſouth dial upſide-down, and leaving out the ſuperfluous hours between 5 and 7, and 4 and 8, and the north dial is made. Only note that the ſtyle muſt point upwards to the north pole. Harris.

PRIME *of the moon* is the new moon at her firſt appearance, for about three days after her change. See NEW *moon*.

PRIME is alſo uſed in the Romiſh church, for the firſt of the canonical hours, ſucceeding to lauds. See HOURS, LAUD, *&c.*

PRIME, in fencing, is the firſt and chief of the guards; which is that the body is in, immediately after drawing the ſword; being fitteſt to menace and terrify the enemy, by reaſon the point of the ſword is held higher up to the eye, than in any of the other guards. See GUARD.

PRIME, or PRIMING *of a gun*. See PRIMING.

PRIMICERIUS, in antiquity, the firſt or chief perſon in any office or dignity. See Chief, Principal, *&c.*

In this ſenſe the word occurs frequently in the code, and even in our old Engliſh laws: though it is there alſo occaſionally uſed for a nobleman; as, *Primicerius totius Angliæ.*

The Romans had great variety of *primicerii*, both in church, and the emperor's court; a *primicerius of the empreſs*, *primicerius auguſtalis*, *primicerius of the bardariotæ*, *primicerii of the legions*, *of the court*, *of the chamber*, *of the palace*, &c.

The *eccleſiaſtical primicerius*, Du Cange obſerves, was the ſame with the *chantor* among us. See Chantor.

In the church of Metz, the *primicerius* is the firſt dignitary of the dioceſe, and preſides at aſſemblies of the clergy, in prejudice of the biſhop.

At Venice, the dean of the church of St. Mark is called *primocirio*, or *primicerius*: he is independent of the patriarch of Venice, and enjoys epiſcopal privileges.

PRIMIER *ſeiſin*, in law, Prima *ſeiſina*, or the *firſt ſeiſin*; a branch of the king's prerogative, whereby he had the firſt poſſeſſion of all lands and tenements held of him in chief, whereof his tenant died ſeized in fee; and conſequently the rents and profits thereof: till the heir, if he were of age, did homage; and if under age, till he became of age.—But all charges ariſing by *primier ſeiſin*, are annulled by a ſtat. 12 *Car.* II. See Seisin.

PRIMING, or Prime *of a Gun*, is the gunpowder put in the pan or touch-hole of a piece, to give it fire by.

The *priming* is the laſt thing done in charging. See Charge.

For pieces of ordnance, they have a pointed iron rod, to pierce the cartridge thro' the touch-hole; called *primer*, or *priming-iron.*

Priming, among painters, ſignifies the laying on of the firſt colour. See Colour, and Painting.

PRIMIPILARII, or Primopilarii, or Primipilares, in antiquity, were properly ſuch as had formerly borne the office of *primipilus*, or firſt centurion of a legion, to whom was entruſted the care of the banner. See Cohort.

Some will alſo have *primipilarii* to have been a denomination given to the ſoldiers of the firſt cohort of a legion.

The *primipilarii* had conſiderable advantages; one of the chief was, that moſt of the ſoldiers who died in the campaign, left them their heirs.

PRIMIPILUS, or Primopilus, or Primipili *centurio*, in antiquity, the centurion of the firſt cohort of a legion, who had charge of the Roman eagle. See Centurion, and Cohort.

PRIMITIÆ, the *firſt fruits* gathered of the earth; whereof the ancients made preſents to the gods. See Fruits.

In Leviticus, the *primitiæ* of all fruits are injoined to be offered to God. See Tithe.

In our law, the *primitiæ* are one year's profits, after avoidance, of every ſpiritual living, as rated in the king's books. See First *fruits.*

PRIMITIVE, in grammar, a *root*; or a word in a language, which is neither derived from any other language, nor compounded from any other words of the ſame. See Root, Word, *&c.* Thus, *God* is a *primitive*; *Godly*, a derivative; *God-like*, a compound. See Derivative.

Primitive, in arithmetic. See Prime, and Number.

PRIMO *beneficio eccleſiaſtico habendo*, in law, a writ directed from the king to the lord chancellor, appointing him to beſtow the benefice that ſhall firſt fail in the king's gift, above or under ſuch a value, upon this or that clerk. See Benefice.

Propoſitio de Primo *adjacente.* See Proposition.

PRIMOGENITURE, Primogenitura, the right of firſt-born, or eldeſt ſon or child.

The *right of primogeniture* ſeems to be an unjuſt prerogative, and contrary to natural right: for ſince it is birth alone gives children a title to the paternal ſuccceſſion, the chance of *primogeniture* ſhould not throw an inequality among them.

Accordingly, the right of *primogeniture*, which calls the elder-born to the crown, preferably to the other, was not introduced into France till very late: it was unknown to the firſt race of kings; and even to the ſecond.

The four ſons of Clovis ſhared the kingdom equally among themſelves; and Louis le Debonnaire did the ſame: it was not till the race of Hugh Capet, that the prerogative of ſucceſſion to the crown was appropriated to the firſt-born.

By the antient cuſtom of *gavel-kind*, ſtill preſerved in ſome parts of our iſland, *primogeniture* is of no account; the paternal eſtate being equally ſhared by all the ſons. See Gavel-kind.

PRIMOPILUS. See the article Primipilus.

PRIMUM *ens.* See the article Ens.

PRIMUM *mobile*, in the Ptolemaic aſtronomy, the ninth or higheſt ſphere of the heavens, whoſe centre is that of the world, and in compariſon of which the earth is but a point. See Mobile. This they will have to contain all the other ſpheres within it, and to give motion to them, turning itſelf, and all them, quite round in twenty-four hours. See Mobile.

PRIMUS *peronæus.* See the article Peronæus.

PRIMUS *ſcalenus.* See the article Scalenus.

PRINCE, Princeps, in politics, a perſon inveſted with the ſupreme command of a ſtate or country; independent of any ſuperior. See Sovereign, Monarch, King, *&c.*

Prince is alſo uſed for a perſon who is ſovereign in his own territory; yet holds of ſome other, as his ſuperior or lord, and pays homage or tribute to him.

Thus all the *princes* of Germany are feudataries of the emperor: they are as abſolute in their reſpective principalities, as the emperor himſelf; yet are all bound in certain ſervices to him. See Emperor. See alſo Electors, Electoral, and College.

Prince, in ancient records, frequently ſignifies no more than *lord.*—Du Cange gives a great number of inſtances of this uſage. See Lord.

In effect, the word *princeps* in Latin, whence *prince* in Engliſh, originally ſignifies only the *chief*, or *firſt*: it is compounded of the Latin *primus*, and *caput*; and is properly a word of dignity and office, not of property and ſovereignty.

Thus, in the charter of king Offa, after the biſhops had ſubſcribed their names, we read, *Brordanus patritius*, *Binnanus princeps*; and afterwards the dukes ſubſcribed their names.

And in a charter of king Edgar, in *Mon. Angl. tom.* 3. *p.* 301. *Ego Edgarus rex rogatus ab epiſcopo meo Deorwolfe*, *&* principe *meo Aldredo*, &c. And in Mat. Paris, *p.* 155. *Ego Halden* princeps *regis pro viribus aſſenſum præbeo*, *& ego Turketillus dux concedo.*

Prince *of the youth.*—Among the ancient Romans, it was the cuſtom for the emperor in his life-time to nominate him whom he would have to ſucceed in the empire, under the title of *princeps juventutis*, *& Cæſar.* See Cæsar.

In the *ludus Trojanus*, the youth who was choſen captain, was alſo called *princeps juventutis.* See Trojanus.

Prince is alſo a title given to the iſſue of *princes*, or thoſe of the royal family. See Son, and Daughter.

In which ſenſe they are called, particularly in France, *princes of the blood*; as partaking of the blood to which the ſovereignty is appropriated: and not by any hereditary right, but as a patrimony ſubſtituted to all the royal race. See Blood.

In England, the king's children are called *ſons and daughters of England*: the eldeſt ſon is created *prince of Wales.* See Prince *of Wales.* The cadets, or younger, are created dukes or earls, with what title the king pleaſes. They have no apanages, as in France; but only what the good pleaſure of the king beſtows on them. See Apanage.

The ſons are all by birth counſellors of ſtate: the daughters are ſtyled *princeſſes*; to violate the eldeſt of which, unmarried, is at this day high treaſon.

To all the king's children belongs the title of *royal highneſs*: all ſubjects are to kneel, when admitted to kiſs their hand; and at table, out of the king's preſence, they are ſerved on the knee.

The firſt *prince* of the blood in France is called abſolutely *monſieur le prince.*—The quality of *prince of the blood* gives a rank and precedency, but does not include any juriſdiction; they are *princes* by order, not by office.

Wicquefort obſerves, that it is not fifty years ſince the *princes* of the blood of France gave place to all embaſſadors, even thoſe of republics; and it was at the king's requeſt, that they were ſince allowed the precedency.

The moment a pope is elected, all his relations become *princes.* See Pope, Nepotism, *&c.*

Prince *of Wales*, the eldeſt ſon of England. See Son.

He is born duke of Cornwall; and immediately intitled to all the rights, revenues, *&c.* belonging thereto; as being deemed, in law, at full age on his birth-day.

He is afterwards created *prince of Wales*; the inveſtiture whereof is performed by impoſition of a cap of ſtate, and a coronet, a verge of gold, and a ring. He holds the principality by patent, granted him and his heirs, kings of England.

The title and principality were firſt given by king Edward the firſt to his eldeſt ſon: till that time the eldeſt ſon of England was called *lord prince.* While Normandy remained to the king of England, the eldeſt ſon was always ſtyled duke of Normandy: ſince the union, his title is *Magnæ Britanniæ princeps.*

He is reputed, in law, the ſame perſon with the king: to imagine his death, or to violate his wife, is high-treaſon. His revenues, as duke of Cornwall, are computed at 14000 *l. per. annum.* The revenues of the principality were eſtimated, 300 years ago, at 4680 *l. per ann.*

Prince's *metal.* See the article Metal.

PRINCIPAL, Principalis, the chief, moſt conſiderable, or neceſſary part of a thing.

Thus we ſay, the mayor is the *principal* magiſtrate of a city or town; a council of war conſiſts of the *principal* officers. In a peroration, the *principal* points inſiſted on are to be briefly ſummoned up. The *principal* of a college, or hall, is the maſter thereof. See University.

Principal, in commerce, is the capital of a ſum due or lent; in which ſenſe the word is uſed in oppoſition to *intereſt.* See Interest.

Principal is alſo uſed for the firſt fund or ſum put by partners into common ſtock; by which it is diſtinguiſhed from the calls or acceſſions ſometimes required, when the former proves inſufficient.

Principal *point*, in perſpective, is a point in the perſpective plane; upon which a line drawn from the eye, perpendicular to the plane, falls. See Point.

This point is in the interſection of the horizontal and vertical plane, and is alſo called *the point of ſight*, and *point of the eye.* See Sight, *&c.*

Principal *ray*, in perſpective, is that which paſſes perpendicularly from the ſpectator's eye to the perſpective plane, or picture. See Ray.

Whence the point, where this ray falls on the plane, is by ſome alſo called *the principal point*, which other writers call *the centre of the picture*, and *the point of concurrence*. See Point.

Principal, Principalium, in old law-writers, is ſometimes uſed for a *heir-loom*. See Heir-loom.

In Urchenfield *com. Hereford*, certain *principals*, as the beſt beaſt, beſt bed, beſt table, *&c.* paſs to the eldeſt child, and are not ſubject to partition.

Principal is ſometimes alſo uſed for a *mortuary*, or *corſe preſent.*——*Item lego equum meum vocatum* le bay gelding, *ut offeratur ante corpus meum in die ſepulturæ meæ, nomini* principalii. *Teſt. Joh. de Macclesfield*, 9 *Hen.* 5.

Principal *cauſe*,	See the articles	Cause,
Principal *challenge*,		Challenge,
Principal *officers of the navy*,		Navy,
Principii *petitio*,		Petitio.

PRINCIPLE, Principium, a term frequently uſed for the cauſe, ſource, or origin of any thing. See Cause, *&c.*

In which ſenſe we ſay, the *principle of thinking, of willing*, &c.

In phyſics, we muſt ever have recourſe to a firſt *principle*, which is God. See Cause.

The Manichees admit of two *principles*, the one of good, the other of evil; which they eſtabliſh in quality of two contrary deities, conſtantly oppoſing each other. See Manichee. See alſo Good and Evil.

According to the doctrine of Pelagius, our own wills are the *principles* of our good actions, and we ourſelves the *principles* of our good wills. See Pelagians.

Principle is defined, among the ſchool philoſophers, to be that from which any thing is, is done, or known: *unde aliquid eſt, fit, aut cognoſcitur*; which is a very extenſive ſignification, and agrees to all kinds of *principles*.

Thus, the premiſes are *principles*, in reſpect of the concluſion; and thus fire, and every other agent, are the *principles* of things which they produce. See Action, and Agent.

The Thomiſts define *principle* to the like effect: *id à quo aliquod procedit aliquo modo.*

Philoſophers uſually diſtinguiſh *principles*, into thoſe of *being*, *principia eſſendi*; and thoſe of *knowing*, *principia cognoſcendi*: or, *principia rei*, and *cognitionis*.

Of the firſt they make two kinds; *viz. principles of origination*, which are thoſe from which ſomething proceeds really the ſame with the *principle*; as in the proceſſion of the Son and Spirit from the Father in the Trinity.—And *principles of dependency*; in which ſenſe, any cauſe is a *principle*, in reſpect of the thing cauſed; or a ſubject, in reſpect of the accidents inherent in it.

The *ſecond* is that from which we borrow or derive our knowledge of ſome other thing; or it is that which makes the thing be known.—Such are *axioms, definitions, hypotheſes*; ſuch alſo are *examples, explanations*, &c. See Knowledge.

Innate Principles. See the article Innate.

Principle, in phyſics, or Principle *of a natural body*, is ſomething that contributes to the eſſence of a body; or whereof a natural body is primarily conſtituted. See Body.

Ariſtotle defines *principles* to be thoſe things which are not made or conſtituted of themſelves, nor of other things, but all things of them: *Quæ non fiunt ex ſe invicem, nec ex aliis, ſed ex iis omnia.*

To give an idea of natural *principles*, conſider a body in ſeveral ſtates; a coal, *e. gr.* that was juſt now a piece of wood: it is evident there is ſomething in the coal, which before exiſted in the wood; this, whatever it is, is a *principle*, and is what we call *matter*. See Matter.

Again, there muſt be ſomething joined with this matter, to make it wood rather than fire, or fire rather than wood: this is another *principle*, and is what we denominate *form*. See Form.

Matter and form, then, are univerſal *principles* of natural bodies. The *Peripatetics* add a third *principle*, viz. *privation*; for though, ſay they, a thing is not made from nothing; yet it muſt be made from its not being that thing before.—This Ariſtotle calls *privation*, and admits it as a third *principle*.—But the moderns reject it: for if *privation* be a *principle*, it is at leaſt ſo in a very different ſenſe from matter and form. See Privation.

Some late philoſophers admit no *principles* but *acid* and *alkali*. See Acid, and Alkali.

Ariſtotle diſtinguiſhes two ſorts of natural *principles*, as they concur in the generation, or in the compoſition of bodies.

Principles *of generation*, or of a body *in fieri*, are thoſe without which a natural generation can neither be, nor be conceived.—Such are the three *principles* above-mentioned, *matter, form*, and *privation*.

Principles *of compoſition*, or of a body *in facto eſſe*, already made, are thoſe whereof natural bodies really conſiſt.—Such, according to him, are *matter* and *form*; to which ſome add a third, *viz. union*, to connect the two others together.—But this is only neceſſary upon ſuppoſition of ſubſtantial forms. See *ſubſtantial* Form.

Principles are uſually confounded with *elements*; yet is there a real difference: elements are properly the firſt and ſimpleſt beings, ariſing from the firſt determination or aſſemblage of *principles*. They are the ſimpleſt things in which matter and form are combined.—Elements and *principles*, therefore, differ in this, that a *principle*, as matter, is only a begun, not a complete nature; but an element is perfect and complete. See Element.

To this head may likewiſe be referred what we call *mechanical principles of bodies*, which ſerve to account for the mechaniſm or artificial ſtructure of things, and all the varieties and differences of bodies from motion, figure, and other common affections. See Mechanical.

Theſe *principles* are differently maintained by three or four different ſects of philoſophers; *viz.* the ancient Epicureans, or Corpuſcularians, to whom may be added the modern Gaſſendiſts; the Carteſians; and the Newtonians. See Epicurean, Corpuscularian, Cartesian, and Newtonian.

Principles, in chymiſtry, are the firſt and ſimpleſt parts whereof natural bodies are compounded; and into which they are again reſolvible by fire. See Part.

Theſe are more properly, as well as more commonly, called *elements*. See Element.

The chymiſts make five *principles*; three whereof are called *active principles*; which are ſuppoſed to act of themſelves, and do not need to be put in motion by others: ſuch as ſalt; ſulphur, or oil; and mercury, or ſpirit. See Active.—The ſalt they ſuppoſe the foundation of all ſavours; ſee Salt: the ſulphur, of odours; ſee Sulphur: and the ſpirit, or mercury, of colours; ſee Spirit.

The two *paſſive principles*, which have no force inherent in themſelves, and only act by being join'd with ſome of the others, are phlegm, and caput mortuum, which they alſo call *elementary principles*. See Passive, and Phlegm, *&c.*

Principles, among Hermetic philoſophers.—According to theſe gentlemen, the two *univerſal principles* of ſenſible nature are ſubtile and ſolid, which being joined in a greater or leſs degree, generate all that beautiful variety of beings in the univerſe.

The three *natural principles* are ſalt, ſulphur, and mercury.

Theſe *principles* generate the four elements; and are, as it were, ſecondary elements, inaſmuch as they are contained in all mixed bodies. Sulphur is the firſt, and ſtands in the place of male; mercury the ſecond, ſtanding in the place of female; and ſalt the third, which copulates the others together. *Dict. Hermet.*

Principle is alſo applied to the foundations of arts and ſciences. See Art, and Science.

In this ſenſe we ſay, *principles* are not to be proved; they muſt be common notions. See Notion, and Axiom.

There is no diſputing againſt a man that denies *principles*: the worſt reaſoning is that which includes a *petitio principii*, i. e. which ſuppoſes a *principle* that ought to be proved.

Principle is alſo applied by extenſion to the firſt rules or maxims of an art. See Rudiment.

In this ſenſe we ſay, a man is ignorant of the *principles* of geometry; meaning, he has not learnt Euclid's elements.—The *principles* of moſt arts and ſciences are found in this dictionary, under their reſpective heads.

PRINTER, *typographus*, a perſon who compoſes, and takes impreſſions from moveable characters, ranged in order, or from plates engraven, by means of ink, and a preſs. See Printing.

Fuſt, Guttemberg, Scheffer, Mentel, and Koſter, were the *firſt printers*. The firſt that practiſed it in England was Fred. Corſeilles, brought over from Haerlem, under king Henry VI. In France, Gering; at Rome, Conrad Sweynheim, and Arnold Pannarts, both Germans; at Naples, Sixtus Ruſinger.

The *great printers* were Aldus, and Paulus Manutius; the two Badii; William and Frederick Morel; Oporin; Frobenius; Rob. Hen. and Char. Stephens; Gryphius, Turnebus, Torres, Commelin, Plantin, Raphelengius, Vaſcoſan, Bleau, Criſpin, and the two Elzevirs.—The *learned printers* were, the Manutii, the Stephens's, the Badii, Turnebus, Wechel, Morel, Juntæ, *&c.*

Plantin had the title of *arch-printer*, archi-typographus, given him by the king of Spain, in conſideration of his printing the polyglot of Antwerp.

The names, characters, and eloges of all the famous *printers* are found in part II. of the firſt tome of the *jugemens des ſçavans.*

The *printers*, ſince the eſtabliſhment of that art, are eſteemed a part of the company of ſtationers and bookſellers: before that eſtabliſhment, the company conſiſted only of bookſellers, binders, writers, illuminers, and parchment-makers.——The *parchment-makers* prepared the ſkins, and made the parchment or velum; which were then almoſt the only matters books were written on. The *writers*, or *copyiſts*, wrote and tranſcribed books after copies given them by the bookſellers. The *binders* were charged with the binding of thoſe days, which was very coarſe; only conſiſting of two ſlight boards covered with ſome paltry leather. The *illuminers* painted in miniature, and gilt initial letters, head-pieces, tail-pieces, and other compartiments. Laſtly, the *ſtationers* or *bookſellers* ſet the *writers* to work, and ſold their copies in ſhops, and other places, on the days allowed them by the ſtatutes to expoſe the ſame. See Book, Bookseller, Bookbinding, Librarius, *&c.*

PRINTING, *typographia*, the art of taking impreſſions with ink, from characters and figures moveable or immoveable, upon paper, velum, or the like matter. See Character, Letter, Ink, Paper, *&c.*

There are two kinds of *printing*; the one for books, the other from copper-plates, for pictures.—The firſt called *common-preſs-printing*, the ſecond *rolling-preſs-printing.*

The prime difference between the two conſiſts in this, that the characters of the former are caſt in relievo, and thoſe of the latter ingraven in creux. See RELIEVO, ENGRAVING, *&c.*

The art of *printing* is a modern invention: it is, indeed, of a very ancient ſtanding among the Chineſe; but then their *printing* is very different from ours. It muſt be owned, the European *printing*, in its original, was much the ſame with the Chineſe; yet, as there was at that time no commerce or correſpondence between Europe and China, the paſſage into the eaſt by the cape of Good Hope being as yet undiſcovered by the Portugueſe; there is no room to charge the Europians with borrowing their art from the Chineſe: but each muſt be owned to have fallen on the ſame thing, though at very different times.

Father Couplet aſſures us, that *printing* has been in uſe in China from the year 930. Father le Comte ſpeaks more largely; ſaying, that it has been there from almoſt all ages: he adds, that there is this difference between theirs and ours, that, whereas we have but a very ſmall number of letters in our alphabets, and by the various arrangement of theſe are able to form infinite volumes; we have the advantage, by making our characters moveable, to print the largeſt works with an inconſiderable quantity of letter; thoſe that ſerved for the firſt ſheets, ſerving over again for the ſucceeding ones: the Chineſe, on the contrary, by reaſon of the prodigious number of their letters, are precluded this reſource; and find it more eaſy, and leſs expenſive, to cut all their letters on wooden blocks; and thus to make as many blocks as there are pages in a book, and theſe of no further uſe but for that ſingle work. *Their method of* printing *ſee hereafter.*

Origin of PRINTING.—Who the firſt inventors of the *European printing* were, in what city, and what year, it was firſt ſet on foot, is a famous problem long diſputed among the learned. In effect, as the Grecian cities contended for the birth of Homer, ſo do the German cities for that of *printing.*

Mentz, Haerlem, and Strasbourg, are the warmeſt on this point of honour: Italy alſo would have entered the liſts; but the ſuffrages being at firſt divided between the firſt three pretenders, they are left in poſſeſſion of the queſtion, which, in reality, is not yet juſtly decided; though it muſt be owned, Mentz has always had the majority of voices.

We ſhall not enter into a nice diſquiſition of the merits of the cauſe, but only propoſe the pretenſions of each.—John Mantel of Strasbourg, John Guttemberg and John Fuſt of Mentz, and L. John Koſter of Haerlem, are the perſons to whom this hohour is ſeverally aſcribed, by their reſpective countrymen; and have all their advocates among the learned.

Mantel, a phyſician of Paris, enters the liſts in behalf of his name-ſake of Strasbourg; and contends that it was he firſt invented *printing* in the year 1442. and that, in conſideration hereof, the emperor Frederic III. gave him a coat of arms correſponding thereto: he adds, that Guttemberg, whom he had taken in as a partner or aſſociate, carried it to Mentz, where he took in Fuſt a partner.

The Haerlemers, with Boxhornius, Schrevelius, *&c.* refer the firſt invention to Laurenzs Janzs Koſter of Haerlem, in the year 1430. adding that his aſſociate Guttemberg ſtole away his tools while he was at church, and carried them to Mentz, where he ſet up for the firſt inventor; though others attribute this theft, *&c.* to his partner Fuſt.

Munſter, Polydore Virgil, Paſquier, *&c.* will have Guttemberg, or Guttemburgh, to have really been the inventor of *printing*; and add that he took in Fuſt and Schoeffer for aſſociates.

Naude, in his Maſcurat, eſpouſes the cauſe of Fuſt, or Fauſt, or Fauſtus; and will have him to be the firſt *printer* in Europe, and that he took in Guttemberg for a partner. His reaſon for putting Fuſt in poſſeſſion of this privilege, is, that the firſt books that were printed, appear to have been all of his impreſſion. It is more than probable, had Guttemberg or Koſter had a greater or an equal ſhare in the invention, they would not have allowed him to attribute the whole to himſelf and his ſon-in-law Schoeffer, as he has done, without ever offering to do the like, or in the leaſt contradicting him, and aſſerting their own right.

Theſe editions are, 1. The *Catholicon Januenſis*, dated in 1460. and now in the king's library. Fuſt's name, indeed, is not to this; but it is perfectly like the following ones, where it is. 2. The Latin bible of 1462. now in the French king's library. 3. Tully's Offices, in 4to, (the reſt being all folio's) in the year 1465. and 1466. for there are copies in the Bodleian, and the library of C. C. college, Oxon, of both thoſe dates. 4. Other Bibles of 1471. 5. St. Auguſtine *de civitate Dei*, 1473. 6. Mercurius Triſmegiſtus *de poteſtate & ſapientia Dei*, in 1503. 7. Titus Livius, in 1518.

Add to this, that at the beginning of Livy, is a privilege granted by the emperor Maximilian to Schoeffer, for the ſole power of *printing* that author for ten years; and for ſix years, to all the other books he ſhould print thereafter, in conſideration of his father-in-law, Fuſt's, having invented the art of *printing*. This privilege is dated 1518. and ſigned Jac. Spiegel.

Eraſmus, however, in the epiſtle after that privilege, does not poſitively aver the fact; he only obſerves, that the firſt or the chief inventor of that art is held to be J. Fuſt. In the advertiſement to the ſaid book, Nic. Carbachius ſpeaks to the ſame effect as the privilege, and Eraſmus.

As to Guttemberg, Mantel, and Koſter, Naude obſerves, the perſon is not yet born that can ſay he has ever ſeen books printed by any of them, before, or as early as thoſe of Fuſt. All that is urged on their behalf, is only founded on reports, conjectures, probabilities, forged authorities, and the jealouſies of cities againſt one another.

Yet Salmuth, in his additions to Pancirollus, cites a public act, whereby it appears, that Fuſt, after having invented *printing*, and ſuſtained it a long time on his own footing; at length took in Guttemberg as a partner, to contribute to the expence; which was very great, by reaſon the firſt books were moſt of them printed on velum, or at leaſt parchment, and after the Chineſe way.

But the cauſe is not thus decided: the advocates for Koſter urge divers things, to put him in the place here aſſigned to Fuſt. Mr. Ellis, in the philoſophical tranſactions, fathers books on him prior to any of thoſe above referred to Fuſt; and even ſome as early as 1430. and 1432. It is certain, the Haerlemers ſhew printed books of that date, which agreeing ſo well with the account given by Theod. Schrevelius, and others, leaves Mr. Ellis little room to doubt, whether the honour of the invention be his or the other's due. All that belongs to Fuſt, according to this writer, is the honour of eſtabliſhing the art in greater luſtre and perfection at another place many years after.

But the difficulty lies, either in ſhewing why the practice ſhould be at a ſtand from 1432. to the reviving of it at Mentz by Fuſt and Schoeffer, in 1465. or elſe in giving ſome account of the condition and progreſs of this invention during that interval.

Now, Boxhornius, Schrevelius, and other authors, expreſly affirm, that ſo large a work as the *De Spiegel*, *Speculum Salutis*, of Koſter, ſhewn at Haerlem for the firſt printed book, could never be his firſt eſſay: he muſt have had the art in its rougher rudiments before, and have made many trials on leſſer works: no doubt his firſt attempts were on looſe ſheets, which we may ſuppoſe were eaſily loſt. In effect, it muſt be allowed no inconſiderable argument in Koſter's behalf, that the rudeſt and moſt artleſs performances ſeem to be his: Mr. Ellis mentions ſome things of this kind without date, which he had ſeen in the king's library at St. James's, in that of Bennet college and the Bodleian at Oxford, with all the marks of the utmoſt ſimplicity; and which might fairly bid for firſt eſſays. There is ſomething ſo aukward and coarſe in them, that any body almoſt might have done them; mere nature being ſufficient, without any art or experience at all. The ink was only common writing ink, unartfully ſpread upon wooden blocks, very clumſily cut, *&c.*

By this time we have traced up the art to ſuch a ſtate, that it may, perhaps, ſcarce ſeem worth the conteſting who it was invented it; and no doubt, *printing*, as it now ſtands, owes more to the genius and addreſs of ſome of the later improvers, than it did to its firſt author.

The ſame conſideration may make us more eaſy under our preſent ignorance of the inventors of moſt other arts; many of which had ſuch ſimple unmeaning originals, that you or I ſhould, perhaps, think it no mighty credit to be eſteemed the authors of inventions nothing leſs artful and ingenious.

Progreſs of PRINTING.—The firſt printers, then, whoever they were, whether Koſter, Fuſt, Schoeffer, or Guttemberg, made their firſt eſſays on wooden blocks, or forms, after the Chineſe manner.

It is not improbable, ſays Mr. Bagford, they might take the hint from ancient medals and ſeals; but others rather imagine it to have come from the method of making playing cards, which, it is certain, bears a near reſemblance to the primitive proceſs of *printing*; as appears from the firſt ſpecimens of that art above-mentioned. See CARDS.

The book at Haerlem, the vocabulary called *Catholicon*, and the pieces in the Bodleian and Bennet's college, are all performed in this way; and the impreſſion appears to have been only given on one ſide the leaves; after which the two blank ſides were paſted together.

But they ſoon found the inconveniencies of this method; and therefore bethought themſelves of an improvement; which was by making ſingle moveable letters, diſtinct from one another.

Theſe being firſt done in wood, gave room for a ſecond improvement; which was the making of them, at length, of metal: and, in order to that, cutting moulds, matrices, *&c.* for caſting them.

From this ingenious contrivance, we ought to date the origin of the preſent art of *printing*, as practiſed throughout Europe; contradiſtinguiſhed from the methods of the Chineſe abroad, and the card-makers at home, which were the ſame art, only practiſed in a different place, or with a different view.

And of this, Schoeffer, or Scheffer, firſt ſervant, and afterwards partner, and ſon-in-law, of Fuſt, at Mentz, above-mentioned, is pretty generally allowed the inventor: ſo that he was properly the firſt printer; and, in ſtrictneſs, the bible, which was printed with moveable letters in 1450. was the firſt printed book; the next was Auguſtine *de civitate Dei*, then Tully's Offices, *&c.* about the year 1461.

But the art being yet in its infancy, there were ſome imperfections in the books they printed; among the reſt was the want of capital letters: hence they left the places of the initial letters blank, and gave them to the illuminers to paint in gold, or azure: though, others ſay, this was done deſignedly, to enable them to paſs off their books for manuſcripts.

Some authors tell us, that Fuſt carrying a parcel of his bibles to Paris, and offering them to ſale as MSS. the French, upon conſidering the number of books, and their exact conformity with one another, even to a point, and that the beſt book-writers could not be near ſo exact, concluded there was witchcraft in the caſe; and by either actually indicting him as a conjurer, or threatening to do ſo, extorted the ſecret. And hence the origin of the popular ſtory of Dr. Fauſtus.

From Mentz, the art of *printing* ſoon ſpread itſelf throughout a good part of Europe; Haerlem and Straſburgh had it very early; which, as the current of authors repreſent it, occaſioned their pretending to the honour of the invention.

From Haerlem it paſſed to Rome in 1467. and into England in 1468. by means of Tho. Bourchier, archbiſhop of Canterbury, who ſent W. Turner, maſter of the robes, and W. Caxton, merchant, to Haerlem, to learn the art. Theſe privately prevailing with Corſeilles, an under-workman, to come over, a preſs was ſet up at Oxford; and an edition of Ruffinus on the creed printed the ſame year in a broad octavo on paper.

From Oxford, Caxton brought it to London about the year 1470. In the ſame year it was carried to Venice, and to Paris, where Gering, Grantz, and Friburger, all Germans, invited thither by two doctors of the Sorbonne, ſet up a preſs in that learned houſe.

Hitherto there had been nothing printed but in Latin, and the vulgar tongues; firſt in Roman characters, then in Gothic, and at laſt in Italic. But in 1480. and, as ſome ſay, in 1476. the Italians caſt a ſet of Greek types; and it was at Venice, or, as ſome ſay, at Milan or Florence, that the firſt editions in that language appeared.

The Italians too have the honour of the firſt Hebrew editions, which were printed about the ſame time with the Greek, at Soucino, a little city in the duchy of Milan; under the direction of two Jewiſh rabbins, Joſhua and Moſes, whoſe works are dated in the year of the world 5240, anſwering to the year 1480. of the chriſtian æra.

Towards the end of the 16th century, there appeared various editions of books in Syriac, Arabic, Perſian, Armenian, Coptic, or Egyptian characters; ſome to gratify the curioſity of the learned, and others for the liturgic uſes of the Chriſtians of the Levant, printed chiefly at Paris; whither puncheons and matrices were ſent from Conſtantinople by M. Savary, then embaſſador at the Porte.

Out of Europe, the art of *printing* has been carried into the three other quarters of the world: for Aſia, we ſee impreſſions of books at Goa, and in the Philippines; at Lima, Boſton, Mexico, *&c.* for America; and at Morocco for Africa.

The Turks, indeed, rigorouſly prohibit *printing* throughout their empire, as imagining that the too free communication with books might occaſion ſome change in religion or government; yet the Jews have ſeveral editions of their books printed at Conſtantinople, Theſſalonica, *&c.*

Method of PRINTING.—The *printing* letters, characters or *types*, as they are ſometimes called, we have already ſpoken of, under the articles LETTER and CHARACTER.

Of the method of forming or caſting them, under the article *letter* FOUNDERY.

and of the art of engraving the puncheons, matrices, *&c.* in order thereto, under the articles ENGRAVING, PUNCHEON, MATRICE, *&c.*

The workmen employed in the art of *printing* are of two kinds; *compoſitors*, who range and diſpoſe the letters into words, lines, pages, *&c.* according to the copy delivered them by the author: And *preſſmen*, who apply ink upon the ſame, and take off the impreſſion. See COMPOSITION, *&c.*

Office of the compoſitor.—The types being caſt, *&c.* are diſtributed, each kind by itſelf, among the diviſions of two long wooden frames, an upper and under one, called *caſes*; each of which is divided into little cells, or boxes, of different ſizes.

The boxes of the upper caſe are in number 98; and in theſe are diſpoſed the capitals, ſmall capitals, accented letters, *&c.*

In the cells of the lower caſe, which are fifty-four, are diſpoſed the common running letters, with the points, comma's, ſpaces, quadrats, *&c.*

Each caſe is placed a little ſlope, like a reading-deſk; that the operator may reach the upper boxes the better, and be in leſs danger of mixing the letters by ſtretching his arm over them. See CASE.

The compoſitor's poſt is againſt the middle of the caſe, and he works ſtanding, holding an inſtrument uſually made of iron, called the *compoſing-ſtick*, in one hand; with the other he takes the letters, points, comma's, *&c.* as he needs them, out of the boxes; ranges them on a ſlip of braſs, called a *rule*, in his compoſing-ſtick; and, putting a ſpace, to make a blank between each two words, forms one line after another; till the ſtick being full, he empties it out upon another inſtrument, called the *galley*; ſeveral of which ranged in a frame, called a *chaſe*, are ready for the preſs.

This ſhort view of compoſing may need to be further illuſtrated and inlarged upon.—The *compoſing-ſtick*, then, (repreſented *tab.* MISCELLANY, *fig.* 9.) conſiſts of a plate, or ſlip of iron, braſs, wood, *&c.* more or leſs broad, and contrived ſo as to be made more or leſs long according to the width of the page, and the number of lines to be compoſed in it,

From the right ſide of this plate ariſes a ledge *aa*, about half an inch high, running the whole length of the plate, and ſerving to ſuſtain the letters, the ſides of which are to reſt againſt it; from the ſame plate likewiſe ariſe three other leſſer pieces, *b*, and *cc*, two of which, *cc*, are contrived to ſlide along it, that ſo the two pieces may be either approached or withdrawn at pleaſure, to adjuſt the length of the line to the meaſure intended.

Add, that where marginal notes, references, *&c.* are required in a work, the two ſliding pieces *cc* are opened in the compoſing-ſtick, to a proper diſtance from each other.

Ere the workman proceeds to compoſe, a rule, or thin ſlip of braſs plate, cut to the length of the line, and of the ſame height as the letter, is placed in the compoſing-ſtick againſt the ledge thereof, for the letter to bear immediately againſt.

Things thus prepared, the compoſitor having the copy lying before him, and the ſtick in his left hand, with the right he picks up the letters, ſpaces, *&c.* and places them againſt the rule; while with the thumb of the left he preſſes them cloſe to the upper ſcrew, or check; and thus keeps them tight and ſteady; while the other hand is conſtantly employed in ſetting in more letters: the whole being performed with a degree of expedition and addreſs, not eaſy to be imagined.

A line being thus compoſed, if it end with a word or ſyllable, and fill the meaſure, there needs no further care; otherwiſe more ſpaces are to be put between the ſeveral words to juſtify the lines, *i. e.* to make the meaſure quite full, ſo that every line may end even; and thus he proceeds to another line.

The ſpaces here uſed are a ſort of blanks, of the like dimenſions as the letters, but leſs high; and whoſe faces, therefore, when ſet, do not appear, nor give any impreſſion. They are of ſeveral kinds according to the dimenſions of the whites or intervals to be made by them, *viz.* quadrats, to fill up a break at the end of a paragraph, or the like; m quadrats, which are ſquare, and of the thickneſs of an m, ſerving to make the diſtance after a period, or between ſentence and ſentence, n quadrats, of the thickneſs of an n, to be placed after colons, ſemicolons, and comma's; and thick or thin ſpaces, to be uſed between the words in juſtifying, as above.

For marginal notes, in the ſpaces reſerved for them, between the two ſliding-pieces of the compoſing-ſtick, are put little quadrated pieces of metal, called *quotations*; which are juſtified by other ſmaller pieces; a ſlip of ſcaleboard being placed from the top of the page to the bottom, to keep the note and text at a due diſtance.

The firſt line thus completely juſtified, the compoſitor advances to the next; in order to which, he moves the braſs rule from behind the former, and places it before it, and thus compoſes another line againſt it, after the ſame manner as the former: and thus he goes on till his ſtick be full, which he empties into the galley, after the manner following.

Taking the rule from behind the laſt line, he places it before it; and with his two middle fingers ſqueezes the lines in the ſtick cloſe; his two fore-fingers at the ſame time being applied on the outſide of the rule: thus he lifts them out of the ſtick, and clapping his two thumbs behind the firſt line, lifts them into the galley, taking care to diſengage his two thumbs without breaking the lines.

The compoſitor having thus ſet the proper number of lines in his ſtick, *viz.* four, five, ſix, or more, and emptied them out into the galley; he again fills, and empties, as before, till a complete page be formed; remembring at the bottom of every page to ſet a line of quadrats, and at the end thereof the firſt word of the page enſuing, for a catch-word; and if it be the firſt page of the ſheet, one of the letters for a ſignature.

The galley is a flat wooden inſtrument, in form of a long ſquare; of a length and breadth proportionable to that of the page; it conſiſts of two parts, the upper, called the *ſlice*, whereby the pages of large volumes, when compoſed, are ſlidden upon the ſtone; the other, which is the body of the galley, is ledged on three ſides, to contain the ſlice; the inner ledge not to exceed half an inch in height, that the compoſed page riſing above it be one half the height of the letter, may be tied up, or bound down, and removed without danger.

This galley is placed at the top of the caſe, and detained by two wooden pins from ſliding down the boxes. See GALLEY.

The page, then, compoſed and ranged in the galley, he ties it up therein with a cord or packthread, and ſets it by; and proceeds to the next, till the number of pages of the ſheet be completed: which done, he carries them to the impoſing or correcting-ſtone, there to range them in order, in a chaſe; which they call *impoſing*.

The chaſe is a rectangular iron frame of different dimenſions, according to the ſize of the paper to be printed on; having two croſs pieces of the ſame metal, called a *long* and *ſhort croſs*, mortiſed at each end, into the frame, ſo as to be taken out occaſionally.

By the different ſituations of theſe croſſes, the chaſe is fitted for different volumes; for quarto's and octavo's, one traverſes the middle lengthwiſe, the other broadwiſe, ſo as to interſect in the centre; which is the moſt cuſtomary ſituation: for twelves and twenty-fours, the ſhort croſs is ſhifted nearer to one end of the chaſe: For folio's the long croſs is left intirely out, and the ſhort one placed in the middle; and for broadſides, or ſheets printed on one ſide only, both croſſes are ſet aſide.

To dreſs the chaſe, or range and fix the pages therein, they make uſe of a ſet of furniture, conſiſting of reglets, or ſlips of wood of different dimenſions, and about half an inch high, that they may be lower than the letters: ſome of theſe are placed at the top of the pages, called *head-ſticks*; others between them, to form the inner margin, called *gutter-ſticks*; others at the ſides, called *ſide-ſticks*; and others at the bottom, called *foot-ſticks*.

The pages, then, placed in order on the ſtone, the chaſe is put over them, and the reglets applied between the letter and the chaſe, in the poſition above-mentioned; the whole is locked up by means of ſmall pieces of wood, cut in the wedge-form, called *quoins*, which are driven with a mallet and ſhooting-ſtick, to a ſufficient tightneſs.

Before the form be quite locked up, they dreſs down the ſame by paſſing a ſmooth piece of wood, called the *plainer*, over the letters, to make their ſurfaces ſtand flat and even; and, when locked up, they ſhake it, to ſee that nothing ſtir.

In this condition the work is called a *form*, containing more or fewer pages, according to the volume. See FORM.

As there are two forms required for every ſheet, when both ſides are to be printed, it is neceſſary they be exactly of the ſame length and breadth; *i.e.* the correſponding reglets, head-ſticks, *&c.* are to be equal in both forms, that the pages may fall exactly on the back one of another, which is called *regiſter*.

Here, then, properly ends the compoſitor's office; the form, thus finiſhed, being to be committed to the preſſman.

Indeed, as it is impoſſible but there muſt be miſtakes in the work, either through the overſight of the compoſitor, or by the caſual tranſpoſition of the letters in the caſes; after drawing off a proof, it is delivered to the corrector, who reading it over, and rectifying it by the copy, it is remanded to the former operator, to be corrected accordingly.—*For the characters uſed in correcting a ſheet for the compoſitor*, ſee CORRECTION.

The compoſitor, then, unlocking the form upon the correcting-ſtone, by knocking out or looſening the quoins; and ſpreading his corrected proof ſo, as that the lines thereof range with the reſpective ones of the metal; by running his eye along both, he eaſily ſpies where corrections are to be made: according to which, he proceeds to pick out the faulty letters, points, *&c.* with a ſharp-pointed ſteel bodkin, and puts others in their places.

Where the alterations are conſiderable, and particularly where inſertions or omiſſions are to be made, there uſually ariſes a neceſſity of over-running; in order to which they muſt decompoſe, or return the lines back from the chaſe into the galley, and from the galley again into the compoſing-ſtick, to be new-modelled and rectified accordingly.

If, *e. gr.* one or more words to be inſerted in a line, cannot be got in by changing the ſpaces of the line for leſſer ones; part of the line muſt be put back into the cloſe of the preceding one, or forward into the beginning of the ſubſequent one, or both, till room is got. If the inſertion be large, ſeveral lines will need to be over-run, either backward or forward, till a break is arrived at; when, if it be not got in, a line is to be driven out; and to get in that line, the next pages, either backward or forward, muſt ſometimes be over-run, ere it can come in.

When an omiſſion is to be made, the contrary courſe muſt be taken. If it be but little, the compoſitor takes it out, and drives out the remaining matter, by either inlarging his ſpaces, or beſtowing the beginning of the following, or the cloſe of the preceding line therein. If it be conſiderable, he may be obliged to over-run ſeveral pages, ere it can be driven out.

Preſſman's office, or PRINTING *properly ſo called.*—To work off the form thus prepared and corrected by the compoſitor, there are three things required, paper, ink, and a preſs.

To fit the paper for uſe, it is to be firſt wet or moiſtened, by dipping ſeveral ſheets together in water: theſe are afterwards laid in a heap over one another; and to make them take the water equally, are all preſſed cloſe down with a weight a-top. As to the degree of wetting, it muſt be according to the quality of the paper, and the ſize of the letter; ſmall letters, and ſtiff paper, requiring moſt wetting.

A PRINTING-HOUSE is a place deſtined for *printing*, and fitted up for that purpoſe with preſſes, caſes, and other furniture.

The moſt conſiderable *printing-houſes* in the world are thoſe of the Louvre and Vatican.—The firſt, begun under Francis I. was carried to its utmoſt perfection under Louis XIII. by the care of cardinal Richelieu; and removed into the galleries of the Louvre by Louis XIV.

The Vatican *printing-houſe*, called alſo the *apoſtolical printing-houſe*, becauſe the pope's bulls, decrees, *&c.* are printed therein, was begun by Pius IV and finiſhed with great magnificence by Sixtus V. See VATICAN.

Out of both theſe *printing-houſes* have come forth very beautiful and ſplendid editions of the ancient authors. The Vatican was the firſt that printed books in the Arabic language.

The Clarendon *printing-houſe* at Oxford (ſo called, becauſe built, in great meaſure, with the profits ariſing from the copy of lord Clarendon's hiſtory, which had been given to the univerſity) promiſes well: it has already furniſhed us with a very fine Engliſh bible.

The PRINTING *ink* is of two kinds, black and red: the laſt occaſionally uſed in the title-pages, calendars, *&c.* the firſt for the body of books. The compoſition of each, though now reckoned no part of the printers buſineſs, but uſually furniſhed them by other hands, is as follows:

For black ink: An hundred pounds of nut or linſeed oil, being reduced, by boiling, to the conſiſtence of a ſyrup, is cleanſed and purified by throwing into it two pounds of coarſe bread, and about a dozen onions. They then boil thirty or thirty-five pounds of turpentine apart, till ſuch time as they find, upon its cooling on paper, that it breaks clean, like glaſs, without pulverizing; for if it pulverize eaſily, it is a ſign it is burnt. The oil and turpentine thus prepared, the firſt is gently poured, half cold, into the latter; and the two ſtirred together with a ſtick, till they be well mixed; after which, the compoſition, which is called the varniſh, is ſet by, to be uſed occaſionally.

Now, to proceed to make ink, they take a quantity of this mixture, and add to it a certain quantity of lamp-black; working it up with a kind of wooden mullet, or brayer, till the whole be incorporated, and reduced into a kind of pulp; which is the ink for uſe.

Where note, that its thickneſs or ſtrength is always to be proportioned to that of the paper, and the warmth of the weather; ſtrong paper, and hot weather, requiring ſtrong ink; and that the ſtrength or weakneſs of the ink depends on the greater or leſs degree of coction of the varniſh.

For red ink: They uſe the ſame materials as for black, excepting that inſtead of lamp-black they add a proper quantity of vermilion. Some hold, that by mixing and incorporating the bigneſs of a nut of fiſh-glue, or brandy, or the white of an egg with the ink, the vermilion acquires a greater luſtre.

The ink is applied upon the forms by balls, which are a kind of wooden funnels, the cavities whereof are filled with wool covered with leather nailed to the wood. One of theſe the preſſman takes in each hand, and applying them on the ink-block, to charge them with ink, he rubs them one againſt the other to diſtribute the ink equally; and, at laſt, ſmears over the form by beating or dabbing them ſeveral times over the whole face thereof: this leaves the form in a condition to be paſſed under the preſs, with the moiſtened paper laid thereon.

The PRINTING *preſs* (repreſented *tab. miſcel. fig.* 8.) is a very complex machine: its two principal parts, each whereof conſiſts of ſeveral others, are the *body* of the preſs, which ſerves to give the pinch or ſtroke for the impreſſion; and the *carriage*, on which the form is laid to undergo the ſame. See PRESS.

The body conſiſts of two ſtrong cheeks *b b*, placed perpendicularly, and joined together by four croſs pieces or planks. See CHEEK.

The firſt plank *c c*, called the *cap* of the preſs, is fixed, and ſerves to keep the two cheeks together at the due diſtance, at-top: the ſecond *d d*, called the *head*, is moveable; being ſuſtained by two iron pins, or *long bolts*, that paſs the cap: in this plank is fixed a female ſcrew or *worm*, with a *braſs nut*, ſuſtained by two *ſhort bolts*, which keep it up: the third plank *e e*, called the *ſhelves*, ſerves to keep ſteady a part called the *hoſe*, in which the *ſpindle* (to be ſpoken of hereafter) is incloſed: the fourth plank *f f*, called the *winter*, is moveable; it bears the carriage, and ſuſtains the effort of the preſs beneath, as the head does above; each giving way a little, the one upwards, the other downwards, to make the pull the eaſier.

The *ſpindle g g* is an upright piece of iron pointed with ſteel, of different dimenſions; having a male ſcrew, which goes into the female of the head above four inches. Through the eye *h* of this ſpindle, is rivetted the *bar*, by which the preſſman works the preſs.

The lower part of the ſpindle paſſes through the ſhelves, being incloſed in a ſquare wooden frame *i*, called the *hoſe*; and its point works into the plug, fixed in a braſs pan ſupplied with oil; which pan is fixed to an iron plate let into the top of the platten. The preſſman, then, by pulling or turning the bar fixed in the eye by an iron key, preſſes upon a ſquare ſmooth piece of wood called the *platten*, and enables it to compreſs the form covered with the paper, tympans, and its blankets, which, in order hereto, are brought under the platten.

At each corner of the hoſe, is an iron hook faſtened to thoſe at each corner of the platten, with cords or packthread, very exactly.

The *carriage l l l l*, which makes the ſecond principal member of the preſs, is placed a foot below the platten, having its fore-part ſupported by a wooden prop *m*, called the *fore-ſtay*, while the other reſts on the winter. On this carriage, which ſuſtains the plank, are nailed two long iron bars, or *ribs*, *o o*; and on the plank are nailed ſhort pieces of iron or ſteel *p p*, called *cramp-irons*, equally tempered with the ribs, and which ſlide upon them when the preſs is turned in or out.

Under the carriage is fixed a ſmall piece of iron called the *ſpit*, with a double wheel in the middle, round which leather *girts* are faſtened, nailed to each end of the plank. To the outſide of the ſpit is fixed a handle, or rounce, by which the preſſman turns the plank in or out at pleaſure.

Upon the plank is a ſquare wooden frame or *coffin q q*, wherein is incloſed a marble or poliſhed ſtone for the form to be laid on. To this coffin are faſtened leather ſtay-girts, one to each ſide; which, being again faſtened to the cheeks of the preſs, prevent the plank from running too far out, when drawn from under the platten. On the fore-part of the plank is a gallows *r r*, which ſerves to ſuſtain the tympans, when taken from off the form.

On the front of the coffin are three frames much alike, though ſerving for different purpoſes, *viz.* the two tympans and friſket: the tympans *ſ ſ* are ſquare, made of three ſlips of very thin wood, and at top of a ſlip of iron, ſtill thinner, called a *head-band:* that called the *outward tympan* is faſtened with iron joints to the coffin. They are both covered with parchment; and between the two are placed blankets, which ſerve to make the impreſſion of the platten upon the ſurface of the letters more equable; as alſo to prevent the letters from being broken by the force of the preſs. The friſket *t t* is all of iron, very thin, faſtened at top to the great or outward tympan, and ſuſtained by a ſlip of wood hanging from the cieling, when opened to take out the printed ſheets, and put in others. It is alſo covered with parchment or paper, cut in the neceſſary places, that the ſheet, which is between the great tympan and friſket, may receive the ink, and that nothing may hurt the margins. On the parchment of the great or outward tympan it is that the blank ſheet is laid to be printed.

To regulate the margins, and make the lines and pages anſwer each other when printed on the other ſide; in the middle of the wood, in the ſides of this tympan, are two iron points, which make too holes in the ſheet, to be placed on the ſame pins, when the ſheet is returned for an impreſſion on the other ſide, called the *reiteration.*

Every thing now about the tympans being prepared for printing, and the preſſman having inked or beat his form now placed on the ſtone, he brings the tympans and friſket down from the gallows upon the form; and advanting the plank under the platten by means of the ſpit-handle, or rounce, gives two ſtrokes or pulls with the bar; and with the ſame handle turned the contrary way, brings back the plank, to take out the printed ſheet, and put in the freſh one; and this he repeats till he have taken off the full number of ſheets the edition is to conſiſt of.

One ſide of the ſheet being thus printed, it is remanded to the preſs for the other; and ſo diſpoſed, as that the iron points paſs through the holes already made in the ſheet.

Sometimes it is required to cut the friſket afreſh, where the ſecond ſide is to be more or leſs full of *printing* than the firſt; as is frequently the caſe at the beginning and ending of books, *&c.*

The number of ſheets of the edition being complete, and the form to be ſeparated, to reſtore the letters into the caſes, they firſt waſh it in a boiling lye to take out the remains of the ink, ſcouring it with a bruſh, and then with fair water. This done, it is carried to a wooden frame to be unlocked, and the furniture, *i. e.* the ſticks, *&c.* taken off to diſengage it from the chaſe. Then the compoſitor taking out ſeveral lines at once upon a little wooden ruler, he replaces each letter in its proper box, to be again uſed in the remainder of the impreſſion; which laſt operation they call *diſtribution.*

Beſide the ſeveral kinds of letters and characters above-mentioned, uſed in *printing*, they have likewiſe rules for blank lines, borders, and head and tail-pieces, accommodated to the ſeveral kinds of letters.

The *rules* for blank lines are of braſs, and made exactly the height of the letter; otherwiſe they will either hinder the neighbouring letters from *printing*, or will themſelves be hindered by them. Theſe the compoſitor occaſionally cuts into proper lengths, as his work requires.

The *borders* are a kind of ornaments in form of long bars, ſerving for the diviſions of books, chapters, *&c.* Their depth is proportioned to the letter, and their length adjuſted to the page; for being compoſed of ſeveral moveable pieces, it is eaſy lengthening or ſhortening them.

The *head* and *tail-pieces*, cut either in wood or pewter, are compartiments uſed at the beginnings and endings of books.

The initial letters are ſometimes cut in wood, and figured; ſometimes caſt like the other characters.

For the conveniency of the binding, the *printers* had early recourſe to ſignatures, *i. e.* letters of the alphabet placed at the bottom of the ſheet, which ſhew the order they are to be bound in; as well as whether the quires be complete.

The *catch-words* ſerve nearly the ſame purpoſe: theſe are the firſt words of each page, which are inſerted at the bottom of the preceding pages. The number of the pages are equally ſerviceable to the reader and the binder, to guide to references, and to warrant the book duly bound and collated: ſome *printers* formerly put them at the bottoms of the pages; but cuſtom has carried it for the tops.

In the infancy of *printing*, they had likewiſe a regiſtrum chartarum for the convenience of the binders: to draw this, at the end of each volume, they collected the ſignatures, and the firſt words of the four firſt ſheets of each alphabet. To abridge it, they afterwards contented themſelves to expreſs the ſignatures, and how oft each letter was repeated: but the regiſtrum has been long diſuſed.

As to the faults which eſcape the corrector and compoſitor, they are uſually noted in what we call *errata.* The ancient editions had no errata; but in lieu thereof they corrected the faults in each printed copy with a pen; which was eaſy enough in thoſe days, though impracticable now. In effect, we have anciently had *printers* who did not need an errata of above five articles in a volume of five hundred ſheets: how different from ſome of the preſent ſet, who might make an errata of five hundred articles in a book of five ſheets!

Chineſe PRINTING.—There are three opinions as to the antiquity of the Chineſe *printing*, one fixing it 300 years before Chriſt; another 900 years after him; and a third carrying it ſtill farther back, and making it coeval with that mighty empire; though it muſt be allowed the laſt is much the leaſt probable of the three.

Their manner of *printing* we have already hinted to be very different from that which now obtains among the Europeans; it is true, it has ſome advantage over ours in correctneſs, and the beauty of the character; but in other reſpects it comes far ſhort, the ſingle advantage of moveable characters making more than amends for all that is urged againſt us by ſome zealous advocates for this oriental *printing.*

Books are printed in China from wooden planks, or blocks, cut like thoſe uſed in *printing* of callico, paper, cards, *&c.* among us. See CARDS, *&c.*

Theſe blocks are made of a ſmooth, firm, cloſe wood, and of the ſize of the leaf required. On the face-ſide they glue a paper, upon which ſome able penman draws out the ſeveral letters and characters, with a Chineſe pen, which is a kind of pencil. This is the principal part of the work, and that whereon the ſucceſs of the reſt depends.

When finiſhed, the block is put into the hands of a ſculptor, or cutter in wood; who, following the ſeveral ſtrokes of the writer with his gravers, and other ſharp little inſtruments, makes them all appear in relievo on the wood. See CUTTING *in wood.*

When the carving or cutting is finiſhed, they moiſten what remains of the paper, and rub it gently off.

The ink they uſe in *printing* is the ſame with the common Chineſe ink, wherewith they alſo write; and is made of lamp-black, mixed up with oil.

Their preſs reſembles our rolling-preſs, much more than the letter-preſs. See ROLLING *preſs.*

As to their paper, it is inferior to ours: it is made of the inner bark or rind of a kind of ruſhes, beat up with water into a pulp or paſte, and formed in moulds, much like ours. See PAPER.

The advantages of the Chineſe *printing* conſiſt in this, that they are not obliged to take off the whole edition at once, but print their books as they need them; that the blocks are eaſily retouched, and made to ſerve afreſh; and that there needs no corrector of the preſs.

Its diſadvantages are, that a large room will ſcarce hold all the blocks of a moderate volume; that the colour of the ink eaſily fades; and that the paper is apt to tear, and is ſubject to worms: whence it is that we ſee ſo few ancient books in China.

Rolling-preſs PRINTING is employed in taken off prints or impreſſions from copper plates engraven or etched. See ENGRAVING, and ETCHING.

It differs, as we have before obſerved, from *letter-printing*; in that the marks and characters, whoſe impreſſions are to be taken, in the former caſe, are indented, or cut inwards; and in the latter, are in relievo, or ſtand out.

This art is ſaid to be as ancient as the year 1460. and to owe its origin to Finiguerra, a Florentine goldſmith, who, caſting a piece of engraven plate in melted brimſtone, found the exact print of the engraving left in the cold brimſtone, marked with black licked out of the ſtrokes by the liquid ſulphur.

Upon this he attempted to do the ſame on ſilver plates with wet paper, by rolling it ſmoothly with a roller; and this ſucceeded.

This novelty tempted Baccio Baldini, a goldſmith of the ſame city, to attempt the ſame, which he did with ſucceſs; engraving ſeveral plates of Sandro Boticello's deſign, and *printing* them off this new way: in which he was followed by Andrew Mantegna, then at Rome.

This knowledge getting into Flanders, Martin of Antwerp, a famous painter, graved abundance of plates of his own invention, and ſent ſeveral prints into Italy, marked thus, *M. C.* After him Albert Durer appeared, and gave the world a vaſt number of prints both in wood and copper. About this time one Hugo de Carpi, an Italian painter, found out a way, by means of ſeveral plates of wood, to make prints reſemble deſigns of chiaro ſcuro; and ſome years after, the invention of etching was diſcovered, which was ſoon made uſe of by Parmeggiano.

The art was not uſed in England till the reign of king James I: when it was brought from Antwerp by Speed.

The fabric of the rolling-preſs, and the compoſition of the ink uſed therein, with the manner of applying both in taking off prints, are as follow.

Structure of the rolling-preſs.—This machine, like the common preſs, may be divided into two parts; the *body* and *carriage*, analogous to thoſe in the other.

The body conſiſts of two cheeks of different dimenſions; ordinarily about four $\frac{1}{2}$ feet high, a foot thick, and two $\frac{1}{2}$ apart; joined at-top and bottom by croſs pieces. The cheeks are placed perpendicularly on a wooden ſtand, or foot, horizontally placed, and ſuſtaining the whole preſs.

From the foot likewiſe riſe four other perpendicular pieces, joined by other croſs or horizontal ones; which may be conſidered as the carriage of the preſs, as ſerving to ſuſtain a ſmooth, even plank, which is about four ½ feet long, two ½ feet broad, and an inch ½ thick; upon which the engraven plate is to be placed.

Into the cheeks go two wooden cylinders, or rollers, about ſix inches in diameter, borne up at each end by the cheeks; whoſe ends, which are leſſened to about two inches diameter, and called *trunnions*, turn in the cheeks between two pieces of wood, in form of half-moons, lined with poliſhed iron, to facilitate the motion.

The ſpace in the half-moons, left vacant by the trunnion, is filled with paper, paſteboard, &c. that they may be raiſed and lowered at diſcretion; ſo as only to leave the ſpace between them neceſſary for the paſſage of the plank, charged with the plate, paper, and blankets.

Laſtly to one of the trunnions of the upper roller is faſtened a croſs conſiſting of two leavers, or pieces of wood, traverſing each other. The arms of this croſs ſerve in lieu of the handle of the common preſs; giving a motion to the upper roller, and that to the under: by which means the plank is protruded, or paſſed between them.

Preparation of the ink.—The ink uſed in rolling-preſs *printing* is a compoſition of black and oil mixed and boiled together in a due proportion.

The black is a factitious matter, made of the ſtones of peaches and apricots, bones of ſheep's-feet, and ivory; all well burnt, beaten, ſifted, and mixed together with ſpirit of wine, and ſometimes only with water.

This black is uſually brought hither ready prepared from Francfort on the Maine; whence our printers call it *Francfort-black*. See BLACK.

The oil wherewith they dilute this black, is nut-oil; which is boiled up differently, according to the different works it is to be uſed in.

They uſually make three kinds, *thin*, *thick*, and *ſtrong*; only differing in the degree of coction: the ſtrong is that uſed in the fineſt works, &c.

To make the ink, they pulverize the black ſtone very carefully, and paſs it through a fine ſieve; then mix it up on a marble with the proper oil, by means of a mullet, after the ſame manner as the painters do their colours.

Method of PRINTING *from copper plates.*—The ink being prepared, they take a little quantity of it on a rubber, made of linen rags, ſtrongly bound about one another; and therewith ſmear the whole face of the plate, as it lies on a grate, over a charcoal fire.

The plate ſufficiently inked, they firſt wipe it coarſely over with a foul rag, then with the palm of the left hand, then of the right; and, to dry the hand, and forward the wiping, rub it from time to time on whiting.

In wiping the plate perfectly clean, yet without taking the ink out of the engraving, conſiſts a good part of the addreſs of the workman. The French printers uſe no whiting, as being detrimental to the colour of the ink; nor do they lay the plate on the grate to warm, till after inking and wiping it.

The plate, thus prepared, is laid on a thick paper, fitted upon the plank of the preſs: over the plate is laid the paper, firſt moiſten'd to receive the impreſſion; and over the paper, two or three folds of blanketing, or other ſtuff.

Thus diſpoſed, the arms of the croſs are pulled; and by that means, the plate with its furniture paſſed through between the rollers; which pinching very ſtrongly, yet equably, preſſes the moiſtened paper into the ſtrokes of the engraving, whence it licks out the ink.

Some works require being paſſed twice through the preſs, others only once, according as the graving is more or leſs deep, or the greater or leſs degree of blackneſs the print is deſired to have.

It muſt be obſerved, that the ſtronger and thicker the ink is, the ſtronger muſt the rollers pinch the plate: this tempts many of the workmen to uſe a thinner oil, in order to ſave labour; which proves prejudicial to the impreſſion.

The wetting of the paper ought to be done two or three days before *printing* it, to render it the more ſupple and mellow: as the prints are drawn off, they are hung up to dry on lines, &c.

Laſtly, after the number of prints deſired have been wrought off from the plate, they rub it over with oil of olives, to prevent its ruſting, and ſet it by againſt a new impreſſion. If the ſtrokes of the graving be perceived full of ink hardened therein, in the courſe of the *printing*, they boil it well in a lye, ere the oil be applied.

PRIOR, *before*, ſomething that is nearer the beginning, than another to which it is compared. See PRIORITY.

PRIOR is particularly uſed for a ſuperior of a convent of monks, or the ſecond perſon after the abbot. See SUPERIOR, and MONASTERY.

Priors are either *clauſtral*, or *conventual*.

Conventual **PRIORS** are the ſame as abbots; all the difference between them being in name; both having the ſame rights, and both alike governors of monaſteries. See ABBOT, and CONVENTUAL.

Clauſtral **PRIOR** is he who governs the religious of an abbey, or *priory, in commendam*; ſo called, becauſe he has ſuperiority in the cloiſter or monaſtery. See COMMENDAM. His juriſdiction is wholly from the abbot; and ends with the abbot's death, unleſs he have been elected by the whole convent.

Conventual priors are of two kinds, *viz. regular conventual priors*, who govern religious living in community; and *ſecular* or *commendatary-conventual priors*.

Conventual *priors* are obliged to take up the prieſthood within a year, or at moſt two, from the dates of their proviſion; in default whereof, their benefices are declared vacant.

Priors muſt be twenty-five years old, ere they can govern the convent; and twenty, if the convent be governed by another.

Grand **PRIOR** is the ſuperior of a large abbey, where ſeveral ſuperiors are required; as in the abbeys of Cluny and Fecamp.

In the monaſtery of St. Denys, there were anciently five *priors*; the firſt whereof was called the *grand-prior*.---In moſt monaſteries there is alſo a *ſub-prior*.---There are alſo *grand priors* in the military orders; as in that of Malta, or St. John of Jeruſalem, &c.

PRIORS *aliens*, certain religious, born in France and Normandy, ſuperiors of religious houſes, erected for their country-folks here in England. See ALIEN.

Theſe, Henry V. deeming no good members for this land, ſuppreſſed; and their livings were afterwards given by Henry VI. to other monaſteries, and houſes of learning; but chiefly, as Stow obſerves, to the erecting of thoſe two famous colleges, called the *king's colleges of Cambridge* and *Eaton*.

Arch **PRIOR**, ſee the article ARCH *prior*.

PRIORITY, PRIORITAS, the relation of ſomething, conſidered as it is *before*, or *prior* to another, *i. e.* nearer to the beginning, or the firſt. See POSTERITY.

The principal modes of *priority* are five, *viz.* in reſpect of *time*; as when we ſay, that the Grecian empire was *prior* to the Roman; *nature*, as when we ſay one is *prior* to two; *order*, *dignity*, and *cauſality*: which are all ſummed up in the technical diſtich;

Tempore, natura, prius ordine, dic & honore;
Effecto cauſam dicimus eſſe prius.

PRIORITY, in law, denotes an antiquity of tenure, in compariſon of another leſs ancient. See TENURE.

To hold by priority, is to hold of one lord more anciently than of another; in reſpect whereof the tenant is ſaid to *hold in poſteriority*. See POSTERIORITY. The lord of the *priority* ſhall have the cuſtody of the body. *Cromp. Juriſd.*

PRISAGE, PRISAGIUM, that ſhare which belongs to the king, or admiral, out of ſuch merchandizes as are taken at ſea, as lawful prize: which is uſually a tenth part. See PRIZE.

PRISAGE *of wines*, a cuſtom in certain ports, whereby the king challenges out of every veſſel laden with wine, containing twenty tuns, or upwards, two tuns of wine, the one before, the other behind the maſt, at his own price; which is twenty ſhillings *per* tun. See DUTY.

This cuſtom varies a little in various places: at Boſton, *e. gr.* every bark laden with ten tuns of wine pays *priſage*.

The term is now grown into diſuſe; and, in lieu of *priſage*, the cuſtom, ſays Cowel, is popularly called *butlerage*; becauſe it is the king's chief butler that receives it. See BUTLERAGE.

PRISCILLIANISTS, PRISCILLIANISTÆ, ancient heretics, who aroſe in Spain, or rather were derived thither from Egypt, towards the end of the fourth century.

The origin of this hereſy is not well known; but it appears to have been brought into Spain by one Marcus of Memphis, who had for his diſciple the rhetor Helpidius, under whom *Priſcillian* was educated.

What their particular tenets were, is not eaſy to diſcover; but they are charged by their adverſaries with indulging all kinds of ſecret filthineſs, and nocturnal mixtures, under a religious notion.—Among their dogmata, this is ſaid to have been one: *Jura, perjura, ſecretum prodere noli.* See FLORINIANS.

They held, that ſouls are of the ſame nature and ſubſtance with God: they admitted all the books of ſcripture, but allegorized them into their own ſenſe. *Forbes.*

Priſcillian, their leader, was a man of great birth, fortune, parts, and learning: he was condemned with ſome biſhops his adherents, in a council at Saragoſſa, and in another at Bourdeaux; but he appealed to the emperor Maximus, and had a hearing at Treves; where, being convicted of broaching novelties, he was condmened to death, with ſeveral of his followers. See LIBERTINES.

PRISE, or PRIZE, in navigation, a veſſel taken at ſea from the enemies of the ſtate, or from pirates, by a man of war, or a merchant-man, having commiſſion from the admiral.

Veſſels are look'd on as lawful *priſe*, if they fight under any other ſtandard than that of the ſtate from whom they have their commiſſion; if they have no charter-party, invoice or bill of lading aboard them; if they be loaded with effects belonging to the king's enemies, or with contraband goods.

Thoſe of the king's ſubjects recovered from the enemy, after having remained twenty-four hours in their hands, are deemed lawful *priſe*.

Veſſels that refuſe to ſtrike their ſails, after having been ſummoned thereto by the king's ſhips, may be conſtrained to do it; and if they make reſiſtance, and fight, are lawful *priſe*.

PRISE, in our ſtatutes, is uſed for things taken of the ſubjects by the king's pourveyors. See POURVEYOR.

Spelman deſcribes *priſes* to be corn and other proviſions taken from the country people, at lower rates than ordinary, for the maintenance of the king's houſhold, gariſons, *&c.*

Roger de Monte alto, who married the ſiſter of Hugo de Albeney, claimed the following privileges, *viz.* his caſtle of Reſinge *cum* priſis 40 *dierum*, with *priſes* of 40 days: which phraſe the ſame author underſtands of the liberty of taking proviſions for the ſupport of the gariſon of his caſtle, upon paying for them within 40 days. See *ſtat.* 12. *Car.* II. *cap.* 34.

PRISM *, Priſma, in geometry, an oblong ſolid or body, contained under more than four planes, and whoſe baſes are equal, parallel, and alike ſituated. See Solid, *&c.*

* It is thus called from the Greek πρισμα, ſomething *ſawn*, or *cut off.*

The *priſm* is generated by the motion of a rectilinear figure, as ACB (*tab. geom. fig.* 16.) deſcending always parallel to itſelf along the right line AE.

If the deſcribent be a triangle, the body is ſaid to be a *triangular priſm*; if ſquare, a *quadrangular* one, *&c.*

From the geneſis of the *priſm*, it is evident it has two equal and oppoſite baſes; that it is terminated by as many parallelograms as the baſe conſiſts of ſides; and that all the ſections of a *priſm* parallel to its baſe are equal.

Every triangular *priſm* may be divided into three equal pyramids. See Pyramid.

To meaſure the ſurface and ſolidity of a Prism.—Find the area of the baſe, *e. gr.* ABC, (ſee Triangle) and multiply it by 2; find the areas of the planes or parallelograms, that include or circumſcribe it, and add their ſum to the former product. The ſum is the whole ſurface of the *priſm.*

Multiply then the baſe BAC, by the altitude CD; the product is the ſolidity of the cube ABCDEF. See Centrobaric.

All *priſms* are in a ratio compounded of their baſes and altitudes: if then their baſes be equal, they are to each other as their heights; and *vice verſa.* Similar *priſms, &c.* are in a triplicate ratio of their homologous ſides, as alſo of their altitudes.

Prism, in dioptrics, is a glaſs in form of a triangular *priſm*, much uſed in experiments about the nature of light and colour. See Light, *&c.*

The phænomena and uſe of the *priſm* ariſe from its ſeparating the rays of light in their paſſage through it. See Ray.

The more general of theſe phænomena are as follow: for, to enumerate all would be endleſs; and even theſe are ſufficient to demonſtrate, that colours do not either conſiſt in the contorſion of the globules of light, as Des Cartes imagined; nor in the obliquity of the pulſes of the ethereal matter, as Hook fanſied; nor in the conſtipation of light, and its greater or leſs concitation, as Dr. Barrow conjectured; but that they are original and unchangeable properties of light itſelf.

Phænomena of the Prism.—1. The ſun's rays, tranſmitted through a *priſm* to an oppoſite wall, project an image like the rainbow, of various vivid colours; the chief whereof are red, yellow, green, blue, and violet. See Rainbow.

The reaſon is, that the various coloured rays, which were before mixed and blended together, are now, in virtue of their different refrangibilities, ſeparated by refraction, in paſſing through the *priſm*, and thrown, each colour, by itſelf. See Refrangibility.

For the blue rays, *e. gr.* repreſented by the dotted lines, (*tab. opt. fig.* 50.) beginning to be ſeparated from the reſt in the ſide *c a*, of the *priſm a b c*, by the firſt refraction in *dd*, are again ſeparated further in the other face of the *priſm b c*, by a ſecond refraction the ſame way in *ee*: whereas in a plain glaſs, or even in a *priſm* in a different poſition, the blue rays ſeparated by the firſt refraction in the firſt ſurface, are again mixed by the ſecond refraction at the other ſurface, which is made a contrary way. See Refraction.

2. The image, thus projected, is not round; but when the angle of the *priſm* is 60 or 65 deg. about five times as long as broad.

Becauſe ſome of the rays are refracted more than others, and therefore exhibit ſeveral images of the ſun ſtretched out in length, as if it were but one.

3. Thoſe rays which exhibit the yellow colour, ſwerve more from the rectilinear courſe, than thoſe which exhibit the red; and the green more than the yellow; and the violet moſt of all.

4. If the *priſm*, through which the rays are tranſmitted, be turned about its axis; ſo as the red, yellow, green, *&c.* rays be received in order on another *priſm* about twelve feet diſtant from the former, through a little hole, and thence projected further, the yellow, red, *&c.* rays, though they fall in the ſame manner on the ſecond *priſm*, yet will not be projected on the ſame place as the red, but will be deflected further that way towards which the refraction is.

And if, in lieu of the ſecond *priſm*, they be received on a lens a little convex; the yellow, green, *&c.* rays, will be collected, each in its order, into a nearer focus than the red ones.—The reaſon of which two laſt phænomena is, that the yellow rays are refracted more than the red ones, the green ones more than the yellow ones, and the violet ones moſt of all.

5. The colours of coloured rays, well ſeparated, can neither be deſtroyed, nor in any manner altered by repeated refractions through a number of *priſms*, nor by paſſing through an illumined ſpace, nor by their mutual decuſſations, nor by the neighbourhood of the ſhade, nor by being reflected from any natural bodies.

Becauſe their colours are not modifications ariſing from refraction, but original and immutable properties thereof. See Colour.

6. All coloured rays collected together in any manner, either by ſeveral *priſms*, or a convex lens, or concave ſpeculum, form whiteneſs; but being again ſeparated after decuſſation, each exhibits its proper colour. See Whiteness.

Becauſe, as the ray was white, ere its parts were ſeparated by refraction; ſo thoſe parts being remixed, it recovers its whiteneſs; and the coloured rays, when they meet, do not deſtroy one another, but only intermix.

Hence duſts, or powders, red, yellow, green, blue, violet, *&c.* mixed in a certain proportion, become grey, or of the colour ariſing from a mixture of black and white; and would be perfectly white, but that ſome of the rays are abſorbed.

Thus, if a circle of paper be ſmeared with all theſe colours apart, in a certain proportion, and turned ſwiftly about its centre, ſo that the ſpecies of the ſeveral colours may be confounded in the eye by the velocity of the motion, the ſeveral colours will diſappear, and the whole be ſeen of one uniform colour between black and white.

7. If the ſun's rays ſtrike very obliquely on the inner ſuperficies of a *priſm*, the rays reflected will be violet; thoſe tranſmitted, red.

8. If there be two *priſms*, the one full of a red liquor, the other of a blue one; the two joined together will be opake; though, if both be filled either with a blue or a red liquor, they will, together, be tranſparent: for the one tranſmitting none but blue, the other none but red rays, the two together will tranſmit none at all. See Blue.

9. All natural bodies, eſpecially white ones, viewed through a *priſm* held to the eye, ſeem fringed or hemmed on one ſide with red and yellow, on the other with blue and violet.

10. If two *priſms* be ſo placed, that the red of the one, and the purple of the other, meet on a paper encompaſſed with darkneſs, the image will be pale; but viewed through a third *priſm* held to the eye at a due diſtance, will appear double, red, and purple.

And if two kinds of powder, the one perfectly red, the other blue, be mixed, a little body, being covered thick with the mixture, will exhibit a double image, the one red, the other blue, through a *priſm* applied to the eye.

11. If the rays tranſmitted through a convex lens be received on a paper before they meet in the focus, the confine of light and ſhadow will ſeem tinged with a red colour; if beyond the focus, with a blue.

12. If the rays about to be tranſmitted through one part of the pupil, be intercepted by the interpoſition of ſome opake body near the eye, the extremes of bodies lying beyond it will ſeem tinged with colours, as if ſeen through a *priſm*, though leſs vivid.

Becauſe the rays tranſmitted through the reſt of the pupil are ſeparated by refraction into divers colours; and the intercepted rays, which would be refracted a contrary way, are prevented from mixing and diluting them: whence alſo it is, that a body, viewed with both eyes thro' two little holes made in a paper, does not only appear double, but tinged with colours too.

PRISMOID, Priſmoides, in geometry, a ſolid figure, bounded by ſeveral planes, whoſe baſes are right-angled parallelograms, parallel, and alike ſituated. See Prism.

PRISON. See the article Gaol.

PRISONER, in law, one that is reſtrained of his liberty upon any action civil or criminal; or upon commandment.

A man, again, may be *priſoner* either upon matter of fact, or of record.

Prisoner *upon matter of record*, is he who, being preſent in court, is by the court committed to priſon.

Prisoner *upon matter of fact*, is he who is committed upon an arreſt, be it by the ſheriff, conſtable, or other. See Arrest.

PRIST.—*Unques* prist. See the article Unques.

PRIVATE *average*, } { Average,
Private *charters*, } See the articles { Charter,
Private *ſpirit*, } { Spirit.

PRIVATION, Privatio, the abſence, want, or defect of ſomething needed, or neceſſary.

In the canon law, *privation* is uſed for an interdiction, or ſuſpenſion. See Deprivation.

Myſtic divines uſe the phraſe, *privation of God*, for thoſe dineſſes which the ſoul experiences, to whom God does not make himſelf felt.

The church of Rome teaches, that children dying without baptiſm go into a limbus, where they undergo a *privation* of the ſight of God.

Privation, in phyſics, is a negative principle, which, with matter and form, the Peripatetics ſuppoſe, conſpires to conſtitute natural bodies. See Matter, and Form.

Privation ſignifies no more than the abſence of the future
form: thus every thing, according to Ariſtotle, is formed of
this, that it was not that thing before; *e. gr.* a chick ariſes
hence, that it was not a chick before it was generated; which
is what the philoſopher calls *privation*. See PRINCIPLE.
Ariſtotle is very angry with the ancients, for not admiting *pri-*
vation as a principle, and imputes it to their ignorance thereof.
But it is an injuſtice to reproach them with ignorance of what
it is impoſſible to be ignorant of; and it is an illuſion to pro-
duce this poor principle of *privation* as ſuch a mighty myſtery;
there being no body but ſuppoſes it a thing known, that a thing
is not before it is made. See ARISTOTELIAN, *&c.*

PRIVATIVE, in grammar, a particle, which, prefixed to a word, changes it into a contrary ſenſe. See PARTICLE.

Thus, among the Greeks, the α is uſed as a *privative*; as in α-θεος, *atheiſt*, *acephalus*, &c.—The Latins have their *privative in*; as, *incorrigibilis*, *indeclinabilis*, &c.---The Engliſh, French *&c.* on occaſion, borrow both the Latin and Greek *privatives*.

PRIVATIVE *modes*. See the article MODE.

PRIVATIVE *quantity*, in algebra, denotes a quantity leſs, than nothing; called alſo a *negative quantity*; in oppoſition to affirmative or poſitive quantities. See QUANTITY, NEGATIVE, *&c.*

Privative quantities are denoted by the character of ſubtraction—prefixed to them. See CHARACTER.

PRIVILEGE*, PRIVILEGIUM, in the general, any kind of right, prerogative, or advantage, attached to a certain perſon, condition, or employment, excluſive of others.

* The word is formed from the Latin *privata lex*

PRIVILEGE, in law, is a particular right granted to a ſingle perſon, place, community, or the like, whereby they are exempted from the rigour of the common laws.

Privilege is either *perſonal* or *real*.

Perſonal PRIVILEGE is that which is granted to any perſon either againſt or beyond the courſe of the common law.

Such, *e. gr.* is that of a member of parliament, who may not be arreſted, nor any of his ſervants, during the ſitting of parliament, nor for a certain time before and after. See PARLIAMENT.

Real PRIVILEGE is a franchiſe granted to a place. See FRANCHISE.

Such is that granted to our univerſities, by which none who are members thereof may be called to Weſtminſter-hall upon any contract made within their own precincts.

So alſo, a perſon belonging to the court of chancery cannot be ſued in any other court, certain caſes excepted; and if he be, he may remove it by *writ of privilege*.

It is an ancient *privilege* for men to be exempted from arreſts within the verge of the court, *i. e.* in or near the palace where the king is reſident: becauſe, in ſuch caſes, quarrels frequently happen; and the peace ought to be ſtrictly kept there. See PAX.

In the laws of Hen. I. it is expreſſed, that peace ought to be maintained religiouſly and reverently within four miles of the king's doors towards the four quarters; and forty-nine acres, nine feet, nine palms, and nine barley-corns around. See PEACE.

Attachment of PRIVILEGE. See the article ATTACHMENT.

PRIVILEGE, in commerce, is a permiſſion from a prince or magiſtrate, to make and ſell a certain merchandize, or to engage in a certain commerce, either excluſively of others, or concurrently with them.

The firſt is called an *excluſive privilege*; the latter, ſimply, *privilege*.

Excluſive privileges are to be granted rarely, by reaſon of the hindrance they are of to trade: yet they are ſometimes very juſt and reaſonable, by way of reward for the invention of uſeful machines, manufactures, *&c.*

Excluſive privileges for foreign commerce are uſually granted on the following conditions:—That the commodities be brought from remote parts, where there is no going without running great riſques: that the *privilege* be only for a limited time: that the perſons *privileged* be not allowed to monopolize, *i. e.* to raiſe and lower their commodities at pleaſure; but that the ſale and price be always proportionable to the expence, intereſts, *&c.* and that the *privileges* aſſiſt the ſtate, on occaſion, with part of their gains.

PRIVILEGE *for the impreſſion of books*, is properly excluſive; being a permiſſion which an author, or bookſeller, obtains under a prince's ſeal, to have alone the impreſſion of a book, with a prohibition of all others to print, ſell, or diſtribute the ſame, within a certain term of years, uſually 14, under the clauſes and penalties expreſſed therein.

Theſe *privileges* were unknown till the beginning of the 16th century, when they were introduced in France: the oldeſt is ſaid to bear date in the year 1507. and to have been occaſioned by ſome printers counterfeiting the works of others as ſoon as they appeared.

But people were yet at liberty to take or let them alone at pleaſure, till the intereſts of religion, and the ſtate, occaſioned the reſtraining of this liberty.

In 1563. Charles IX. publiſhed a celebrated ordonnance, forbidding any perſon, on pain of confiſcation of body and goods, to print any letter, ſpeech, *&c.* without permiſſion. The like has been ſince done in England; though, at preſent, *privileges* are not only not required, but by the late act for ſecuring the properties of books, ſeem needleſs.

PRIVILEGES *of the clergy*. See the article CLERGY.

PRIVILEGE *of the tabouret*. See the article TABOURET.

PRIVILEGED *debt*. See the article DEBT.

PRIVITIES, the natural parts of either ſex; or thoſe immediately miniſtering to the buſineſs of generation. See GENITALS.

PRIVITY, an intimate freedom, or private familiarity between two perſons. See PRIVY.

The lawyers ſay, if there be lord and tenant, and the tenant hold of the lord by certain ſervices; there is a *privity* between them in reſpect of the tenure.

PRIUS—*Niſi* PRIUS, in law. See NISI.

PRIVY, in law, a perſon who is partaker, or has an intereſt in an action or thing.

In this ſenſe they ſay, *privies in blood*: every heir in tail is *privy* to recover the land intailed.

In old law-books, *merchants privy* are oppoſed to merchants ſtrangers.

Coke mentions four kinds of *privies*.—*Privies in blood*, as the heir to his father; *privies in repreſentation*, as executors and adminiſtrators to the deceaſed; *privies in eſtate*, as he in reverſion, and he in remainder; donor and donee; leſſor and leſſee; laſtly, *privy in tenure*, as the lord by eſcheat, *i. e.* when land eſcheats to the lord for want of heirs.

PRIVY *council*, a council of ſtate, held by the king with his counſellors, to concert matters for the public ſervice, the honour and ſafety of the realm, *&c.* See COUNCIL.

The *privy council* is, or ought to be, the primum mobile of the ſtate, and that which gives the motion and direction to all the inferior parts. It is likewiſe a court of juſtice of great antiquity; the primitive and ordinary way of government in England being by the king and *privy* council.

It has been frequently uſed by all our kings for determining controverſies of great importance: the ordinary judges have ſometimes declined giving judgment till they had conſulted the king and *privy* council; and the parliament have frequently referred matters of high moment to the ſame; as being by long experience better able to judge of, and by their ſecrecy and expedition, to tranſact, ſome ſtate-affairs, than the lords and commons.

At preſent, the *privy* council takes cognizance of few or no matters except ſuch as may not be well determined by the known laws, and ordinary courts, ſuch as matters of complaint, and ſudden emergencies.

The oath of a *privy* counſellor is, to the utmoſt of his power and diſcretion, truly and juſtly to counſel the king, and to keep ſecret the king's counſels.

Anciently, to ſtrike in the houſe of a *privy* councillor, or elſewhere in his preſence, was grievouſly puniſhed: to conſpire his death, is felony; and to effect it, treaſon.

With the advice of this council, the king iſſues proclamations that bind the ſubject, provided they be not contrary to law. See PROCLAMATION.

In debates, the loweſt delivers his opinion firſt, the king laſt; and thereby determines the matter.

A council is never held without the preſence of a ſecretary of ſtate. See SECRETARY.

The members of the *privy* council in the year 1710. were in number 57; their officers, four clerks of the council, three clerks extraordinary, three clerks in the council-office, a keeper of the records, and two keepers of the council-chamber.

Lord Preſident of the PRIVY *council*. See PRESIDENT.

PRIVY *ſeal*, a ſeal which the king uſes, previouſly, to ſuch grants, *&c.* as are afterwards to paſs the great ſeal.

Yet the *privy* ſeal is ſometimes uſed in matters of leſs conſequence, which do not require the great ſeal. See SEAL.

Lord PRIVY *ſeal* is the fifth great officer of the crown, through whoſe hands paſs charters and grants of the king, and all pardons ſigned by him, before they come to the great ſeal: alſo matters of leſs moment, which do not paſs the great ſeal, *v. gr.* for payments of money, *&c.*

He is a lord by office, and a member of the *privy* council: he was anciently chief judge of the court of requeſts. See PRIVY *ſeal*, and LORD.

Clerks of the PRIVY *ſeal*. See the article CLERK.

PRIVY *chamber*. See the article CHAMBER.

PRIZE. See the article PRISE.

PRO *confeſſo*. See the article PRO-CONFESSO.

PRO *indiviſo*. See the article PRO-INDIVISO.

PROBABILISTS, a ſect, or diviſion, among the Romaniſts who adhere to the doctrine of *probable opinions*; holding, that a man is not always obliged to take the more probable ſide, but may take the leſs probable, if it be but barely probable. See PROBABLE.

The Jeſuits and Moliniſts are ſtrenuous *probabiliſts*. See JESUIT, *&c.*

Thoſe who oppoſe this doctrine, and aſſert, that we are obliged on pain of ſinning, always to take the more probable ſide, are called *probabilioriſts*.

The Janſeniſts, and particularly the Port-royaliſts, are probabilioriſts. See JANSENISM, *&c.*

PROBABILITY, in reaſoning, *veriſimilitude*; or an appearance of truth. See TRUTH.

To define it philoſophically, *probability* is the appearance of the agreement or diſagreement of two things by the intervention of proofs, whoſe connexion is not fixed or immutable, or is not perceived to be ſo; but is, or appears, for the moſt part, to be ſo; ſo as to ſuffice to induce the mind to judge the propoſition to be true or falſe, rather than the contrary. See EVIDENCE.

That propoſition, then, is *probable*, for which there are arguments and proofs to make it paſs, or be received for true. See PROBABLE.

The entertainment the mind gives to this ſort of propoſitions, is called *belief*, *aſſent*, or *opinion*. See FAITH.

Probability, then, being to ſupply the defect of our knowledge, is always converſant about propoſitions whereof we have no certainty, but only ſome inducements to receive them for true. See OPINION.

According to Ariſtotle, a propoſition is *probable*, if it ſeem true to all or moſt people, and thoſe the wiſer and more reputable ſort: But by *ſeem*, he means, what, after a cloſe inquiry, ſhall ſeem to be true.

Of *probability* there are various degrees, from the confines of certainty and demonſtration, down through improbability and unlikeneſs to the confines of impoſſibility; and alſo degrees of aſſent from certain knowledge, and, what is next to it, full aſſurance and confidence, quite down to conjecture, doubt, diſtruſt, and disbelief.

The grounds of *probability* are, in ſhort, theſe two following; *viz.* the conformity of any thing with our own knowledge, experience, or obſervation, called *internal probability*; and the teſtimony of others vouching their obſervation, or experience, called *external probability*. See CREDIBILITY.

PROBABILITY, in poetry, denotes the appearance of truth in the fable or action of a poem. See ACTION and FABLE.

There are four kinds of actions; for a thing may be either only true, or only probable; or true and probable at the ſame time; or neither the one nor the other. See ACTION.

Theſe four kinds of actions are ſhared between four arts: hiſtory takes the firſt, ſtill keeping to truth, without regard to *probability*. See HISTORY.

Epic and dramatic poetry have the ſecond, and ſtill prefer *probability*, though falſe, to an *improbability*, though true: thus the death of Dido, who killed herſelf on her being deſerted by Æneas, though falſe in itſelf, is a fitter ſubject for a poem, than the action of Samſon, or the maid of Orleans.

Moral philoſophy takes the third; and the fabuliſts, as Æſop, *&c.* the fourth. See FABLE.

Boſſu adds, that the epopœia, in its nature and eſſence, uſes truth and *probability* like morality; yet in it's certainty and expreſſion takes a liberty like that of Æſop: inſtances of each we have in the Æneid.

Poetical *probability* may be ſo either in reſpect of the rules of theology, of morality, nature, reaſon, experience, or opinion.

As to theology, there is ſcarce any thing but is probable, in reſpect hereof; becauſe nothing is impoſſible to God. This is an expedient the poets have frequent recourſe to, in order to bring things feigned contrary to the order of nature, within the bounds of *probability*. See this conſidered under the article MACHINE.

As to *morality*, we have obſerved, it requires both truth and veriſimilitude: an ancient poet was condemned on the theatre for a ſlip herein, *viz.* for making a perſon, whom he repreſented as an honeſt man, ſay, that *though his tongue ſwore, his mind did not.*

Seneca accuſes Virgil of an offence againſt *natural probability*, in ſaying, that the winds were pent up in caves; for, ſays that philoſopher, wind being only air in motion, to ſuppoſe it at reſt, is to deſtroy its nature. To which Voſſius anſwers, that the poet only ſpeaks of the natural origin of winds; which are produced in mountains by vapours, *&c.* pent there: juſt as we ſhould ſay, the winds are incloſed in an *æolipyle.*

Virgil, likewiſe, committed an offence againſt *natural probability*, by making Æneas find deer in Africa; becauſe that country produces none.

Indeed theſe faults are excuſable, becauſe, as Ariſtotle finely obſerves, they are not faults in the poet's art, but ariſe from his ignorance of ſomething taught in the other arts.

However, care muſt be taken they be not too groſs; there being ſome *probabilities* of this kind, which Æſop himſelf could not diſpenſe withal: he would never be forgiven, were he to repreſent a lion fearful, a hare daring, a fox ſtupid, *&c.*

Probability, in reſpect of *reaſon*, is frequently broken in upon by thoſe who affect nothing but the *merveilleux*. Here Statius is a notorious criminal: Tydeus, being ſurpriſed in an ambuſcade by fifty bravoes, who had vowed his death, kills forty-nine of them, and pardons the laſt.

Again, two young kings, whereof this ſame Tydeus was one, the other Polynices, upon a quarrel, go together by the ears, and box it out; their ſwords all the while by their ſides.

—— Scrutatur & intima vultus
Unca manus, penituſque oculis cedentibus inſtat.

Scaliger accuſes Homer of an offence againſt *experience*, in ſaying, that *Jupiter thundered and ſnowed at the ſame time.* This, ſays the critic, was never known; and yet have there been inſtances hereof even in our time.

But the principal and moſt important kind of *probability*, is that in reſpect of *common opinion*. A thing is probable when it looks like truth: but ſometimes it ſhall appear true to the people, and falſe to the learned; and *vice verſâ*. When, then, the learned and the people are divided, to which ſide muſt the poet adhere? Suppoſe, for inſtance, the adventure of Penelope, the hiſtory of Medea, Helena, or the like: what Virgil and Homer have written of them, ſhall appear probable to the populace; yet the learned read the contrary in hiſtory; ſome authors having written, that Dido was chaſte, and Medea innocent; that Penelope was divorced and baniſhed by Ulyſſes for abuſing his abſence; and that Helena never ſaw Troy.

This point is ſoon decided: Homer and Virgil make no ſcruple of leaving hiſtory, to improve their fables: Horace does not ſend the poets to the truths of hiſtory; but either to fables already invented, or to common fame.

All which is confirmed by Ariſtotle: where he ſays, that a poet does not tell, like an hiſtorian, what kind of perſon Alcibiades was, nor what he really did or ſaid on this or that occaſion; but what he probably might have done or ſaid. Add to this, that Ariſtotle approves of the fable of Oedipus and Iphigenia, though it can never be imagined the truth of thoſe ſtories was believed by the learned in thoſe days.

In effect, every one finds his account in this conduct: the people think they ſee truth; and the learned do really ſee truths, and more ſolid ones too, than thoſe the people look for; and more certain than thoſe of the hiſtory, which the poet neglects. The more underſtanding they are, the leſs will they deſire theſe hiſtorical truths in a poem, which is intended for other and deeper ends. The truths they require, are moral and allegorical truths. The Æneid was not written to teach us the hiſtory of Dido, but to ſhew, under that name, the genius and conduct of the republic founded by her, and the ſource and ſeries of its differences with Rome. This we ſee with pleaſure; and theſe truths are more agreeable, more certain and notorious, than any the poet could take from a hiſtory, ſo little known in his time.

To theſe kinds of *probability* may be added another, which we call *accidental probability*: it conſiſts not in the uſing of ſeveral incidents, each probable apart; but in diſpoſing them ſo as to hang probably together.

A man, *e. gr.* may probably die of an apoplexy; but that this ſhould happen juſt in the nick, when the poet wanted it for unravelling, is highly *improbable*.

It is an offence againſt this kind of *probability* to produce an incident all at once, and without any preparation, which yet needed one. Virgil is wonderfully exact in this point: Juno prepares the tempeſt raiſed in the firſt book; Venus in the ſame book prepares the amours of the fourth. The death of Dido, in the end of the fourth, is prepared on the firſt day of marriage; Helenus in the third diſpoſes the whole matter of the ſixth; and in the ſixth, the Sibyl predicts all the wars that follow.

PROBABLE *opinion*, a term long time controverted among the Romiſh caſuiſts; uſually defined an opinion founded on a grave motive, or an apparently good foundation, and which has authority enough on its ſide to perſuade a wiſe diſintereſted perſon to aſſent to it. See PROBABILITY.

Others define a *probable opinion* to be that which being compared to the contrary opinion, becomes problematical, by a perfect equality of the reaſons on each ſide; ſo that there is nothing in reaſon or nature to determine a man to this ſide rather than that.

But the Jeſuits go ſtill farther, and maintain, that to render an *opinion probable*, it ſuffices, that it be either built on a reaſon of ſome conſequence, or on the authority of ſome one grave doctor. With theſe qualifications it is allowable to follow it, even though it be leſs *probable*, and leſs certain, than the contrary opinion: here it is the venom of *probability* lies. — This doctrine is attacked with infinite addreſs by M. Paſchal in the *provincial letters.*

One of the twenty-four patriarchs of the Jeſuits, Caſtro Palaio, aſſerts, that a judge, in a queſtion of right, may give ſentence according to a *probable opinion*, againſt a more *probable* one; and this, contrary to the judgment and perſuaſion of his own mind; *imo contra propriam opinionem.* Eſcobar. *tr.* 6. *ex.* 6. *n.* 45.

So Vaſquez maintains, that it is lawful to follow the leſs *probable* and leſs ſecure *opinion*, diſcarding the more *probable*, and more ſecure one.

Leſſius and Eſcobar, treating of the queſtion, Whether a man may kill another for giving him a box on the ear? decide it to be a *probable opinion*, and ſpeculatively true; though there may be ſome inconveniencies in the practice, for which it would be as well to let it alone. *In praxi tutam &* probabilem *judicarunt—ſed non facile admittendam.* Let. provinciales, p. 307, 308.

PROBANDA *proprietate*. See the article PROPRIETATE.

PROBATE, *of a will*, or *teſtament*, in law, is the exhibiting and proving a will and teſtament, before the eccleſiaſtical judges delegated by the biſhop, who is ordinary of the place where the party dies. See WILL and TESTAMENT.

The ordinary is known by the quantity of goods the deceaſed hath out of the dioceſe wherein he departed; for if all his goods be in the ſame dioceſe, then the biſhop of the dioceſe, or the archdeacon, according as their compoſition leads, has the *probate* of the teſtament.—If the goods be diſperſed in ſeveral dioceſes, ſo that there be any ſum of note, *bona notabilia*, as five pounds, out of the dioceſe where the party lived; then is the archbiſhop of Canterbury the ordinary by *prerogative.* See BONA *notabilia*, and PREROGATIVE.

This *probate* may be made two Ways; either in *common Form* or *per teſtes.*—The proof in *common form* is only by the oath of the executor, or party exhibiting the will, who ſwears upon his belief, that the will exhibited by him, is the laſt will and teſtament of the deceaſed. See EXECUTOR.

The proof *per teſtes, by witneſſes,* is, when over and beſides his own oath, he alſo produces witneſſes, or makes other proof to confirm, that it is the laſt will of the deceaſed; and this in the preſence of ſuch as may pretend ſome intereſt in the goods of the deceaſed; or at leaſt in their abſence, after they have been lawfully ſummoned to ſee ſuch a will proved, if they think fit.

The latter courſe is commonly taken when there is fear of ſtrife, or diſpute about the deceaſed's goods: for ſome hold, that a will proved in common form only, may be called in queſtion any time within thirty years after.

Where a will diſpoſes of lands and tenements of freehold, it is now frequently proved by witneſſes in chancery.

PROBATICA *piſcina*. See the article PISCINA.

PROBATION, in a monaſtic Senſe, a time of trial; or the year of noviciate, which a religious muſt paſs in a convent to prove his virtue and vocation, and whether he can bear the ſeverities of the rule. See NOVICIATE.

The year of *probation* commences from the day of novices taking the habit.

PROBATION, in the univerſities, denotes the examination and trial of a ſtudent who is about to take his degrees. See DEGREE.

PROBATIONER, in the presbyterian diſcipline, a perſon licenſed by a presbytery to preach; which is uſually done a year before he be ordained. See PRESBYTERY.

A ſtudent in divinity is not admitted *probationer* till after ſeveral trials: the firſt, private, before a presbytery; the ſecond, public, before a congregation, the presbytery being preſent.

The privare trials are a homily and exegeſis; *i. e.* a theological ſubject is given in to the presbytery in theſes, and the candidate anſwers any objections ſtarted againſt it.

The public trials are a popular ſermon, and an exerciſe and addition; *i. e.* a text is handled, half an hour, logically and critically; and half an hour more, practically.

If he acquit himſelf to the ſatisfaction of the presbytery, he ſigns the confeſſion of faith, owns the presbyterian government, *&c.* Upon which he receives a licence to preach.

PROBATOR, in law, an accuſer, or approver; one who undertakes to prove a crime charged upon another: properly, an accomplice in the crime, who impeaches others. See APPROVER and PROVER.

PROBATUM *eſt, q. d. it is proved*; a term frequently ſubjoined to a receipt, for the cure of ſome diſeaſe. See RECIPE.

PROBE, a ſurgeon's inſtrument, wherewith to ſound and examine the circumſtances of wounds, ulcers, and other cavities. See SPECULUM.

PROBLEM*, PROBLEMA, in logic, a doubtful queſtion; or a propoſition that neither appears abſolutely true, nor falſe; but which is probable on both ſides, and may be aſſerted either in the negative or affirmative, with equal Evidence.

* The word is originally Greek, ϖροβλημα, ſigifying the ſame thing.

Thus, that the moon and the planets are inhabited by animals in ſome reſpect like us, is a *problem:* that the fixed ſtars are all ſuns, and each the centre of a ſeveral ſyſtem of planets and comets, is a *problem.* See PLANET, STAR, *&c.*

PROBLEM is alſo a propoſition expreſſing ſome natural effect, propoſed in order to a diſcovery of its apparent cauſe.--Such are the *problems* of Ariſtotle.

A logical or dialectical *problem*, ſay the ſchoolmen, conſiſts of two parts; a ſubject, or ſubject matter, about which the doubt is raiſed; and a predicate or attribute, which is the thing doubted whether it be true of the ſubject or not. See SUBJECT and PREDICATE.

There are four topical predicates, *viz. genus, definitio, proprium*, and *accidens*; whence ariſe four different kinds of dialectical *problems*.

The firſt, when the thing attributed to the ſubject is in the relation of a genus: as, whether fire be an element or not? See GENUS.

The ſecond, when the thing attributed has the effect of a definition: as when it is aſked, whether or no rhetoric be the art of ſpeaking? See DEFINITION.

The third, when the attribute imports a propriety: as, whether it belong to juſtice to give every one their due? See PROPER.

The laſt is when the thing attributed is adventitious: as, whether juſtice is to be deſired? See ACCIDENT.

Problems, again, may be divided into thoſe relating to things to be done, or avoided, called *ethical*; thoſe relating to the knowledge of nature, called *phyſical*; thoſe relating to ſpirits, called *metaphyſical problems*, &c.

PROBLEM, in geometry, denotes a propoſition wherein ſome operation, or conſtruction, is required; as, to divide a line, to make an angle, to draw a circle through three points not in a right line, *&c.* See PROPOSITION.

Meſſieurs of the Port-Royal define a *geometrical Problem*, a propoſition given to be demonſtrated, wherein ſomething is required to be done; and what is done, to be proved to be the thing required.

A *problem*, according to Wolfius, conſiſts of three parts. The propoſition, which expreſſes what is to be done. See PROPOSITION.

The reſolution, or ſolution, wherein the ſeveral ſteps, whereby the thing required is to be effected, are orderly rehearſed. See RESOLUTION.

The demonſtration, wherein is ſhewn, that by doing the ſeveral things preſcribed in the reſolution, the thing required is obtained.

Accordingly, the general tenor of all *problems* is this: The things preſcribed in the reſolution being done, the thing required is done. See DEMONSTRATION.

PROBLEM, in algebra, is a queſtion or propoſition which requires ſome unknown truth to be inveſtigated or diſcovered; and the truth of the diſcovery demonſtrated.

In this ſenſe it is a *problem*, to find a theorem. See THEOREM and INVESTIGATION.--Algebra is defined to be the art of reſolving all *problems* that are reſolvable. See ALGEBRA.

Kepler's PROBLEM, in aſtronomy, is the determining of a planet's place from the time; thus called from the aſtronomer Kepler, who firſt propoſed it. See PLANET and PLACE.

The *problem*, ſtated in form, ſtands thus: To find the poſition of a right line, which paſſing through one of the foci of an ellipſis, ſhall cut off an area deſcribed by its motion, which ſnall be in any given proportion to the whole area of the ellipſis.

The propoſer knew no way of ſolving the *problem* directly and geometrically; and therefore had recourſe to an indirect method; for which he was taxed with an αγεωμετρησια, or want of geometry; and his aſtronomy charged with not being geometrical. But the *problem* has ſince been ſolved directly and geometrically ſeveral ways, by ſeveral authors; particularly Sir Iſaac Newton, Dr. Keill, *&c.* See PLANET, PLACE, *&c.*

Determinate PROBLEM,	See	DETERMINATE.
Limited PROBLEM,		LIMITED.
Linear PROBLEM,		LINEAR.
Local PROBLEM,		LOCAL.
Plain PROBLEM,		PLAIN.
Solid PROBLEM,		SOLID.
Surſolid PROBLEM,		SURSOLID.
Unlimited PROBLEM,		UNLIMITED.

Deliacal PROBLEM, in geometry, is the doubling of a cube. See CUBE.

This *problem* was ſo called from the people of Delos, who, upon conſulting the oracle for a remedy againſt a plague they were then infeſted with, were anſwered, that the plague ſhould ceaſe, when Apollo's altar, which was in form of a cube, ſhould be doubled. See DUPLICATION.

This *problem* coincides with that for finding two mean proportionals between two given lines; whence that is alſo called the *Deliac problem.* See PROPORTIONAL.

PROBLEMATICAL *reſolution*, in algebra, a method of ſolving difficult queſtions by certain rules, called *canons.* See SOLUTION and CANON.

PROBOSCIS*, in natural hiſtory, the *trunk* or ſnout of an elephant, and ſome other animals. See TRUNK.

* The word is Greek, προβοσκις, where it has the ſame ſignification.

The *proboſcis* is a member iſſuing out of the middle of the forehead, ſerving inſtead of a hand; and having a little appendix faſtened to the end thereof, in form of a finger.---By the *proboſcis* the ſhe-elephant ſucks herſelf; and by the ſame conveys the milk to her young.

The *proboſcis*, Mr. Derham obſerves, is a member ſo admibly contrived, ſo curiouſly wrought, and with ſo great agility applied by that unweildy animal, that it may paſs as an inſtance of the Creator's ſkill, *&c.*

All quadrupeds have the length of their neck equal to that of their feet; the elephant alone excepted; in whom the ſhortneſs of the neck is compenſated by the length of the *proboſcis.*

The camelion has alſo a kind of trunk or *proboſcis*, which is its tongue; and which it darts nimbly out of its throat, as if it ſpat it; and draws it in again inſtantaneouſly. It ſerves, like the elephant's trunk, to lay hold on, and take its food. See CAMELEON.

The microſcope ſhews us a little trunk in flies and gnats, by means whereof they ſuck the blood of animals, or liquors, for their food.

PROCATARCTIC* *cauſe*, the original, primitive, or preexiſtent cauſe, or occaſion, of an effect.

* The word is Greek, ϖροκαταρκτικος; formed from the verb ϖροκαταρχω, I pre-exiſt, I go before.

Such, *e. g.* is a diſeaſe which co-operates with ſome other diſeaſe, ſubſequent thereto.--Thus, anger, or heat of a climate, bring on ſuch a diſpoſition of the juices, as occaſions a fever; where the ill diſpoſition is the immediate cauſe, and the heat or anger, the *procatartic* cauſe.

PROCEDENDO, in law, a writ whereby a plea or cauſe, formerly called from an inferior court to the chancery, king's bench, or common pleas, by writ of privilege, habeas corpus, or certiorari, is releaſed, and returned to the other court to be *proceeded* in; upon its appearing that the defendant has no cauſe of privilege, or that the matter comprized in the party's allegation is not well proved.

Non PROCEDENDO *ad aſſiſam rege inconſulto.* See Non.

PROCEDURE, Proceedings in law, the courſe of the ſeveral acts, expeditions, and inſtructions of a proceſs, or lawſuit. See Process.

Procedure is either civil or criminal.—*Civil procedure* is that where the eſtate alone is concerned: *criminal*, or *extraordinary procedure*, is that where the perſon is proſecuted.

PROCEED, among merchants, that which ariſes from a thing.—In which ſenſe they ſay, the *net proceed.* See Net.

PROCELEUSMATICUS, προκελευσματικὸς, in the ancient poetry, a foot conſiſting of four ſhort ſyllables: as, *arietat.* See Foot.

PROCESS, Processus, in law, is uſed for all the proceedings in any cauſe or action, real or perſonal, civil or criminal, from the original writ, to the end. See Action.

In France they carry on a formal *proceſs* againſt the memory of people killed in duels; or that have murdered themſelves.—Pirates, when taken in the fact, are hanged without any *proceſs*; as are ſometimes alſo robbers.

Process is alſo uſed in a more reſtrained ſenſe, for that by which a man is firſt called into any temporal court; this being the beginning, or principal part, and that by which the reſt of the buſineſs is directed.

The difference between *proceſs* and *precept* or *warrant* of the juſtice, is this; that the precept or warrant is only to attach or convene the party, before any indictment or conviction, and may be made either in the name of the king, or the juſtice: but *proceſs* is always in the king's name, and uſually after an indictment. See Precept.

Process *by attainder.* See the article Attainder.

Process, in chemiſtry, the whole courſe of an operation, or experiment. See Operation and Experiment.

Process, Processus, in anatomy, is a term of equal import with *apophyſis*, *prominence*, *protuberance*, or *production.* See Apophysis, *&c.*

Proceſs is particularly applied to certain eminences of the bones, and other parts; diſtinguiſhed by peculiar names, expreſſing their place, form, or the like. See Bone.

Such are the *proceſſus peritonæi*, *proceſſus vermiformes*, *proceſſus papillares*, *ciliares*, &c. See Vermiformes, Papillares, Ciliare, Peritoneum, *&c.*

Processus *aliformis*, } See { Aliformis.
Processus *cornicularis*, } See { Cornicularis.
Processus *pyrenoides.* } See { Pyrenoides.

PROCESSION, Processio, in theology, a term uſed for the manner wherein the Holy Spirit is conceived to iſſue from the Father and the Son, in the myſtery of the Trinity. See Spirit, Trinity, Person, *&c.*

The Greeks and Latins are not agreed about the *proceſſion* of the Holy Spirit. See Greek.

Procession alſo denotes a ceremony in the Romiſh church, conſiſting of a formal march of the clergy in their robes, and the people after them, putting up prayers, ſinging hymns, *&c.* and in this manner making a viſit to ſome church, or other holy place.

There are general *proceſſions* of all the people in jubilees, and in public calamities. See Jubilee.—The *proceſſions* of the holy ſacrament are very ſolemn.---They have alſo *proceſſions*, frequently, around the church, at the ſalutations, *&c.* in the maſs. Anciently, among us, there were, in each pariſh, cuſtomary *proceſſions* of the pariſh-prieſt, and the patron of the church, with the chief flag, or holy banner, attended by the other pariſhioners, each aſcenſion-week; to take a circuit round the limits of the pariſh, and pray for a bleſſing on the fruits of the earth.—Of which cuſtom there ſtill remains a ſhadow in that annual perambulation, ſtill called *proceſſioning*; though the order and devotion of the ancient *proceſſions* be almoſt loſt.

PROCESSUM *continuando*, a writ for the continuance of the *proceſs*, after the death of the chief juſtice, or other juſtices in the commiſſion of oyer and terminer. *Reg. orig.* 128.

Recordo & Processu *mittendis.* See Recordo.

PROCHEIN *amy*, proximus *amicus*, in law, the *neareſt friend*, or perſon next a-kin, to a child in nonage; and who, in that reſpect, is allowed in law to deal and negotiate for him, to manage his affairs, to ſee him redreſſed of any wrong, and to be his guardian, if he hold land in ſocage. See Guardian.

By *prochein amy* is commonly underſtood the guardian in ſocage: though, in propriety, it is he who appears in court for an infant who ſues any action, and aids the infant in purſuit thereof.---For, to ſue, an infant is not allowed to make an attorney; but the court will admit his *prochein amy*, next friend, as plaintiff; or his guardian, as defendant.

PROCIDENTIA, or prolapsus *ani*, in medicine, is when, upon a diſcharge by ſtool, the inteſtinum rectum is protruded ſo far, as that it cannot be drawn back again into the body; or when drawn back, falls again. See Rectum.

This is ſometimes a chronical diſeaſe, eſpecially when it ariſes from a palſy: its cauſes are a relaxation of the fibres of the rectum or of the ſphincter muſcle; either from the adſtriction of the alvus, a diarrhœa, dyſentery, or teneſmus.

It is very difficultly cured, when attended with hæmorrhoids: The principal cure is by aſtringents.---External aſſiſtance is alſo required to reduce the fallen gut; which, if it be not ſoon had is apt to tumefy and mortify, by the contact of the air.

It is ſubject to relapſe after reduction in children, eſpecially upon violent crying; and it is difficult to keep up, in caſe of a diarrhœa.

Procidentia *uteri*, the deſcent, or falling down of the womb, cauſed by a relaxation of the ligaments which ſhould hold it in its place. See Uterus.

If the uterus fall into the vagina, ſo that its orifice may be either perceived with the finger within, or by the eye juſt without, the labia vulvæ; it is called a *bearing down* of the womb.--If it fall quite down, ſo as to hang pendulous without the labia, but ſo as that no more of the inſide than the orifice is ſeen, it is called a *prolapſus*, or *procidentia.*---If falling thus low, it be turned inſide out, and hang like a fleſhy bag, with a rugged unequal ſurface, it is called a *perverſio uteri.*

Theſe diſorders may proceed from violent motions, vehement coughing, ſneezing, fluor albus. They appear moſt frequent in women with child, from the weight preſſing and bearing hard upon the uterus; but eſpecially if the fœtus be dead, lie in a wrong poſture, or be violently extracted.

After replacing the part, reſtringents both inwardly and by injection are here uſed; ſuch as obtain in diarrhœa's, hæmorrhoids, the gonorrhœa ſimplex, *&c.*

Procidentia, or Prolapsus, *uvulæ*, the deſcent or relaxation of the uvula, or almonds of the ears. See Uvula.

PROCLAMATION*, Proclamatio, an inſtrument diſpatched by the king, with the advice of his privy-council, whereby the people are advertiſed of ſomething which his majeſty thinks fit for them to know; and whereby they are ſometimes required to do, or not to do, certain things. See King and Privy *council.*

* The word is of Latin origin, formed from *proclamare, palam & valde clamare.*

Proclamations have the force of laws; but then they are ſuppoſed to be conſiſtent with the laws already in being; otherwiſe they are ſuperſeded. See Law.

Proclamation is alſo uſed for a ſolemn denunciation, or declaration of war and peace. See War, *&c.*

Proclamation alſo denotes the act of notifying to the people the acceſſion of a prince to the crown. See Accession.

The *proclamation* does not inveſt the prince with the regal authority; it ſuppoſes him already inveſted therewith, and only gives notice thereof to the people.

Proclamation *of a fine* is a notice openly and ſolemnly given thereof in the court of common pleas where it paſſed, and at all the aſſizes in the county held within one year after the ingroſſing it. See Fine.

Theſe *proclamations*, at the aſſizes, are made on tranſcripts of the fine, ſent by juſtices of the common pleas to the juſtices of the aſſize, and of the peace.

Proclamation, in a monaſtic ſenſe, is the accuſation of a frier or brother, by another brother, in open chapter, and in preſence of the ſuperior and community, for ſome external crime he has ſeen him commit.

PROCONDYLUS, προκονδυλος, an appellation given to the firſt point of each finger. See Condylus and Finger.

PRO-CONFESSO, in law.---When, upon a bill exhibited in chancery, the defendant appears, and is in contempt for not anſwering, and in cuſtody: upon an habeas corpus (which is granted by order) to bring him to the bar, the court aſſigns him a day to anſwer; which being expired, and no anſwer put in, a ſecond habeas corpus is granted, and a farther day aſſigned; by which day, if he anſwer not, the bill, upon the plaintiff's motion, ſhall be taken *pro confeſſo*, or as allowed, unleſs cauſe be ſhewn by a day, which the court uſually gives.

For want of ſuch cauſe ſhewed, upon motion, the ſubſtance of the plaintiff's bill ſhall be decreed, *as if it had been confeſſed* by the defendant's anſwer: or, after a fourth inſufficient anſwer made to the bill, the matter of fact not ſufficiently anſwered unto, ſhall be taken *pro confeſſo.*

PROCONSUL, a Roman magiſtrate, ſent to govern a province with a conſular authority. See Consul and Province.

The *proconſuls* were appointed out of the body of the ſenate; and ordinarily, as the year of any one's conſulate expired, he was ſent *proconſul* into ſome province.

The *proconſuls* had the ſame honours, *&c.* with the conſuls themſelves; except that they had only ſix lictors and faſces before them. See Fasces.

The *proconſuls* did not ordinarily hear and determine proceſſes in perſon, but had that office performed by their aſſeſſors, or other judges, conſtituted or delegated by them.

As the *proconſuls* had the direction both of juſtice, of war, and of the revenues; they had their ſeveral lieutenants in each capacity; theſe were called *legati*, and were ordinarily nominated by the ſenate. See Legatus.

The *proconſular* function only held a year. The charges of their journey backwards and forwards, were borne by the public, and were called *viaticum.* See Viaticum.

After the partition of the provinces between Auguſtus and the people, thoſe who preſided over the provinces of the people were called eſpecially *proconſuls.*

Proconsul, in our ancient law-books, is ſometimes uſed for a *juſtice in eyre*, or *juſtice errant.* See Justice.

PROCREATION, Procreatio, the action of begetting, and bringing forth children. See Generation.

PROCTOR, Procurator, a perſon commiſſioned to act as proxy, or delegate, in behalf of another. See Procurator.

Proctor, *procurator*, in the civil law, is an officer appointed to appear in court, and manage the cauſes of parties who will make uſe of his procuration. See Civil *law*.

Anciently every body was obliged to appear in perſon; and when the affair happened to be drawn out to a great length, was allowed to create a *proctor*, or proxy, in his cauſe.

But this was a favour only granted for a certain time; till towards the middle of the 16th century, when it was decreed, that all procuration ſhould hold till revoked.

Proctors *of the commons*, are perſons ſkilled in the civil and eccleſiaſtical laws, who exhibit their proxies, and make themſelves parties for their clients, to draw up acts and pleadings, produce witneſſes, prepare cauſes for ſentences, and attend the advocates with the proceedings. See College.

Theyare thirty-four in number; are admitted by the archbiſhop's fiat; and wear black robes, and hoods lined with white furs.

Proctors *of the clergy*, are deputies, or repreſentatives choſen by the clergy of each dioceſe, two for each; and by the cathedral and collegiate churches, one for each: to ſit in the lower houſe of convocation. See Convocation.

Proctors *in the univerſity*, are two officers, choſen from among the ſtudents, to ſee good orders, and exerciſes daily performed there. See University.

PROCUMBENT *leaves*, in botany, ſuch leaves of plants as lie flat, or trailing on the ground. See Leaf.

PROCURATION, or Procuracy, an act, or inſtrument, whereby a perſon is impowered to treat, tranſact, receive, &c. in another's name, as if he himſelf were actually preſent. See Procurator.

When a man treats in behalf of another, the firſt thing is to examine his *procuration*, or *procuracy*.

Procuration is now little uſed in this ſenſe, except in the caſe of a perſon who collects the fruits of a benefice for another.

Procuration, in the canon law, is uſed for the repaſt or entertainment anciently given to church-officers or ordinaries, who came to viſit in churches or monaſteries, whether they were biſhops, archdeacons, or viſitors. See Visitation.

Procuration was due to the pope's legates, and even to popes themſelves, when they came into France; and the charge was comprized in the bulls then granted.

Complaints were frequently made to the pope, of the exceſſive charges of the *procurations* of biſhops and archdeacons, upon which they were prohibited by ſeveral councils and bulls.

That of Clement IV. mentioned in the Monaſticon, is very expreſs; wherein that pope tells us, complaint had been made, that the archdeacon of Richmond, viſiting the dioceſe, travelled with one hundred and three horſes, twenty-one dogs, and three hawks; and did ſo grievouſly oppreſs a religious houſe with that vaſt equipage, that he cauſed the monks to ſpend in an hour as much as would have maintained them a long time.

Procuration is now uſed for a ſum of money paid yearly by pariſh-prieſts to the biſhop, or archdeacon, in lieu of this entertainment, towards defraying the charge of their viſitation. See Visitation.

PROCURATOR, Proctor, or Proxy, a perſon who has a charge or office committed to him, to act in behalf of another. See Procuration, and Proctor.

Thus the *proxies* of the lords in parliament, in our law-books, are called *procurators*. See Proxy.

The word is alſo uſed for a vicar, or lieutenant.—Thus in Petrus Bleſenſis, we read of a *procurator regni*.

Thoſe who manage cauſes in Doctors Commons, are alſo called *procurators*, or *proctors*. See Proctor.

The biſhops are ſometimes called *procuratores eccleſiarum*, and the repreſentatives ſent by the clergy to convocation, *procuratores cleri*. See Convocation.

In our ſtatutes, a perſon who gathers the fruits of a benefice for another, is particularly called *procurator*; and the inſtrument impowering him to receive the ſame, *procuracy*.

Procurator is alſo a kind of magiſtrate in ſeveral cities of Italy, who takes care of the public intereſts.—There are *procurators* of St. Mark, *procurators* at Venice, at Genoa, &c.

Originally there was but one *procurator* of St. Mark at Venice: In 1442. the number was augmented to nine, when the ſenate made a decree, appointing, that for the future none ſhould be admitted to the dignity but after the death of ſome of the nine. But in the neceſſities of the republic, the number was afterwards inlarged to forty; though of theſe there are only nine that bear the title of *procurators*, and whoſe place is regularly filled. They are adminiſtrators of the church of St. Mark, and of the revenues attached thereto, the patrons of orphans, and the executors of teſtaments.

This office receives more luſtre from the merit of thoſe who diſcharge it, than from its authority.—They are clothed in black, or violet, with ducal ſleeves.

Procurator *monaſterii*, anciently, was the advocate of a religious houſe, who was to ſolicit the intereſt, and plead the cauſes of the ſociety. See Advocate and Advouee.

Procuratores *eccleſiæ parochialis*, are the church-wardens, whoſe office is to act as *proxies* and repreſentatives of the church. See Church *warden*.

PROCYON, in aſtronomy, a fixed ſtar of the ſecond magnitude in canis minor. See Canis *minor*, and Canicular.

PRODES *hommes*, *q. d.* wiſe or diſcreet men, in our ancient cuſtoms, a title given to the barons, and other military tenants, who are called to the king's council, and were to give advice according to the beſt of their prudence, and knowledge. See Thane, Baron, &c.

PRODICTATOR, among the Romans, a magiſtrate who had the power, and did the office of a dictator. See Dictator.

The Romans ſometimes created a *prodictator*, in caſes where they could not have a dictator. Fabius Maximus was *prodictator*.

PRODROMUS, προδρομος, literally denotes a forerunner, a harbinger.—Hence,

Prodromus *morbus*, among phyſicians, is uſed for a diſeaſe which precedes or foreruns a greater.

Thus a ſtraitneſs of the breaſt is a *prodromus* of a conſumption, &c. a vertigo is ſometimes a *prodromus* of an apoplexy. See Phthisis, Apoplexy, Vertigo, &c.

PRODUCE,— *Net* Produce. See the article Net *produce*.

PRODUCING, in geometry, denotes the continuing a right line, or drawing it out farther, till it have any aſſigned length, See Line.

PRODUCT, in arithmetic and geometry, the factum of two numbers; or the quantity ariſing from, or produced by, the multiplication of two or more numbers, lines, &c. into one another. See Factum.

Thus, if 6 be multiplied by 8, the *product* is 48. See Multiplication.

In lines it is always (and ſometimes in numbers) called the *rectangle* between the two lines, multiplied by one another. See Rectangle.

PRODUCTION, in anatomy, a continuation, or proceſs. See Process.

PROEDRUS. προεδρος, in antiquity. See Epistates.

PROEM, Prooemium, a term anciently uſed for *preface*. See Preface.

PROEMPTOSIS, in aſtronomy, that which makes the new moons appear a day later, by means of the lunar equation, than they would do without that equation. See Moon and Equation.

PROFANATION, in religion, the doing of ſomething diſreſpectful to holy or ſacred things. See Profane.

PROFANE, a term uſed in oppoſition to *holy*, *ſacred*. See Sacred, &c.

Except churches, and church-yards, all places are eſteemed *profane*.—By the canon law, a ſacred chalice, or cup, becomes *profane*, by giving it a blow with an hammer.

Profane is alſo applied in general to all perſons who have not the ſacred character, and all things which do not belong to the ſervice of religion.

In this ſenſe, Xenophon, Seneca, &c. are *profane* authors.—The Heathen prieſts, pontiffs, &c. alſo paſs with us for *profane*.

PROFECTITIOUS. See Adventitious.

PROFER*, in law, the time appointed for the accounts of ſheriffs, and other officers, to be given into the exchequer; which, by ſtat. 51. Hen. 3. is to be twice in the year. See Sheriff and Exchequer.

* The word is formed of the French *proferer*, to produce.

Profer, is alſo uſed for an offer, or endeavour to proceed in an action by a perſon concerned ſo to do.

Trinity-term ſhall begin the monday next after Trinity-ſunday, whenever it ſhall happen to fall, for the keeping of the eſſoins, *profers*, returns, and other ceremonies heretofore in uſe. *Stat. an.* 32. *Hen.* 8.

Profer *the half-mark*. See the article Half *mark*.

PROFESSED *monk*, or *nun*, one who having made the vow, is admitted of a religious order. See Vow, Monk, and Religious.

In this ſenſe the word is uſed in oppoſition to *novice*. See Novice and Probation.

PROFESSIO *viduitatis*. See the article Viduitatis.

PROFESSION, Professio, in a monaſtic ſenſe, the entering into a religious order; or an action whereby a perſon offers himſelf to God, by a vow of obſerving three things, *viz.* obedience, chaſtity, and poverty, which he promiſes inviolably to maintain. See Vow, Order, &c.

This is called *ſanctæ religionis profeſſio*, and the perſon a *religious profeſſed*. See Religious.

Perſons are not admitted to make *profeſſion* till after a year of probation. See Probation, Noviciate, &c.

PROFESSOR, in the univerſities, a perſon who teaches, or lectures publicly, ſome art or ſcience, in a chair eſtabliſhed for that purpoſe. See Chair.

The *profeſſors* in foreign univerſities teach the arts, and have their claſſes of pupils; thoſe in our univerſities only read public lectures in term-time. See Term.

Of *profeſſors* we have a great number, ſome denominated from the arts they profeſs, as *caſuiſtical profeſſor*, *Hebrew profeſſor*, *phyſic profeſſor*, *divinity profeſſor*, &c.

Others from thoſe who founded the *profeſſorſhip*, or aſſigned a revenue for the ſupport of the *profeſſor*; as the *Savilian profeſſors* of aſtronomy and geometry, the *Lucaſian profeſſor* of mathematics, *Margaret profeſſor* of divinity, &c.

Regius Professors. See the article Regius.

PROFICISCENDUM. — *Capias conductos ad proficiſcendum.* See CAPIAS.

PROFILE, in architecture, the figure, or draught of a building, fortification, or the like, wherein are expreſſed the ſeveral heights, widths, and thickneſſes, ſuch as they would appear, were the building cut down perpendiculary from the roof to the foundation.

Whence the *profile* is alſo called the *ſection*, ſometimes *orthographical ſection*; and by Vitruvius alſo, *ſciagraphy*. See SECTION and ORTHOGRAPHY.

Profile, in this ſenſe, amounts to the ſame with *elevation*; and ſtands oppoſed to a *plan*, or *ichnography*. See PLAN and ICHNOGRAPHY.

PROFILE is alſo uſed for the contour, or out-line of a figure, building, member of architecture, or the like; as a baſe, a cornich, &c.

Hence *profiling* is ſometimes uſed for deſigning, or deſcribing the member with rule, compaſs, &c.

PROFILE, in ſculpture and painting.—A head, a portrait, &c. are ſaid to be in *profile*, when they are repreſented ſide-ways, or in a ſide-view.

As, when in a portrait there is but one ſide of the face, one eye, one cheek, &c. ſhewn, and nothing of the other.—On almoſt all medals, the faces are repreſented in *profile*. See MEDAL.

PROFITS, *pernor of*. See the Article PERNOR.

PROFLUVIUM, in medicine, any kind of flux, or liquid evacuation. See FLUX. Whence,

PROFLUVIUM *ventris*, flux of the belly, denotes a diarrhœa. See DIARRHOEA.

PROFUNDUS. See MUSCLE.

PROGNOSTIC*, PROGNOSIS, in medicine, a judgment of the event either of a ſtate of health, or of a diſeaſe: as, whether it ſhall end in life, or death; be long, or ſhort; mild, or malignant, &c. taken from certain ſymptoms thereof. See SIGNUM and SYMPTOM.

* The word comes from the Greek προγνωσις, *fore-kuowledge*: whence alſo προγνωστικον, a *prognoſtic ſign*.

In all continued fevers, Morton tells us, a ſtrong equable pulſe is a *good prognoſtic*, and always preſages well, whatever other threatening ſymptoms attend it; on the contrary, a quick, feeble, intermitting pulſe is a *prognoſtic* of death, how much ſoever the other ſymptoms may flatter. See PULSE.

Hippocrates obſerves, that all predictions and *prognoſtics* of acute diſeaſes are very fallacious; Diemerbroeck, however, adds, that in the plague of Nimeguen, ſixth day criſes were conſtantly found fatal *prognoſtics*; alſo to be infected about the new, or full moon; faintings in the beginning of the diſeaſe, and palpitations of the heart, were found deadly *prognoſtics*; on the contrary, a pleuriſy, and ſuppreſſion of ſtool, were good *prognoſtics*.

The *prognoſis* is a part of ſemeiology. See SEMEIOLOGY.

PROGNOSTICS *of the weather*. See the article WEATHER.

PROGRAMMA, anciently denoted a letter ſealed with the king's ſeal. See SEAL.

PROGRAMMA is alſo a college term, ſignifying a billet, or advertiſement poſted up, or given into the hand, by way of invitation to an oration, or other college ceremony, containing the argument, or ſo much as is neceſſary for the underſtanding thereof. — *Programma's* are ſent to invite people to aſſiſt at declamations, dramatic performances, &c.

PROGRESSION, PROGRESSIO, an orderly advancing, or going forward, in the ſame manner, courſe, tenor, &c.

PROGRESSION, in mathematics, is either *arithmetical*, or *geometrical*.

Arithmetical **PROGRESSION** is a ſeries of quantities equidiſtant from each other; *i. e.* either increaſing or decreaſing by the ſame common interval or difference. See SERIES.

Thus 3, 6, 9, 12, 15, 18, &c. make an *arithmetical progreſſion*; becauſe increaſing, or differing equally, by 3: Thus alſo 25, 20, 15, 10, and 5, are in *arithmetical progreſſion* decreaſing by a common difference, 5.

In every *arithmetical progreſſion*, whether increaſing or decreaſing, the ſum of the firſt and laſt term is equal to the ſum of any two intermediate terms equidiſtant from the extremes; as alſo, if the number of terms be uneven, to the double of the middle term.—For inſtance:

$$\begin{array}{ccccccc} 3, & 6, & 9, & 12, & 15, & 18, & 21 \\ & & & 12, & 9, & 6, & 3 \\ \hline & & & 24, & 24, & 24, & 24 \end{array}$$

Hence 1°. we find the ſum of any *arithmetical progreſſion* by multiplying the ſum of the firſt and laſt term by half the number of terms.

2°. Having therefore the firſt term, the difference, and the number of terms given; the ſum of the *progreſſion* is had by multiplying the firſt term by the number of terms, and to the product adding the product ariſing from the difference multiplied into the ſemi-difference of the number of terms from the ſquare of that ſame number.

Thus, ſuppoſe the firſt term 3, the number of terms 7, and the difference 3; the product of 3 and 7 = 21 being added to the product 63, of the difference 3 multiplied into the ſemi-difference of the number of terms 7, from the ſquare thereof 49, =21, gives 84, the ſum of the *progreſſion*.

3°. The number of terms leſſened by one, being multiplied by the common difference, and the firſt term added to the product, the ſum is the laſt term. Thus in a *progreſſion* of 52 places, where the difference is 3, and the firſt term 5; 51 being multiplied by 3, produces 153, to which adding 5, the ſum 158 is the laſt term required.

4°. If the *progreſſion* begin with 0, the ſum of all the terms is equal to half the product of the laſt term multiplied by the number of terms.

Whence it follows, that the ſum of a *progreſſion* beginning from 0, is ſubduple the ſum of ſo many terms, all equal to the greateſt.

5°. In an *arithmetical progreſſion*, as the difference of the ſum of the firſt and laſt term from double the ſum of the *progreſſion*, is to the difference of the firſt term from the laſt; ſo is the ſum of the firſt and laſt terms to the *progreſſional* difference.

Geometrical **PROGRESSION**, is a ſeries of quantities increaſing or decreaſing in the ſame ratio or proportion; or a ſeries of quantities that are continually proportional. See PROPORTION and GEOMETRICAL.

Thus 1, 2, 4, 8, 16, 32, 64, &c. make a *geometrical progreſſion*; or 729, 243, 81, 27, 9, 3, 1.

1°. In every *geometrical progreſſion*, the product of the extreme terms is equal to the product of two intermediate terms equidiſtant from the extremes; as alſo, if the number of terms be uneven, to the ſquare of the middle term.—For example:

$$\begin{array}{cccccc} 3, & 6, & 12, & 24, & 48, & 96 \\ & & & 12, & 6, & 3 \\ \hline & & & 288, & 288, & 288 \end{array}$$

2°. If the difference of the firſt and laſt term of a *geometrical progreſſion* be divided by a number leſs than the denominator of the ratio, *i. e.* than the quotient of a greater term divided by a leſs; the quotient will be the ſum of all the terms except the greateſt: Hence, by adding the greateſt ſum, we have the ſum of the whole *progreſſion*.

Thus, in a *progreſſion* of 5 terms, beginning with 3, and the denominator being likewiſe 3, the greateſt term will be 243. If then the difference of the firſt and laſt term 240, be divided by 2, a number leſs by 1 than the denominator; the quotient 120, added to 243, gives 363, the ſum of the *progreſſion*.

Hence, 3°. the firſt or laſt term of a *progreſſion*, is to the ſum of the *progreſſion*, as the denominator leſſened by 1, to its power likewiſe leſſened by 1; the exponent of which power is equal to the number of terms.

Thus ſuppoſing the firſt term 1, the denominator 2, and the number of terms 8; the ſum will be 255.

4°. Hence alſo the difference between the laſt term and the ſum is to the difference between the firſt term and the ſum, as unity to the denominator: Wherefore, if the difference between the firſt term and the ſum, be divided by the difference between the ſum and the laſt term, the quotient is the denominator.

Arch of **PROGRESSION**. See the article ARCH.

PROHIBITED *goods*, in commerce, ſuch commodities as are not allowed to be either imported or exported. See CONTRABAND.

PROHIBITIO *de vaſto directa parti*, is a writ judicial, directed to the tenant, *prohibiting* him from making waſte upon the land in controverſy, during the ſuit.—It is ſometimes alſo directed to the ſheriff.

PROHIBITION, PROHIBITIO, the act of forbidding, or inhibiting any thing.

It is the *prohibition* of the law that makes the ſin: A teſtator frequently bequeaths things with a *prohibiton* to alienate.

PROHIBITION, in common law, denotes a writ iſſued out of the chancery, king's-bench, or common-pleas, to forbid ſome other court, either ſpiritual or ſecular, to proceed in a cauſe there depending; upon ſuggeſtion, that the cognizance thereof belongeth not to that court.

It is now uſually taken for that writ which lieth for one, who is impleaded in the court Chriſtian, for a cauſe belonging to the temporal juriſdiction, or the cognizance of the king's courts; whereby, as well as the party and his council, as the judge himſelf, and the regiſter, are forbid to proceed any farther in that cauſe. See COURT, CIVIL LAW, &c.

PROJECTILE, or PROJECT, in mechanics, a heavy body, which being put into a violent motion by an external force impreſſed thereon, is diſmiſſed from the agent, and left to purſue its courſe. See MOTION.

Such, *e. gr.* is a ſtone thrown out of the hand, or a ſling, an arrow from a bow, a bullet from a gun, &c. See PROJECTION.

The cauſe of the continuation of the motion of **PROJECTILES**, or what it is determines them to perſiſt in motion, after the firſt cauſe ceaſes to act, has puzzled the philoſophers. See MOTION and COMMUNICATION.

The Peripatetics account for it from the air, which being violently agitated by the motion of the *projecting* cauſe. *e. gr.* the hand and ſling, and forced to follow the *projectile*, while accelerated therein, does, upon the diſmiſſion of the *projectile*, preſs after it, and protrude it forward, to prevent a vacuum. See VACUUM.

The moderns account for the motion of *projectiles* on a much more rational and eaſy principle; it being, in effect, a natural conſequence from one of the great laws of nature; *viz.* That all bodies being indifferent as to motion or reſt, will neceſſarily continue the ſtate they are put into, except ſo far as they are hindered, and forced to change it by ſome new cauſe. See NATURE.

Thus a *project* put in motion muſt continue to move eternally on in the ſame right line, and with the ſame velocity; were it to meet with no reſiſtance from the medium, nor had any force of gravity to encounter.

The doctrine of the motion of *projectiles* is the foundation of all gunnery. See GUNNERY.

Laws of the motion of PROJECTILES—1. If a heavy body be *projected* perpendicularly, it will continue to aſcend or deſcend perpendicularly: becauſe both the *projecting* and the gravitating force are found in the ſame line of direction.

2. If a heavy body be *projected* horizontally, it will, in its motion, deſcribe a parabola; the medium being ſuppoſed void of reſiſtance.

For the body is equally impelled by the impreſſed force, according to the right line A R, (*tab.* MECHANICS, *fig.* 46.) and by the force of gravity according to the right line A C, perpendicular thereto. While then the body by the action of the impreſſed force is arrived in Q; by the force of gravity it will be arrived in Q M; and, therefore will be found in M. But the motion in the direction A R will ſtill be uniform (ſee MOTION); and, therefore, the ſpaces Q A and *q* A are as the times; and the ſpaces Q M and *qm*, are likewiſe as the ſquares of the times. Therefore, $AQ^2 : Aq^2 :: QM : qm$. That is, $PM : pm :: AP : ap$.

The courſe or path therefore, A M *m*, of a heavy body *projected* horizontally, is a parabola. See PARABOLA.

Two hundred years ago, the philoſophers took the line deſcribed by a body *projected* horrizontally, *e. gr.* a bullet out of a cannon, while the force of the powder exceeded the weight of the bullet conſiderably, to be a right line; after which it became a curve.

N. Tartaglia was the firſt who perceived the miſtake, and maintained the path of the bullet to be a crooked line, throughout its whole extent; but it was Galileo who firſt determined the preciſe curve the bullet deſcribed; and ſhewed the path of the bullet, *projected* horizontally from an eminence, to be a parabola; the vertex whereof is the point where the bullet quits the cannon.

3. If a heavy body be *projected* obliquely, either upwards or downwards, in a medium void of reſiſtance; it will likewiſe deſcribe a parabola.

Hence, 1°. the parameter of the diameter of the parabola A S (*fig.* 47.) is a third proportional to the ſpace through which the body deſcends in any given time, and the celerity, which is defined by the ſpace paſſed over in the ſame time; *i. e.* to A P and A Q.—2°. Since the ſpace deſcribed by a body falling perpendicularly in one minute, is 15 $\frac{1}{12}$ Paris feet in a ſecond; the parameter of the diameter of the parabola to be deſcribed is found, if the ſquare of the ſpace paſſed over by the *projectile* with the impreſſed force in a ſecond, be divided be 15 $\frac{1}{12}$.—3°, If then the velocity of the *projectiles* by the ſame, the ſpaces deſcribed in the ſame time by the force impreſſed, are equal; conſequently the parameter of the parabola's paſſed over by the compound motion, is the ſame.—4°. If from the parameter of the diameter be ſubtracted quadruple the altitude of A P, the remainder is the parameter of the axis; the fourth part whereof is the diſtance of the vertex of the axis from the focus of the parabola. Hence the celerity of the *projectile* being given, the parabola deſcribed by the *projectile* may be laid down on paper.—5°. The line of direction of the *projectile* A R is a tangent to the parabola in A.

Sir Iſaac Newton ſhews, in his *principia*, that the line a *projectile* deſcribes, approaches nearer to an hyperbola than a parabola.

4. A *projectile* in equal times deſcribes portions of its parabolic path, as A M, A *m*, which are ſubtended by equal ſpaces of the horizon A T, T *t*; *i. e.* in equal times it paſſes over equal horizontal ſpaces.

5. The quantity or amplitude of the path A B, *i. e.* the range of the *projectile*, is to the parameter of the diameter AS, as the ſine of the angle of elevation R A B to its ſecant.

Hence, 1. The ſemiparameter is to the amplitude of the path AB, as the whole ſine to the ſine of double the angle of elevation.—2. If then the celerity of two *projectiles* be the ſame, the parameter is the ſame. Wherefore, ſince the ſemiparameter of the path, in the one caſe, is to the amplitude, as the whole ſine to the ſine of double the angle of elevation; and the ſemiparameter of the path in the other caſe is to the amplitude, as the whole ſine to the ſine of double the angle of elevation: We may ſay farther, as the amplitude is to the ſine of the angle of double the elevation in the one caſe, ſo is the amplitude to the ſine of the angle of double the elevation in the other caſe. The amplitudes therefore, or magnitudes of the paths, are as the ſines of double the angles of elevation; the velocity of the *projectile* remaining the ſame.

6. The celerity of the *projectile* being the ſame, the amplitude

A B is greateſt, *i. e.* the range of the *projectile* is greateſt, at an angle of elevation of 45°; and the amplitudes or ranges, at angles of elevation equally diſtant from 45°, are equal.

This is found by experiment; and is likewiſe demonſtrable thus: ſince the ratio of the ſine of double the angle of elevation to the amplitude is always the ſame, while the celerity of the *projectile* remains the ſame; as the ſine of double the angle of elevation increaſes, the amplitude will increaſe. Wherefore, ſince the ſine of double the angle of elevation of 45° is radius, or the largeſt ſine; the amplitude, or range in that elevation, muſt be the greateſt. Again, ſince the ſines of angles equidiſtant from right angles; *e. gr.* 80° and 100° are the ſame; and the double angles muſt be equidiſtant from a right angle, if the ſimple ones be ſo; the amplitudes or ranges at elevations equidiſtant from 45°, muſt be equal.

Hence, ſince as the whole ſine is to the ſine of double the angle of elevation; ſo is the ſemiparameter to the amplitude; and the whole ſine is equal to double the ſine of the angle of elevation, if that be 45°: Under the angle of elevation 45°, the amplitude is equal to the ſemiparameter.

7. *The greateſt range or amplitude being given; to determine the amplitude or range under any other given angle of elevation; the celerity remaining the ſame.* Say thus; As the whole ſine is to the ſine of double the angle of any other elevation; ſo is the greateſt amplitude or range, to the amplitude required.

Thus, ſuppoſe the greateſt range of a mortar at 45°, to be 6000 paces, and the length of the range at 30°, required; it will be found 5196 paces.

8. *The velocity of a* projectile *being given, to find its greateſt range or amplitude.* Since the celerity of the *projectile* is given in the ſpace it will paſs over by the impreſſed force; *e. gr.* in one ſecond; there is nothing required but to find the parameter of the path (by *corol.* 2. of the 3d law); for half of this is the amplitude or range required.

Suppoſe, *e. gr.* the celerity of the *projectile* ſuch as that in one ſecond it will run over 1000 feet, or 12000 inches: If then 144000000 be divided by 181, the quotient will give the parameter of the path 795580 inches, or 66298 feet. The range or amplitude required, therefore, is 33149. Any object, therefore, found within this extent, may be ſtruck by the *projectile.*

9. *The greateſt range or amplitude being given; to find the velocity of the* projectile, *or the horizontal ſpace, it will paſs over in a ſecond.* Since double the greateſt amplitude is the parameter of the path; between double the greateſt amplitude, and the ſpace paſſed over in a ſecond by a body falling perpendicularly, *viz.* 181 Paris inches, find a mean proportional; for this will be the ſpace deſcribed by the *projectile* in the given ſecond.

Thus, if the greateſt amplitude be 1000 feet, or 12000 inches, the ſpace required will be $=\sqrt{(12000.181)}=120$ feet and 4 inches.

10. *To determine the greateſt altitude to which a body obliquely* projected *will riſe.* The rule is; biſect the amplitude A B in *t*, and from the point *t* erect a perpendicular *t m*; this *t m* will be the greateſt altitude to which the body *projected*, according to the direction A R, will ariſe.

11. *The range or amplitude* A B, *and the angle of elevation* B A R, *being given; to determine the greateſt altitude of the* projectile. If A R be taken for the whole ſine, B R will be the ſine, and A B the co-ſine of the angle of elevation B A R: Wherefore ſay, As the co-ſine of the angle of elevation is to the ſine of the ſame; ſo is the amplitude A B to a fourth number, which will be B R; the fourth part whereof is the greateſt altitude required.

Hence, ſince from the given velocity of a *projectile*, its greateſt range or amplitude, and thence its range under any other angle, is found; the velocity being given, the greateſt altitude of the *projectile* is likewiſe found.

12. The altitude of the range *t m* is to the eighth part of the parameter, as the verſed ſine of double the angle of elevation to the whole ſine.

Hence, 1. Since, as the whole ſine is to the verſed ſine of double the angle of elevation in one caſe; ſo is the eighth part of the parameter to the altitude of the range: And as the whole ſine is to the verſed ſine of double the angle of elevation in any other caſe; ſo is the eighth part of the parameter to the altitude: but the velocity remaining the ſame, the parameter, in different angles of elevation, will likewiſe be the ſame: The altitudes of the ranges under different angles of elevations are as the verſed ſines of double their angles.—2. Hence alſo, the velocities remaining the ſame, the altitudes of the ranges are in a duplicate ratio of the ſines of double the angles of elevation.

13. *The horizontal diſtance of any mark or object, together with its height above, or depth beneath the horizon, being given; to find the angle of elevation required to hit the ſaid object.*

Wolfius gives us the following theorem, the reſult of a regular inveſtigation: Suppoſe the parameter of the diameter $AS, =a$; $In=b$, $AI=c$, the whole ſine$=t$. Then, as c is to $\frac{1}{2}a+\sqrt{(\frac{1}{4}a^2-ab-c^2)}$ ſo is the whole ſine t, to the tangent of the angle of elevation required RAB.

Dr. Halley gives the following eaſy and compendious geometrical conſtruction of the problem; which he likewiſe deduces from an analytical inveſtigation.

Having the right angle LDA, (*fig.* 48.) make D A, D F, the greateſt range, D G the horizontal diſtance, and DB, DC, the perpendicular height of the object; and draw GB, and make DE equal thereto. Then with the radius AC, and centre E, ſweep an arch, which, if the thing be poſſible, will interſect the line AD in H; and the line DH being laid both ways from F, will give the points K and L; to which draw the lines GL, GK.

Here the angles LGD, KGD, are the elevations required for hitting the object B.---But note, that if B be below the horizon, its deſcent DC=DB, muſt be laid from A, ſo as to have AC=to AD+DC. Note likewiſe, that if in deſcents, DH be greater than FD, and ſo K fall below D; the angle KGD ſhall be the depreſſion below the horizon.

It may be here obſerved, that the elevation ſought conſtantly biſects the angle between the perpendicular and the object. This the author was not aware of, when he gave the firſt ſolution of the problem; but upon diſcovering it, obſerves, that nothing can be more compendious, or bid fairer for the perfection of the art of gunnery; ſince it is here as eaſy to ſhoot with a mortar at any object in any ſituation, as if it were on the level; nothing more being required but to lay the piece, ſo as to paſs in the middle line between the zenith and the object, and giving it the due charge. See MORTAR.

14. The times of the *projections* or caſts under different angles of elevation, the velocity remaining the ſame, are as the ſines of the angles of elevation.

15. *The velocity of a* projectile, *together with the angle of elevation* R A B, *being given* (fig. 47.) *to find the range, or amplitude* A B, *and the altitude of the range* t m, *and deſcribe the path* A m B. To the horizontal line AB erect a perpendicular AD, which is to be the altitude whence the *projectile* falling, might acquire the given velocity: on A D deſcribe a ſemicircle AQD, cutting the line of direction AR in Q: through Q draw C *m* parallel to A B, and make CQ=Q *m*. From the point *m* let fall a perpendicular *m t* to AB: laſtly, through the vertex M deſcribe the parabola A *m* B.

Here A *m* B is the path ſought, 4 CQ its amplitude or range, *t m* the altitude of the range, and 4 CD the parameter.

Hence, 1°. The velocity of a *projectile* being given, the amplitudes and altitudes of all the poſſible ranges are given at the ſame time. For, drawing EA, we have under the angle of elevation E A B, the altitude A I, and the amplitude 4 I E: Under the angle of elevation F A B, the altitude AH, the amplitude 4 HF. 2°. Since AB is perpendicular to AD, it is a tangent to the circle in A: hence the angle ADQ is equal to the angle of elevation RAB; conſequently AIM is double the angle of elevation; and therefore CQ, the fourth part of the amplitude, is the right ſine; AC the altitude of the range, the verſed ſine of double the angle of elevation.

16. The altitude *t m* of a caſt, or its amplitude A B, together with the angle of elevation RAB, being given; to find the velocity wherewith the *projectile* firſt moved, that is, the altitude AD, in falling from whence it would acquire the like velocity. Since AC=*t m* is the verſed ſine, C Q=¼ AB, the right ſine of double the angle of elevation AIQ; to the verſed ſine of double the angle of elevation, find the whole ſine, and the height of the caſt. Or to the right ſine of double the angle of elevation, the whole ſine, and the fourth part of the amplitude, find a fourth proportional. This will be the radius IQ or IA, the double whereof AD is the altitude required.

PROJECTING *table*. See the article TABLE.

PROJECTION, in mechanics, the action of giving a projectile its motion. See PROJECTILE.

If the direction of the force whereby the projectile is put in motion, be perpendicular to the horizon, the *projection* is ſaid to be *perpendicular*; if parallel to the apparent horizon, it is ſaid to be a *horizontal projection*; if it make an oblique angle with the horizon, the *projection* is oblique. See OBLIQUE.

The angle A R B, (*tab. mechan. fig.* 47.) which the line of direction AR makes with the horizontal line AB, is called the *angle of elevation of the projectile*.

PROJECTION, in perſpective, denotes the appearance or repreſentation of an object on the perſpective plane. See PLANE.

The *projection, e. gr.* of a point, as A, (*tab. perſpect. fig.* 1.) is a point *a*, through which the optic ray O A paſſes from the objective point through the plane to the eye; or it is the point *a*, wherein the plane cuts the optic ray.

And hence is eaſily conceived what is meant by the *projection* of a line, a plane, or a ſolid. See PERSPECTIVE.

PROJECTION *of the ſphere, in plano*, is a repreſentation of the ſeveral points or places of the ſurface of the ſphere, and of the circles deſcribed thereon, or of any aſſigned parts thereof, ſuch as they appear to the eye ſituate at a given diſtance, upon a tranſparent plane placed between the eye and the ſphere. See SPHERE and PLANE.

For the laws of this *projection*, ſee PERSPECTIVE; the *projection of the ſphere* being only a particular caſe of perſpective.

The principal uſe of the *projection of the ſphere* is in the conſtruction of planiſpheres, and particularly maps and charts, which are ſaid to be of this or that *projection*, according to the ſeveral ſituations of the eye, and the perſpective plane with regard to the meridians, parallels, and other points and places to be repreſented. See PLANISPHERE, &c.

The moſt uſual *projection* of maps of the world is that on the *plane of the meridian*, which exhibits a right ſphere; the firſt meridian being the horizon: The next is that on the *plane of the equator*, wherein the pole is in the centre, and the meridians the radii of a circle, &c. This repreſents a parallel ſphere.

See the application of the doctrine of the projection of the ſphere, *in the conſtruction of the various kinds of maps, under the article* MAP.

The projection of the ſphere is uſually divided into *orthographic*, and *ſtereographic*, to which may be added *gnomonic*.

Orthographic PROJECTION, is that wherein the ſuperficies of the ſphere is drawn on a plane, cutting it in the middle; the eye being placed at an infinite diſtance vertically to one of the hemiſpheres. See ORTHOGRAPHIC.

Laws of the orthographic PROJECTION.—1. The rays by which the eye at an infinite diſtance perceives any object, are parallel.

2. A right line perpendicular to the plane of the *projection* is projected into a point, where that right line cuts the plane of the *projection*.

3. A right line, as A B, or CD, (*tab. perſpect. fig.* 17.) not perpendicular, but either parallel or oblique to the plane of the *projection*, is projected into a right line, as E F, or G H, and is always comprehended between the extreme perpendiculars A F, and B E.

4. The *projection* of the right line A B is the greateſt, when AB is parallel to the plane of the *projection*.

5. Hence it is evident, that a line parallel to the plane of the *projection*, is projected into a right line equal to itſelf; but if it be oblique to the plane of the *projection*, it is projected into one which is leſs.

6. A plane ſurface, as ABCD, (*fig.* 18.) at right angles to the plane of the *projection*, is projected into that right line; *e. gr.* AB, in which it cuts the plane of the *projection*.

Hence it is evident, that the circle BCAD, ſtanding at right angles to the plane of the *projection*, which paſſes through its centre, is projected into that diameter AB, in which it cuts the plane of the *projection*.

It is likewiſe evident, that any arch, as *c c*, is projected into *o o* equal to C *a*, C *b*, which is the right ſine of that arch; and the complemental arch *c* A is projected into *o* A, the verſed ſine of the ſame arch c c.

7. A circle parallel to the plane of the *projection*, is projected into a circle equal to itſelf; and a circle oblique *to the plane* of the *projection*, is projected into an ellipſis.

Stereographic PROJECTION, is that wherein the ſurface and circles of the ſphere are drawn upon the plane of a great circle, the eye being in the pole of that circle. See STEREOGRAPHIC.

Properties of the ſtereographic PROJECTION.—1. In this *projection*, a right circle is projected into a line of half tangents.

2. The repreſentation of a right circle, perpendicularly oppoſed to the eye, will be a circle in the plane of the *projection*.

3. The repreſentation of a circle placed oblique to the eye, will be a circle in the plane of the *projection*.

4. If a great circle be to be projected upon the plane of another great circle, its centre will lie in the line of meaſures, diſtant from the centre of the primitive by the tangent of its elevation above the plane of the primitive.

5. If a leſſer circle, whoſe poles lie in the plane of the *projection*, were to be projected; the centre of its repreſentation would be in the line of meaſures, diſtant from the centre of the primitive, by the ſecant of the leſſer circles diſtance from its pole, and its ſemidiameter or radius, be equal to the tangent of that diſtance.

6. If a leſſer circle were to be projected, whoſe poles lie not in the plane of the *projection*, its diameter in the *projection*, if it falls on each ſide of the pole of the primitive, will be equal to the ſum of the half tangents of its greateſt and neareſt diſtance from the pole of the primitive, ſet each way from the centre of the primitive in the line of meaſures.

7. If the leſſer circle to be *projected*, fall intirely on one ſide of the pole of the *projection*, and do not encompaſs it; then will its diameter be equal to the difference of the half tangents of its greateſt and neareſt diſtance from the pole of the primitive, ſet off from the centre of the primitive one; and the ſame way in the line of meaſures.

8. In the *ſtereographic projection*, the angles made by the circles of the ſurface of the ſphere, are equal to the angles made by their repreſentatives in the plane of their *projection*.

Gnomonic PROJECTION *of the ſphere*. See GNOMONIC *projection*.

Mercator's PROJECTION. See the article MERCATOR.

PROJECTION *of globes* &c. See the article GLOBE, &c.

Polar PROJECTION. See the article POLAR.

PROJECTION *of ſhadows*. See the article SHADOW.

PROJECTION, in alchymy, the caſting of a certain imaginary powder, called *powder of projection*, into a crucible, or other veſſel, full of prepared metal; or other matter, which is to be hereby preſently tranſmuted into gold. See *powder of* PROJECTION.

Powder of PROJECTION, or of the philoſopher's ſtone, is a powder ſuppoſed to have the virtue of changing any quantity of an imperfect metal, as copper or lead, into a more perfect one, as ſilver or gold, by the admixture of a little quantity thereof. See TRANSMUTATION.

The mark to which the alchymiſts direct all their endeavours, is to find the *powder of projection*; which every one of them has been within an ace of, an hundred times. See ALCHYMY.

For the characters, properties, virtues, &c. *of this powder,* ſee PHILOSOPHER's *ſtone.*

PROJECTION in building. See PROJECTURE.

PROJECTIVE *dialing,* a manner of drawing, by a method of projection, the true hour-lines, furniture of dials, *&c.* on any kind of ſurface whatſoever, without any regard had to the ſituation of thoſe ſurfaces, either as to declination, reclination, or inclination. See DIALING.

PROJECTURE, in architecture, the out-jetting, or prominency, which the mouldings and members have, beyond the plane or naked of the wall, column, *&c.* See NAKED, COLUMN, *&c.*

Theſe the Greeks call *ecphoræ,* the Italians *ſporti,* the French *ſailles,* our workmen frequently *ſailings over,* and the Latins *projecta,* from *projicio,* I caſt forward; whence the Engliſh, *projecture.*

Vitruvius gives it as a general rule, that all the *projecting* members in buildings have their *projectures* equal to their heights: but this is not to be underſtood of the particular members, or mouldings, as dentils, corona's, the faſciæ of architraves, the abacus of the Tuſcan and Doric capital, *&c.* but only of the *projectures* of intire cornices, *&c.* See CORNICE, *&c.*

The great point of building, according to ſome modern architects, conſiſts in knowing how to vary the proportions of *projectures,* &c. agreeably to the circumſtances of the building. Thus, ſay they, the nearneſs and remoteneſs, making a difference in the view, require different *projectures;* but it is evident the ancients had no ſuch intention. See PROPORTION.

The *projecture* of the baſe and cornice of pedeſtals, M. Perrault obſerves, is greater in the antique than the modern buildings by one third; which ſeems to follow, in good meaſure, from the ancients proportioning this *projecture* to the height of the pedeſtals; whereas the moderns make the *projecture* the ſame in all the orders, though the height of the pedeſtal be very different.

The reaſon of this charge, which the moderns have made of the antique, the ſame author refers to a view to the appearance of ſolidity. See PEDESTAL.

PRO-INDIVISO, in law, a poſſeſſion or occupation of lands or tenements, belonging to two or more perſons, whereof none can ſay which is his ſeveral portion, each having the whole, *&c.* as co-parceners before partition. See POUR *party,* COPARCENER and PARTITION.

PROKING, ſee FISHING.

PROLABIA, *fore-lips;* a term in anatomy for that part of the labia or lips which jets out. See LABIA.

PROLATE, in geometry, an epithet applied to a ſpheroid produced by the revolution of a ſemi-ellipſis about its longer diameter. See SPHEROID.

If the ſolid be formed by the revolution of a ſemi-ellipſis about its ſhorter diameter, it is called an *oblate ſpheroid;* of which figure is the earth we inhabit, and, perhaps, all the planets too; having their equatorial diameter longer than their polar. See OBLATE.

PROLATION, in muſic, the act of ſhaking, or making ſeveral inflections of the voice, on the ſame ſyllable.

PROLEGOMENA*, in philology, preparatory obſervations, or diſcourſes prefixed to a book, *&c.* containing ſomething neceſſary for the reader to be apprized of, to enable him the better to underſtand the book, to enter deeper into a ſcience, *&c.*

* The word is Greek, προλεγομενον, formed of προλεγω, *I preface,* or *ſpeak before.*

The generality of arts and ſciences require ſome previous inſtructions, ſome *prolegomena.* See PRELIMINARY.

PROLEPSIS, προληψις, a figure in rhetoric, by which we anticipate, or prevent what might be objected by the adverſary. See FIGURE.

Thus: *It may perhaps be objected,* &c.—*You will ask,* &c. But ſome man will ſay, how are the dead raiſed, or with what body do they come? Thou Fool, that which thou ſoweſt, *&c.* Where the objection is turned into an argument againſt the adverſary, as in the laſt inſtance, it is called *antiſtrophe,* or *inverſio*—Where it is rejected as unſufferably abſurd, it is called *Apodioxis.* See ANTISTROPHE.

PROLEPTIC, προληπτικος, denotes a periodical diſeaſe, which anticipates, or whoſe paroxyſm returns ſooner and ſooner every time; as is frequently the caſe in agues, *&c.*

PROLIFIC, in medicine, ſomething that has the qualities neceſſary for generating. See FECUNDITY.

Some phyſicians pretend to diſtinguiſh whether or no the ſeed be *prolific.* See SEED.

PROLIXITY, in diſcourſe, the fault of entering into too minute a detail; of being too long, preciſe, and circumſtantial, to a degree of tedіouſneſs. See STYLE.

Prolixity is the vice oppoſite to conciſeneſs and laconiſm. See LACONISM.—*Prolixity* is a fault commonly charged on Guicciardini, Gaſſendus, *&c.*---Formal harangues at the head of an army, and deliberations, of nauſeous *prolixity,* formerly ſo frequent, are now diſuſed in all the better hiſtories.

PROLOCUTOR *of the convocation,* the ſpeaker, or chairman of that aſſembly. See CONVOCATION.

The archbiſhop of Canterbury is, by his office, preſident, or chairman of the upper houſe of convocation.—The *prolocutor* of the lower is an officer choſen by the members the firſt day of their meeting, and to be approved of by the higher. It is by the *prolocutor* their affairs, debates, *&c.* are to be directed; and their reſolutions, meſſages, *&c.* delivered to the higher houſe: by him all things propounded to the houſe are read, ſuffrages collected, *&c.*

PROLOGUE*, PROLOGUS, in dramatic poetry, a diſcourſe addreſſed to the audience before the drama or play begin. See DRAMA.

* The word is formed from the Greek προλογος, *præloquium,* fore-ſpeech, formed of προ, and λογος, *ſermo.*

The original intention of the *prologue* was to advertiſe the audience of the ſubject of the piece, and to prepare them to enter more eaſily into the action; and ſometimes to make an apology for the poet.

This laſt article ſeems to have almoſt excluded the two former in the Engliſh drama; and to be in ſole poſſeſſion of the *prologue.*

The *prologue* is of a much more ancient ſtanding than the epilogue. See EPILOGUE.—The French have left off the uſe of *prologues;* thoſe few they now-and-then make have nothing in them of the genuine *prologue,* as bearing no relation to the ſubject, but being mere flouriſhes or harangues in praiſe of the king, *&c.*

In the ancient theatre, the *prologus* was properly the actor who rehearſed the *prologue:* the *prologus* was eſteemed one of the dramatis perſonæ, and never appeared in the piece in any other character; ſo that the learned are ſurprized to find Mercury in Plautus's Amphitryo, ſpeaking the *prologue,* and yet acting a conſiderable part in the play afterwards.

The *prologue,* therefore, among them, was a part of the piece; indeed, not an eſſential, but an acceſſary part;—with us, the *prologue* is no part at all; but ſomething intirely diſtinct and ſeparate: with them the drama was opened with the appearance of the *prologue;* with us it is not opened till after the *prologus* is retired: with us therefore the curtain is kept cloſe till after the *prologue;* with them it muſt have been withdrawn before. Hence proceeds a ſtill more conſiderable difference in the practice of the *prologue:* for with us the *prologus* ſpeaks in his real or perſonal character; it is Mr. Booth or Mrs. Oldfield ſpeaks, not Cato or Andromache: with them the *prologue* ſpoke in his dramatic character, not as Turpius or Attilius, but as *prologus.*

With us, he directs his ſpeech to the audience, conſidered as in a play-houſe; to pit, box, and gallery: with them, he ought, in propriety, to have ſpoken as to a chorus of by-ſtanders, or perſons to be preſent at the real action: but this being in good meaſure inconſiſtent with the deſign of the *prologue;* their perſons ſpoke in their dramatic capacity to the audience in its perſonal capacity; which was an irregularity that either the good fortune, or the good ſenſe of the moderns, have freed them from.

They had three kinds of *prologues;* the firſt ὑποθετικος, wherein the poet delivered the argument of the piece; the ſecond συστατικος, wherein the poet recommended himſelf or his piece to the people; the third αναφορικος, wherein objections were obviated, *&c.*

PROLONGED *face.* See the article FACE.

PROLUSION, PROLUSIO, in literature, a term applied to certain pieces, or compoſitions, made previouſly to others, by way of prelude or exerciſe.

Diomedes calls the culex of Virgil, and his other opuſcula, *proluſions;* becauſe written before the great ones.—The *proluſions* of Strada are very ingenious pieces. The famous M. Huet, biſhop of Avranches, had all Strada's *proluſions* by heart.

PROMETHEUS, in the ancient aſtronomy, was the name of a conſtellation of the northern hemiſphere, now called *Hercules,* or *Engonaſis.* See HERCULES.

PROMISE, in law, is when, upon a valuable conſideration, a man binds himſelf, by his word, to do or perform ſuch an act as is agreed on with another. See CONTRACT, PACT, COVENANT, *&c.*

PROMONTORY, in geography, a high point of land, or rock, projecting out into the ſea;---the extremity of which to the ſea-ward is uſually called a *cape,* or *headland.* See CAPE.

PROMOTERS, PROMOTORES, in law, thoſe perſons, who, in popular and penal actions, do proſecute offenders in their name and the king's; and are intitled to part of the fines and penalties for their pains.

Theſe, among the Romans, were called *quadruplatores,* or *delatores;* in Engliſh alſo *informers.*

Sir Tho. Smith obſerves, that *promoters* belong chiefly to the exchequer, and king's-bench. My lord Coke calls them, *turbidum hominum genus,* 3 Inſt.

PROMPT *payment,* ready money. See PAYMENT.

In many caſes there is a diſcount for *prompt payment.* See DISCOUNT, REBATE, *&c.*

PROMPTER, in the drama, an officer poſted behind the ſcenes, whoſe buſineſs is to watch attentively the actors ſpeaking on the ſtage, in order to ſuggeſt and put them forward when at a ſtand, to correct them when amiſs, *&c.* in their parts.

PROMULGATED, PROMULGED, PROMULGATUS, ſomething publiſhed, or proclaimed.

In this ſenſe we ſay, the Jewiſh law was *promulgated* by Moſes; the *promulgation* of the new law was chiefly affected by the apoſtles and diſciples.

PRONAOS, προναος, in the ancient architecture, a porch to a church, palace, or other ſpacious building. See PORCH.

PRONATION, among anatomiſts. The radius of the arm has two kinds of motions, the one called *pronation*, the other ſupination. See RADIUS.

*Pronation** is, that whereby the palm of the hand is turned downwards; the oppoſite motion hereto is called *ſupination*, whereby the back of the hand is downwards.

M. Winſlow has lately advanced, that the *pronation* and ſupination of the hand are not effected ſolely by the motion of the radius; but that the cubitus in moſt caſes contributes equally thereto; and that both bones uſually move at the ſame time. *Vid. mem. acad. R. ſcienc. an.* 1729. *p.* 36.

There are peculiar muſcles whereby the *pronation* is effected, called *pronators*.—The radius has two other muſcles, called *ſupinators*, which have an oppoſite effect. See SUPINATOR.

PRONATORS, PRONATORES, in anatomy, two muſcles of the radius, which ſerve to turn the palm of the hand downwards. See PRONATION.

They are diſtinguiſhed by the names of *rotundus* and *quadratus*.

PRONATOR *radii quadratus*, or *brevis*, riſes broad and fleſhy, from the lower and inner part of the ulna; and paſſing tranſverſely over the ligament that joins the radius to the ulna, is inſerted into the ſuperior and external part of the radius: which it helps to pull inwardly; together with the

PRONATOR *radii rotundus*, or *teres*, a muſcle which riſes fleſhy, from the internal extuberance of the os humeri, where thoſe bending the carpus and fingers do ariſe; and firmly adhering to the flexor carpi radialis, deſcends obliquely downwards to its fleſhy inſertion a little above the radius, in the middle externally: its uſe is to move the radius and palm inwards. See *tab. anat. (myol.) fig.* 1. *n.* 27. *fig.* 2. *n.* 15.

PRONOUN, PRONOMEN, in grammar, a part of ſpeech uſed in lieu of a noun or name. See NOUN.

Whence the denomination, from *pro*, and *nomen*, q. d. *for-noun*, or *name*.

As it would have been diſagreeable to have been always repeating the ſame name, there are words invented in all languages, called *pronouns*, to ſave the neceſſity thereof, and to ſtand in the place of names; as, *I*, *thou*, *he*, &c.

As nouns are the marks or ſigns of things, *pronouns* are the ſigns of nouns.—Father Buffier, however, ſhews, that *pronouns* are real nouns or names; and that all the difference between what the grammarians call nouns, and *pronouns*, is, that the former are more particular, and the latter more general.

They are called *pronouns*, becauſe uſed in the place of particular nouns. Indeed ſometimes they do not fill the place of nouns intirely, but need other words to aſſiſt them, to expreſs the object ſpoken of: ſuch *e. gr.* are *who*, *whoever*, &c. which do not expreſs any determinate object whereof a thing may be affirmed, unleſs accompanied with another word, eſpecially a verb: As, *Whoever labours, deſerves a reward*.

Theſe father Buffier calls *incomplete pronouns*, to diſtinguiſh them from thoſe which expreſs an object completely; as, *I*, *thou*, *he*, &c.

The grammarians ordinarily diſtinguiſh *pronouns* into four claſſes, with regard to their different ſignification, formation, *&c. viz. pronouns perſonal*, *relative*, *poſſeſſive*, and *demonſtrative*; to which may be added, *indeterminate pronouns*.

Perſonal **PRONOUNS** are thoſe uſed in lieu of names of particular perſons: ſuch are, *I*, *thou*, *he*, *we*, *ye*, *they*. See PERSON and PERSONAL.

PRONOUNS *relative*, which Buffier calls *modificative*, or *determinative*, are thoſe placed after nouns, with which they have ſuch affinity, that without them they ſignify nothing: ſuch are, *qui*, *who*, *that*, &c. See RELATIVE.

PRONOUNS *poſſeſſive* are thoſe which expreſs what each poſſeſſes, or what belongs to him; as, *mine*, *thine*, *his*, &c. See RELATIVE.

Theſe are pure adjectives, and only differ from the reſt by the relation they bear to *pronouns*, whence they are derived, and by ſome particular inflections, which they have in ſome languages. See ADJECTIVE.

PRONOUNS *demonſtrative*, thoſe which ſerve to indicate or point out the ſubject ſpoken of; as, *this*, *thoſe*, &c. See DEMONSTRATIVE.

PRONOUNS *indefinite*, are thoſe which expreſs their ſubject indeterminately; as *whoever*, *any*, &c.—Theſe coincide with what F. Buffier calls *incomplete pronouns*.

Pronouns are likewiſe divided into *ſubſtantive* and *adjective*.—To the firſt belong, *I*, *thou*, *he*: to the ſecond, *my*, *mine*, *who*, *what*, &c.

Pronouns may alſo be conſidered in two ſtates; the firſt, or foregoing ſtate, as *I*, *we*; the ſecond, or following one, as *me*, *us*.

PRONOUNCING, PRONUNCIATION, in painting, the marking and expreſſing the parts of all kinds of bodies with that degree of force neceſſary to make them more or leſs diſtinct and conſpicuous.

Thus the painters, in ſpeaking of a piece, ſay, theſe or theſe parts are well *pronounced*; which is a metaphorical way of ſpeaking; as when we ſay, that a man who talks well has a fine *pronunciation*. See EXPRESSION.

PRONUNCIATION, PRONUNTIATIO, in grammar, the manner of articulating, or ſounding the words of a language, repreſented to the eye by writing and orthography. See WORD, LANGUAGE, SOUND, *&c.*

From the definition it would ſeem, that the *pronunciation* were only the image of the orthography: but as we pronounce before we write, and only write to expreſs what we pronounce, it is more juſt to lay down the *pronunciation* as the rule and model of orthography. See ORTHOGRAPHY and WRITING.

Pronunciation makes much the moſt difficult article of a written grammar: in effect, a book only expreſſing itſelf to the eyes in a matter that concerns the ears; the caſe ſeems next akin to that of teaching the blind to diſtinguiſh colours. See GRAMMAR.

Hence it is, that there is no part ſo defective in the grammars as the *pronunciation*; for the writer has frequently no term whereby to give the reader an idea of the ſound he would expreſs; for want of a proper term, therefore, he frequently ſubſtitutes a vicious or precarious one.

Thus the French grammarians frequently tells us, that the vowels, *a*, *e*, *i*, &c. are pronounced in French the ſame as in Latin; never conſidering, that there is not any known and determinate *pronunciation* of the Latin; but each nation, now, pronounces the Roman characters in the Latin, the ſame as it pronounces thoſe ſame characters in its own language: thus the Latin *cæcus* is pronounced by the Engliſh, *ſekus*; and by the Italians, *tchekous*, &c.

Hence it appears, that the relation between ſounds and characters, as well as between things and words, is purely arbitrary and national.

Indeed, Plato ſeems of a contrary ſentiment, and will have a natural relation between words and the things they expreſs, as there is a natural relation between the ſigns made by mutes, and the things they would intimate: ſo that, according to Plato, to every ſeveral word there muſt be a ſeveral motion of the mouth relative to the action expreſſed by the word.

Whether or no there might be ſuch a thing in the primitive language, we dare not undertake to ſay; but it is certain ſuch a relation would require a facility of contortions in the mouth, to which we are ſtrangers.

To give a juſt and preciſe idea of the *pronunciation* of a language, it ſeems neceſſary to fix, as nearly as poſſible, all the ſeveral ſounds employed in the *pronunciation* of that language: this Mr. Lodwick has done in his attempt towards an univerſal alphabet, where he enumerates forty-three ſeveral ſimple ſounds (ſome of them, indeed, ſtrangers to the Engliſh language); and F. Buffier, who gives thirty-three ſeveral ſounds in the French tongue, twenty-nine in the Italian, thirty in the German, twenty-two in the Spaniſh, and twenty-four in the Engliſh. See ALPHABET.

The French language is clogged with a difficulty in *pronunciation*, from which moſt others are free; and it conſiſts in this, that moſt of their words have two different *pronunciations*; the one in common proſe, the other in verſe.

In proſe, *e. g.* they omit the *pronunciation* of the final *s* in the plural of nouns, and of the *t* in the third perſon of the plural of verbs, and of ſeveral other final conſonants; but in verſe they *pronounce* all.

Thus, in *à quoi bon reveiller mes muſes endormies?* the final *s* of *muſes* is *pronounced*: and in *mille & mille douceurs y ſemblent attachés*, the *t* of *ſemblent* is to be *pronounced*.

Add to this, that in proſe they ſoften the ſound of a great many words, pronouncing *craire* for *croire*; but in poetry the genuine *pronunciation* is retained. See ENGLISH, FRENCH, *&c.*

PRONUNCIATION is alſo uſed for the fifth and laſt part of rhetoric, which conſiſts in regulating and varying the voice and geſture agreeably to the matter and words, ſo as more effectually to perſuade and touch the hearers. See RHETORIC.

The *pronunciation* is of ſuch importance, that Demoſthenes called it the firſt, the ſecond, and the third part of eloquence. See ACTION.

Quintilian defines the *pronunciation*, *vocis, & vultus, & corporis moderatio cum venuſtate*; a decent, agreeable manner of managing the voice, geſture, and action of the whole body. Cicero ſomewhere calls it *quædam corporis eloquentia*, a certain eloquence of the body; and in another place, *ſermo corporis*, the language or ſpeech of the body.

Pronunciation is the ſame with what we otherwiſe call *action*. See ACTION.—Some writers, particularly Mr. Henley, confound it with *elocution*, which is a very different thing. That author, when he ſtyles himſelf *reſtorer of the ancient elocution*, means of the ancient *pronunciation*. See ELOCUTION.

There are three things which come under the *pronunciation*; the memory, voice, and geſture. See each under its proper article.

Auguſtus, to avoid being balked by his memory, and at the ſame time ſave the trouble of getting off by heart, uſed to harangue from a writing; as we are told by Dio and Suetonius.

PRONUNCIATION, in painting. See the article PRONOUNCING.

PROOF, PROBATIO, in arithmetic, an operation whereby the truth and juſtneſs of a calculation is examined and aſcertained. See CALCULATION.

The proper proof is always by the contrary rule: thus ſubtraction is the *proof* of addition, and multiplication of diviſion; and *vice verſa*. See ADDITION, SUBTRACTION, *&c.*

---

* The word is formed from the Latin *pronus*, prone, that which lies on the foreſide, or with the face downwards.

— The *proof* of multiplication by 9 or by 7 is precarious. See Multiplication.

There would need no *proofs* in arithmetic, were it not that a man is liable to make miſtakes; for all the rules and operations being built on demonſtration, it is thence we are aſſured of their truth and certitude. See Demonstration.

The *proof*, then, does not confirm the rule, but only ſhews us whether or no we have applied it right. See Rule.

Proof, in law, logic, *&c.* denotes the mediums, or arguments uſed to evince the truth of any thing. See Truth and Semi *proof*.

By the French law, a *literal proof*, or *proof in writing*, called alſo *dead proof*, *probatio mortua*, is preferable to a teſtimonial, or *proof* viva voce, by witneſſes.—The ordonnance de Moulins excludes all *proof* by witneſſes for loans of above 1000 livres. See Evidence, Witness, Testimony, *&c.*

The *proof* of crimes was anciently effected among our anceſtors divers ways; *viz.* by duel or combat, fire, water, *&c.* See Purgation, Duel, Fire, Water, *&c.*

The *proof* by red-hot iron was very frequent: the accuſed, to purge himſelf, was here obliged to make an oath, as he touched the iron. The formula, ceremonies, prayers, *&c.* made on this occaſion, are ſtill extant in the notes at the end of the capitularies of Charlemaign. See Ordeal.

This cuſtom was abrogated by the emperor Frederic; but ſtill obtains in Mingrelia; as we are told by Lamberti, in his relation inſerted in Thevenot's voyages.

If they cannot have *proof* of a crime, a croſs is laid at the bottom of a caldron full of boiling water, out of which the accuſed is obliged to fetch it with his naked hand and arm: this done, the arm is put up in a bag, tied, and ſealed, and three days after opened; when, if there be no marks of the burn or ſcald, the accuſed is declared innocent.

In the kingdom of Siam, to have *proof* of a crime, the party is obliged to waſh his hands in boiling oil, or to walk on burning coals; from either of which he muſt come out untouched to be reputed innocent.

Sometimes they oblige the two contending parties to plunge under water; and he who ſtays there longeſt gains the cauſe; and ſometimes to ſwallow a grain of rice, prepared and charmed by their doctors: he who is able to ſwallow it is declared innocent, and carried home in triumph; and the accuſer puniſhed.—This looks like an imitation of what was done among the Jews to have *proof* of adultery.

The *proof* by combat is likewiſe ſaid to ſubſiſt among the Mingrelians. See Combat and Duel.

PROPAGATION, Propagatio, the act of multiplying the kind, or of producing the like in the way of natural generation. See Generation.

Some plants are only propagated by ſowing, as wheat, poppies, *&c.* The reaſon is, that the ſtem in theſe plants withers and dies away, and conſequently is incapable of being planted: and as to the root, the whole force and virtue thereof paſſes into the ear, or ſpica, which being the uſeful part of the plant, exhauſts the whole. See Plant, Seed, and Semination.

Sometimes plants are *propagated* by the roots, as the anemonies, *&c.* In which caſe there is a conſiderable ſtock of ſeminal or ſpermatic virtue ſtill reſerved in the root, ſo as to be in a condition for ſhooting new fibres upon any favourable occaſion. See Root.

Sometimes a branch lopped off, and ſet in the ground, ſhall ſhoot into a new plant; as we ſee in the willow, vine, poplar, *&c.* and ſometimes a truncheon ſhall do the ſame. In this caſe, the plants being of a very porous texture, readily imbibe nouriſhment, and take root.—This method of *propagation* is particularly remarkable in the vine, any part of which, put any how in the ground, will become a plant. The little chips of elm are ſaid to do the ſame. See Branch and Planting.

When a branch, or arm of a vine, ſhoots too great a length or withers towards the extreme, or grows too ſmall to feed its grapes, it is uſual to cut pieces of it off, and put them in the ground, which readily grow into thriving plants.

Nay, ſometimes to bring up young plants, and make them grow and advance the faſter, eſpecially lemon, orange, and citron trees, they paſs a branch or ſhoot of an old tree, without cutting it off, through an aperture of a veſſel filled with good earth; upon which, the pores opening by the moiſture and warmth, roots preſently burſt forth, which, being furniſhed with food both from the earth and the parent plant, grow at a great rate, and are ſoon in a condition to be ſeparated from the parent, and ſhift for themſelves. See Stock, Dwarf, *&c.*—Laſtly, plants are ſometimes alſo propagated by bulbs. See Bulb.

PROPER, Proprium, ſomething naturally and eſſentially belonging to any being.

The ſchool-philoſophers, after Porphyry, diſtinguiſh four kinds of *propers*, or modes of *propriety*, which are expreſſed in the following verſe.—*Eſt medicus, bipes, caneſcens, riſibiliſque.*

The firſt, called Proprium *primo modo*, is what agrees to a ſingle ſpecies, but not to all the individuals: this they call *ſoli, ſed non omni.*— As, to be a geometrician, a phyſician, a divine, *&c.* which are things *proper* to man; but not to all men.

The ſecond, proprium *ſecundo modo*, is what agrees to the whole ſpecies, but agrees likewiſe to another, which they call *omni, ſed non ſoli.*—Thus, to have two feet is *proper* to a man, but is likewiſe *proper* to a bird.

The third, proprium *tertio modo*, is that which agrees to a ſingle ſpecies, but not at all times; *omni & ſoli, ſed non ſemper.*—As, to grow grey, according to Porphyry, is *proper* to a man, but it is to an old man.

The laſt, and higheſt, proprium *quarto modo*, is that which alone agrees to one kind, to all the individuals thereof, and at all times; *omni ſoli, & ſemper.*—Thus, the faculty of laughing is *proper* to man, of neighing to horſes, *&c.* And it is this that Porphyry calls the *true proper*. See Essence, *&c.*

The firſt three ſpecies are only accidents of the fifth vulgar predicable, to which they directly belong. See Predicable.

The fourth is an univerſal agreeing to every individual, or ſubject of predication of any ſpecies, in ſuch manner as to be always found abſolutely in the ſpecies alone, but not at every determinate time: thus man alone is naturally riſible; not that he is always laughing, but has the faculty of laughing at all times. See Definition.

Pproer, in reſpect of words, denotes their immediate and peculiar ſignification, or that directly and peculiarly attached to them. See Word and Signification.

In which ſenſe the word ſtands oppoſed to *figurative* and *metaphorical.* See Figurative, *&c.*

Proper is alſo uſed in a moral ſenſe, to denote ſomething that is uſually found in things: as, their particular or ſpecific virtues, *&c.*

In which ſenſe we ſay, magnanimity is the *proper* virtue of heroes. See Hero.

Proper is alſo uſed for the natural qualities neceſſary to ſucceed in a thing.

In which ſenſe we ſay, people of a hot vigorous temperament are *proper* for the army; the cold and phlegmatic are *proper* for ſtudy. The Romans became leſs *proper* for war, in proportion as they grew more learned and polite.

Proper, in grammar, is alſo applied to nouns or names, which are diſtinguiſhed into *proper* and appellative. See Noun.

Man is the appellative, Peter the *proper* name. See Appellative.

The *proper* name among Chriſtians is that impoſed at baptiſm. See Name and Baptism.

Proper *fraction* is ſuch a one whoſe numerator is leſs than its denominator. See Improper.

Such is $\frac{3}{4}$, or $\frac{5}{6}$, which is really leſs than unity; and therefore, *properly* ſpeaking, a fraction. See Fraction.

Proper, in the civil juriſprudence, is uſed in oppoſition to *acquired*, for an inheritance derived by direct or collateral ſucceſſion. See Acquest.

By the French laws, a teſtator can only diſpoſe of one fifth of his *proper* effects; the paternal relations inherit the paternal *propria*, and the maternal the maternal ones: ſo that *propria* always return to the line whence they proceed.

The origin of the law which fixes this difference between *proper* goods and acqueſts, is not known; neither the Greeks nor Romans having ever made any ſuch diſtinction.

Indeed it ſeems founded on this principle of natural equity, that men are uſually deſirous to preſerve and attach to their family the goods they have received from their forefathers, and to tranſmit them to thoſe deſcending from the ſame ſtock.

Proper ſometimes alſo ſtands as a reduplicative, ſerving to mark or deſign a thing more expreſly and formally.

In this ſenſe we ſay, Jeſus Chriſt came to redeem the world in his *proper* perſon. The king did ſuch and ſuch a thing of his own *proper* motion.

Proper *motion.* See the article Motion.

Proper *objects.* See the article Object.

PROPERTY, or Propriety, Proprietas, that which conſtitutes or denominates a thing *proper*; or, it is a particular virtue or quality, which nature has beſtowed on ſomething, excluſive of all others. See Proper and Essential.

Thus colour is a *property* of light; extenſion, figure, diviſibility, and impenetrability, are *properties* of body. See Colour, Body. *&c.* Every day diſcovers new *properties* in the loadſtone. See Magnet.

Property, or Propriety, in law, denotes *dominion*, or the higheſt right a man can have to a thing; and ſuch as no-ways depends on any other man's courteſy. See Right.

In this ſenſe, none in our kingdom have the *property* of any lands or tenements, except the king, in right of his crown; all other lands being of the nature of fee, and held of the king either mediately or immediately. See Fee, King, *&c.*

Property or *propriety*, however, is uſed for that right in lands or tenements, which common perſons have; importing as much as *utile dominium*, though not *directum.* See Dominium.

There are three manners of right or *property*; viz. *property* abſolute, *property* qualified, and *property* poſſeſſory. See Proprietor and Fee.

Incumbents have not the *propriety* of benefices, they have only the enjoyment thereof. See Benefice.—The monks have a long time diſputed whether they had the *propriety* or the bread they eat, or only the uſe?

One may give the *propriety* of an eſtate, yet reſerve the uſufruit; in which caſe, by the death of the uſufructuary, the uſufruit is conſolidated to the *propriety*. See Consolidation.

PROPHECY, ϖϱοφητεια., a prediction, made by divine inſpiration. See Prophet and Inspiration.

A late author obſerves, that the Chriſtians have this in common with the Pagans, that they equally build their religions upon *prophecy* and *divination*. See Divination and Augury.

He adds, That divination was an art learnt by the Romans in ſchools, or under diſcipline; as the Jews did *propheſying* in the ſchools and colleges of the prophets.

In theſe ſchools, as the learned Dodwell obſerves, the candidates for *prophecy* were taught the rules of divination practiſed by the Heathens; who were in poſſeſſion of the art long before them. It is added, that the gift of *prophecy* was not an occaſional thing, but a conſtant and ſtanding matter of fact; and ſome think they have diſcovered an eſtabliſhment of an order of prophets in the old teſtament, in analogy to the Heathen diviners.

This is certain, from many paſſages of ſcripture, that there were great numbers of prophets among them, who not only exerciſed their talents in matters of government and religion, but even in the diſcovery of loſt goods, and in telling of fortunes.

One of the greateſt difficulties in chriſtianity turns upon the completion of the ſcripture *prophecies*. In the prophets of the old teſtament are frequent predictions of the Meſſiah; which the writers of the new frequently urge to the Jews and Heathens as fulfilled in Jeſus Chriſt; and on this principle evince the truth of his miſſion: but theſe texts thus urged from the old, in the new teſtament, are ſometimes not to be now found in the old; and at other times, not urged in the new in the literal and obvious ſenſe which they ſeem to bear in the old; whence moſt of the Chriſtian commentators, divines, and critics, ancient and modern, judge them to be applied in a ſecondary, typical, allegorical, or myſtical ſenſe. See Allegorical, Accomplishment, &c.

Thus, *ex. gr.* St. Matthew, after an account of the conception of the Virgin, and the birth of Jeſus, ſays, "All this was done, "that it might be fulfilled which was ſpoken by the prophet, "ſaying, Behold a virgin ſhall be with child, and ſhall bring "forth a ſon, and they ſhall call his name Emanuel." But the words, as they ſtand in Iſaiah, whence they are ſuppoſed to be taken, do, in their obvious and literal ſenſe, relate to a young woman who was to bring forth a child in the days of Ahaz; as appears from the context, and as is owned by Grotius, Huetius, Caſtalio, Curcellæus, Epiſcopius, Hammond, Simon, le Clerc, Lamy, &c.

This *prophecy* then not being fulfilled in Jeſus, in the primary, literal, or obvious ſenſe of the words, is ſuppoſed, like the other *prophecies* cited by the apoſtles, to be fulfilled in a ſecondary, typical, or allegorical ſenſe; *i. e.* this *prophecy*, which was firſt literally fulfilled by the birth of the prophet's ſon in the time of Ahaz, was again fulfilled by the birth of Jeſus, as being an event of the ſame kind, and intended to be ſignified either by the prophet, or by God, who directed the prophet's ſpeech.

Grotius obſerves this to be the caſe in moſt, if not all the *prophecies* and citations quoted from the old in the new teſtament; and Dodwell, with Sir John Marſham, refer even the famous *prophecy* in Daniel, about the ſeventy weeks, to the time of Antiochus Epiphanes; ſhewing, that the expreſſions taken thence by Chriſt, and urged by him as predicting the deſtruction of Jeruſalem by the Romans, have only in a ſecondary ſenſe a reſpect to that deſtruction.

And even that famous *prophecy* in the Pentateuch, "A pro- "phet will the Lord God raiſe up unto thee, like unto me; "to him ſhall ye hearken;" which St. Luke refers to as ſpoken of Jeſus Chriſt, is, by Simon, Grotius, Stillingfleet, &c. underſtood to ſignify, in its immediate ſenſe, a promiſe of a ſucceſſion of prophets.

It is allowed then, the apoſtles applied the *prophecies* they quote from the old teſtament, in a typical ſenſe; but unhappily the rules whereby they quoted are loſt. Dr. Stanhope laments the loſs of the Jewiſh traditions or rules for interpreting ſcripture received among the rabbins, and followed by the apoſtles. But this loſs Surenhuſius, Hebrew profeſſor at Amſterdam, thinks he has retrieved from the Jewiſh talmud, and the ancient Jewiſh commentaries; and has accordingly publiſhed to the world the rules whereby the apoſtle quoted the old teſtament.

But the truth is, theſe rules are too precarious, ſtrained, and unnatural, to gain much credit. See Quotation.

Mr. Whiſton condemns all allegorical explanation of the *prophecies* of the old teſtament cited in the new, as weak, enthuſiaſtic, &c. and adds, that if a double ſenſe of the *prophecies* be allowed, and there be no other method of ſhewing their completion, than by applying them ſecondarily and typically to our Lord, after having been in their firſt and primary intention long ago fulfilled in the times of the old teſtament, we loſe all the real advantages of the ancient *prophecies*, as to the proofs of Chriſtianity.

He therefore ſets up a new ſcheme in oppoſition thereto: he owns, that taking the preſent text of the old teſtament for genuine, it is impoſſible to expound the apoſtles citations of the *prophecies* of the old teſtament, on any other than the allegorical foundation; and therefore, to ſolve the difficulty, is forced to have recourſe to a ſuppoſition contrary to the ſenſe of all Chriſtian writers before him, *viz.* that the text of the old teſtament has been greatly corrupted ſince the apoſtolical age by the Jews. See Text.

His hypotheſis is, that the apoſtles made their quotations out of the old teſtament rightly and truly from the Septuagint verſion, which in their time was in vulgar uſe, and exactly agreed with the Hebrew original; and that, as they made exact quotations, ſo they argued juſtly and logically from the obvious and literal ſenſe of the ſaid quotations, as they then ſtood in the old teſtament: but that ſince their times, both the Hebrew and Septuagint copies of the old teſtament have been ſo greatly corrupted, and ſo many apparent diſorders and diſlocations introduced therein, as to occaſion many remarkable differences and inconſiſtences between the old and new teſtament in reſpect to the words and ſenſe of thoſe quotations. See Septuagint, &c.

As to the manner wherein theſe corruptions were introduced, he ſays, the Jews in the ſecond century greatly corrupted and altered both the Hebrew and Septuagint, eſpecially in the *prophecies* cited by the apoſtles, to make their reaſoning appear inconcluſive: that in the third century, they put into Origen's hand one of theſe corrupted copies of the Septuagint; which Origen miſtaking for genuine, inſerted in his Hexapla, and thus brought into the church a corrupted copy of the Septuagint; and that in the end of the fourth century, the Jews put into the hands of the Chriſtians, who till then had been almoſt univerſally ignorant of the Hebrew, a corrupted copy of the Hebrew old teſtament.

The diſagreement then between the old and new teſtament, in reſpect to the ſaid quotations, he contends, has no place between the genuine text of the old teſtament, (now no-where exiſting) but only between the preſent corrupted text of the old and new teſtament: and therefore, to juſtify the reaſonings of the apoſtles, he propoſes to reſtore the text of the old teſtament, as it ſtood before the days of Origen, and as it ſtood in the days of the apoſtles: from which text thus reſtored, he doubts not it will appear, that the apoſtles cited exactly, and argued juſtly and logically from the old teſtament.

But this ſcheme of accompliſhing *prophecies* labours under difficulties at leaſt as great as the allegorical ſcheme. Its foundation is incredible, and its ſuperſtructure, from firſt to laſt, precarious. In effect, it is inconceivable the old teſtament ſhould be ſo corrupted; and it may even be made appear, that the Hebrew and Septuagint diſagreed in the times of the apoſtles: add to this, that the means whereby he propoſes to reſtore the true text, will never anſwer that end; nor has he himſelf, from all the means he is yet poſſeſſed of, been able to reſtore one prophetical citation, ſo as to make that ſeem literally, which before only ſeemed allegorically applied. See Pentateuch, &c.

PROPHET*, Propheta, ϖϱοφητης, a perſon inſpired by God with the knowledge of future events; and commiſſioned to declare his laws, his will, &c. to the world. See Prophecy, and Divination.

* The word is derived from the Greek ϖϱο, and φατος, ſaid; of φημι, I ſay; whence alſo the Latins derive their *fatus*, ſpoken.

Among the canonical books are thoſe of ſixteen *prophets*; four of which are denominated the *greater prophets*, *viz.* Iſaiah, Jeremiah, Ezekiel, and Daniel; ſo called from the length or extent of their writings, which exceed thoſe of the others, *viz.* Hoſea, Joel, Amos, Obadiah, Jonas, Micah, Nahum, Habakkuk, Haggai, Zechariah, and Malachi; who are called the *leſſer prophets*, from the ſhortneſs of their writings.

The Jews only reckon three *greater prophets*; Daniel they exclude, as no more to be ranked among the *prophets* than David: not but that both the one and the other foretold many important things; but becauſe their manner of life differed from that of the other *prophets*, David being a king, and Daniel a peer.

In the Greek church, the leſſer *prophets* are placed in order before the great ones; apparently becauſe many of the leſſer *prophets* are more ancient than the greater.

Among the Greeks too, Daniel is ranked among the leſſer *prophets*.—In the 48th chapter of Eccleſiaſticus, Iſaiah is particularly called the *great prophet*; both on account of the great things he foretold, and the magnificent manner wherein he did it.

Spinoſa ſays, the ſeveral *prophets* propheſied according to their reſpective humours; Jeremiah, *e. gr.* melancholy and dejected with the miſeries of life, propheſied nothing but miſfortunes.

Dacier obſerves, that among the ancients the name *poet* is ſometimes given to *prophets*; as that of *prophet* is at other times given to *poets*. See Poet.

PROPHETICAL *types*. See the article Type.

PROPHYLACTICE, ϖϱοφυλακτικη, that part of the art of medicine which directs the preventing or preſerving from diſeaſes. See Medicine, Preservative, &c.

PROPITIATION, in religion, a ſacrifice offered to God to aſſuage his wrath, and render him propitious. See Sacrifice, Expiation, and Lustration.

Among the Jews there were both ordinary and public ſacrifices, as holocauſts, &c. offered by way of thankſgiving; and extraordinary ones offered by particular perſons guilty of any crime, by way of *propitiation*.

If it were a crime of ignorance, they offered a lamb or a kid; if done wittingly, they offered a ſheep: for the poor, a pair of turtles was injoined as a *propitiation*.

The Romiſh church believe the maſs to be a ſacrifice of *propitiation*

pitiation for the living and the dead. The reformed churches allow of no *propitiation*, but that one offered by Jeſus Chriſt on the croſs.

PROPITIATION alſo gives the name to a ſolemn feaſt among the Jews, celebrated on the tenth of the month Tiſri, which is their ſeventh month, and anſwers to our September.

It was inſtituted to preſerve the memory of the pardon proclaimed to their forefathers by Moſes on the part of God; who thereby remitted the puniſhment due for their worſhip of the golden calf.

PROPITIATORY, among the Jews, was the cover or lid of the ark of the covenant; which was lined both within and without-ſide with plates of gold; inſomuch that there was no wood to be ſeen. See ARK.

Some even take it to have been one piece of maſſive gold. The cherubims ſpread their wings over the *propitiatory*.

This *propitiatory* was a type or figure of Chriſt, whom St. Paul calls the *propitiatory* ordained from all ages.

PROPLASM, PROPLASMA, ϖροπλασμα, is ſometimes uſed for a mould, wherein any metal or ſoft matter, which will afterwards grow hard, is caſt. See MOULD and PLASM.

PROPLASTICE, ϖροπλαϛικη, the art of making moulds, for caſting things in. See PLASTICE, MOULD, FOUNDERY, &c.

PROPOLIS, ϖροπολις, a thick yellow odorous ſubſtance, ſmelling like ſtorax, nearly akin to wax; wherewith the bees ſtop up the holes and crannies of their hives, to keep out the cold air, &c. See WAX.

The *propolis* is a friable matter, by ſome eſteemed ſovereign in diſeaſes of the nerves. It is alſo uſed to make holes in abſceſſes; and being heated on the fire, its vapour is received for inveterate coughs.

PROPORTION, PROPORTIO, in arithmetic, the identity or ſimilitude of two ratio's. See RATIO.

Hence quantities that have the ſame ratio between them, are ſaid to be *proportional*; *e. gr.* if A be to B, as C to D; or 8 be to 4, as 30 to 15; A, B, C, D, and 8, 4, 30, and 15, are ſaid to be in *proportion*, or are ſimply called *proportionals*. See PROPORTIONAL.

Proportion is frequently confounded with *ratio*; yet have the two, in reality, very different ideas, which ought by all means to be diſtinguiſhed.

Ratio is, properly, that relation or habitude of two things, which determines the quantity of one from the quantity of another, without the intervention of any third: thus we ſay, the ratio of 5 and 10 is 2; the ratio of 12 and 24 is 2. See RATIO.

Proportion is the ſameneſs or likeneſs of two ſuch relations: thus, the relations between 5 and 10, and 12 and 24, being the ſame, or equal; the four terms are ſaid to be in *proportion*. Hence ratio exiſts between two numbers; but *proportion* requires at leaſt three.

Proportion, in fine, is the habitude or relation of two ratio's, when compared together; as ratio is of two quantities. See QUANTITY.

Proportion again is frequently confounded with *progreſſion*. In effect, the two often coincide; the difference between them only conſiſting in this, that progreſſion is a particular ſpecies of *proportion*, wherein the ſecond of the three terms is a mean *proportional* between the other two, or has the ſame ratio to the third, which the firſt has to the ſecond.

Add to this, that *proportion* is confined to three terms, but progreſſion goes on to infinity (ſo that progreſſion is a ſeries or continuation of *proportions)*; and that in four terms, 3, 6, 12, 24, *proportion* is only between the two couples 3 and 6, and 12 and 24; but progreſſion is between all the four terms. See PROGRESSION.

Proportion is ſaid to be *continual*, when the conſequent of the firſt ratio is the ſame with the antecedent of the ſecond; as, if 3 be to 6, as 6 to 12. See CONTINUED.

The *proportion* is ſaid to be *diſcrete*, or interrupted, when the conſequent of the firſt ratio differs from the antecedent of the ſecond; as if 3 be to 6, as 4 to 8. See DISCRETE.

Proportion, again, is either ſaid to be *arithmetical*, or *geometrical*; as the ratio's are.

Arithmetical PROPORTION is the equality of two or more arithmetical ratios, or the equality of difference between three or more ſeveral quantities.

Thus, 1, 2, 3, and 2, 5, 8, 11, 14, are in *arithmetical proportion*; becauſe there is the ſame difference betwixt the numbers compared, which are 1 to 2, and 2 to 3; or 2 to 5, and 5 to 8.

If every term have the ſame ratio to the next, as the firſt has to the ſecond; the terms are ſaid to be in *continual arithmetical proportion*; as 5, 7, 9, 12, 15.

If the ratio between any two terms differ from that of any others; the terms are ſaid to be in *arithmetical proportion diſcrete*, or interrupted; as where 2 : 5 : : 6 : 9, the ratio's of 5 and 6 being different from that of 2 and 5.

A ſeries of more than four terms in *arithmetical proportion*, form an arithmetical progreſſion. See PROGRESSION.

1. If three numbers be in *arithmetical proportion*, the ſum of the extremes is equal to double the middle term: thus, in 3, 7, 11; the ſum of 3 and 11 is equal to twice 7; *viz.* 14.

Hence we have a rule for finding a mean *arithmetical proportional* between two given numbers; half the ſum of the two being the mean required: thus, half the ſum of 11 and 3, *viz.* 14, is 7.

2. If four numbers be in *arithmetical proportion*, the ſum of the extremes is equal to the ſum of the middle terms: thus, in 2 : 3 : 4 : 5; the ſum of 5 and 2 is equal to the ſum of 3 and 4, *viz.* 7.

Hence, four terms in *arithmetical proportion* are ſtill proportional, if taken inverſely, 5 : 4 : 3 : 2; or, alternately, thus, 2 : 4 : 3 : 5; or inverſely and alternately, thus, 5 : 3 : 4 : 2.

3. If two numbers in *arithmetical proportion* be added to other two, the leſs to the leſs, &c. their difference is in a duplicate ratio, *i. e.* double that of the reſpective parts added: thus, if to 3 : 5 be added 7 : 9, the ſums are 10 : 14; whoſe difference 4, is double the difference of 3 : 5, or 7 : 9. And if to this ſum you add other two, the difference of the laſt ſum will be triple the ſum of the firſt two, and ſo on.

If two *arithmetical proportionals* be ſubtracted from two others in the ſame ratio, the leſs from the leſs, &c. the arithmetical ratio of the remainder is 0. Thus, from 9 : 7 taking 5 : 3, the remainders are 4, 4.

Hence, if *arithmetical proportionals* be multiplied by the ſame number, the difference of their products will contain the firſt difference as oft as the multiplier contains unity: thus, 3 : 5, multiplied by 4, produce 12, 20, whoſe difference 8 is equal to 4 times 2, the difference of 3 and 5.

4. If two numbers in *arithmetical proportion* be added to, or multiplied by, other two in another ratio of the ſame kind, leſs by leſs, &c. the ſums are in a ratio which is the ſum of the ratio's added or multiplied: thus 2 : 4 and 3 : 9 being added, the ſums are 5 : 13, whoſe difference is 8, the ſum of 2 and 6, the differences of the numbers given.

Geometrical PROPORTION is the quality of two geometrical ratio's, or compariſons of two couples of quantities. See GEOMETRICAL.

Thus 4 : 8 : : 12 : 24, are in *geometrical proportion*; the ratio of 4 and 8 being equal to that of 12 and 24; *i. e.* 4 is contained as often in 8, as 12 is in 24. Again, 9, 3, 1, are in *geometrical proportion*, 9 being triple of 3, as 3 is of 1.

If, in a ſeries of terms, there be the ſame ratio between every two terms, that there is between the firſt and ſecond; they are ſaid to be *continual geometrical proportionals:* as 1 : 2 : 4 : 8.

If any two terms have a different ratio from that of the firſt and ſecond, they are ſaid to be in *disjunct*, or *interrupted geometrical proportion*; as are 2 : 4 : 3 : 6; where 2 is to 4, as 3 to 6; but not ſo as 4 to 3.

A ſeries or progreſſion of more than four *geometrical proportionals* is called a *geometrical progreſſion*. See PROGRESSION.

1. If three quantities be in *continual geometrical proportion*, the product of the two extremes is equal to the ſquare of the middle term: thus, in 6 : 12 : : 12 : 24, the product of 6 and 24 is equal to the ſquare of 12, *viz.* 144. Hence we have a rule,

2. To find a mean *geometrical proportional* between two numbers, *e. gr.* 8 and 72.

Multiply one of the numbers by the other, and from the product 576, extract the ſquare root 24; this will be the mean required.

3. To find a fourth proportional to the three given numbers, *e. gr.* 3, 12, 5; or a third proportional to two given numbers.

Multiply the ſecond 12 into the third 5, in the firſt caſe; and in the latter, multiply the ſecond into itſelf: divide the product by the firſt 3, the quotient 20 is the fourth *proportional* ſought in the one, or the third in the other.

The ſolution of this problem is what we popularly call the *rule of proportion*, or the *golden rule*, or *rule of three*. See RULE.

4. If four numbers be in *geometrical proportion*, the product of the extremes is equal to the product of the two middle terms: thus, in 2 : 5 : : 4 : 10, the product of 10 and 2 is equal to that of 5 and 4, *viz.* 20. Hence,

5. If four numbers repreſented *a : b : : c : d* be either in *arithmetical*, or *geometrical proportion*; they will alſo be in the ſame, if taken inverſely, *viz.* *d : c : : b : a*; or alternately, as *a : c : : b : d*; or alternately and inverſely, as *d : b : : c : a*.

6. If the two terms of a geometrical ratio be added to, or ſubtracted from, other two in the ſame ratio, the leſs to or from the leſs, &c. the ſums or differences are in the ſame ratio: thus in 6 : 3 : 10 : 5, where the common ratio is 2; 6 added to 10, makes 16, as 3 to 5 makes 8; and 16 : 8 is in the ſame ratio as 6 : 3, or 10 : 5. Again, 16 being to 8, as 6 to 3, their differences 10 and 5 are in the ſame ratio.

The reverſe of which propoſition is likewiſe true; *viz.* if to or from any two numbers be added or ſubtracted other two, if their ſums or differences be in the ſame geometrical ratio as the firſt two, the numbers added or ſubtracted are in the ſame ratio. Hence,

7. If the antecedents, or the conſequents, of two equal geometrical ratio's, 3 : 6, and 12 : 24, be divided by the ſame 3; in the former caſe, the quotients 1 and 4 will have the ſame ratio's to the conſequents, *viz.* 1 : 6 : : 24; and in the latter, the antecedents the ſame ratio to the quotients, *viz.* 3 : 1 : : 12 : 4.

8. If the antecedents or conſequents of ſimilar ratio's, 2 : 6, and 3 : 9, be multiplied by the ſame quantity 6; in the former caſe the facta 12 and 18 have the ſame ratio to the conſequents, *viz.* 12 : 6 : : 18 : 9; and in the latter, the antecedents have the ſame ratio to the products, *viz.* 2 : 6 : : 3 : 9.

9. If in a *geometrical proportion* 3 : 6 : : 12 : 24, the antecedents be multiplied or divided by the ſame number 2; or divided by the ſame number 3; in the former caſe, the facta; in the latter, the quotients will be in the ſame *proportion*, *viz.* 6 : 18 : : 24 : 72, and 1 : 3 : : 4 : 12.

10. If in a *proportion* 4 : 2 : : 10 : 5, the antecedent of the firſt ratio be to its conſequent, as the antecedent of the ſecond to its conſequent; then, by compoſition, as the ſum of the antecedent and conſequent of the firſt ratio is to the antecedent or conſequent of the firſt, ſo is the ſum of the antecedent and conſequent of the ſecond to the antecedent or conſequent of the ſecond, *viz.* 6 : 2 : : 15 : 5, or 6 : 4 : : 15 : 10.

11. If in a *proportion* 6 : 4 : : 15 : 10, as the antecedent of the firſt ratio is to its conſequent, ſo is the antecedent of the other to its conſequent; then, by diviſion, as the difference of the terms of the firſt ratio is to its antecedent or conſequent, ſo is the difference of the terms of the ſecond ratio to its antecedent or conſequent, *viz.* 2 : 4 : : 5 : 10, or 2 : 6 : : 5 : 15.

12. If in a *proportion* 4 : 2 : : 6 : 3, as the antecedent of the firſt ratio is to its conſequent, ſo is the antecedent of the ſecond to its conſequent: and as the conſequent of the firſt is to another number 8, ſo is the conſequent of the ſecond to another number 12; *viz.* 2 : 8 : : 3 : 12; then will the antecedent of the firſt be to 8, as the antecedent of the ſecond to 12; *viz.* 4 : 8 : : 6 : 12.

13. If in a *proportion* 8 : 4 : : 12 : 6, as the antecedent of the firſt ratio is to its conſequent, ſo is the antecedent of the ſecond to its conſequent; and as the conſequent of the firſt is to another number 16, ſo is another number 3 to the antecedent of the ſecond, *viz.* 4 : 16 : : 12; then will the antecedent of the firſt be to 16, as 3 to the conſequent of the ſecond; *viz.* 8 : 16 : : 3 : 6.

14. Suppoſe any four proportional quantities, *viz.* 3 : 6 : : 12 : 24, and any other four proportional quantities 1 : 3 : : 9 : 27; if you multiply the ſeveral terms of the latter into thoſe of the former, the products will likewiſe be *proportional*, *viz.* 3 : 18 : : 108 : 648.

15. If there be ſeveral quantities continually *proportional*, A, B, C, D, &c. the firſt A is to the third C, in a duplicate ratio; to the fourth D, in a triplicate ratio, &c. of the firſt A to the ſecond B.

16. If there be three numbers in continual *proportion*, the difference of the firſt and ſecond will be a mean *proportional* between the difference of the ſecond and third, and the firſt term. and the difference of the ſecond and third, and the firſt term.

Harmonical or *muſical* PROPORTION is a third kind of proportion formed out of the other two, thus: of three numbers, if the firſt be to the third as the difference of the firſt and ſecond to the difference of the ſecond and third; the three numbers are in *harmonical proportion.* See HARMONICAL.

Thus 2 : 3 : 6 are harmonical, becauſe 2 : 6 : : 1 : 3. So alſo four numbers are harmonical, when the firſt is to the fourth, as the difference of the firſt and ſecond to the difference of the third and fourth.

Thus 24 : 16 : : 12 : 9 are harmonical, becauſe 24 : 9 : : 8 : 3. By continuing the *proportional* terms in the firſt caſe, there ariſes an harmonical progreſſion, or ſeries. See SERIES.

1. If three or four numbers in *harmonical proportion* be multiplied or divided by the ſame number; the products, or quotients, will alſo be in *harmonical proportion:* thus, if 6, 8, 12, which are harmonical, be divided by 2, the quotients 3, 4, 6, are alſo harmonical; and reciprocally their products by 2; *viz.* 6, 8, 12.

2. To find an harmonical mean between two numbers given: Divide double the product of the two numbers by their ſum, the quotient is the mean required; thus, ſuppoſe 3 and 6 the extremes, the product of theſe is 18, which doubled, gives 36; this divided by 9 (the ſum of 3 and 6) gives the quotient 4. Whence 3 : 4 : 6 are harmonical.

3. To find a third *harmonical proportional* to two numbers given.

Call one of them the firſt term, and the other the ſecond; multiply them together, and divide the product by the number remaining after the ſecond is ſubtracted from double the firſt; the quotient is a third *harmonical proportional:* thus, ſuppoſe the given terms 3 : 4, their product 12 divided by 2, (the remainder after 4 is taken from 6, the double of the firſt) the quotient is 6, the harmonical third ſought.

4. To find a fourth *harmonical proportion* to three terms given: Multiply the firſt into the third, and divide the product by the number remaining after the middle or ſecond is ſubtracted from double the firſt; the quotient is a third *harmonical proportional:* thus, ſuppoſing the numbers 9 : 12 : 16; a fourth will be found by the rule to be 24.

5. If there be four numbers diſpoſed in order, whereof one extreme and the two middle terms are in arithmetical *porportion*; and the ſame middle terms with the other extreme, are in *harmonical proportion*; the four are in geometrical *proportion:* as here, 2 : 3 : : 4 : 6, which are geometrical; whereof 2 : 3 : 4 are arithmetical, and 3 : 4 : 6 harmonical.

6. If betwixt any two numbers you put an arithmetical mean, and alſo an harmonical one, the four will be in geometrical *proportion:* thus, betwixt 2 and 6, an arithmetical mean is 4, and an harmonical one 3; and the four 2 : 3 : : 4 : 6 are geometrical.

We have this notable difference between the three kinds of *proportion*; that from any given number we can raiſe a continued arithmetical ſeries increaſing *in infinitum*, but not decreaſing; the *harmonical* is decreaſable *in infinitum*, but not increaſable; the geometrical is both. See SERIES.

Contra-harmonical PROPORTION is that relation of three terms, wherein the difference of the firſt and ſecond is to the difference of the ſecond and third, as the third to the firſt.

Thus, 3, 5, 6, are numbers in *contra-harmonical proportion*, becauſe 2 : 1 : : 6 : 3.

To find a mean in *contra-harmonical proportion* between two numbers: divide the ſum of the two ſquared by the ſum of the roots, the quotient is the mean required: thus, the ſum of the ſquares of 3 and 6, *viz.* 45, divided by 9, the ſum of the roots, gives 5.

Extreme and mean PROPORTION,	See	EXTREME.
Inordinate PROPORTION,		INORDINATE.
Reciprocal PROPORTION,		RECIPROCAL.
PROPORTION *of equality*,		EQUALITY.
Compoſition of PROPORTION,		COMPOSITION.
Rule of PROPORTION,		RULE.
Terms of PROPORTION,		TERM.

PROPORTION is alſo uſed for the relation between unequal things of the ſame kind, whereby their ſeveral parts correſpond to each other with an equal augmentation or diminution.

Thus, in reducing a figure into little, or in inlarging it, care is taken to obſerve an equal diminution, or inlargement, through all its parts; ſo that if one line, *e. gr.* be contracted by one third of its length; all the reſt ſhall be contracted in the ſame *proportion.*

The making of reductions of this kind is the great uſe of the proportional compaſſes. See COMPASSES. See alſo REDUCTION, DRAUGHT, &c.

PROPORTION, in law. See PRO RATA and ONERANDA.

PROPORTION, in architecture, denotes the juſt magnitude of the members of each part of a building, and the relation of the ſeveral parts to the whole; *e. gr.* of the dimenſions of a column, &c. with regard to the ordonnance of the whole building. See SYMMETRY and BUILDING.

One of the greateſt differences among architects, M. Perrault obſerves, is in the *proportions* of the heights of entablatures with reſpect to the thickneſs of the columns, to which they are always to be accommodated. See ENTABLATURE.

In effect, there is ſcarce any work, either of the ancients or moderns, wherein this *proportion* is not different; ſome entablatures are even near twice as high as others:— yet it is certain, this *proportion* ought of all others to be moſt regulated; none being of greater importance, as there is none wherein a defect is ſooner ſpied, nor any wherein it is more ſhocking. See COLUMN.

PROPORTION is likewiſe underſtood of the magnitudes of the members of architectures, ſtatues, or the like, with regard to the diſtance whence they are to be viewed.

The moſt celebrated architects are much divided in their opinions on this ſubject: ſome will have it, that the parts ought to be inlarged in *proportion* to their elevation; and others, that they ought to remain in their natural dimenſions. See STATUE.

PROPORTION, in painting, is the juſt magnitude of the ſeveral members of a figure, a groupe, &c. with regard to one another, to the whole figure, the groupe, and the intire piece. See PAINTING.

Proportion makes one of the moſt important articles in the art of painting, the principal ſubject it is employed in being the human body; for which reaſon, the curious in that art will not be diſpleaſed with the following ſcheme of the rules and laws thereof.

By the way, let it be obſerved, 1. That to meaſure and ſet off *proportions*, they either divide the module into twelve parts, and ſubdivide each of theſe into four; or divide the face into three lengths of the noſe, ſubdividing each length into twelve; or, laſtly, divide the whole face into three, and ſubdivide each of thoſe into four: which laſt method is what we ſhall here follow.

2. That the multiplicity of little meaſures are to be ſtudiouſly avoided, becauſe they confound, and becauſe they require great ſkill in oſteology to hit juſtly.

3. That in meaſuring there be a regard had to the relievo, or juttings out of figures.

Rules of PROPORTION *in painting.*—In the *proportions* of a human figure, regard is had to the *age*, *ſex*, and *quality.*

As to *age*; we conſider the ſtages thereof, infancy, youth, and manhood. For the firſt, at three years of age, we count five lengths of the face from top to toe; *viz.* from the tip of the head to the bottom of the belly, three; thence to the foot, two; breadth about the ſhoulders, one face, one eighth; and in the place of the hips, one face.

At four years, the height is ſix faces $\frac{1}{3}$; *viz.* from the top of the head to the bottom of the belly, three faces $\frac{1}{3}$; thence to the ſole of the foot, three faces; the breadth about the ſhoulders, one face $\frac{2}{3}$; about the haunches, one face $\frac{1}{3}$.

At five years, the height is ſix faces $\frac{1}{2}$, $\frac{1}{3}$ abated, the lower being ſhorter.

In youth at twelve years, we have two *proportions*; the one from nature, which gives nine faces for the height; the breadth about the ſhoulders, two faces; about the haunches, one face $\frac{1}{3}$

The other from the antique ſtatues, as that of Laocoon, *&c.* which give the height, ten faces $\frac{1}{2}$; the breadth from one ſhoulder to another, one face $\frac{2}{3}$; at the haunches, 1 $\frac{2}{3}$; at the place of the muſcle called *vaſtus externus*, 2; at the thigh, 1; the knee, $\frac{2}{3}$ and $\frac{1}{2}$, a ſubdiviſion; and at the ancles, $\frac{1}{3}$.

In the ſtate of manhood, when the proportions are arrived at perfection, we reckon the height ten faces: the firſt, from the top of the head to the noſtril; the ſecond to the hole in the neck between the clavicles; the third, to the pit of the ſtomach, called *cartilago enſiformis*; the fourth, to the navel; the fifth, to the pyramidal muſcles; thence to the knee, 2 $\frac{2}{3}$; and as much to the ſole of the foot.—The extent of the arms is the ſame with the height; *viz.* from the tip of the long finger to the joint of the wriſt, one face; thence to the elbow, 1 $\frac{1}{3}$; thence to the juncture of the ſhoulders, 1 $\frac{1}{3}$; thence to the hole in the neck, 1 $\frac{1}{3}$; in all, five heads; which, with the five of the other arm, gives ten: the thickneſs of the arms to be adjuſted by the quality or character.

As to the breadth of the figure ſeen frontwiſe, the width of the ſhoulders acroſs the deltoides is 2 faces $\frac{2}{3}$; breadth of the pectoral muſcle, to the juncture of the arm, 2. About the haunches, where the obliqui externi are, 1 $\frac{2}{3}$, and the ſubdiviſions. The thighs, at the biggeſt place, 1. The knee, $\frac{1}{3}$, three ſubdiviſions $\frac{1}{2}$. The leg, at the thickeſt, $\frac{2}{3}$, and one ſubdiviſion. The extreme of the ancle, $\frac{1}{3}$, one ſubdiviſion $\frac{1}{2}$. The feet, $\frac{1}{3}$, and one half a ſubdiviſion. Their length, 1 face $\frac{1}{3}$, one ſubdiviſion.

Others, meaſuring by the length of the whole head, make only eight heads in height and breadth; thus: The head, one; thence to the bottom of the breaſts, one; thence to the navel, one; thence to the yard, one; thence to the middle of the thigh, one; thence to the lower parts of the knee, one; thence to the ſmall of the leg, one; thence to the bottom of the foot, one.

The breadth thus: From the end of the long finger to the wriſt, one; thence to the bend of the arm, one; thence to the bottom of the ſhoulder, one; thence over to the other ſhoulder, two; thence to the end of the other long finger, three.

To theſe general *proportions* may be added others, which uſually obtain; as, that the hand is the length of the face; the thumb the length of the noſe; and the great toe the ſame: the two nipples, and the hole in the neck, make a juſt equilateral triangle: the ſpace between the eyes is the breadth of an eye: the breadth of the thigh, at the thickeſt, is double that of the thickeſt part of the leg, and treble that of the ſmalleſt: from the top of the head to the noſe, the ſame as from the top of the noſe to the chin. The diſtance from the chin to the throat-pit, is the breadth of the throat; the diſtance of the centre of the eye to the eye-brow, the ſame as the prominence of the noſtrils, and the ſpace between them and the upper lip: the length of the fore-finger, the ſame as the ſpace thence to the wriſt; the ſpace from the tip of the fore-finger to the wriſt, the length of the face.

For the *ſex:* The *proportions* of man and woman differ in height, in that the woman has a longer neck; the parts at the breaſts, and the lower parts of the belly, bigger by half a part; which makes the ſpace from the breaſt to the navel leſs by one part; and the thigh ſhorter by a third part.

As to breadth, a woman has her breaſts and ſhoulders narrower, and haunches larger; and thighs, at the place of their articulation, larger; arms and legs thicker, feet ſtraiter; and becauſe women are more fat and fleſhy, their muſcles are leſs ſeen, and therefore the contours more ſmooth and even.

Young maids have little heads, long necks, low or down ſhoulders, ſlender bodies, haunches big, legs and thighs long, feet little.

Young men have the neck thicker than women, the ſhoulders and breaſts larger, the belly and haunches narrower, legs and thighs ſlenderer, and feet larger.

As to the *quality* of ſubjects, we are either to follow ſimple nature, or fine and agreeable nature, or to chuſe nature, or exceed it. In following *ſimple* nature, in common and country ſubjects, men of dull wit, and a moiſt temperament, are to be of an heavier and rougher *proportion*, the muſcles appearing but little diſtinguiſhed, the head big, neck ſhort, ſhoulders high, ſtomach little, knees and thighs thick, and feet large.

In nature, as *fine* and *agreeable*, for ſerious hiſtories, *&c.* the figures of the heroes to be well ſhaped, the haunches high and upright, the joints well knit, little and compact, free from fleſh and fat.

Military men, to have the head little, neck thick and nervous, ſhoulders large and high, body and paps elevated, haunches and belly little, thighs muſcly, principal muſcles raiſed up and knit together at the heads; the legs ſmooth, feet ſlender, ſoles hollow.

Nature is ſometimes to be *ſelected*, *i. e.* made up of parts from various good originals, to form extraordinary and perfect figures for great and heroic ſubjects, as in Roman hiſtories; giving, thus, a character of force ſufficient to execute actions agreeable to the deſcriptions the poets, *&c.* make.

Laſtly, ſometimes nature is to be *exceeded*, as in repreſentations of fabulous deities, of heroes and giants: in theſe the great pieces, which ſerve to form the body, are to be ſet out in meaſures agreeable to the height; only diverſifying them by their bigneſs.

In the rule of *proportions*, it is to be obſerved, that there is a difference in the contours of ſome parts, when put in different poſtures: thus, when the arm is bent, it is larger than when ſtrait; the ſame is true of the foot and knee, as is ſhewn by Leonardo da Vinci.

Rule of Proportion, in arithmetic, a rule whereby we find a fourth proportional to three numbers given.

This is popularly called the *golden rule*, and ſometimes *the rule of three.* See Rule.

Compaſs of Proportion, a name by which the French, and after them ſome Engliſh authors, call the *ſector.—See its conſtruction and uſe under the article* Sector.

PROPORTIONAL, relating to proportion. Thus we ſay, proportional *compaſſes*, *parts*, *ſcales*, *ſpirals*, &c. See Compasses, *&c.*

Proportionals, in geometry, are quantities, either linear or numeral, which bear the ſame ratio, or relation to each other. See Ratio and Proportion.

Thus, if 3, 6, 12, be *proportionals*, then will 3 : 6 : : 6 : 12.

To find a fourth Proportional *to three given lines*, A B, A C, *and* B D, *(tab. geom. fig. 62.)* draw an angle FAG at pleaſure; from A ſet off the firſt of the lines to B; from A, the ſecond, to C; and from B, to D, the third: draw B C; and in D make an angle equal to ABC: then is CE the fourth *proportional* ſought; and A B : A C : : B D : C E.

If a third *proportional* be required to two given lines, A B and A C; make B D equal to A C, *i. e.* let A C be repeated twice: then A B : A C : : A C : C E.

To find a mean proportional *between two given lines*, A B *and* B E, *(fig. 63.)* join the two given lines into one continued right line, and biſect it in C. From C, with the interval of A C, deſcribe a ſemicircle A D E; and from B erect a perpendicular BD; this is the mean *proportional* ſought; and A B : B D : : B D : BE.

The geometricians have been theſe two thouſand years in ſearch of a method for finding *two mean proportionals.* See Mean.

The ancients performed it mechanically, by the meſolabe deſcribed by Eutochius; and many of them attempted to give the demonſtration; ſome by the ſolid loci, as Menechmus; others by the plain loci, as Nicomedes, Diocles, and, in our times, Viety; and others by implicit motions, as Plato, Archytas, Pappus, and Sporus; others tentatively, by the deſcription of circles, as Hero and Apollonius, *&c.* but all in vain. See Problem and Quadrature.

To find a mean proportional *between two numbers:* Half the ſum of the two given numbers is an arithmetical mean *proportional*, and the ſquare root of their product a geometrical mean *proportional.* See Proportion *arithmetical* and *geometrical.*

To find a mean harmonical proportional. See Proportion *harmonical.*

Proportionals, in grammar. See Numerals.

Proportional *compaſſes*, an inſtrument for the ready drawing of lines and figures, in any given ratio to other lines or figures.—*See their conſtruction and uſe under the article* Compasses.

Proportional *part.* See the article Part.

Proportional *ſcales*, called alſo *logarithmical ſcales*, are the artificial numbers or logarithms, placed on lines, for the eaſe and advantage of multiplying, dividing, *&c.* by means of compaſſes, or of ſliding-rules. See Logarithm and Scale.

They are, in effect, only ſo many lines of numbers, as they are called by Gunter, but made ſingle, double, triple, or quadruple; beyond which they ſeldom go. See Gunter's *ſcale*, *&c.*

Proportional *ſpirals.* See the article Spiral.

PROPORTIONALITY, a term uſed by Gregory de St. Vincent, for the proportion that is between the exponents of four ratio's. See Exponent and Ratio.

PROPORTUM, or Purport, in our law-books, the intention or meaning of any thing.—*Secundum* proportum *dicti chirographi inter eos confecti.*

PROPOSITION, Propositio, in logic, part of an argument, wherein ſome quality, either negative or poſitive, is attributed to a ſubject. See Enunciation, Attribute, *&c.*

Chauvin defines *propoſition*, a complete, conſiſtent ſentence indicating or expreſſing ſomething either true or falſe, without ambiguity: As, *Xanthippe is a bad wife.---If an aſs fly, he muſt have wings.*

Others, more philoſophically, define *propoſition*, a ſpeech uttered or produced, to ſignify ſome judgment of the mind. See Judgment.

A *propoſition* conſiſts of two terms; the one, that whereof we affirm or deny, called the *ſubject:* the other, the thing affirmed or denied, called the *attribute* or *predicate.* See Subject and Predicate.

Theſe two are either joined, or ſeparated, by the intervention of ſome copula or disjunctive. See Copula.

Thus in the *propoſition, God is juſt*; the ſubject, *God*, is joined with the attribute, *juſt*, by the verb ſubſtantive, *is.*

The ſchoolmen call the two terms the *matter*, and the copula the *form* of the *propoſition.* See Form, *&c.*

Now, as terms may be either ſingular, or common and univerſal, if the ſubject of a *propoſition* be a common term, taken in all its extent, the *propoſition* is called *univerſal:* as, *Every atheiſt is blind.* See UNIVERSAL.

If the common term be only taken in an indeterminate part of its extent, the *propoſition* is called *particular:* as, *Some atheiſts are wicked.*

If the ſubject of the *propoſition* be ſingular, the *propoſition* is called *ſingular:* as *George is king of England*,

Thoſe *propoſitions* which have only one ſubject, and one attribute, are called *ſimple*;—thoſe that have ſeveral ſubjects, or attributes, are called *compound.*

A ſyllogiſm conſiſts of three *propoſitions*, major, minor, and concluſion. See SYLLOGISM.—An enthymeme, of two. See ENTHYMEME.

The ſchoolmen make ſeveral other ſpecies and diviſions of *propoſition*; as, a

PROBOSITION *de primo adjacente*, where the ſubject and predicate are both included under the verb: ſuch are, *veni*, *vidi*, *vici.*

PROPOSITION *de ſecundo adjacente* is, where either the ſubject or predicate is included in the verb: as, *I love*,—or, *I write.*

PROPOSITION *de tertio adjacente* is, where both the ſubject and predicate are expreſs, and ſtand diſtinct from the verb: as, *The king is juſt.*

This *propoſition* is the rule or ſtandard of all the other; ſo that whatever *propoſition* can be reduced thereto, is legitimate; and what cannot, is not.

Propoſitions, again, are divided into three claſſes: the firſt regarding the *matter*; the ſecond, the *form*; the third, the *thought.*

Thoſe of the firſt claſs are ſubdivided into *finite* and *infinite*, *direct* and *indirect*, *ſingle* and *manifold.*

Finite or *definite* PROPOSITION is that which declares ſomething determinate on a ſubject: as, *Man is biped.*—*The wind is not viſible.*

Infinite or *indefinite* PROPOSITION is that where either one or both of the terms are *infinite*, or have a negative prefixed to them: as, *Non homo eſt albus.*—*Homo eſt non albus.*

Direct PROPOSITION is that wherein a higher or more general thing is predicated of a lower and more particular: as, *Man is an animal.*

Others will have it that, wherein the ſubject ſtands as a matter receiving, and the predicate, as a form received: as, *Peter is learned.*

Indirect PROPOSITION, according to ſome, is that wherein an inferior is predicated of a higher: as, *An animal is man.*—According to others, it is that wherein the ſubject ſtands as the form, and the predicate as the matter: as, *Every rational is man.*

Single PROPOSITION is ſuch, either ſimply, or by conjunction:—*Simply*, when it affirms and denies one thing of one other thing: as, *The ſun ſhines.*—By *conjunction*, when ſeveral *propoſitions* are joined and coupled together. Thus, *The ſun ſhines, and it is day*, are two *propoſitions*, which conjoined, make this one, *If the ſun ſhines, it is day.*

Of ſuch *conjunct propoſitions* there are divers kinds, *viz. hypothetical*, *disjunctive*, *copulative*, &c.

Hypothetical PROPOSITION is that conſiſting of ſeveral ſimple ones, affected with ſome conditional one: as, *If the ſun be ſet, it is night.* See HYPOTHETICAL and CONDITIONAL.

Disjunctive PROPOSITION is that conſiſting of ſeveral, affected with a disjunctive copula: as, *It is either day, or night.* See DISJUNCTIVE.

Copulative PROPOSITION is that conſiſting of ſeveral affected with a conjunction copulative: as, *Peter does not ſtand, and ſit.* See COPULATIVE.

Some add *diſcrete* or *adverſative propoſition:* as, *He is rich, but covetous.* See DISCRETIVE.

Compound PROPOSITION is that where one and both the terms excite ſeveral ideas in the mind: as, *A man is body and ſoul, and both together*; or, *a foundation, walls, and roof, are a houſe.*

Manifold PROPOSITION is that conſiſting of ſeveral ſubjects; as, *Peter and Paul preached*; or ſeveral predicates; as, *Simon reads and walks*; or both, as, *Peter and Paul preach and pray.*

In reſpect of *form*, *propoſitions* are divided into *affirmative* and *negative*; *true* and *falſe*, *pure* and *modal.*

Affirmative PROPOSITION is that whoſe attribute is joined to the ſubject; as, *God is a ſpirit.*

Negative PROPOSITION is that whoſe attribute is ſeparated from the ſubject; as, *Man is not a ſtone.*

True PROPOSITION is that which declares a thing to be what it really is; or not to be what it is not. See TRUTH.

Falſe PROPOSITION is that which ſignifies a thing to be what it is not; or not to be what it is. See FALSHOOD.

The truth of a *propoſition*, therefore, depends on the connecting of the ſubject with the attribute, which is done by that act of the mind, called *judgment.* See JUDGMENT, ERROR, *&c.*

PROPOSITIONS are ſaid to be *pure*, when they imply or involve nothing beſides their matter and form: as, *Man is rational.*

Modal PROPOSITION is that which, beſide the pure matter and form, involves ſome mode, or manner of diſpoſition: as, *It is neceſſary man be rational.*

Hence ſuch *propoſition* is ſaid to conſiſt of a mode, and a diction; the mode denotes ſome circumſtance which affects the *propoſition*; as, *It is neceſſary:* the diction is the reſt of the *propoſition*, *that man be rational.*

There are four of theſe modes very famous, *viz. neceſſary*, *poſſible*, *impoſſible*, and *contingent.* See NECESSARY, POSSIBLE, *&c.* Others produce other modes, as *true*, *falſe*, *certain*, *uncertain*, *probable*, &c.

To modal *propoſitions*, the philoſophers refer *excluſive*, *exceptive*, and *reſtrictive propoſitions*; all which are denoted by a common name, *exponible propoſitions*, becauſe requiring ſome explanation to make them clearly underſtood.

Excluſive PROPOSITION is that denoted by a ſign, or character of excluſion: as, *only*, *ſolely*, *alone*; as, *God alone is eternal*; which is expounded thus, *God is eternal, and no other being beſide him is ſo: Peter only plays*; which we expound, *Peter plays, and does nothing elſe.* See EXCLUSIVE.

Every *excluſive propoſition* is expounded by two *propoſitions*, one of which is affirmed, and the other denied.

Exceptive PROPOSITION is that denoted by an exceptive ſign; as, *beſide*, *unleſs*, &c.—Thus, *Every animal, beſide man, is irrational.* See EXCEPTIVE.

Every *exceptive propoſition* is to be reſolved, or expounded by three *propoſitions*; as that, *e. g.* above-mentioned, by theſe: *Every animal that is not man is irrational: every man is an animal: no man is irrational.*

Reſtrictive, or *limitative* PROPOSITION, is that affected with a reſtrictive ſign; as, *according to*, *ſo far as*, *conſidered as*, *quatenus*, &c. Thus, *man*, quatenus *an animal*, *perceives.*

Complex PROPOSITION,	See the articles	COMPLEX,
Reduplicative PROPOSITIONS,		REDUPLICATIVE,
Relative PROPOSITION,		RELATIVE,
Reduction of PROPOSITIONS.		REDUCTION.

PROPOSITION, in mathematics, is either ſome truth advanced, and ſhewn to be ſuch by demonſtration; or ſome operation propoſed, and its ſolution ſhewn.

If the *propoſition* be deduced from ſeveral theoretical definitions compared together, as this; A parallelogram is double of a triangle, ſtanding on the ſame baſe, and of the ſame altitude: it is called a *theorem.* See THEOREM.

If it be deduced from a praxis or ſeries of operations, it is called *a problem:* as, to find a third proportional to two given quantities. See PROBLEM.

Indeed, in ſtrictneſs, the *propoſition* is only part of a theorem, *viz.* that which ſhews what agrees to ſuch a thing under ſuch conditions, and what not: in which ſenſe it is diſtinguiſhed from the *demonſtration*, which ſhews the reaſons why the underſtanding conceives that to agree to it. See DEMONSTRATION.

Again, ſtrictly ſpeaking, the *propoſition* is only a member of a problem, *viz.* that which ſhews what is required to be done: in which ſenſe it is diſtinguiſhed from the *ſolution*, which rehearſes the ſeveral things to be done in order to effect what is required; and from the *demonſtration*, which proves, that by doing the things injoined in the ſolution, the thing required in the *propoſition* is truly done. See RESOLUTION.

PROPOSITION, in poetry, denotes the firſt part of an epic poem, wherein the author propoſes, or lays down, briefly and in general, what he has to ſay in the courſe of his work. See POEM, EPIC, *&c.*

The *propoſition*, F. Boſſu obſerves, is to contain the bare matter of the poem, *i. e.* the action, and the perſons that are to execute it, both human and divine.

This is what we have both in the Iliad, the Odyſſee, and the Æneid. The action propoſed in the Iliad, is the wrath of Achilles; that of the Odyſſee, the return of Ulyſſes; and that of the Æneid, the tranſlation of the Trojan empire into Italy.

The ſame author obſerves, that the divine perſons are named in all the three *propoſitions.* Homer, *e. gr.* declares, that what happens in the Iliad, is by the will of Jupiter; and that Apollo was the cauſe of the quarrel between Agamemnon and Achilles: the ſame poet ſays, it was Apollo prevented the return of Ulyſſes's companions; and Virgil mentions the deſtinies, the will of the gods, and the anger of Juno.—But they all three dwell chiefly on the perſon of the hero, as if he were the matter of the poem. See HERO.

Yet there is ſome difference, in this reſpect, in the three poems; in that Achilles is named in the Iliad; but Ulyſſes and Æneas are not: they are only pointed at, and that in ſuch general terms, as if it were ſuppoſed they were known before.

This Practice ſeems to fall in with the firſt intention of the poet; who is to feign an action without names, and who, as Ariſtotle ſays, does not relate the action of Achilles, nor Ulyſſes, nor Æneas, nor any particular perſon, but of an univerſal, general, and allegorical perſon. See FABLE and ACTION.

Add to this, that the character which the poet is to give his hero, and his whole work, is expreſſed in the *propoſition*, both by Homer and Virgil. See CHARACTER.

The whole Iliad is anger and violence; it is Achilles's character, and it is what the poet commences with: Μηνιν αειδε. The Odyſſee preſents us in the firſt verſe with the prudence, diſſimulation, and addreſs, which make the character of Ulyſſes, and the buſineſs of the poem: Ανδρα ϖολυτροπον. And we ſee the piety and mildneſs of Æneas in the beginning of the Latin poem: *Inſignem pietate virum.*

As to the manner of the *propoſition*, Horace contents himſelf to preſcribe modeſty and ſimplicity; not to promiſe much, nor raiſe great expectations in the reader. *Do not begin*, ſays he, *like that wretched poet, who ſet out with*, Fortunam Priami cantabo, & nobile bellum. *How much better is that of Homer,* Dic mihi, muſa, virum! *&c. He does not ſpend all his fire, at once, and leave nothing but ſmoke: from this feeble beginning, you ſhall ſoon ſee him riſe to the wonders of Antiphates, Scylla, Charybdis, and Polypheme.*

The ſame modeſty we find in the *propoſition* of the Æneid: if that of the Iliad be a little more furious, it is, perhaps, in conformity to the character of the poem, which is a ſeries of violences and extravagances.

Add, that if the poet be to ſpeak with modeſty of his hero; much more is he to do ſo of himſelf: thus Virgil only ſays, *I ſing the action of Æneas.* Homer begs his muſe to *ſay,* or *ſing.* How far does Claudian ſwerve from theſe examples?

——————Audaci promere cantu
Mens congeſta jubet; greſſus removete, profani:
Jam furor humanos noſtra de pectore ſenſus
Expulit, & totum ſpirant præcordia Phœbum.

A ſhort poem, *e. gr.* an ode, *&c.* wherein the violent ſtrain could be purſued to the end, might admit of ſuch a pompous beginning. Thus we find Horace begin an ode much after the manner of Claudian:

Odi profanum vulgus, & arceo——
——Carmina non prius
Audita Muſarum ſacerdos
Virginibus puerisque canto.

But the length of an epic poem quite excludes all pompous *propoſitions.*

There is ſcarce any fault we have yet obſerved a *propoſition* liable to, but there is an inſtance of in the *propoſition* of Statius's Achilleid: he bids his *muſe rehearſe the deeds of the magnanimous ſon of Æacus, who was formidable even to the thunderer.* He adds, *That he has worthily diſcharged a former undertaking; and that Thebes eſteems him a ſecond Amphion.*

Magnanimum Æacidem, formidatamque Tonanti
Progeniem, & patrio vetitam ſuccedere cœlo,
Diva, refer.——
Tu modo, ſi veteres digno deplevimus hauſtu,
Da fontes mihi, Phœbe, novos, &c.

PROPREFECT, Propræfectus, among the Romans, the prefect's lieutenant; or an officer whom the prefect of the pretorium commiſſioned to do any part of his duty in his place. See Prefect.

In Gruter, *p.* CCCLXX. the third inſcription mentions *proprefects* of the pretorium under Gratian, in the city of Rome, and the neighbouring parts. See Pretorium.

PROPRETOR, or Proprætor, a Roman magiſtrate, who having diſcharged the office of pretor at home, was ſent into a province to command there with his former pretorial authority. See Pretor.

Propretor was alſo an appellation given to thoſe, who, without having been pretors at Rome, were ſent extraordinarily into the provinces, to adminiſter juſtice with the authority of pretors.

Propretor is alſo a denomination given by ſome to thoſe ſent by the emperors into the provinces, which, upon partition in Auguſtus's time, fell to their lot: as the name *proconſul* was given to thoſe ſent into the provinces that fell to the people's ſhare. See Proconsul.

PROPRIETARY *monks,* were ſuch as had reſerved goods and effects to themſelves, notwithſtanding their former renunciation of all at the time of their profeſſion.

They are frequently mentioned in the *Monaſt. Anglic. &c.* and were to be very ſeverely dealt withal; to be excommunicated, deprived of burial, *&c.*—Monachi proprietarii *excommunicentur ab abbatibus, & ſi in morte* proprietarius *inventus fuerit, eccleſiaſtica careat ſepultura,* &c. Addit. ad Matt. Par.

PROPRIETATE *probanda* is a writ to the ſheriff to enquire of the property of goods diſtrained, when a defendant claims a property upon a replevin ſued.

Where a property is proved by the defendant, a replegiari properly lyes not. See Replevin and Distress.

Proprietatis *elixir.* See the article Elixir.

PROPRIETOR, or Proprietary, he who has the property or propriety of any thing. See Property.

Proprietor, in law, is ſtrictly ſuch a one as has or poſſeſſes any thing as his own in the utmoſt degree: *Quæ nullius arbitrio eſt obnoxia.*

The term was formerly applied in a particular manner to him who had the fruits of a benefice to himſelf and his ſucceſſors; as in ancient time abbots and priors had.

PROPRIETY, in grammar, is where the direct and immediate ſignification of a word agrees to the thing it is applied to. See Proper and Impropriety.

In which ſenſe *propriety* is uſed in oppoſition to a figurative or remote ſignification. See Figurative, *&c.*

PROPYLÆUM*, the porch of a temple, or great hall. See Porch.

* The word is Greek, προπυλαιον, which ſignifies the ſame.

Hence *propylæum* is alſo uſed figuratively in matters of learning, for an introduction, apparatus, or prodromus to ſome greater work.—In this ſenſe we ſay, the *propylæum* of the Jeſuits at Antwerp, *&c.*

PROQUESTOR, Proquæstor, the queſtor's lieutenant, or a perſon who diſcharged the office of queſtor in his ſtead See Questor.

The word is chiefly applied to an officer appointed by the governor of a province to diſcharge the queſture after the deceaſe of the queſtor, till the ſenate and people ſhould ſend a new one.

PRORÆ *os,* in anatomy, a bone of the cranium, called alſo *os occipitis.* See *os* Occipitis.

PRO RATA, in commerce, a term ſometimes uſed among merchants, for *in proportion.* See Proportion.

Thus, when ſpeaking of any undertaking they ſay, Each perſon muſt reap the profit, or ſuſtain the loſs, *pro rata* to his intereſt; it is meant, each ſhall gain or loſe, in proportion to the ſum he put in ſtock.

Pro rata *portionis,* in law. See Onerando *pro rato portionis.*

PROROGANDA *aſſiſa.* See the article Assisa.

PROROGATION, Prorogatio, the act of prolonging, adjourning, or putting off to another time.

The difference between a *prorogation* and an *adjournment* of parliament is, that by *prorogation* the ſeſſion is ended; and ſuch bills as paſſed in either houſe, or both houſes, and had not the royal aſſent, muſt at the next aſſembly begin again; for that every ſeſſion of parliament is, in law, a ſeveral parliament: whereas, if the parliament be only *adjourned,* there is no new ſeſſion; and conſequently, all things continue in the ſame ſtate they were in before the adjournment. See Adjournment.—But this difference between *prorogation* and adjournment is of no long ſtanding: anciently they were uſed as ſynonymous, Prorogetur *curia de hora in horam, quouſque placitum terminetur. MS. de L L.*

To *prorogue* the parliament, the king goes in perſon, with his crown on his head, and ſends the black rod for the houſe of commons to attend him at the bar of the houſe of lords; where, after giving an anſwer to each bill ſignified to him, he makes a ſpeech; and the lord chancellor by command, ſignifies the parliament to be *prorogued.* See Parliament.

The proroguing of the lower houſe of convocation is a power veſted in the archbiſhop with the conſent of the ſuffragans. See *Life of Queen Anne, p.* 87.

PROSAIC *numbers.* See the article Number.

PROSCENIUM, in the ancient theatre, an eminence whereon the actors performed their parts. See Theatre.

The *proſcenium* anſwered to our ſtage.—It conſiſted of two parts among the Greeks; one particularly ſo called, where the actors performed: the other was the *logeion,* where the ſingers and the mimics acted their parts.—Among the Romans, the *proſcenium* and *pulpitum* were the ſame thing. See Pulpitum.

PROSCRIPTION, Proscriptio, a publication made in the name of the chief or leader of a party, whereby he promiſes a reward to any one who ſhall bring him the head of one of his enemies.

Sylla and Marius by turns *proſcribed* each other's adherents.—Under the triumvirate, a great part of the beſt and braveſt of the Romans fell by *proſcription.*

The term took its riſe from the practice of writing down a liſt of the perſons names, and poſting it in public: from *pro,* and *ſcribo;* I write.

PROSE*, Prosa, the natural language of mankind, looſe, and unconfined by poetical meaſures, rhymes, *&c.*—In which ſenſe it ſtands oppoſed to *verſe.* See Verse.

* The word comes from the Latin *proſa,* which ſome will have derived from the Hebrew *poras,* which ſignifies *expendit:* others deduce it from the Latin *prorſa,* of *prorſus,* going forwards; by way of oppoſition to *verſa,* or turning backwards, as is neceſſary in writing.

Though *proſe* have its connexions, which ſuſtain it, and a ſtructure, which renders it numerous; it ought ſtill to appear free: its character conſiſts in running eaſy and unconſtrained. See Style, Numbers, *&c.*

Poets very rarely have the talent of *proſe:* the habit of wearing chains ſits faſt upon them, even when the chains are off.

St. Evremond compares *proſe* writers to foot-travellers, who walk with leſs noiſe, but more ſecurity, than the cavaliers.

PROSECUTOR, in law, is he that purſues a cauſe in another's name. See Promoter.

PROSELYTE*, Proselytus, a new convert to the faith.

* The word is pure Greek, προσηλυτος, which, in Latin, ſignifies *advena;* in Engliſh, *ſtranger,* or one arrived out of another country.

The term was much uſed in the primitive church.—The Jews too had their *proſelytes,* who from Gentiles embraced Judaiſm. See Neophyte and Catechumen.

PROSODY*, Prosodia, that part of grammar which teaches and directs the pronunciation and manner of rehearſal; marks the accents, and diſtinguiſhes the long and ſhort ſyllables. See Grammar, Pronunciation, *&c.*

* The word is formed from the Greek προσωδια, compounded of προς, and ωδη, *cantus,* ſinging.

Proſody is properly that branch of grammar which relates to ſyllables; treating of their true pronunciation in reſpect of accent, and time or quantity. See Syllable and Accent, *&c.*

The Engliſh *proſody* turns chiefly on two things: *numbers,* that is, a certain number of feet or ſyllables; ſee Numbers:—and *rhyme,* or a ſimilitude of ſound between the laſt ſyllables of words. See Rhyme

The Greek and Roman *proſodies* were unacquainted with rhyme; but in lieu thereof had ſomething to make their verſe harmonious, without, *viz. quantity*. See QUANTITY.

PROSONOMASIA, προσονομασια, a figure in rhetoric, whereby alluſion is made to the likeneſs of a ſound in ſeveral names or words; much the ſame with *paronomaſia*, or *agnominatio*. See PARONOMASIA.

PROSOPOPOEIA *, προσωποποιια, in rhetoric, a figure, whereby we make perſons that are abſent, or dead, or even things which are inanimate, as cities, &c. to ſpeak. See FIGURE.

* The word is formed from the Greek, προσωπον, *perſon*, and ποιεω, *I make*, or *feign*.

The poets, in their fictions, make frequent uſe of the *proſopopœia*; as alſo do the orators, in their painting of violent paſſions, which ſeem to tranſport, and make them forget themſelves.

There are two kinds of *proſopopœia's*; the one *direct*, the other *indirect*.—For an inſtance of the latter: *Juſt gods, protectors of the innocent, permit the order of nature to be interrupted for one moment, and let this carcaſe reſume the uſe of ſpeech*, &c.

Inſtances of the former are found every-where among the orators and poets: that which follows is a very beautiful one, found by way of epitaph on a tomb-ſtone: the dead wife addreſſes her ſurviving huſband thus:

Immatura peri: ſed tu felicior, annos
Vive tuos, conjux optime, vive meos.

PROSPECT, } See { PERSPECTIVE.
PROSPECTIVE *glaſs*, } See { PERSPECTIVE *glaſs*.

PROSPHYSIS, ſee ADHESION.

PROSTATÆ, προϛαται, in anatomy, two white, ſpongy, glandulous bodies ſituate at the root of the penis, or juſt below the neck of the bladder, and about the ſize of walnuts.—See *tab. anat.* (ſplanch.) *fig.* 8. *lit.* pp. *fig.* 15. *lit.* cc. See alſo GLAND and PENIS.

Authors aſcribe two kinds of ſubſtance to the *proſtatæ*, the one, glandulous, the other ſpongeous, or porous; which laſt ſeems nothing but a congeries of minute veſſels and cells, through the middle of which paſs the veſiculæ ſeminales, without any communication therewith.

The *proſtatæ* have excretory ducts of their own, pretty numerous: De Graaf does not remember to have known them fewer than ten in the *proſtatæ* of a man; in dogs they are ſometimes an hundred, each of which diſcharges itſelf into the urethra, ſome above, ſome below the caput gallinaceum; each having its proper caruncle.

Out of theſe iſſues a whitiſh, ſlimy humour, ſecreted in the glandular part of the *proſtatæ*, and conveyed into the cavity of the urethra.

The uſe of this humour is to line and lubricate the cavity of the urethra, and prevent it from being annoyed with the acrimony of the urine in its paſſage through it; and to ſerve as a vehicle to the ſeed, in the time of ejaculation. See URINE, URETHRA, &c.

Some take it for a third kind of ſeed, but without much reaſon. See SEED.—Boerhaave thinks it may ſerve to nouriſh the animalcule during the firſt moments after coition.—This humour, he adds, remains after caſtration, but is not prolific.

The ſame author, from the memoirs of the French academy, makes the *proſtatæ* to conſiſt of an aggregate of twelve glands, each of which terminates by its excretory duct in a little bag, into which it diſcharges its humour. Theſe twelve bags open by as many excretory ducts into the cavity of the urethra, ſo as to encompaſs the exit of the veſiculæ; whence the ſeed and the humour of the *proſtatæ* are the more accurately mixed.

PROSTHAPHÆRESIS *, in aſtronomy, the difference between the true and mean motion, or true and mean place, of a planet; called alſo *equation of the orbit*, or *of the centre*, and ſimply *the equation*. See EQUATION.

* The word is formed from the Greek, προσθε, *ante*, *ſuper*; and αφαιρεσις, *ademptio*.

Proſthaphæreſis amounts to the difference between the mean and equated anomaly. See ANOMALY.

Thus, ſuppoſe the circle ALMPNR (*tab. aſtron. fig.* 51.) the orbit of the earth, ſurrounded by the ecliptic ♈, ♋, ♎, &c. and ſuppoſe S the ſun, and the earth in R, the mean anomaly will be the arch APR, or, caſting away the ſemicircle, the arch PR, or the angle PCR; and the true anomaly, rejecting the ſemicircle, will be PSR, which is equal to PCR and CRS: if then to the mean anomaly, we add the angle CRS, we ſhall have the true anomaly PSR, and the earth's place, in the ecliptic. See PLACE, &c.

And here the angle CLS, or CRS, is called the *proſthaphæreſis* or *equation*, by reaſon it is ſometimes to be added, and ſometimes to be ſubtracted from the mean motion, that we may have the true motion or place of the earth. See EARTH.

PROSTHESIS, προσθεσι, in grammar, a ſpecies of metaplaſm; being the perfixing of ſome letter or ſyllable at the beginning of a word:—As in, *gnavus*, *pro navus*.

This is alſo called *appoſition*. See APPOSITION.

PROSTHESIS, among ſurgeons, is the filling up of what was before wanting, by the appoſition of new matter.

Such, *e. gr.* is the filling up of fiſtulous ulcers with new fleſh. See INCARNATION, &c.

PROSTYLE *, προϛυλος, in the ancient Greek architecture, a range of columns in the front of a temple. See TEMPLE and AMPHIPROSTYLE.

* The word is formed from the Greek προ, *before*, and ϛυλος, *column*.

PROSYLLOGISM, PROSYLLOGISM, is uſed by ſome ſchool-writers, for a reaſon or argument produced to ſtrengthen or confirm one of the premiſes of a ſyllogiſm. See SYLLOGISM and PREMISE.

Others define *proſyllogiſm*, an argument compoſed of two ſyllogiſms, ſo diſpoſed, as that the concluſion of the former is the major or minor of the latter.—*e. gr.* Every rational is riſible: but every man is rational, therefore every man is riſible; but no aſs is riſible, therefore no aſs is a man.

The major, or the ſecond ſyllogiſm, may be omitted or underſtood; and ſome even contend that it ought to be ſo: ſo that on their principle, a *proſyllogiſm*, or redundant ſyllogiſm, is when two ſyllogiſms are ſo contained in five propoſitions, as that the concluſion of the former is the major or minor of the latter. See SYLLOGISM.

PROTASIS *, προτασις, in the ancient drama, the firſt part of a comic or tragic piece; wherein the ſeveral perſons of the play are ſhewn, their characters and manners intimated, and the action, which is to make the ſubject of the piece, propoſed, and entered upon. See DRAMA, TRAGEDY, &c.

* The word is formed from the Greek προτεινω, *porrigo*, *I hold forth*.

The ancient *protaſis* might go about as far as our two firſt acts. See ACT.—Where the *protaſis* ended, the epitaſis commenced. See EPITASIS.

PROTATICUS, προτατικος, in the ancient drama, a perſon who never appeared but in the *protaſis*, or firſt part of the play; as Soſia in Terence's Andria, &c.

PROTECTION, PROTECTIO, the ſhelter, defence, authority, and aid, employed by any one in behalf of the helpleſs or unhappy. See PROTECTOR.

Active protection ſuppoſes power, intereſt, favour, &c. in the perſon that protects.—*Paſſive protection*, on the contrary, implies neceſſity, weakneſs, and dependence, in the perſon protected. See SAFEGUARD.

PROTECTION is alſo uſed for a privilege belonging to embaſſadors, members of parliament, &c. whereby they and their domeſtics are ſecur'd from arreſts, &c. See PRIVILEGE, &c.

PROTECTION is ſometimes alſo underſtood of the perſon of the protector. Such a cardinal has the *protection* of France.—The *protection* of Spain is become vacant by the death of ſuch a cardinal. See PROTECTOR.

PROTECTION, in law, in its general ſenſe, denotes that benefit and ſafety which every ſubject, denizen or alien, ſpecially ſecured, hath by the laws. See LAW.

PROTECTION, in a more ſpecial ſenſe, is uſed for an exemption, or immunity, given by the king to a perſon, to ſecure him againſt ſuits in law, or other vexations, upon reaſonable cauſes moving him thereunto, and for a certain time.

Of this, Fitzherbert makes two kinds: the *firſt* he calls a *protection, cum clauſula volumus*; whereof he mentions four caſes: —1°. A *protection*, *quia profecturus*, for him that is to paſs over-ſea in the king's ſervice.—2°. A *protection*, *quia moraturus*, for him who is already abroad in the king's ſervice; as an embaſſabor, &c.—3°. A *protection* for the king's debtor, that he be not ſued or attached, till the king be paid his debt.—4°. A *protection* for a perſon in the king's ſervice beyond ſea, or in the marches of Scotland.

The *ſecond* form of *protection* is *cum clauſula nolumus*, which is moſt commonly granted to a ſpiritual company, for their immunity from having their cattle taken by the king's miniſters.—But it may be alſo granted to a ſingle perſon, either ſpiritual or temporal.

Protection extends not to pleas of dower, quare impedit, aſſize of noveil diſſeiſin, darrein preſentment, attaints, nor pleas before juſtices in eyre.

PROTECTOR, a perſon who undertakes to ſhelter and defend the weak, helpleſs, or diſtreſſed. See PROTECTOR and PATRON.

God, and the magiſtrate, are the *protectors* of the widow and orphan.—Among the heathens, Minerva was eſteemed the *protectreſs* of arts.

Every catholic nation, and every religious order, has a *protector* reſiding at the court of Rome, who is a cardinal, and called the *cardinal protector*. See CARDINAL.

PROTECTOR is ſometimes alſo uſed for a regent of a kingdom, made choice of to govern it during the minority of a prince.—Cromwell aſſumed the title and quality of *lord protector of the commonwealth of England*.

PROTEST, in law, is uſed for a caution, or call of witneſs, or an open affirmation, that a perſon does either not at all, or but conditionally, yield his conſent to any act; or to the proceeding of any judge in a court, wherein his juriſdiction is doubtful; or to anſwer upon his oath farther than by law he is bound. See PROTESTATION.

Any of the lords in parliament have a right to *proteſt* their diſſent to any bill paſſed by a majority; which *proteſt* is entered in form.—This privilege is ſaid not to be very ancient: the commons have no right to *proteſt*. See PARLIAMENT.

Proteſt, in commerce, is a ſummons made by a notary public to a merchant, banker, or the like, to accept or diſcharge a bill of exchange drawn on him, after his having refuſed either to accept or pay the ſame. See Bill *of exchange*.

It is called a *proteſt*, becauſe containing a proteſtation, that the party will return the bill, and even take up money at intereſt; and charge all coſts, damages, carriage and recarriage, on the refuſer.

There are two kinds of *proteſts*; the one for want of acceptance, the other for want of payment. See Acceptance, *&c.*

The firſt, to be made by the bearer of the bill at the time of preſenting it, in caſe the perſon, on whom it is drawn, refuſe to accept it for the time, or the ſum there expreſſed.—The latter is made as the bill falls due, whether it have been accepted or not. See Exchange.

The bearers of bills of exchange, that have been accepted, or which become payable at a certain day, are obliged to have them either paid or *proteſted* within three days after due; on the penalty of anſwering for the omiſſion: and it muſt be obſerved, that if the third day happen to be a holy-day, the *proteſt* is to be made on the eve thereof.

At Paris and Hambourg, the *proteſt* is to be made within ten days: at Venice, where all bills are paid in banco, the *proteſt* for want of payment is to be made within ſix days; but then the bank is ſuppoſed open, otherwiſe no *proteſt* to be made: at Rome, *proteſts* for want of payment are to be made within fifteen days: at Leghorn, Milan, and Bologna, there is no time fixed: at Amſterdam, they are to be made within five days: at Venice, the third day.

The negotiants of ſome places, as thoſe of Rome, M. Savary obſerves, do not look on themſelves as obliged to *proteſt* in default of payment; but this opinion is contrary to univerſal cuſtom, and natural reaſon; ſince, till after *proteſtation*, they have no remedy or reſource againſt the drawer or indorſer, nor any title to be reimburſed.

M. Ricard adds, that bills of exchange drawn from Amſterdam, or Antwerp, or Spain, are to be *proteſted*, in default of payment within fourteen days after they fall due; after which time the bearer ſtands the riſque and chance of the *non-proteſted* bill, not the drawer or indorſer, in caſe the party happens to fail after the ſaid fourteenth day.

Proteſtant, a name firſt given in Germany to thoſe who adhered to the doctrine of Luther; becauſe in 1529. they *proteſted* againſt a decree of the emperor Charles V. and the diet of Spires; and declared, that they appealed to a general council. See Reformation.

The name has been ſince alſo given to thoſe who adhere to the ſentiments of Calvin, and is now become a common denomination for all thoſe of the reformed churches. See Lutheran, Calviniſt, Presbyterian, *&c.*

Great endeavours have been made to unite the Lutheran *proteſtants* with the Calviniſts; but hitherto in vain.

PROTESTATION, a ſolemn declaration made by ſome judiciary act or proceeding, againſt an oppreſſion, violence, or injuſtice; or againſt the legality of a ſentence, judgment, decree, or other procedure; importing, that the party is determined to oppoſe it at the proper time, *&c.* See Proteſt.

Proteſtation is defined by juſtice Walſh, a defence or ſafeguard to the party that makes it, from being concluded by the act he is about to do; ſo that iſſue cannot be joined upon it.

Proteſtation is defined by Plowden, a form of pleading, when one does not either directly affirm or deny any thing alledged by another, or which he himſelf alledges. Plowd. *fol.* 276.

PROTHESIS, a little altar in the Greek churches, whereon a ceremony is performed, called by the ſame name ϖροθεσις. See Altar.

On this altar the prieſt, with the other miniſters, prepares every thing neceſſary to the celebration of maſs; *viz.* the bread, wine, *&c.*—After which they go in proceſſion from this to the great altar, to begin maſs, carrying with them the ſpecies thus prepared.

PROTHONOTARY, **Protonotarius**, **Protonotary**, a term properly ſignifying *firſt notary*, and which was anciently the title of the principal notaries of the emperors of Conſtantinople. See Notary.

With us, *prothonotary*, called alſo *preignatory*, is uſed for an officer in the courts of king's-bench and common-pleas; the latter whereof has three, the former one. See Court, *&c.*

Prothonotary *of the king's-bench* records all actions civil ſued in that court; as the clerk of the crown-office doth all criminal cauſes. See King's *bench*, Record, *&c.*

Prothonotaries *of the common-pleas* enter and inrol all declarations, pleadings, aſſizes, judgments, and actions: they alſo make out all judicial writs; as the venire facias, after iſſue joined; habeas corpus, for bringing in of the jury; diſtringas jurator; writs of execution and ſeiſin, of ſuperſedeas, of privilege, *&c.* they inrol all recognizances acknowledged in that court, all common recoveries; make exemplifications of records, *&c.*

Prothonotary, or **Protonotary**, is alſo an officer in the court of Rome, who has a degree of pre-eminence over the other notaries. See Notary.

There is a college of twelve *prothonotaries*, called *participantes*, becauſe partaking in the fees of the expeditions in chancery. See Participation.

They are ranked among the numbers of prelates, wear the violet rochet, the hat, *&c.* They aſſiſt at all grand ceremonies, and have a place in the pope's chapel.

Their office is to diſpatch the acts in grand cauſes, which the ſimple apoſtolical notaries diſpatch in leſſer cauſes: they may create apoſtolical notaries and doctors, to officiate out of the city.

Thoſe out of the college have none of the privileges of the others, except the habit.

The *prothonotaries* were firſt eſtabliſhed at Rome by pope Clement I. with deſign to write the lives of the martyrs. See Notary.

PROTHYRIS, in the ancient architecture, is ſometimes uſed for a quoin, or corner of a wall; otherwiſe called *anco*. See Anco.

Sometimes alſo for a croſs-beam, or over-thwart rafter.

Prothyris is alſo uſed by Vignola for a particular ſort of key of an arch, an inſtance of which we have in his Ionic order, conſiſting of a roll of water-leaves, between two reglets and two fillets, crowned with a Doric cymatium; its figure being much like that of a modillion.

PROTHYRUM, ϖροθυρον, a porch at the outward door of an houſe, or portal. See Porch and Veſtible.

PROTO*, a word uſed in compoſition with divers terms in our language, to expreſs a relation of priority; as in *proto-martyr*, *proto-type*, &c.

* It is formed of the Greek ϖρωτος, *primus*, firſt.

PROTOCOLLUM, ϖρωτοκολλον, a term uſed in the ancient juriſprudence, for the firſt leaf of a book, wherein was the mark of the paper or parchment.

It was even ſometimes uſed for the mark itſelf; which was uſually in the margin, but ſometimes at the top of the page.

The xlivth novel of Juſtinian forbids cutting the *protocollum* of charters, which ſhew the year wherein the paper or parchment were made, and the officer commiſſioned for the delivery of them; by means whereof frauds were frequently detected.

Protocollum was alſo uſed for the firſt minute, draught, or ſummary, of an act to be paſſed; which the notary drew up in ſhort, in little table-books, to be afterwards enlarged at leiſure. See Notary.

PROTO-FORESTARIUS was he whom our ancient kings made chief of Windſor-foreſt, to take cognizance of all cauſes of death or mayhem there; after the manner of a lord chief juſtice in eyre. See Foreſt, Foreſter, Juſtice, *&c.*

PROTO-MARTYR*, the *firſt martyr*, or witneſs, who ſuffered death in teſtimony of the truth; as Abel in the old teſtament, and St. Stephen in the new. See Martyr.

* The word is compounded of ϖρωτος, *firſt*, and μαρτυς, *witneſs*.

PROTONOTARY. See Prothonotary.

PROTOPLAST, **Protoplaſtus**, a title ſometimes given to our firſt father Adam; from the Greek ϖρωτοπλαστος, *q. d.* firſt formed. See Plaſtic.

PROTOTYPE, ϖρωτοτυπος, the original or model, whereby a thing is formed. See Type and Archetype.

It is uſed chiefly for the patterns of things to be engraven, moulded, or caſt. See Model, Mould, *&c.*

PROTOTYPON, ϖρωτοτυπον, in grammar, is ſometimes uſed for a primitive or original word. See Primitive.

PROTRACTING, or **Protraction**, in ſurveying, the act of plotting, or laying down the dimenſions taken in the field, by means of a *protractor*, &c. See Protractor and Plotting.

Protracting makes one half of ſurveying. See Surveying.

Protracting *pin*, a mathematical inſtrument; or rather, an appendage of an inſtrument called a *protractor*.

The *protracting pin* is a fine needle, fitted into a handle, uſed to prick off degrees and minutes from the limb of the *protractor*. See Protractor.

PROTRACTOR, an inſtrument uſed in ſurgery, to draw out any foreign or diſagreeable bodies from a wound or ulcer; in like manner as the forceps. See Forceps.

Protractor is alſo an inſtrument uſed in ſurveying; whereby the angles taken in the field with a theodolite, circumferentor, or the like, are plotted or laid down on paper. See Plotting.

The *protractor* conſiſts of a ſemicircular limb B A G (*tab.* Surveying, *fig.* 29.) of braſs, ſilver, horn, or the like, divided into 180°, and ſubtended by a diameter B A; in the middle whereof is a little notch or lip, *o*, called the *centre of the protractor*.

On the limb of the *protractor* are ſometimes alſo placed numbers, denoting the angles at the centres of regular polygons: thus, againſt the number 5, denoting the ſides of a pentagon, is found 72, the angle at the centre of a pentagon. See Polygon.

Uſe of the **Protractor**.—1. *To lay down an angle of any given quantity, or number of degrees.* Suppoſe, *e. gr.* an angle of 50° with the line A *o* B, required on the point *o*. Lay the centre of the *protractor* on the given point, and the diameter of the *protractor* on the given line. Make a mark againſt the given degree 50, on the limb of the *protractor*; through which, from the given point, draw a line *o p*: this gives the angle required.

2. *To find the quantity of a given angle: e. gr.* the angle *po* A. Lay the centre of the *protractor* on the point of the angle *o*, and the diameter on the line. The degree of the limb cut by the other line *op*, *viz.* 50, is the number of degrees of the angle required.

3. *To inſcribe any given regular polygon*, e. gr. *a pentagon in a circle.* Lay the centre and diameter of the *protractor* on the centre and diameter of the circle; and make a dot againſt the number of degrees of the angle at the centre, *viz.* 72. Through this dot, and the centre of the circle, draw a line cutting the circumference of the circle. To the point of interſection, from the point where the diameter cuts the circumference, draw a right line: this line will be a ſide of the pentagon, which being taken in the compaſſes, and ſet off as often as it will go in the circumference, will give points, which being connected by lines, will form the pentagon required. See POLYGON.

4. *To deſcribe any regular polygon*, e. gr. *an octagon on a given line.* Subtract the angle at the centre, which the *protractor* gives, 45° from 180, the remainder 135 degrees is the angle included between two ſides of the octagon; one half whereof is 67½. Applying then the diameter of the *protractor* over the given line, with the centre over one extreme; make a dot againſt 67½, to which from the centre draw a line. Apply the *protractor* to the other end of the line, ſo as the centre be over the extreme, and there ſet off another angle of 67°½. From the point where the two lines thus drawn interſect as a centre, deſcribe a circle with the interval of the given line. The given line will be one ſide of the octagon, which being ſet off as often as it will go in the circumference thus drawn, will give points, which being connected, will form the octagon required.

PROTRACTOR *improved*, is an inſtrument much like the former, only furniſhed with a little more apparatus, whereby we are enabled to ſet off an angle to a minute; which is impracticable in the other.

The chief addition is an index fitted on the centre, and moveable thereon; ſo as to play freely and ſteadily over the limb. Beyond the limb the index is divided, on both edges, into 60 equal parts of the portions of circles, intercepted by two other right lines drawn from the centre; ſo as each makes an angle of one degree with lines drawn to the aſſumed points from the centre.

To ſet off an angle of any number of degrees and minutes with this *protractor*. Move the index, ſo that one of the lines drawn on the limb, from one of the fore-mentioned points, may fall upon the number of degrees given; and prick off as many of the equal parts on the proper edge of the index, as there are minutes given: thus, drawing a line from the centre to that point ſo pricked off, you have an angle with the diameter of the *protractor*, of the propoſed number of degrees and minutes.

Indeed, it may be of good uſe to lay down an angle to a minute, when we are able to take it to a minute: but till we have other-guiſe needles, and juſter theodolites, than are yet made, the old *protractor* may ſerve very well. See THEODOLITE.

PROTUBERANCE, PROTUBERANTIA, in anatomy, any eminence, whether natural or preternatural, that projects, or advances out beyond the reſt. See APOPHYSIS, PROCESS, &c.

The *orbicular protuberances* of the third ventricle of the brain are called *nates*: and the apophyſes of the *orbicular protuberances* are called *teſtes*. See NATES and TESTES.

The *annular protuberance* is a proceſs of the medulla oblongata, in form of a ring; whence its name, firſt given it by Willis. See MEDULLA *oblongata* and ANNULAR.

PROVEDITOR, PROVEDITOUR, or PROVEDITORE, an officer in ſeveral parts of Italy, particularly at Venice.

There are various kinds of *proveditors* in Venice: as *proveditor of the commons*, who is nearly the ſame with *ædile* among the Romans, conſul in Languedoc, and eſchevin in other cities.—Of theſe *proveditors* there are three:

The *proveditores alle ragioni vecchie*, *alla biave*, *alla giuſtitia*; &c. have the direction of matters relating to policy throughout the ſignory.

PROVEDITOR *general of the ſea*, is an officer whoſe authority extends over the whole fleet, when the captain-general is abſent.—He has, particularly, the diſpoſal of the caſh, and pays the ſeamen and ſoldiers.

The captain-general and *proveditor* are mutually ſpies over one another: though the *proveditor* be inferior to the general, yet is the power ſo divided, that one has authority without ſtrength, the other ſtrength without authority.

PROVEND*, or PROVENDOR, is properly a ſort of veſſel containing the meaſure of gains daily given to a horſe, or other beaſt of labour for his daily ſubſiſtence.

* Some derive the word from the Latin *præbenda*, or prebend. See PREBEND.

Hence, *provender* is alſo become a general name for all food of cattle.—In monaſteries, when the religious go to meals, they are ſaid to go to *provend*.

PROVER, in law, *probator*, an approver, or perſon who, confeſſing felony, appeals, or accuſes another of the ſame. See PROBATOR and APPROVER.

He is thus called, becauſe he muſt prove what he alledges in his appeal; which proof is either by battle, or by the country, at his election who is appealed. See TRIAL, COMBAT, &c.

39. *Edw.* 3. *coràm rege*, *rot.* 97. *Suff.* a man became an *approver*, and appealed five, who all joined battle with him, and he overcame them all: four of them were accordingly hanged, and the fifth pleaded he was a clerk. The *prover* was pardoned.

PROVERB, PROVERBIUM, is defined by Camden, a conciſe, witty and wiſe ſpeech, grounded upon long experience, and containing, for the moſt part, ſome uſeful caveat. See ADAGE. Such are, A cloſe mouth catches no flies.—An high building, a low foundation.— A carrion kite will never be a good hawk.— A ſhort horſe is ſoon curried.— A man may love his houſe well, though he ride not on the ridge.—A falſe knave needs no broker. —Better to ſpare at brim than at bottom, &c.

PROVIDENCE, PROVIDENTIA, the conduct and direction or the ſeveral parts of the univerſe, by a ſuperior, intelligent being. See UNIVERSE.

The notion of a *providence* is very ancient, even in the heathen theology: we find Thales mentions it —It is founded on this ſuppoſition, That the creator has not ſo fixed and aſcertained the laws of nature, nor ſo connected the chain of ſecond cauſes, as to leave the world to itſelf; but that he ſtill preſerves the reins in his own hands, and occaſionally intervenes, alters, reſtrains, inforces, ſuſpends, &c. thoſe laws by a *particular providence.* See MIRACLE.

Some uſe the word *providence* in a more general ſenſe, ſignifying by it, that power or action whereby the ſeveral parts of the creation are ordinarily directed.

Thus, Damaſcenus defines *providence* to be the divine will, whereby all things are ordered and directed to the proper end. —Which notion of *providence* ſuppoſes no laws at all fixed by the author of nature at the creation; but that he reſerved it at large to be governed by himſelf occaſionally. See NATURE and LAW.

The ancients called *providence* by the names of *fate*, *fortune*, *nature*, *deſtiny*, *neceſſity*, &c. See FATE, FORTUNE, &c.

The ancient Ægyptians ſeem to have been the firſt who had the notion of a divine *providence.* Arnobius obſerves they reaſoned thus:—“ *Providence* is ſo eſſential to a prince, that with-“ out it he cannot be, nor even be called, a prince; and the “ more auguſt a prince is, the more perfect ought his *provi-*“ *dence* to be. Since then God is the greateſt and moſt “ auguſt of all princes, to him muſt belong the moſt perfect “ *providence.*”

The Epicureans deny any divine *providence*, as thinking it inconſiſtent with the eaſe and repoſe of the divine nature to meddle with human affairs. See EPICUREAN.

Others deny the exiſtence of a *providence* from the ſeemingly unjuſt diſtribution of good and evil, which appear to fall indiſcriminately on the juſt and unjuſt.

Simplicius argues thus for a *providence:* If God do not look to the affairs of the world, it is either becauſe he cannot, or will not: but the firſt is abſurd; ſince to govern cannot be difficult, where to create was eaſy: the latter is both abſurd and blaſphemous. See GOD.

PROVIDENTIÆ*, in old law-books, were proviſions of meat and drink. See PURVEYANCE.

* *Providentia vini ante adventum ſuum in cellaria erat centum doliorum.* Knighton, *anno* 1354.

PROVINCE*, PROVINCIA, among the Romans, was a country conquered by them, without the bounds of Italy; governed by a deputy or lieutenant, and having peculiar laws and privileges. See PROCONSUL, &c.

* Nicod derives the word *à procul vivendo*, living afar off; but it is better deduced from *pro* and *vinco*, I overcome.

Of theſe countries that part of France next the Alps was one, and ſtill retains the name *Provence.*

PROVINCE is now chiefly uſed for a canton or diviſion of a kingdom or commonwealth, comprehending ſeveral cities, towns, &c. all under the ſame government, and uſually diſtinguiſhed by the extent either of the civil or eccleſiaſtical juriſdiction.

The *provinces* were anciently duchies, counties, &c. which have been ſince all re-united under the ſame chief. See DUKE, COUNT, &c.

The church diſtinguiſhes its *provinces* by archbiſhopricks, each containing a certain number of biſhopricks. See ARCHBISHOP.

In this ſenſe England is divided into two *provinces*, Canterbury and York.

The monks make particular diviſions of *provinces*, according to the antiquity and number of convents in each. See PROVINCIAL, ORDER, &c.

The United *Provinces* are the ſeven northern *provinces* of the Low-countries, who, revolting from the Spaniſh dominion, made a firm and perpetual alliance, offenſive and defenſive, at Utrecht, in the year 1579. See STATES *General.*

PROVINCIAL, PROVINCIALIS, ſomething relating to a *province.* See PROVINCE.

Thus we ſay, a *provincial council* or *ſynod*, &c. See SYNOD and COUNCIL.

PROVINCIAL, in the monaſtic ſenſe, denotes a perſon who has the direction and ſuperintendency of the ſeveral convents of a *province*, according to the diviſion eſtabliſhed in that order. See ORDER. &c.

The *general* of the order has ſeveral *provinces* under him; the *provincial* ſeveral priors, abbots, &c. See GENERAL, ABBOT, &c.

PROVINE, Provin, a branch of a vine laid in the ground to take root. See Vine, Propagation, *&c.*

PROVISION, Proviſio, any thing got or procured, as neceſſary for the ſubſiſtence of life. See Providentiæ.

Provision, in traffick, is ſometimes uſed for the wages due to a factor. See Factorage.

Commiſſary of Provisions. See the article Commissary.

Park of Provisions. See the article Park.

Provision, in the canon law, the title or inſtrument by virtue whereof an incumbent holds, or is *provided* of a benefice, biſhoprick, or the like. See Title, Benefice, *&c.*

Ordinary collators give *proviſions* in caſe of vacancy by death, pure and ſimple demiſſion and permutation. See Collation.

The court of Rome grants *proviſions* by reſignation, devolution, and prevention.

Provisions *by prevention* are alſo called *gratiæ expectativæ*, and *mandata de providendo*; of the great abuſe whereof throughout England frequent complaint was made in our ancient ſtatutes, and a remedy provided for the ſame by the ſtatute of premunire. See Prevention, Premunire, *&c.*

Proviſions of ſmall benefices, in the court of Rome, are only ſimple ſignatures, which are, as it were, minutes of the bull; becauſe the bulls themſelves diſpatched on parchment would be too expenſive. The ſignature is no more than the petition of the impetrant anſwered by the pope in theſe words, *Conceſſum uti petitur in præſentia D. N. papæ*, wrote in the hand of the prelate who preſides over the ſignature. See Bull.

Extraordinary *proviſions* are ſigned by the pope himſelf, in theſe words, *fiat ut petitur*, with the firſt letter of his name. See Signature.

PROVISO, in law, a condition inſerted in a deed, upon the obſervance whereof the validity of the deed depends. See Condition, *&c.*

Proviso, in judicial matters, is where the plaintiff deſiſts from proſecuting an action, by bringing it to trial in due time; in which caſe, the defendant may take out a venire facias to the ſheriff, having it in theſe words, *Proviſo quod*, &c. to the end that, if the plaintiff take out any writ to that purpoſe, the ſheriff ſhall ſummon but one jury upon them both.—In which caſe it is called *going to trial by proviſo.*

Caſu Proviso. See the article Casu.

Proviso is alſo a ſea-term.—A ſhip is ſaid to moor a *proviſo*, when ſhe has an anchor out, and alſo a hawſer aſhore; and ſo is moored with her head to the ſhore with two cables at leaſt. See Mooring.

PROVISOR is generally taken for him who hath the care of providing things neceſſary; in which ſenſe it coincides with *purveyor*. See Purveyor.

Provisor *monaſterii* is uſed for the ſteward or treaſurer of a religious houſe.

Provisor *, in our ſtatutes, alſo denotes a perſon who ſued to the court of Rome for a *proviſion*, or expectative grace. See Provision and Premunire.

* Proviſores *dicuntur, qui vel epiſcopatum, vel eccleſiaſticam aliam dignitatem in Romana curia ſibi ambiebant de futuro, quod ex gratia expectativa nuncuparunt, quia uſque dum vacaret expectandum eſſet.* Spelm.

PROVOCATIVE, in phyſic, a medicine which ſtrengthens nature, and ſtimulates or incites to venery. See Priapism.

Such are cantharides, ſatyrion, *&c.* See the article Cantharides, *&c.*

PROVOST, Præpositus, an officer, whereof there are divers kinds; civil, military, *&c.*

Provost *of the city, or of the merchants*, is the chief municipal magiſtrate in ſeveral conſiderable trading cities, particularly Edinburgh, Paris, and Lyons; much the ſame with the *mayor* in other places. See Mayor.

The *provoſt* preſides at the city-courts, and together with the ſheriffs, or bailiffs, decides all differences relating to trade and merchandize; takes cognizance of the affairs of officers of policy of the city with regard to their functions; of the delinquencies of merchants, commiſſioners, and factors; inſpects the ports, rivers, duties, impoſts, *&c.*

Authors attribute the inſtitution of *provoſt* of the *merchants* of Paris to Philip Auguſte. Du Haillan refers its epocha to the year 1190.

The *provoſt* of Edinburgh has the title of *lord*: the bailiffs are his deputies. He calls conventions of the boroughs by his own miſſives.

Provost, or Prevot *royal*, alſo denotes a ſort of inferior judge eſtabliſhed throughout France, for the taking cognizance of all civil, perſonal, real, and mixt cauſes, among the people; but without any juriſdiction in the cauſes of nobles.

Theſe in the Bourbonnois, Auvergne, *&c.* are called *chatelains*; in Normandy, *vicomptes*; in Languedoc and Provence, *viguiers.*

Grand Provost *of France*, or *of the houſhold*, has juriſdiction in the king's houſe, and over the officers therein; looks to the policy and regulation thereof, the rates of proviſions following the court, *&c.*—He was anciently called *roi des ribauds.*

Grand Provost *of the conſtable*, a judge of the ſword, who manages proceſſes againſt the ſoldiers in the army, who have committed any crime. He has four lieutenants diſtributed throughout the armies, called *provoſts of the army*; and particularly *provoſts* in the ſeveral regiments.

Provost *marſhal of an army* is an officer appointed to ſeize and ſecure deſerters, and all other Criminals. See Marshal.

The *provoſt marſhal* is to go often abroad round the army to hinder the ſoldiers from pillaging: it is his office to indict offenders, and to ſee the ſentence paſſed upon them executed.

He likewiſe regulates the weights and meaſures, and the price of all proviſions, *&c.* in the army.—For the diſcharge of his office, he has a lieutenant, a clerk, and a troop of *provoſts* or marſhals men on horſeback; as alſo an executioner.

There is alſo a *provoſt marſhal* in the navy, who hath charge of the priſoners taken at ſea.

The French have a *provoſt general of the marines*, who is to proſecute the marines when guilty of any crime, and make report thereof to the council of war; beſides a *marine provoſt* in every veſſel, who is a kind of gaoler, and takes the priſoners into his care, and keeps the veſſel clean.

Provosts *of the marſhals* are a kind of lieutenants of the marſhals of France, eſtabliſhed for the ſecurity of the country againſt rogues, vagabonds, and deſerters.

They take cognizance of royal cauſes; which, for this reaſon, are called *prevotal cauſes*: ſuch are all crimes committed by ſtrollers, or people without any fixed abode; robberies on the high-way, infraction of ſafeguard, burnings, *&c.* They pronounce *en dernier reſſort.*

There are 180 ſeats of theſe *provoſts* in France: their chief juriſdiction regards highwaymen, foot-pads, houſe-breakers, *&c.* They correſpond to the officers eſtabliſhed by Auguſtus and Tiberius, called, as Cujas tells us, *latrunculatores*, to ſhew that their office was to purſue thieves.

Provost *of the mint* is a particular judge inſtituted for the apprehending and proſecuting of falſe coiners. See Mint.

PROW*, Prora, in navigation, denotes the head or forepart of a ſhip, being that which is oppoſite to the *poop* or *ſtern.* See Poop and Stern.

* The word is formed from the Latin *prora* which ſignifies the ſame thing.

In the front hereof is the beak that cuts the water to make way for the veſſel. See Cut-water.

The *prow* is lower than the poop, and contains fewer ſtories or decks. On the beak is uſually ſome figure or hieroglyphic, which often gives name to the veſſel.

Prow, in ſtrictneſs, is only that part of the forecaſtle which is aloof, and not in the hold, particularly that between the chaſe and the loof. See Ship and Forecastle.

The ancients repreſented beaks of birds in the *prows* of their ſhips, whence they were called *roſtra.* See Rostra.

PROXENETA*, or Proxenetes, a kind of broker or agent, who tranſacts between two perſons. See Broker and Agent.

* The word is Greek, προξενητης, *q. d. conciliator*, or *pararius*, reconciler or mediator. The Latins give them a more honourable appellation, calling them *interpreters.* See Interpreter.

The term *proxeneta* is chiefly applied to thoſe who negotiate offices, marriages, *&c.* See Proxy.

The Roman law grants the *proxenetæ* an action for recovery of their hire or wages.

Theſe made a kind of office or college in Rome: to them the fathers addreſſed themſelves, to ſound and examine the inclinations of the young men they intended for their daughters.

A commentator on the Digeſt accounts it a great defect in the modern policy, that there are not now any of theſe *proxenetæ* or match-makers eſtabliſhed by public authority.

PROXIMITY, Proximitas, denotes the relation of nearneſs either in reſpect of place, or blood, or alliance. See Venue, Consanguinity, *&c.*

PROXY, Procurator, a deputy, or perſon who officiates in the room of another. See Procurator.

Princes are uſually married by *proxies* or repreſentatives.

Proxy, Procuracy, among civilians, alſo denotes a commiſſion given to a proctor by a client to manage a cauſe in his behalf. See Proctor.

PRUINA, in phyſiology, *hoar-froſt*, a concretion of the dew made by the violence of the external cold. See Dew and Freezing.

PRUNELLA, a name given by ſome phyſicians to a drineſs of the tongue and throat, happening in continued fevers, eſpecially acute ones, accompanied with a heat and redneſs of the throat, and a ſcurf covering the tongue; ſometimes whitiſh, and ſometimes blackiſh. See Fever.

Some alſo give the name *prunella* to the quinzy, and others to the aphthæ. See Quinzy and Aphthæ.

Prunellæ *ſal*, in pharmacy, is a preparation of purified ſalt-petre; called alſo *lapis prunellæ*, and *cryſtal mineral.* See Salt-Petre, Crystal, *&c.*

It is prepared by ſeparating and abſorbing ſome of the more volatile parts of the ſalt-petre, which is done by burning upon it, when melted in a crucible over the fire, about a thirtieth part of its weight of flower of brimſtone.

It is given to cool and provoke urine in fevers and quinzies; though ſome think, that ſalt-petre, purified three or four times, would be a better medicine. See Nitre and Salt-Petre.

The *ſal prunellæ* is frequently adulterated with alum; the deceit is known by its whiteneſs and glittering.

PRUNES*, PRUNA, are plums dried and baked in an oven, or in the ſun.

* The word comes from the Latin, *prunum*, plum.

The *prunes* chiefly uſed among us are black and large, brought from Bourdeaux: great quantities are uſed by the Engliſh and Dutch.—The juice of *prunes* is eſteemed laxative.

PRUNIFEROUS *trees*, or *ſhrubs*, the *plum-bearing kind*, are thoſe whoſe fruit is pretty large and ſoft, with a ſtone in the middle. See TREE and FRUIT.

In this kind, the flower adheres to the bottom of the baſe of the fruit.

PRUNING, in gardening and agriculture, the operation of lopping or cutting off the ſuperfluous branches of trees; either to diſpoſe them to bear better, to grow higher, or appear more regular. See TREE, *&c.*

Pruning is one of the moſt important branches of the gardeners province, and that whereon the weal or woe of his fruit-trees, as well as the form and regularity of his garden, in great meaſure depends. See GARDEN.

It is ſometimes practiſed purely for the trimming or adjuſting of trees to the eye, by taking away irregular branches; as in box, holly, yew, *&c.*

Sometimes to make the ſtem grow fairer, and riſe higher, by taking off all the large branches ariſing out of it, and thus ſending the ſap, which would otherwiſe be expended by them, to the top of the tree, to nouriſh and prolong the ſame.

But its more ordinary uſe is to render the tree more fertile, and to mend its fruit, by retrenching ſuch uſeleſs branches as might impoveriſh the trunk, and conſume the juice neceſſary to nouriſh the branches that bear. See VEGETATION.

Pruning is an annual operation; the amputation is uſually made ſloping, ſometimes ſtump-wiſe. Its beſt ſeaſon is about the end of February, though it may be begun as ſoon as the leaves are off, *viz.* in November, and continued to the time freſh leaves come on, *viz.* in April.

As the gardiner has uſually three kinds of trees to manage, *viz.* ſome too weak, others too ſtrong, and others in a juſt plight, he will find *pruning work* through all that ſpace; it being proper to *prune* ſome ſooner, and ſome later. The weaker and more languiſhing a tree is, the ſooner it ought to be *pruned*, to eaſe it of its offenſive branches; and the more vigorous the tree is, the longer may the *pruning* be deferred. See PINCHING and BRANCH.

For PRUNING *a tree of the firſt year*, *i. e.* a tree planted the year before: if it have only ſhot one fine branch from the middle of the ſtem, it muſt be cut to that branch, and the branch ſhortened to four or five eyes or buds; the effect of which is, that the next year there will be at leaſt two fine branches oppoſite to each other.

If the tree produce two fine branches well-placed, with weak ones among them, all required is to ſhorten them equally, to the compaſs of five or ſix inches in length; care, however being taken, that the two laſt eyes or buds of the extremes of the branches thus ſhortened, look on the right and left to the two bare ſides, that each may bring forth at leaſt two new ones, and the four be ſo well placed, that they may be all preſerved. If one of the two branches be much lower than the other, or both on one ſide, or the like, only one is to be preſerved: and that the fitteſt to begin a fine figure; the other to be cut off ſo cloſe, as that it may never be able to produce thick ones in the ſame place.—If a tree have put forth three or four branches, all in the extremity, or a little beneath, they muſt be all *pruned* by the ſame laws as the two abovementioned: if they be equally thick, they are to be uſed alike; if ſome of them be ſmaller than the reſt, they muſt only be *pruned* with a proſpect of getting a ſingle branch each, taking care to have it on that ſide which ſhall be found empty; in order to which they ſhould be ſhortened to an eye or bud that looks on that ſide; and the ſame care to be taken in the larger, in order to begin to fill up the better: if theſe fine branches ſhoot a little below the extremity, it is but ſhortening the ſtem to them: on the contrary, if the branches be moſt of them ill ones, two at leaſt, if poſſible, are to be preſerved, and *pruned* in the ſame manner as the two fine ones above. Good weak branches are to be carefully preſerved for fruit; only cutting them a little at the extremity, when they appear too weak for their length, not failing to take away all the ſapleſs branches.—If the tree have produced five, ſix, or ſeven branches, it is ſufficient to preſerve three or four of the beſt: the reſt to be cut quite off, at leaſt if they be thick; for if they be weak, *i. e.* fit for fruit branches, they ſhould be kept till they have performed what they are capable of doing; and if among the great ones there happen to be many ſmall ones, two or three of the beſt only to be preſerved, pinching off the ends of the longeſt.

PRUNING *of a tree of the ſecond year.*—If, having put out two fine wood-branches, and one or two ſmall ones, for fruit the firſt year, the ſap have altered its courſe in the ſecond year, from the thick branches to the ſmall ones, ſo that the ſmall become wood, and the large fruit-branches, the productions of the former muſt be quite cut off to the mother-branch, and thoſe of the latter uſed as fruit-branches.—If a tree, from the firſt year's *pruning*, have produced four or five branches, or more, it muſt needs be very vigorous; for which reaſon it may be ſometimes adviſeable to preſerve thoſe branches, even though they be not neceſſary to the figure of the tree, but only to conſume part of the ſap, which might otherwiſe be prejudicial to the fruit-branches. Theſe ſuperfluous branches may be left long, without much ill conſequence; but thoſe eſſential to the beauty of the tree, muſt be all *pruned* a little longer than thoſe of the preceding year, *i. e.* about two, or at moſt three eyes, or a good foot. This is making an advantage of the figure of the tree, which, without this, would not yield fruit in a long time, the redundant ſap converting all the eyes into wood-branches, which, with a more ſpare diet, would have been fruit-branches. In theſe vigorous trees, ſome branches cut ſtump-wiſe are to be left on, and even ſome thick ones, though of falſe wood, eſpecially where there are any neceſſary to the form of the tree, to employ the exceſs of ſap, and prevent its doing miſchief. Still more to aſſwage its violence, it may be neceſſary to preſerve many long, good, weak branches, when placed ſo as to occaſion no confuſion; and even on the thick branches, a good number of outlets for the ſap to range in.—Be it a general rule rather to ſpare the lower branches, and cut off the higher, than the contrary: by this means the tree ſpreads more eaſily to the bottom of the wall.

PRUNING *of a tree of the third year.*—In a tree that has been planted three years, and *pruned* twice, if it be vigorous, as many old branches as poſſible are to be preſerved, eſpecially for fruit: if it be weak, it muſt be eaſed of the burden of old branches, as well thoſe for fruit as wood. It muſt likewiſe be cut ſhort, to enable it to ſhoot out new ones; which if it cannot do with vigour, let it be pulled up, and a new one, with freſh earth, planted in its place.

In all *pruning*, proviſion is to be made for branches to proceed from thoſe now under the *pruning-knife*, to prepare ſuch as may be proper for the form; with this aſſurance, that when the high branch is taken down from over the lower, this latter being reinforced with the ſap that would have gone to the former, will certainly produce more branches, than it would have done without ſuch reinforcement.

General rules of PRUNING *fruit-trees.*—1. The more the branches ſhoot horizontally, the apter and better diſpoſed the tree is to bear fruit; conſequently the more upright the branches, the more inclined is the tree to increaſe in wood, and the leſs in fruit.

Hence, ever take care to keep the middle of a tree from wood or thick branches; and as thoſe increaſe and grow upon you, cut them out intirely; for there is no danger but the place will be ſoon filled with better and more fruitful wood.

In dwarfs you are to *prune* all open, and clear of wood, leaving none but horizontal branches: and in wall-trees, if you do but furniſh your walls with horrizontal branches, nature will provide for the middle. Chuſe therefore ſuch ſhoots as are not vigorous, to furniſh bearing branches.

2. Take care the tree be not left over-full of wood, not even of bearing branches; as is frequently ſeen in the management of peaches, nectarines, and cherries.

Nature cannot ſupply them all with juice enough; whence none will be ſupplied well: the conſequence of which is, that either the bloſſoms will fall off, or the fruit dwindle. It is certain, a multitude of branches crowding on one another, produces neither ſo good, nor ſo much fruit as where there is a convenient ſpace, beſide the diſagreeable effect of croſſing one another.

3. All ſtrong and vigorous branches are to be left longer on the ſame tree than weak and feeble ones; conſequently the branches of a ſickly tree muſt be *pruned* ſhorter, and fewer in number, than thoſe of a ſtrong healthful tree.

4. All branches ſhooting directly forward from trees that grow againſt a wall, are to be *pruned* cloſe to the branch whence they ſpring, *&c.*

5. When a branch well-placed either againſt a wall, or in a dwarf, has ſhot ſome falſe wood, neither fit for the figure nor the fruit, *prune* it off within the thickneſs of a crown piece, or ſlopingly; though this is beſt *pinched* off in the beginning of ſummer.

6. Cut off all branches ariſing from hard knobs, whereon pear-ſtalks grew; or from ſhort ſtrait branches like ſpurs.

7. If a tree, in its years, have produced branches of moderate vigour, and afterwards puts forth ſtrong ones, well-placed, though of falſe wood; the latter may be uſed as the foundation of the figure, and the other kept a time for bearing fruit.

8. When an old tree ſhoots ſtronger branches towards the bottom than the top, and the top is in ill caſe; cut it off, and form a new figure from the lower ones. If the top be vigorous, cut off the lower ones, unleſs well-placed.

9. The order of nature in the production of roots and branches, is, that a branch is always leſs than that out of which it ſhoots: if this order be inverted, uſe them as falſe wood.

10. Regard to be always had to the effects of former *pruning*, in order to correct its defects, or continue its beauties.

11. In vigorous trees, the weaker branches are the fruit-bearers. In weak trees, the ſtronger chiefly; therefore, in the latter, *prune* off the feeble and ſmall.

12. In vigorous trees, three good branches may put forth at one eye or bud: in which caſe the two ſides branches are ge-

nerally to be preſerved, and the middlemoſt cut off in May or June.

13. It is difficult to ſtrengthen a weak branch without cutting off others above it: ſometimes it can ſcarce be done without cutting off the end of the branch it ſhoots out of.

14. The *pruning* of vigorous peach-trees to be deferred till they are ready to bloſſom, the better to know which are likely to bear fruit.

15. Fruit-buds next the ends of branches are commonly thicker and better fed than others. In weak trees, therefore, it may be beſt to *prune* them early, that the ſap may not waſte itſelf in ſuch parts as are to be retrenched.

16. The farther a weak branch is from the trunk, the leſs nouriſhment it receives; and therefore the more it is to be ſhortened: but thick branches, the more diſtant they are from the heart, the more they receive; and are therefore to be removed, that the vigour may extend it ſelf to the middle or lower part.

17. A branch for wood muſt never be *pruned* without eſpecial occaſion; as where it annoys others.

18. If an old well-liking tree be diſordered with falſe wood, through ill *pruning*, or want of *pruning*; take it lower, by cutting off a branch or two yearly, till it be ſufficiently reduced. Some trees put forth ſo vigorouſly, that they cannot be reduced to compaſs in one year; but muſt be allowed to extend themſelves, otherwiſe they will produce falſe wood.

19. All trees have a predominant branch or two, if not more; yet the more equably the vigour is divided, the better: where it runs much on one ſide, it is faulty.

20. The buds of all ſtone-fruit frequently form themſelves the ſame year in which the branch they grow on is formed: the ſame holds of pears and apples; though it is, generally, at leaſt two or three years ere the latter come to perfection.

21. All ſhoots put forth in autumn, are to be *pruned* off, as naught: the ſame may be ſaid of all ſapleſs branches.

22. When a tree puts forth much ſtronger ſhoots on one ſide than the other, a great part of the ſtrong ones muſt be cut off cloſe to the body, or ſome of them ſtump-wiſe.

23. In all trees, leſs length to be allowed the weak than ſtrong branches.

24. Upper branches to be cut off cloſe to others, that they may heal over; lower branches are to be cut ſloping, or at a little diſtance, that new ones may grow out of them.

25. If a young crooked tree produce a fine branch beneath the crook, cut the head off cloſe to the branch.

26. Though five, ſix, or ſeven inches, be the ordinary lengths wood-branches are left at; yet muſt this be varied on occaſion of the vigour or weakneſs of the tree, thickneſs or ſmallneſs of the branch, the fullneſs or vacuity of the place, &c.

27. Be careful not to prune many thick branches ſtanding over weak ones; leſt the ſap, which fed the larger, flow ſo plentifully into the leſs, as to occaſion them to put forth much ill wood and ſuckers.

28. Branches ſhot from the ends of others are uſually good wood; ſometimes it happens otherwiſe, and then they muſt be *pruned*.

As to the grand *yearly prunings*:—Fruit-branches being of ſhort continuance, and periſhing the firſt year wherein they produce fruit, are to be cut off, unleſs they put forth ſhoots for bloſſoms the ſucceeding year. In the ſecond *pruning*, about the middle of May, where the fruit is ſo cloſe as to be like to obſtruct each other, ſome of them and their branches to be taken off, as muſt alſo the multitude of young ſhoots that cauſe confuſion. Branches more luxurious than others to be cut clear off. To preſerve old trees, they muſt be disburdened by leaving few branches for wood on them, and thoſe to be ſhortened to five or ſix inches; and very few weak ones, and none dry, and nigh waſted.

PRUNING *of foreſt or timber trees.*—For large trees, it is beſt not to prune them at all; yet if there be an abſolute neceſſity for it, avoid taking off large boughs as much as poſſible; and obſerve the following rules.

1. If the bough be ſmall, cut it ſmooth and cloſe, that the bark may ſoon cover it; and ſloping, that the water may run off.

2. If the branch be large, and the tree old, cut it off at three or four foot from the ſtem, or where any young ſhoots are found iſſuing out of it.

3. Boughs growing upright, not to be cut croſs over, but ſloping upwards. In boughs leaning from the head, the ſlope to be on the lower ſide.

4. If the tree grow crooked, cut it off at the crook, ſloping upwards; and nurſe up one of the moſt promiſing ſhoots for a new ſtem. Indeed, in trees that have great piths, as the aſh, walnut, &c. we muſt be cautious of cutting off the heads.

5. If the tree grow top-heavy, its head muſt be lightened; and that rather by thinning the boughs that grow out of the main branches, than by cutting off the main branches themſelves. But if you would have them ſpring, it is beſt done by rubbing off the buds, as they put out in the ſpring, and ſhrouding up the ſide-ſhoots.

6. If the ſide-bough ſtill break out, and the top be able to ſuſtain itſelf, give the boughs that put forth in ſpring a *pruning* after Midſummer; cutting them cloſe. This will cauſe the bark to cover and kill them, ſo as never to ſhoot out again; and is the only method to make a tree grow with a fine, ſtrait, handſom body. See SHROWDING.

PRUNING *of vines.* See the article VINE.

PRURITUS, a painful, pleaſurable kind of ſenſation of the ſkin, popularly called *itching*; which is ſuppoſed to ariſe hence, that the extremities of the capillary veins, being obſtructed, cannot take up the redundant blood of the members, to carry it back again to the heart; whence as there is a freſh ſtock of blood continually ſent into the part by the inceſſant pulſation of the heart, the fibres become preternaturally ſtretched or diſtended.—And hence the uſually titillating ſenſe of itching.

PRYTANEUM, Πρυτανειον, in antiquity, a conſiderable building in Athens, where the council of *prytanes* aſſembled, and where thoſe who had rendered any ſignal ſervices to the commonwealth, were maintained at the public expence. See PRYTANIS.

PRYTANIS, or PRYTANES, in antiquity, the firſt magiſtrate in moſt of the cities of Greece.

At Athens there were fifty *prytanes*; at Corinth there was but one, who was the ſame with what the *archon* was at Athens. See ARCHON.

The *prytanes* of Athens were the ſenators who compoſed the grand council that governed the ſtate; and correſponded to what we now call, *the ſtates general of the united Provinces.*

Fifty of theſe were choſe each year out of each tribe; and to theſe were nominated fifty more, to ſupply the places of the former, in caſe of death or male-adminiſtration.

The tribes took the government by turns, each after other, for the ſpace of thirty-five days.—This was an eſtabliſhment of Solon. Scaliger is miſtaken, when he ſays the tribes took their turns every day. See TRIBE.

All the fifty *prytanes* of the tribe did not govern together during thoſe five weeks; but in companies, ten at a time, choſen by lot; ſeven days each company: after which another tribe came into play, and had its five weeks after the ſame manner.

PSALM*, ψαλμος, a divine ſong, or hymn. See SONG and HYMN.

* The word is formed from the Greek, ψαλλω, *I ſing*.

The denomination *pſalm* is now appropriated to the cl. *pſalms* of David; and the name *canticle*, or *ſong*, given to other pieces of the ſame kind, compoſed by other prophets and patriarchs.

The ancients, as is obſerved by St. Auguſtin, made this difference between a *canticle* or ſong, and a *pſalm*, that the former was ſung ſolitarily, or by the voice alone, but the latter accompanied with a muſical inſtrument.

The *pſalms*, in the ancient editions, are divided into five books; nor is David's name found at the head of more than ſeventy-three of them; though ſome, and among the reſt, St. Auguſtin and St. Chryſoſtom, attribute all the hundred and fifty to him without exception.

The Jews, however, were always of another ſentiment; and it is certain there are ſome few, at leaſt, that are not his.—St. Jerom obſerves, among the number, ſeveral that were compoſed long time after David. Du Pin adds, that it is difficult to aſcertain the authors; all we know of the book is, that it is a collection of ſongs, made by Eſdras.

Gradual pſalms were thoſe anciently ſung on the ſteps of the temple.—The *penitential pſalms* were not formerly the ſame with thoſe now called by that name. See GRADUAL, &c.

PSALMODY, ψαλμωδια, the art of ſinging pſalms. See PSALM and SINGING.

PSALTER, ψαλτηριον, the book or collection of pſalms, aſcribed to David. See PSALM.

There are a multitude of editions of the *pſalter*.—Auguſtin, Juſtinian, a Dominican, and biſhop of Nebo, publiſhed a *polyglot pſalter* at Genoa, 1516. Contarinus publiſhed the *pſalter* in Hebrew, Greek, Chaldee, and Arabic, with Latin notes and gloſſes. See POLYGLOT.

PSALTER is alſo uſed among religious for a large chaplet or roſary, conſiſting of 150 beads; the number of pſalms in the *pſalter*.

St. Dominic is ſaid to have been the inventor of the *pſalter*. See CHAPLET and ROSARY.

PSALTERY, PSALTERION, alſo denotes a muſical inſtrument much in uſe among the ancient Hebrews, who called it *nebel*.

We know but little of the preciſe form of the ancient *pſaltery*: that now in uſe, is a flat inſtrument, in form of a pezium, or a triangle truncated at-top.

It is ſtrung with thirteen wire chords, ſet to uniſon or octave, and mounted on two bridges on the two ſides.—It is ſtruck with a *plectrum* or little iron rod, or ſometimes a crooked ſtick; whence it is uſually ranked among the inſtruments of percuſſion.

Its cheſt, or body, is like that of a ſpinet. It has its name *à pſallendo*; ſome call it *nablum*, or *nablium*.

Papias alſo gives the name *pſaltery* to a kind of flute, uſed in churches, to accompany the ſinging; in Latin, *ſambucus*.

PSAMMISMUS*, ψαμμισμος, in medicine, a term ſometimes uſed for a bath of dry and warm ſand, to dry the feet of dropſical perſons upon. See BATH, &c.

* The word is formed from the Greek ψαμμος, *ſand* or *gravel*.

PSATYRIANS, PSATYRIANI, a ſect of Arians, who in the council of Antioch, held in the year 360, maintained that the Son was not like the Father, as to will; that he was taken from nothing, or made of nothing; and that in God, generation was not to be diſtinguiſhed from creation. See ARIAN.

PSEUDO *, a term, or particle, uſed in the compoſition of divers Latin and Engliſh words; in the ſenſe of *falſe* or *ſpurious.*

* The word is formed from the Greek ψευδος, *lye, falſhood,* of ψευδω, *decipio, fallo,* I deceive.

We ſay a *pſeudo-martyr, q. d.* a falſe witneſs; *pſeudo-prophet, pſeudo-apoſtle, pſeudo-chriſt,* &c.

PSEUDO-DIPTERE, ψευδοδιπτερος, in the ancient architecture, a temple with eight columns in front, and a ſingle row of columns all around. See TEMPLE.

The word ſignifies *falſe* or *imperfect diptere*; and is uſed to diſtinguiſh this from the *diptere*; which had two rows of columns all around. See DIPTERE.

PSEUDONYMUS *, ψευδωνυμος a name given by the critics to thoſe authors who publiſh books under falſe or feigned names.—Much as the name *cryptonymus* is given to thoſe who publiſh under ſecret and diſguiſed names: and *anonymus,* to thoſe who publiſh without any names at all. See ANONYMOUS.

* The word is formed from the Greek ψευδη, *lye*; and ονομα, *name.*

The apoſtolical conſtitutions, the greater epiſtles of St. Ignatius, *&c.* are uſually ſuppoſed to be *pſeudonymous.* See CONSTITUTIONS.

PSEUDO-STELLA, in aſtronomy, any kind of meteor or phænomenon, newly appearing in the heavens, and reſembling a ſtar. See PHÆNOMENON, METEOR, *&c.*

PSILOTHRON *, ψιλωθρον in medicine, *depilatory*; an external form of medicine proper to make the hair fall. See DEPILATORY.

* The word is formed from the Greek ψιλοω, *deglabro,* I make bald, or bare; and θριξ, *hair.*

Such are ſtrong lixiviums, quick-lime, ants eggs, ſandarac, orpiment, and arſenic.

PSOAS *magnus,* or *lumbaris,* in anatomy, a round, hard, fleſhy, muſcle, which ariſes from the internal ſide of the tranſverſe proceſſes of the vertebræ of the loins, within the abdomen; and deſcending upon part of the internal ſide of the ilium, is inſerted into the lower part of the little trochanter.—It is the firſt of the flexors of the thigh. See FLEXOR and THIGH.

PSOAS *parvus,* ariſes fleſhy from the inſide of the upper vertebræ of the loins, and hath a thin and broad tendon, which embraces the *pſoas magnus*; and which is inſerted into the os innominatum, where the os pubis and ilium join together.—This, tho' ordinarily reckoned among the muſcles of the thigh, properly belongs to the lower venter.

PSORA, ψορα, in medicine, a cutaneous diſeaſe, called by the Latins, *ſcabies*; by the Engliſh, *itch.* See ITCH.

The *pſora* is deſcribed by Celſus as a reddiſh hardneſs and roughneſs of the ſkin, from an eruption of puſtules thereon; ſome drier, others moiſter; and ouzing out a ſanious matter, which occaſions a continual *pruritus* or itching.

Theſe eruptions are moſt frequent about the junctures of the limbs, and between the fingers: in ſome they ſpread over the whole body; in others they ſoon ceaſe; and in ſome return at certain ſeaſons of the year.

In youth, this diſeaſe frequently prevents others, or cures them.—It ſometimes degenerates into a leproſy. See LEPROSY.

The *dry* is much more difficultly cured than the *moiſt,* which ariſes from a diſorder in the humours or viſcera. Willis derives the diſeaſe from a ſharp, ſaline humour, occaſioning an itching.

Some of the later phyſicians will have it to conſiſt in a number of little animals preying on the ſkin: and hence it is that it becomes ſo very contagious.—Willis obſerves, that in this reſpect it is ſecond to no other diſeaſe but the plague, which many conjecture to ariſe in like manner from animalcules.

For the cure, Borelli recommends a lotion of black ſoap, to poor people, *&c.* But the ſoap to be ſoon waſhed off, leſt it excoricate the ſkin. Where the diſeaſe is inveterate, recourſe is had to ſalivation. See SALIVATION.

PSORICA, ψωρικα, medicines good againſt the itch, ſcabs, and other cutaneous eruptions, eſpecially of the eye-lids.

PSOROPHTHALMIA*, ψωροφθαλμια, a ſcurfy eruption of the eye-brows, attended with a pruritus, or itching of the part.

* The word is formed from ψωρα, *itch*; and οφθαλμος, *eye.*

PSYCHOLOGY*, ψυχολογια, the doctrine of the ſoul. See SOUL.

* The word is formed from the Greek ψυχη, *ſoul*; and λογος, *diſcourſe.*

Anthropology, or the ſcience which conſiders man, conſiſts of two parts: the firſt treating of the body, and the parts belonging thereto, called *anatomy:* and the ſecond of the ſoul, called *pſycology.* See ANTHROPOLOGY, *&c.*

PSYCHOMANCY*, a kind of magic, or divination, performed by raiſing the ſouls of perſons deceaſed. See DIVINATION.

* The word is formed of ψυχη, *ſoul*; and μαντεια, *divination.*

PSYCHROMETER*, an inſtrument for meaſuring the degree of coldneſs of the air; more uſually called *thermometer.* See THERMOMETER.

* The word is formed from the Greek ψυχρος, *cold*; and μετρον, *meaſure.*

PTARMICA* πταρμικα, medicines proper to promote ſneezing; more uſually called *errhines* and *ſternutatories.* See STERNUTATORY.

* The word is formed of the Greek, πταρμος, *ſternutamentum,* ſneezing.

PTERYGIUM*, πτερυγιον, in medicine, a diſeaſe of the eye, much of the ſame nature with what the Latins call *unguis,* nail; and ſometimes, though improperly, *pannus,* web. See UNGUIS and PANNUS.

* The word is formed by diminution from the Greek πτερυξ, *ala,* a wing; *q. d.* a little wing.

The cure is much the ſame as that of the *ophthalmia.* See OPHTHALMIA.

PTERYGIUM is alſo the name given to a *whitloe,* when ſeated at the root of the nail. See PANARIS.

PTERYGOIDES* πτερυγοειδης, in anatomy, two apophyſes of the os ſphenoides; ſo called from their reſembling the wings of a bat. See SPHENOIDES.

* From the Greek πτερυξ, πτερυγος, wing, and ειδος, *form.*

PTERYGOIDEUS *internus,* is a muſcle of the jaw which ariſes from the internal part of the *pterygoides* proceſs, and deſcends to be inſerted into the inferior part of the internal ſide of the lower jaw, near its angle.—When it acts, it draws the jaw to one ſide.

PTERYGOIDEUS *externus,* is a muſcle which ariſes from the external part of the ſame proceſs, and goes backward to be inſerted between the condyloid proceſs, and the corone, on the inſide of the lower jaw. This pulls the lower jaw forwards, and makes it ſhoot beyond the upper.

PTEROPHORI, πτεροφοροι, in antiquity, a name given to ſuch of the Roman couriers as brought tidings of any declaration of war, a battle loſt, or any miſhap befallen the Roman armies.

They were ſo called, becauſe they bore wings on the points of their pikes: from the Greek πτερον, wing, and φερω, I bear.

PTERYGOPHARYNGÆUS, a pair of muſcles ariſing from the proceſſus *pterygoides,* where the tendon of the *pterygoſtaphylinus* is reflected.—Some fleſhy fibres of it do likewiſe ariſe from the upper jaw-bone, behind the fartheſt grinder, and ſome from the ſides of the tongue, and os hyoides.

From all theſe places its fleſhy fibres paſs ſemicircularly, and meet with thoſe of the oppoſite ſide in the middle line on the back ſide of the pharynx externally.

In the inner ſurface of the fauces is another order of fleſhy fibres, decuſſating each other at acute angles.—They ariſe both from the ſides of the uvula, and from the root of the cartilage; and deſcend obliquely to their inſertions in the glandulous membrane of the pharynx.

This muſcle ſerves both to conſtringe the pharynx, and to compreſs the tonſils, and force out the mucus; whence its uſe in hawking.

The various originations of the ſeveral parts of this muſcle have cauſed its being generally divided into ſeveral muſcles.—Thus Valſalva calls that part ſpringing from the tongue, the *gloſſopharyngæus*; that immediately below it, the *hyopharyngæus.*—Hence, in like manner, come the *cephalopharyngæus, ſphenopharyngæus,* &c.

PTERYGOSTAPHYLINUS*, in anatomy, the internal muſcle of the uvula; called by Valſalva, *novus tubæ muſculus*; as being unknown to the ancient anatomiſts.

* The word is formed from the Greek πτερον, wing, and σταφυλη, *uvula.*

It ariſes fleſhy, near the ſphenoſtaphylinus, from the os petroſum, where the tube from the palate enters that, near an acute proceſs of the ſphenoides; and aſcending to the proceſſus *pterygoides,* becomes a broad flat tendon, which expands itſelf on the fore part of the uvula.

Some of the tendinous fibres aſcend to the lower edge of the os palati, others deſcend down the ſides of the fauces; the middle ſeries either unites with thoſe of the other ſide, or is loſt in two fleſhy bodies that compoſe the uvula. See UVULA.

This muſcle, with its partner, draws the uvula upwards and forwards, and alſo raiſes the amygdalæ.

PTISAN, PTISANA, πτισανη, in medicine, a cooling potion, uſually made of barley boiled in water, and ſweetened with liquorice, *&c.*

To theſe are ſometimes added the herb quich-graſs, and ſena, to render it laxative.—Moſt of the decoctions of phyſicians are in *ptiſans.* See DECOCTION.—Feveriſh patients are prohibited wine, *&c.* and reduced to *ptiſans.*

PTOLEMAIC *ſyſtem,* or *hypotheſis,* the order or diſpoſition of the heavens and heavenly bodies, wherein the earth is ſuppoſed to be at reſt, in the centre, and the heavens to revolve round it, from eaſt to weſt, carrying with them the ſun, planets, and fixed ſtars, each in their reſpective ſpheres. See SUN, EARTH, PLANET, *&c.*

This hypotheſis took its name from Ptolemy, the great Alexandrian aſtronomer, becauſe maintained and illuſtrated by him: not that it was his invention, for it was much older, as having been held by Ariſtotle, Hipparchus, *&c.* See it further illuſtrated under the article SYSTEM.

PTOLEMAIC *ſphere.* See the article SPHERE.

PTOLEMAITES, a branch of the ancient Gnoſtics, ſo called from their leader Ptolemy, a man of conſiderable learning, who improved greatly on the ſyſtem of the Gnoſtics his predeceſſors, and inlarged it with a number of notions and viſions of his own. See Gnostics.

St. Epiphanius is very ample on the ſubject of the *Ptolemaites* and produces a letter of Ptolemy to Flora, wherein that heretic lays down his doctrine.—He maintained, that in the law of Moſes there were three things to be conſidered, inaſmuch as it did not all come from the ſame hand; but part of it, ſaid he, from God, part of it from Moſes, and part of it from neither of them, but from the pure traditions of the ancient doctors: on which laſt part it was that he founded his dreams.

PTYALISM*, Ptyalismus, in medicine, a *ſpitting*; or a diſcharge of ſaliva by the glands of the mouth; whether it amount to an abſolute ſalivation, or not. See Salivation.

[*] The word is Greek, πτυαλισμος, formed from πτυω, *ſpuo, exſpuo*, I ſpit.

PUBERTY, Pubertas, in the civil law, a natural majority, or the age wherein a perſon is allowed to contract marriage. See Majority, &c.

Boys arrive at *puberty* at fourteen years of age, maids at twelve. —*Full puberty* is accounted at eighteen. See Age.

PUBES, a term uſed for the external parts of the *pudenda*, or parts of generation, in both ſexes.

This, from the age of *puberty*, is ſuppoſed to be covered, more or leſs, with hair; whence the name. See Hair.

PUBIS *os*, or *os* Pectinis, in anatomy, a bone of the hip, ſituate in the fore and middle part of the trunk, and making the lower and inner part of the os innominatum. See *tab. anat.* (Splanch.) *fig.* 1. *lit. y.* (oſteol.) *fig.* 3. *n.* 18. *fig.* 7. *n.* 19. *fig.* 12. *lit. d.* See alſo Innominatum *os.*

It is joined to the other part by a cartilage, thicker, but looſer in women than men; in the former whereof, the *os pubis* recedes, or gives a little in time of travail, to make way for the fœtus. See Delivery.

It has a large foramen, which makes room for the paſſage of two muſcles of the thigh, beſides a ſinus, whereby the crural veins and arteries paſs to the thighs.—See *tab. anat.* (oſteol.) *fig.* 3. *lit. S. S.*

PUBLIC *buildings*. See the article Building.

Public *road*. See the article Road.

Public *notary*. See Notary *public*.

PUBLICAN, Publicanus, among the Romans, a perſon who farmed the impoſts, taxes, and public revenues.

The appellation appears to have been odious to the Jews, &c. apparently, becauſe of the exactions of this ſort of people.

Publicans was alſo a name given to the *Arnoldiſts* and *Albigenſes*.

PUBLICANDIS—*Regula de* publicandis. See Rule.

PUBLICATION, Publicatio, the act of *promulgating*, or making a thing known to the world. See Promulgation.

By the canons, *publication* is to be made of the banns of marriage three times ere the ceremony can be ſolemnized; without eſpecial licence to the contrary. See Marriage, Banns, &c.

PUCELLAGE, Pucellagium, in an ancient manuſcript written puellagium, denotes the ſtate of virginity, or maidenhead. See Virginity.

PUDENDUM denotes a thing to be aſhamed of. Hence, *pudendum virile* ſignifies the penis, and *pudendum muliebre*, the cunnus. See Genital, &c.

PUDICA *planta*. See Sensitive *plant*.

PUERI *alimentarii*. See the article Alimentarii.

PUERILE *ſtyle*. See the article Style.

PUERILITY, in diſcourſe, is by Longinus defined to be a thought, which, by being too far fetched, becomes flat and inſipid.—*Puerility*, he adds, is the common fault of thoſe who affect to ſay nothing but what is brilliant and extraordinary. See Sublime.

PUERORUM *epiſcopus*. See the article Episcopus.

PUGIL*, among phyſicians, &c. a meaſure of flowers, ſeeds, or the like matters, containing ſo much as may be taken up between the thumb and two fore-fingers. See Measure.

[*] The word comes from the Latin, *pugillus*, little hand.

The *pugil* is eſteemed the eighth part of the manipule or handful; though ſome confound *pugil* with *manipulus*, and uſe it for a handful.—The French frequently call it *pincée*, pinch. See Manipulus.

PUISNE*, Puny, in law, a younger-born; or a child born after another. See Mulier.

[*] The word is pure French, in which language it bears the ſame ſignification.

Puiſne is not only applied to the ſecond, third, fourth, &c. with regard to the firſt; but to the third with regard to the ſecond, &c.—The laſt of all is called abſolutely *cadet*. See Cadet. In the like ſenſe we ſay a *puiſne judge*, a *puiſne counſellor*. See Judge and Justice.

PUKING, a cant word for a nauſea, or diſpoſition to vomit. See Nausea and Vomiting.

PUL, in commerce, a general name which the Perſians give to all the copper-moneys current in that empire; particularly the *kabeſqui* and *demi-kabeſqui*. See Money and Coin.

Olearius, who was at Iſpahan in 1637. in the retinue of the ambaſſador of Holſtein, aſſures us, That each city in Perſia has its ſeveral copper-money, marked with its particular badge, which is only current in that diſtrict, and changed every year.—At the beginning of each year, which is at the vernal equinox, all the old money is cried down, and the new appears in its place. Both the emperor and the ſtate find their intereſt in this frequent change: the firſt, in that he only gives at the rate of 17 *d.* ſterling *per* pound for copper; yet delivers it out coined in *kabeſqui* and *demi-kabeſqui* at above 2 *s. per* pound: the ſecond, in that the copper-money is by this means leſs abundant, being reduced each year to nearly the ſame quantity.

The ſame author adds, that at the time when he was in Perſia, the *kabeſqui* at Iſpahan were ſtruck with the image of a lion, at Scamachia with a devil, at Kaſchan with a cock, and at Kilan with a fiſh.

PULLEY, in mechanics, one of the five mechanical powers; conſiſting of a little wheel, or rundle, having a channel around it, and turning on an axis; ſerving, by means of a rope, which ſlides in its channel, for the raiſing of weights. See Mechanical *power*.

The Latins call it *trochlea*; and the ſeamen, when fitted with a rope, a *tackle*. — An aſſemblage of ſeveral *pulleys* is called a *polyſpaſton*.

The moveable wheel or rundle, is called the *ſheave* or *ſhiver*; the axis on which it turns, the *gudgeon*; and the fixed piece of wood or iron, into which it is put, the *block*.

Doctrine of the Pulley. —1°. If a power P, (*tab.* Mechanics, *fig.* 49.) ſuſtain a weight Q. by means of a ſingle *pulley* AB, in ſuch manner as that the line of direction of each is a tangent to the periphery of the rundle; the weight and the power are equal.

Hence, a ſingle *pulley*, if the lines of direction of the power and the weight be tangents to the periphery, neither aſſiſts nor impedes the power, but only changes its direction.

The uſe of the *pulley*, therefore, is, when the vertical direction of a power is to be changed into an horizontal one; or an aſcending direction into a deſcending one; and on the contrary.

This is found a good proviſion for the ſafety of the workmen employed in drawing with the *pulley*. — For ſuppoſe a large weight E F *g* required to be raiſed to a great height by workmen pulling a rope AB: if now the rope ſhould chance to break, the workmens heads underneath would be in immediate danger; but if by means of the *pulley* B, the vertical direction AB be changed into an horizontal one BC, there is no danger from a breaking of the rope.

This change of direction by means of a *pulley* has this further advantage; that if any power can exert more force in one direction than another, we are here able to employ it in its greateſt force.

Thus, *e. gr.* an horſe cannot draw in a vertical direction, but draws with all its advantage in an horizontal one. By changing the vertical draught, therefore, into an horizontal one, an horſe becomes qualified to raiſe a weight.

But the grand uſe of the *pulley* is, where ſeveral of them are combined; thus forming what Vitruvius, and others after him, call *polyſpaſta*; the advantages whereof are, that the machine takes up but little room, is eaſily removed, and raiſes a very great weight with a very moderate force.

2°. If a power applied in E, (*fig.* 50.) acccording to the line of direction BE, which is a tangent to the *pulley* in B, and parallel to the rope AD, ſuſtain the weight F ſuſpended from the centre of the *pulley* C; the power is ſubduple of the weight.

3°. The effect of *polyſpaſta* is founded on the following theorem:—If a power applied in B, (*fig.* 51.) ſuſtain (by means of a *polyſpaſton*) a weight F, ſo as all the ropes AB, HI, GF, EL, CD, are parallel to each other; the power will be to the weight as unity to the number of ropes, HI, GF, EL, CD, drawn by the weight F; and therefore as unity to the number of *pulleys*, higher and lower, taken together.

Hence the number of *pulleys* and the power being given, it is eaſy to find the weight that will be ſuſtained thereby: or, the number of *pulleys* and weight to be ſuſtained, being given, the power is found: or, the weight and power being given, the number of *pulleys* the *polyſpaſton* is to conſiſt of, is found. See Polyspaston.

4° If a power move a weight by means of ſeveral *pulleys*; the ſpace paſſed over by the power will be to the ſpace paſſed over by the weight, as the weight to the power.

Hence, the ſmaller the force that ſuſtains a weight by means of *pulleys* is, the ſlower is the weight raiſed: ſo that what is ſaved in force, is ſpent in time.

PULMO, in anatomy. See Lungs.

Pulmo *marinus*, *ſea-lungs*, among naturaliſts, a light ſpongeous body, of a ſhining colour, like cryſtal, intermixed with blue, and uſually of a figure reſembling the human lungs: whence its name.—It is alſo called *urtica marina*, the ſea-nettle.

It ſwims at top of the water, and is popularly reputed to preſage a ſtorm.—It is commonly ſuppoſed to be only a viſcous excrement of the ſea, hardened by the ſun: but Sir Robert Sibbald and Dr. Merret rank it among the zoophytes.

It ſhines in the night-time, and communicates its luminous property to a ſtick rubbed therewith. Being applied to the ſkin, it raiſes an itching, and takes off the hair.

PULMONARY *veſſels*, in anatomy, are thoſe which carry the blood from the heart to the lungs, and back again from the lungs to the heart.

Theſe are two in number, *viz.* the *pulmonary artery* and *vein*.

PULMONARY *artery*, which the ancients called *vena arterioſa*, the *arterial vein*, is, in reality, an artery, and compoſed, like the reſt, of ſeveral tunics.— It ariſes from the right ventricle of the heart, and divides into two large branches; which ſubdividing into ſeveral ſmaller, diffuſes itſelf throughout the whole ſubſtance of the lungs.—See *tab. anat.* (Angeiol.) *fig.* 8. *lit. dd.* &c. *bb. fig.* 12. *lit. I.* See alſo LUNGS.

PULMONARY *vein*, which the ancients called *arteria venoſa*, the *venous artery*, conſiſts of four membranes like the other veins. It ariſes in the lungs from an infinity of little branches, which uniting in one trunk, opens into the left ventricle of the heart. —See *tab. anat.* (Angeiol.) *fig.* 9. *lit. a. b. c. d. d. d.* See alſo HEART.

For the office of theſe veſſels, ſee CIRCULATION. See alſo RESPIRATION, HEART, BLOOD, *&c.*

Mr. Cowper gives us an inſtance of a polypus in the *pulmonary vein.* See POLYPUS.

PULMONARY *conſumption*, or conſumption of the lungs, is what we properly call a *phthiſis.* See PHTHISIS and CONSUMPTION.

PULMONUM *anima.* See the article ANIMA.

PULP, PULPA, in fruits, the *fleſh*; or that ſoft and ſucculent part between the rind and the nucleus or ſeed. See FRUIT.

The *pulp* of a tree or plant, is the parenchyma, which grows and ſwells by means of a juice, at firſt very coarſe and diſagreeable, at length ſweeter and more delicate. See PARENCHYMA; ſee alſo VEGETABLE, PLANT, *&c.*

PULP, in pharmacy, denotes the ſoft part of fruits, roots, or other bodies, extracted by infuſion or boiling, and paſſed through a ſieve.

PULP, in medicine, denotes the fatteſt, fulleſt, and moſt ſolid part of the fleſh. See FLESH.

Phyſicians apply the word particularly to the upper part of the belly, becauſe fleſhy; and becauſe it is here that they feel animals *, to examine whether they be fat.

* This part the Latins call *pulpa*, from *palpare*, to feel, handle.

PULPIT*, PULPITUM, a term now reſtrained to an elevation, or apartment in a church, whence ſermons are delivered.

* Some authors derive the word from *publicum*, becauſe people are there expoſed to open view.

PULPITUM, among the Romans, was a part of the theatre, called alſo *proſcenium*, or what we now call the *ſtage*, whereon the actors trod.

Tho' ſome ſay it was properly an eminence on the ſtage for the muſic, or a ſuggeſtum whence declamations, *&c.* where ſpoken.

The French uſe the word *pulpit*, *pupitre*, for a reading-deſk in a church, library, or the like: thoſe large ones in churches they properly call *lutrins.*

PULSATION, PULSATIO, in medicine, the motion of the pulſe, or the beating of an artery. See PULSE.

PULSE, PULSUS, in the animal œconomy, denotes the beating or throbbing of the heart and arteries. See ARTERY.

The *pulſe* is that reciprocal motion of the heart and arteries, whereby the warm blood, thrown out of the left ventricle of the heart, is ſo impelled into the arteries, to be by them diſtributed throughout the body, as to be perceivable by the finger. See BLOOD.

The pulſation of the arteries ariſes from that of the heart; and has, like it, a ſyſtole and diaſtole; the ſyſtole of the one correſponding to the diaſtole of the other. See HEART, SYSTOLE, *&c.*

Galen tells us, that Hippocrates was the firſt who obſerved the motion of the *pulſe.* — M. Homberg mentions the caſe of a woman in Paris, who had a *pulſe* in the veins, perfectly like that we commonly obſerve in the arteries. He adds, that he is the firſt author that ever mentioned ſuch a thing. See VEIN.

The *pulſe* is thus accounted for.—When the left ventricle of the heart contracts, and throws its blood into the great artery; the blood in that artery is not only thruſt forwards towards the extremities, but the channel of the artery is likewiſe dilated; becauſe fluids, when they are preſſed, preſs again towards all ſides, and their preſſure is always perpendicular to the ſides of the containing veſſels: but the coats of the artery, by any ſmall impetus, may be diſtended; therefore, upon the contraction of the heart, the blood from the left ventricle will not only preſs the blood in the artery forwards, but both together will diſtend the ſides of the artery: and thus is a motion of dilatation effected. And when the impetus of the blood againſt the ſides of the artery ceaſes, that is, when the left ventricle ceaſes to contract, then the ſpiral fibres of the artery, by their natural elaſticity, return again to their former ſtate, and contract the channel of the artery, till it is again dilated by the ſyſtole of the heart: ſo that here is a motion of contraction effected.

The diaſtole or dilatation of the artery is called its *pulſe*, and the time of the ſpiral fibres returning to their natural ſtate, is the diſtance between two *pulſes.*

This *pulſe* is in all the arteries of the body at the ſame time: for while the blood is thruſt out of the heart into the aorta, that artery being full, the blood muſt be propelled in all the arteries at the ſame time; and becauſe the arteries are conical, and the blood moves from the baſis of the cone to the apex, therefore the blood is continually preſſing againſt the ſides of the veſſels; and conſequently every point of the artery muſt be dilated, at the ſame time that the blood is thrown out of the left ventricle of the heart; and as ſoon as the elaſticity of the ſpiral fibres can overcome the impetus of the blood, the arteries are again contracted.

Thus, two cauſes operating alternately, the heart and fibres of the arteries keep the blood in a continual motion. See CIRCULATION.

The obſervation of the *pulſe* is of the laſt importance to a phyſician; both as it diſcovers the ſtate of the heart, the firſt mover in the animal frame; and as it ſhews the nature, quantity and motion of the blood, that univerſal humour whereon all the reſt depend; and as it indicates the condition of the artery, the primary veſſel of the whole body.

A ſtrong PULSE, then, denotes, 1. A great muſcular force of the contracting heart; and, conſequently, the ſtrength of the contracting cauſe; *i. e.* 2. A briſk and copious influx of the nervous juice into the villi of the heart. 3. Plenty of blood. 4. A laudable ſecretion and circulation of humours.

A ſtrong *pulſe*, therefore, is a good preſage, if it be alike throughout the whole body. Indeed it is frequently fallacious in apoplectic, and ſome other diſeaſes, where the paſſage between the heart and the brain is free; and in other parts, eſpecially the viſcera, obſtructed.

A weak PULSE denotes the contrary of the former; though this ſometimes deceives, particularly in fat people.

A hard PULSE ſignifies, 1. That the membrane of the artery is drier than ordinary: and therefore, 2. Obſtructions in the minute veſicles, whereof the membranes of the artery are woven. 3. That the arteries are full: but, 4. That their capillary extremities are obſtructed with an inflammatory viſcidity. 5. That the blood is very denſe and compact: hence, 6. That the circulations, ſecretions and excretions are depraved.

A ſoft PULSE denotes the contrary to all theſe; yet is very fallacious in an acute peripneumonia.

A ſlow PULSE denotes, 1. That the contractions of the heart are ſlow; and therefore, 2. A ſlowneſs of the influxes of the nervous juice from the brain into the villi of the heart. 3. That the blood has circulated a great number of times. 4. That all the humours circulate eaſily through their veſſel. Indeed, if the *pulſe* be thus from weakneſs, it is an ill ſign.

A quick PULSE denotes the contrary to all theſe; as acrimonies, ſpirits agitated, fevers, phrenſy.

An equable PULSE denotes a conſtant tenor of the vital functions; an uneven one the contrary.

An intermitting PULSE ſhews life in a ſlippery ſituation.

An intermitting *pulſe* is either owing to a fault in the nervous juice, which flows unequally into the heart; or in the veſſel which tranſmits the blood and humours; or to the humours themſelves.

The cauſe of this diſorder is various, as convulſions, polypus's, cacochymia's, inflammations, want of blood, bony or cartilaginous arteries, *&c.*

A ſtrong, equable, and, at the ſame time, ſlow *pulſe*, is of all others the beſt. A ſtrong and great, or ſtrong and ſlow *pulſe*, together, are good. A weak, ſmall, hard, unequal, intermitting, quick *pulſe*, is of all others the worſt.

Yet in all theſe things, regard muſt be had to the nature of the particular artery, the age, ſex, temperament, affections of the mind, the ſix non-naturals, habit of body, ſeaſon, country, *&c.* all which have an influence on the *pulſe.*

A diminution or total ſuſpenſion of the *pulſe*, is reducible either to a *lipothymia*, where it fails to ſuch degree, as that there is ſcarce ſtrength left to ſuſtain the body. See LIPOTHYMIA.

Or to a *lipopſychia*, when it is attended with a ſenſible diminution of the natural heat.

Or to a *ſyncope*, when the heart fails, ſo as the heat, motions, ſenſes and all, are almoſt deſtroyed.

Or, laſtly, to an *aſphyxia*, where thoſe are all abſolutely deſtroyed as to ſenſe, and death itſelf ſeems in poſſeſſion. See SYNCOPE, *&c.*

PULSE is alſo uſed for the ſtroke with which any medium is affected by the motion of light, ſound, *&c.* through it. See LIGHT and SOUND.

Sir Iſaac Newton demonſtrates, *lib.* 2. *prop.* 48. *Princip.* That the velocities of the *pulſes* in an elaſtic fluid medium (whoſe elaſticity is proportionable to its denſity) are in a ratio compounded of half the ratio of the elaſtic force directly, and half the ratio of the denſity inverſely: ſo that in a medium whoſe elaſticity is equal to its denſity, all *pulſes* will be equally ſwift. See MEDIUM, FLUID, *&c.*

PULSE, *legumen*, in botany, is a term applied to thoſe grains or ſeeds which are gathered with the hand; in contradiſtinction to corns, *&c.* which are reaped or mowed.

Pulſe is the ſeed of the leguminous ſpecies of plants. See LEGUMINOUS.

The word is primarily underſtood of grains that grow in pods; as beans, peas, vetches, *&c.* but is alſo uſed by extenſion for artichoaks, aſparagus, and other kitchen roots and herbs.

PULSION*, *truſion*, the act of driving or impelling a thing forwards. See TRUSION and REPULSION.

* The word comes from *pello*, I drive. See ATTRACTION and ELECTRICITY.

PULTURA *, in our old law-books, denotes a previous demand or examination: — on account of the monks, who, ere they were admitted into the monaſteries, *pulſabant ad fores*, knocked at the doors for ſeveral days.—*Et volo ut ſint quieti de* *de omnibus cauſis, & querelis, & placitis ballivorum & præpoſitorum hundredi, & a* pultura *ſerjanorum*, i. e. from the examination of ſerjeants; *& de rewardo foreſtarum*, i. e. the viſitation of the foreſts.

* The word is formed from the Latin *pulſare*, to knock, to aſk.

PULVERIZATION, Pulverizatio, the art of *pulverizing*, or reducing a dry body into a fine powder. See Powder.

This is performed, in friable bodies, by pounding or beating in a mortar; but to *pulverize* malleable ones, other methods muſt be taken. See Friable and Malleable.

To *pulverize* lead, or tin, the method is thus: Rub a round wooden box all over the inſide with chalk; pour a little of the melted metal nimbly into the box, when, ſhutting the lid, and ſhaking the box briſkly, the metal will be reduced into powder. See Trituration.

PULVINATED, Pulvinatus, in the ancient architecture, a term applied to a freeze, which ſwells, or bulges out, in manner of a pillow, *pulvinus:* whence the name. See Freeze.

PULVIS *fulminans*, or the thundering powder. See Fulminans *pulvis*.

Pulvis *patrum*, the Jeſuits powder. See Cortex and Quinaquina.

PUMICE *ſtone*, Pumex, a kind of ſpongeous ſtone, very porous and friable. See Stone.

Naturaliſts are not agreed about the nature and origin of *pumice*.—Some look on it as pieces of rock half-burnt and calcined, caſt up in eruptions of volcanoes, particularly Ætna and Veſuvius, into the ſea; and which, by being there waſhed in the ſalt-water, lays aſide the black colour that the impreſſion of the ſubterranean fires had given it, and becomes whitiſh, or ſometimes only greyiſh, according as it has floated more or leſs in the ſea.

Dr. Woodward conſiders *pumice* as only a ſort of ſlag or cinder; and affirms, it is only found either where forges of metals have anciently been, or near ſome volcano, or burning mountain.

Other authors will have the *pumice* to riſe from the bottom of the ſea; whence they ſuppoſe it detached by ſubterranean fires: and hence account both for its lightneſs and poroſity, and its ſaline taſte; alledging, in confirmation hereof, that *pumice* is frequently found in parts of the ſea far remote from all volcanoes; and adding, that ſeveral parts of the Archipelago are frequently found covered with it, all at once, after a few inward ſhakes and heavings of the bottom of the ſea.

Pumice makes a very conſiderable article in commerce, and is much uſed in the arts and manufactures, to poliſh and ſmooth ſeveral works. See Polishing, *&c.*

Its pieces are of ſeveral ſizes: the parchment-makers and marblers uſe the largeſt and lighteſt;—the curriers the heavieſt and flatteſt; — pewterers the ſmalleſt.

Pliny obſerves, that the ancients made conſiderable uſe of *pumice* in medicine; but it is out of the preſent practice.

PUMMEL. See the article Pommel.

PUMP, Antlia, in hydraulics, a machine formed in the model of a ſyringe, for the raiſing of water. See Syringe.

Vitruvius aſcribes the firſt invention of pumps to Cteſebes the Athenian; whence the Latins call it *machina Cteſebiana*, or *organum Cteſebicum*.

Pumps are diſtinguiſhed into ſeveral kinds, with regard to the ſeveral manners of their acting.—As the

Common, ſometimes called the *ſucking* Pump, which acts by the preſſure of the air, and whereby water is raiſed out of a lower into a higher place, not exceeding thirty-two feet.—Its ſtructure and action may be conceived from what follows:

1. A hollow cylinder, or barrel, ABCD, (*tab. hydroſtat. fig.* 27.) is provided of any ſolid matter, uſually wood, and erected perpendicularly in a ſpring, or other ſource of water; the lower baſe of the cylinder being firſt fitted with a valve I, which opens upwards.

2. A piſton or embolus, called the ſucker, E K, furniſhed with a valve L, which likewiſe opens upwards, is let down the cylinder; and for the more eaſy working upwards and downwards, furniſhed with a lever or handle, as G H. See Embolus and Valve.

Now, the embolus E L, being drawn up from I to L, will leave the ſpace L I void of air, at leaſt in a great meaſure ſo: the preſſure, therefore, of the air on the ſurface of the ſtagnant water prevailing, will, by the laws of hydroſtatics, lift up the valve I, and raiſe it to fill the cavity L I. See Air and Siphon.

If, then, the embolus be again let down, the lower valve being now faſt cloſed with the weight of the incumbent water, upon preſſing the piſton, the water muſt open the upper valve, and get into the embolus, by which it is raiſed up and diſcharged out at the ſpout H.

Thus is the embolus alternately raiſed and depreſſed, *&c. See the theory of the* pump *more accurately laid down under the article* Syringe.

The forcing Pump, which acts by mere impulſe or protruſion, and raiſes water to an height at pleaſure.—Its ſtructure is as follows: —1. A cylinder A B, (*fig.* 28.) is divided by a diaphragm, or tranſverſe piece, C D, fitted with a valve E, opening upwards; and thus immerged in water.

2. An embolus F, furniſhed with a valve G, is ſo fitted to an iron rod I H, moveable on a hinge at each, as that it may be conveniently raiſed and depreſſed by the hand applied in K.

Now, upon depreſſing the embolus F, the water will open the valve G, and thus aſcend into the cavity of the cylinder BC: but upon raiſing it again, the valve G is ſhut, ſo that there is no paſſage for it that way: the valve E therefore becomes opened, and the water mounts through it; and, by repeating the agitation of the embolus, is at length driven out through the ſpout M.

The great difficulty of rectifying this *pump*, when it happens to be out of order, on account of the chief ſeat of action's being under water, makes people decline the uſe of it when they can do well without it, notwithſtanding its advantage of raiſing the water to any given height.

Cteſebes's Pump, the firſt and fineſt of all the kinds, acts both by ſuction and pulſion.— Its ſtructure and action are as follow: — 1. A braſs cylinder ABCD, (*fig.* 29.) furniſhed with a valve in L, is placed in the water. 2. In this is fitted the embolus M K, made of green wood, which will not ſwell in the water, and adjuſted to the aperture of the cylinder with a covering of leather; but without any valve. In H is fitted on another tube N H, with a valve that opens upwards in I.

Now, the embolus E K being raiſed, the water opens the valve in L, and riſes into the cavity of the cylinder:—and when the ſame embolus is again depreſſed, the valve I is opened, and the water driven out through the tube HN.

This is the *pump* uſed among the ancients, and that from which both the others are deduced.—Sir S. Morland has endeavoured to increaſe its force by leſſening the friction; which he has done to good effect, inſomuch as to make it work without almoſt any friction at all.

Pumps uſed in ſhips are of ſeveral kinds: as the

Chain Pump, uſed by the Engliſh in large veſſels, is double; one of which riſes as the other falls: this yields a great quantity of water, works eaſily, and is eaſily mended; but takes up a great deal of room, and makes a diſagreeable noiſe.—See *tab. ſhip. fig.* 2. *n.* 59.

Bare Pumps are ſmall ones made of cane, or a piece of wood, bored through, uſed in lieu of cocks, *&c.* to *pump* beer or water out of the caſks.

Bur Pumps, called alſo *bildge pumps*, are chiefly uſed by the Dutch, who have them by their ſhips-ſides. In theſe is a long ſtaff, with a bur at the end like a gunner's ſponge, to *pump* up the bildge water. See Bildge.

Air Pump, in pneumatics, is a machine, by means whereof the air is emptied out of veſſels, and a ſort of vacuum produced therein. See Air and Vacuum.—*For the invention, ſtructure and uſe of this pump*, ſee Air *pump*.

PUN, or Punn, a luſus verborum, the wit whereof depends on a reſemblance between the ſounds or ſyllables of two words, which have different, and perhaps, contrary ſignifications. See Wit.

Such are,—*Cane de cane, cane.*—*Far mole mole molæ.*—*Lex Dei, lux diei.*—All houſes are ale-houſes.—The holy ſtate of matrimony, is become matter of money.—Some mens paradiſe is a pair of dice.—Was it ſo in the time of Noah? Ah no.—*L'ordre tiré du diſordre, ou diſordre ordonné*, is the title of a French book.

Puns, when they come eaſily, and are very ingenious, poignant, and appoſite, are allowed of in converſation, letters, epigrams, madrigals, and the like compoſitions; but are abſolutely baniſhed out of the grave, ſerious, and ſublime, by reaſon they weaken its force, and diminiſh its beauty, which conſiſts in ſomething great and elevated. The Greeks and Romans, it is true, ſometimes indulged themſelves the practice, and uſed *puns* as ornaments in the moſt ſerious diſcourſes: but the more ſevere and philoſophical genius of our age is by no means ſatisfied with ſuch an outſide of wit.—Deviſes, ſymbols, rebus's, motto's, *&c.* are their proper ſphere, where they ſhine to moſt advantage. See Devise, Rebus, *&c.*

PUNCH, an inſtrument of iron or ſteel, uſed in ſeveral arts, for the piercing or ſtamping holes in plates of metals, *&c.* being ſo contrived, as not only to perforate, but to cut out and take away the piece: whence the French call it, *emporte-piece, p. d.* take-off-piece.

The *punch* is a principal inſtrument of the metal-button-makers, wafer-makers, patch-makers, ſhoe-makers, *&c.*—The *punch* of the makers of plate-buttons ſerves to cut and parcel out the plates of gold and ſilver, wherewith they cover their moulds.—It is large, round, four or five inches high, the bottom hollow for about half an inch, well ſteeled, and the edge very ſharp.

To uſe it, they extend the plate of metal on a leaden table or block, and with a pretty heavy hammer ſtrike the head of the *punch*, &c. See Button *making*.

Punch *horſe*, in the manage, is a well-ſet, well-knit horſe, ſhort-backed, and thick-ſhouldered, with a broad neck, and well lined with fleſh.

Punch is alſo a ſort of compound drink frequent in England, and particularly about the maritime parts thereof; though little known elſewhere. See Drink.

Its baſis is ſpring-water, which being rendered cooler, brisker, and more acid, with lemon-juice, and ſweetened again to the palate with fine ſugar, makes what they call *ſherbet*; to which a proper quantity of a ſpirituous liquor, as brandy, rum, or arrac, being ſuperadded, the liquor commences *punch*.

Several authors condemn the uſe of *punch*, as prejudicial to the brain and nervous ſyſtem.—Dr. Cheyne inſiſts that there is but one wholeſom ingredient in it, which ſome now begin to leave out, *viz.* the mere element. See WATER, BRANDY, RUM, ARRAC, SUGAR, *&c.*

The proportions of the ingredients are various; uſually the brandy and water are in equal quantities.—Some, inſtead of lemon-juice, uſe lime-juice, which makes what they call *punch royal*, found leſs liable to affect the head, as well as more grateful to the ſtomach.

Some alſo make *milk punch*, by adding near as much milk to the ſherbet as there is water, which tempers the acrimony of the lemon.—Others prefer *tea punch*, made of green tea inſtead of water, and drank hot.

Laſtly, What they call *punch for chamber-maids* is made without any water, of lime-juice, ſharpened with a little orange and lemon-juice; twice as much white-wine as lime-juice, and four times as much brandy, with ſugar.

PUNCHEON. See the article PUNCHION.

PUNCHIN, or PUNCHION, in building. See the article PUNCHION.

PUNCHION, or PUNCHEON, a little block, or piece of ſteel, on one end whereof is ſome figure, letter, or mark, engraven either in creux, or in relievo; impreſſions whereof are taken on metal, or ſome other matter, by ſtriking it with a hammer on the end not engraved. See ENGRAVING, *&c.*

There are various kinds of theſe *punchions* uſed in the mechanical arts.—Such, for inſtance, are thoſe of the gold-ſmiths, cutlers, pewterers, *&c.* See MARK.

PUNCHION, in coining, is a piece of iron ſteeled, whereon the engraver has cut, in relievo, the ſeveral figures, arms, effigy, inſcription, *&c.* that are to be in the matrices wherewith the ſpecies are to be marked. See MATRICE, *&c.*

Minters diſtinguiſh three kinds of *punchions*, according to the three kinds of matrices to be made; that of the effigy, that of the croſs or arms, and that of the legend or inſcription.

The firſt includes the whole portrait in relievo.—The ſecond are ſmall, each only containing a piece of the croſs or arms, *v. gr.* a fleur-de-lys, a harp, a coronet, *&c.* by the aſſemblage of all which the intire matrice is formed.—The *punchions* of the legend only contain each a letter, and ſerve equally for the legend on the effigy-ſide, and the croſs-ſide. See COINING.

For the manner of engraving, tempering, and ſtamping theſe punchions, *to form the matrices, ſee* ENGRAVING *on ſteel*, MATRICE, *&c.*

PUNCHIONS, in printing, are thoſe uſed in ſtamping the matrices, wherein the types of printing characters are caſt. See *letter* FOUNDERY.

PUNCHION is alſo uſed for ſeveral iron tools of various ſizes and figures, uſed by the engravers in creux on metals.—Seal-gravers particularly uſe a great number, for the ſeveral pieces of arms, *&c.* to be engraven; —and many ſtamp the whole ſeal from a ſingle *punchion*. See ENGRAVING.

PUNCHION is alſo a common name for all the iron inſtruments uſed by ſtone-cutters, ſculptors, lock-ſmiths, *&c.* for the cutting, inciding, or piercing their ſeveral matters.

Thoſe of ſculptors and ſtatuaries ſerve for the repairing ſtatues, when take out of the moulds. See STATUE, FOUNDERY, *&c.*

The lock-ſmiths uſe the greateſt variety of *punchions*; ſome for piercing hot, others for piercing cold; ſome flat, ſome ſquare, ſome round, others oval; each to pierce holes of its reſpective figure in the ſeveral parts of locks.

PUNCHION, or PUNCHIN, in carpentry, is a piece of timber placed upright between two poſts, whoſe bearing is too great, ſerving, together with them, to ſuſtain ſome large weight. See BEARING, *&c.*

The *punchion* is uſually lower and ſlighter than either prick-poſts, or principal poſts, and is joined by a brace, or the like, of iron. See POST.—Thoſe on each ſide of a door are called *door punchions*. See DOOR.

PUNCHION is alſo a piece of timber raiſed upright under the ridge of a building, wherein the little forces, *&c.* are jointed.—Vitruvius calls the *punchion*, *columen*.

PUNCHION is alſo uſed for the arbour or principal part of a machine, whereon it turns vertically: as that of a crane, *&c.* See CRANE.

PUNCHION is alſo a meaſure for liquids, containing a hogſhead and $\frac{1}{3}$, or 84 gallons, or $\frac{1}{3}$ of a tun. See MEASURE.

The Paris *punchion* is the ſame with their demi-queue; at Rouen it is three buſhels, *&c.*

PUNCTA *lachrymalia*. See the article LACHRYMALIA.

PUNCTATED *hyperbola*, in the higher geometry, an hyperbola whoſe oval conjugate is infinitely ſmall, *i. e.* a point. See CURVE and HYPERBOLA.

PUNCTION, or PUNCTURE, in chirurgery, an aperture made in the lower belly, in dropſical perſons, to diſcharge the water; called alſo *paracenteſis*. See PARACENTESIS and DROPSY.

PUNCTUATION, in grammar, the art of *pointing*; or of dividing a diſcourſe into periods, and members of periods, by points expreſſing the pauſes to be made in the reading thereof. See SENTENCE, PERIOD, *&c.*

The points uſed herein are four, *viz.* the *period*, *colon*, *ſemicolon*, and *comma*. *See the particular uſe of each under its proper article*, COMMA, COLON, PERIOD, and SEMI-COLON.

Punctuation is a modern art: the ancients were intirely unacquainted with the uſe of our commas, colons, *&c.* and wrote not only without any diſtinction of members and periods, but alſo without diſtinction of words; which cuſtom, Lipſius obſerves, continued till the hundred and fourth olympiad; during which time the ſenſe alone divided the diſcourſe. See POINT.

There is much more difficulty in *pointing*, than people are generally aware of.—In effect, there is ſcarce any thing in the province of the grammarians ſo little fixed and aſcertained as this. The rules uſually laid down are impertinent, dark, and deficient; and the practice, at preſent, perfectly capricious, authors varying not only from one another, but from themſelves too.

Indeed F. Buffier, and ſince him, Mr. Ward, have done ſomething towards a fixed and preciſe ſyſtem of *pointing*, from the reaſon and analogy of things. Their doctrine the reader will find under the articles COMMA, COLON, *&c.*

In the general, we ſhall only here obſerve, that the comma is to diſtinguiſh nouns from nouns, verbs from verbs, and ſuch other parts of a period as are not neceſſarily joined together. —The ſemi-colon ſerves to ſuſpend and ſuſtain the period when too long:—the colon, to add ſome new, ſupernumerary reaſon, or conſequence, to what is already ſaid: —and the period, to cloſe the ſenſe and conſtruction, and releaſe the voice.

PUNCTUM, in geometry, *&c.* See the article POINT.

In the ſchools they have their

PUNCTUM *terminans*, which is the indiviſible extreme of a line, beyond which no part of the line extends. See LINE.

PUNCTUM *continuans*, an indiviſible magnitude between contiguous points of a line, whereby they are connected, and from whence ariſes a continuity. See CONTINUITY.

PUNCTUM *initians*, an indiviſible , from which the line begins.

PUNCTUM *formatum* or *generatum*, in conics, is a point determined by the interſection of a right line drawn through the vertex of a cone to a point in the plane of the baſe that conſtitutes the conic ſection. See CONE and CONIC.

PUNCTUM *ex comparatione* denotes either of the foci of an ellipſis and hyperbola; thus called by Apollonius, becauſe the rectangles under the ſegment of the tranſverſe diameter in the ellipſis, and under that and the diſtance between the vertex and the focus in the hyperbola, are equal to one fourth part of what he calls the *figure* thereof. See ELLIPSIS and HYPERBOLA.

PUNCTUM *lineans*, in geometry, is a term uſed by ſome authors for that point of the generating circle of a cycloid, or epicycloid, which in the geneſis produces any part of the cycloidal line. See CYCLOID, *&c.*

PUNCTUM *ſaliens*, in anatomy, the firſt rudiments of the heart, in the formation of the fœtus, where a throbbing motion is perceived. See CONCEPTION, HEART, and EMBRYO.

This is eaſily obſerved with a microſcope in a brood-egg, wherein, after conception, we ſee a little ſpeck or cloud; in the middle whereof is a ſpot that appears to beat, or leap a conſiderable time, ere the fœtus be formed ready for hatching. See EGG, GENERATION, and EMBRYO.

PUNCTUM *lachrymale*, in anatomy, a little hole in the edge of each eye-lid, opening into a bag called *glandula lachrymalis*. See LACHRYMAL.

PUNCTURE, PUNCTURA, in chirurgery, *&c.* any wound made by a pointed inſtrument. See WOUND.

In phlebotomy, people are ſometimes brought in danger of the loſs of a limb, and even of life, by the *puncture of a tendon*. —The patient here does not immediately feel any pain; but twelve hours after the operation, complains thereof; not in the puncture itſelf, but in the parts tending towards the arm-pit.—The wounded part ſwells to the ſize of a filbert, and diſtils an aqueous humour, or ichor, which is the chief diagnoſtic of the *punctura tendinis*. See TENDON.

PUND-BRECH *, or POUND-BREACH, denotes the illegal taking of cattle out of the pound; either by breaking the pound, picking the lock, or otherwiſe. See POUND.

* The word is compounded of the Saxon, *pund*, pound, and *brech*, fracture, breaking.

—*Si* pund-brech *fiat in curia regis, plena* wyta *ſit: alibi quinque mancæ.* Leg. Hen. I.

PUNISHMENT, a penalty impoſed upon the commiſſion of ſome crime or offence againſt the law. See CRIME.

It is eſſential to the nature of a law, that it import or decree a *puniſhment* to the trangreſſors thereof. See LAW.

The forms and manners of *puniſhment* are various in various countries and ages, and for various crimes; as treaſon, felony, adultery, parricide, *&c.* See ADULTERY, *&c.*

Among the Romans, the *pecuniary puniſhments* were the *mulcta* and *confiſcatio*.—The *corporal puniſhments* were *capitis diminutio, aquæ & ignis interdictio, proſcriptio, deportatio, relegatio, furca, crux, carcer, culeus, equuleus, ſcalæ gemoniæ, damnatio ad gladium, ad metallum; flagellatio, talio*, &c. moſt of which ſee deſcribed under their reſpective articles.

Among us, the principal *civil puniſhments* are *fines, impriſonments, the ſtocks, pillory, burning in the hand, whipping, cucking-ſtool, hanging, beheading, quartering, burning, tranſportation*, &c. See FINE, PILLORY, CUCKING-STOOL, GALLOWS, GIBBET, *&c.*

The *eccleſiaſtical puniſhments* are *cenſures, ſuſpenſions, deprivations*,

tions, degradations, excommunications, anathemas, penances, &c. See Censure, Suspension, Deprivation, Degradation, Excommunication, Anathema, Penance, &c

The *military puniſhments* are, *being ſhot*, *running the gantelope*, *riding the wooden horſe*, *bilboes*, &c.—Among the Turks, &c. *impaling*, *baſtinadoes* on the ſoles of the feet, &c. obtain. See Empalement, &c.

PUNITORY *intereſt*, in the civil law, ſuch intereſt of money as is due for delay of payment, breach of promiſe, &c. See Interest.

PUNN. See the article Pun.

PUPIL, Pupillus, in the civil law, a boy or girl not yet arrived at the age of puberty, *i. e.* under fourteen years of age the boy, and twelve the girl. See Puberty and Age.

While a minor remained under the direction of a tutor, he was called *pupil*; after puberty, a curator being aſſigned him, he ceaſed to be called a *pupil*. See Tutor and Curator.

A tutor is obliged to pay intereſt for what moneys of his *pupil* lye idle and unemployed.—A tutor is allowed to do any thing for his *pupil*, but nothing againſt him.

Pupil is alſo uſed by way of extenſion in univerſities, &c. in the ſenſe of *alumnus*, for a youth under the education or diſcipline of any one.

Pupil, Pupilla, in anatomy, denotes a little aperture in the middle of the uvea and iris of the eye, through which the rays of light paſs to the cryſtalline, in order to be painted on the retina, and cauſe viſion. See Eye and Vision.

It is obſerved, that as we are forced to uſe various apertures to our optic glaſſes, ſo nature has made a like proviſion in the eyes of animals, whereby to ſhut out too much, and admit ſufficient light, by the changes in the aperture of the *pupil*. See Aperture.

The ſtructure of the uvea and iris is ſuch, as that by their aperture the *pupil* is contractible and dilatable at pleaſure, ſo as to accommodate itſelf to objects, and to admit more or fewer rays, as the object, being either more vivid and near, or more obſcure and remote, requires more or leſs light:— it being a conſtant law, that the more luminous the object, the ſmaller the *pupil*; and again, the nearer the object, the ſmaller the *pupil*; and *vice verſa*. See Uvea and Ray.

This alteration of the *pupil* is effected by certain muſcular fibres on the outſide of the uvea, which ariſe from nerves detached hither from the ſclerotica.—Theſe fibres, proceeding ſtrait from their origin towards the centre, terminate in the orbicular limb or verge of the *pupil*, which conſiſts of orbicular fibres, whereby the figure and ſpace of the *pupil* are defined.—The firſt, or longitudinal fibres, dilate the aperture of the *pupilla*; the latter, or orbicular ones, conſtringe it.

Some authors, however, attribute the motions of the *pupilla* to the ligamentum ciliare; and others think, that both this, and the fibres of the uvea, concur herein.—Dr. Derham adds, that while the *pupil* opens and ſhuts, the ligamentum ciliare dilates or compreſſes the cryſtalline, and brings it nigher to, or farther from the retina, as the object is more or leſs remote. See Ciliare, &c.

The figure of the *pupil* in various animals is wonderfully adapted to their various circumſtances and occaſions: in ſome, *e. gr.* in man, it is round, that form being fitteſt for the poſition of our eyes, and the various uſe we make of them in all directions.

In others it is elliptical or oblong: in ſome of which, *e. gr.* the horſe, ſheep, ox, &c. the ellipſis is tranſverſe, and the fiſſure large, to enable them to ſee laterally, and even with a little light; and thereby both to gather their food the better in the night, and to avoid dangers on either ſide.—In others, *e. gr.* the cat, the ellipſis is erect, and alſo capable of opening very wide, and ſhutting very cloſe; by means of the latter of which, that animal can exclude all, but, as it were, a ſingle ray of light, and ſo avoid all the inconveniences of the bright ſun; and by the former can take in all the fainteſt rays, and thus, avoid the inconveniencies of the night. An incomparable proviſion for theſe animals, which are to watch and way-lay their prey both by day and night, to ſee upwards and downwards, to climb, &c. See Eye.

PUPILLARITY, or Pupillage, the ſtate of a pupil; in oppoſition to *puberty*. See Puberty aud Pupil.

PURA *eleemoſyna*, Pure *alms*, denotes a tenure whereby the churchmen hold lands in Scotland, ſomewhat on the footing of the primitive clergy. See Alms and Tithes.

Pura *haſta*, See the article Hasta.

PURBECK *ſtone*. See the article Stone.

PURCELAIN. See the article Porcelain.

PURCHASE, in law, the acquiſition of goods, lands, tenements, or the like, by means of money; in contradſtinction to thoſe obtained by deſcent, or hereditary right. See Goods.

Purchase, in the ſea-language, has the ſame ſignification with *draw in*, at land.—Thus, they ſay, *The capſtan purchaſes apace*, *i. e.* draws in the cable apace: and when they cannot draw or hale any thing in with the tackle, they ſay, *The tackle will not purchaſe*.

PURE, ſomething free from any admixture of foreign or heterogeneous matters. See Purification and Net.

Pure *fire*. See the article Fire.

Pure *hyperbola*, in conics, is an hyperbola without any oval, node, ſpike, or conjugate point. See Curve.

Pure *mathematics*. See the article Mathematics.

Pure *propoſition*,		Proposition,
Pure *quadratics*,	See the articles	Quadratic,
Pure *reſignation*,		Resignation.

PURFLEW, a term in heraldry, expreſſing ermines, peans, or any of the furs, when they compoſe a bordure round a coat of arms. See Pean, Bordure, &c.

Thus they ſay, he beareth gules a bordure *purflew*, vairy: meaning, that the bordure is vairy.

PURGATION, Purgatio, the act of *purging*, ſcowring, or purifying a thing, by ſeparating and carrying off any impurities found therein. See Purification.

Purgation, in pharmacy, is the cleanſing of a medicine by retrenching its ſuperfluities; as the wood and ſeeds out of caſſia, ſtones out of dates, tamarinds, and other fruits. See Ablution.

Purgation is alſo uſed in chymiſtry for ſeveral preparations of metals and minerals, to clear them of their impurities; more uſually, called *purification* and *refining*. See Purification and Refining.

The *purgation* of mercury is performed by paſſing it through a chamois ſkin. See Mercury.—Gold is *purged* by the coppel, cementation, &c. See Gold, Coppel, &c.—*Purgation* in other metals is performed by repeated fuſion, &c. See Metal, Fusion, &c.

Purgation, *catharſis*, in medicine, is an excretory motion, ariſing from a quick and orderly contraction of the fleſhy fibres of the ſtomach and inteſtines; whereby the chyle, corrupted humours and excrements lodged therein, are protruded farther and farther, and at length quite excluded the body by ſtool. See Excretion, Stomach, Intestines, &c.

Purgation is one of the principal ſpecies of *evacuation*. See Evacuation.—*For the means and manner wherein it is effected*, ſee Purgative.—See alſo Super-purgation.

Purgation, in law, is the clearing one's ſelf of a crime, wherein he is publickly ſuſpected or accuſed before a judge, called alſo *judicium Dei*. See Judicium *Dei*.

Of theſe *purgations* there was anciently much uſe in England, eſpecially touching matters of felony charged on clerks; and there is ſomething of them ſtill retained in the eccleſiaſtical court in ſuſpicion of incontinency, &c.

Purgation is either *canonical* or *vulgar*.

Canonical Purgation is that preſcribed in the canon law, the form whereof obtaining in the ſpiritual court, is, that the party ſhall take his oath he is clear of the fact objected; and bring ſo many of his honeſt neighbours, not above twelve, as the court ſhall aſſign him, to ſwear, on their conſciences, they believe he ſwears truly.

Vulgar Purgation, being the moſt ancient manner, was by fire, or water, or combat; uſed by infidels, and by chriſtians too, till aboliſhed by the canon law. See Ordeal, Water, Duel, &c.

Combat, though now diſuſed, may yet be ſtill practiſed by the laws of the realm in caſes where evidence is wanting, and the defendant rather chuſes combat than any other trial. See Suthdure, Duel, Champion, &c.

Terris, bonis, &c. *redhabendis poſt* Purgationem. See Terris.

Purgation, in tragedy, is a term which Ariſtotle uſes for the effect of tragedy on the mind. See Passion.

That philoſopher obſerves, that tragedy, by means of the terror and compaſſion which it excites, *purges* thoſe paſſions out of the ſoul.

Indeed, Corneille adds, that tragedy frequently creates thoſe paſſions, inſtead of *purging* them; ſo that he takes Ariſtotle's *purgation* to be no more than a chimera. See Tragedy.

Menſtrual Purgations, the catamenia or menſes of women. See Menses.

PURGATIVE, or Purging *medicine*, a medicament which evacuates the impurities of the body by ſtool; called alſo *cathartic*. See Stool, Purgation, and Cathartic.

Purgatives are divided, with regard to their effect, into *gentle*, *moderate*, and *violent*.—*Gentle purgatives* are ſuch as operate very mildly, as tamarinds, caſſia, manna, rhubarb, ſena, and moſt of the mineral waters. See Cassia, Manna, Rhubarb, &c.—The moderate purge ſomewhat more briſkly, as jalap, ſcammony, &c. See Jalap and Scammony.—The *violent* operate exceſſively, as coloquintida, hellebore, laureola, &c. See Coloquintida, Hellebore, &c.

Purgatives are, again, divided with regard to the humour they evacuate, into *phlegmagogues*, *cholagogues*, *melanagogues*, and *hydragogues*; each whereof ſee under its proper article, Phlegmagogue, Cholagogue, &c.

The modern phyſicians reject this diviſion; and ſhew the operations of all *purgatives* to be alike.

Purgatives make one of the moſt important articles in medicine.—Their effect is produced by vellicating and irritating the nervous fibres of the ſtomach and inteſtines, and thereby urging them to an expulſion. See Stomach and Intestine.

An idea of the manner of their operation is thus given by Dr. Cheyne.—A *purgative* medicine being received into the ſtomach by the mouth, its particles do there vellicate or ſtimulate the fibres of the ſtomach, and thereby increaſe the digeſtive faculty, *i. e.* bring the muſcular fibres of the ſtomach, and the muſcles of the abdomen and diaphragma, into more frequent contractions than ordinary, till the medicine is admitted into the inteſtines; the fibres and glands whereof being more ſenſible than thoſe of the ſtomach, (whoſe parts, by the frequent rough contacts of one againſt another, and of the groſs bodies often thrown into it, are, as it were, deadened) it eaſily moves and brings them into frequent forcible contractions, whereby theſe glands are ſqueezed, and ſo emit a fluid matter, which lubricates the paſſages, and which mixing with the feculent matter of the inteſtines, (which is rendered fluid by the ſame active and ſtimulating quality of the *purgative* medicine) renders it more fluid; by which, and by the uncommon contractions of the inteſtines, it paſſes more eaſily and plentifully into the inteſtinum rectum, and is thence ejected by ſtool.

Thus do gentle *purges* act, and only cleanſe the inteſtines, few of their particles entering in by the lacteal veins ſo as to affect the blood.—But in violent *purgatives* the ſtimulating particles are mixed with the blood, and produce there, many times, very great effects, by occaſioning unnatural fermentations, by ſeparating the natural coheſions of the fluids of the body; and do alſo by vellicating the ſpiral fibres of the veins and arteries, bring thoſe into more forcible contractions, and thereby accelerate the motion of the blood:—all which may have ſometimes a good, ſometimes a bad effect.

As to the effects of *purgatives* on animal bodies, Dr. Quincy adds, that every irritation of the inteſtines either quickens the periſtaltic motion in its natural direction, or occaſions ſome little inverſions of it.—Now, in both caſes, any matters that but ſlightly adhere to the coats, or inner membranes, will be looſened, and ſhook off, and carried forward with the other contents; and they will alſo be more agitated, and thus rendered more fluid.

Hence is manifeſt how a *purging* medicine haſtens and increaſes the diſcharges by ſtool; but the ſame manner of operation alſo carries its effects much farther, in proportion to the force of the ſtimulus: for where it is great, all the appendices of the bowels, and even all the viſcera in the abdomen, will, by a conſent of parts, be pulled or twitched ſo as to affect their reſpective juices in the ſame manner as the inteſtines themſelves do their contents.—The conſequence of which muſt be, that a great deal will be drained back into the inteſtines, and made a part of what they diſcharge.—And when we conſider the vaſt number of glands in the inteſtines, with the outlets of thoſe viſcera opening thereunto, and particularly of the liver and pancreas, it will be no wonder, that vaſt quantities, eſpecially in full conſtitutions, may be carried off by one *purge*.

As to thoſe *purgatives* diſtinguiſhed by the names of *cholagogues*, *hydragogues*, *phlegmagogues*, on a ſuppoſition of an elective quality therein, they may be accounted for upon more intelligible principles:—For when the diſcharges by ſtool diſcover an over-proportion of any particular humours, it is to be ſuppoſed there was a redundance of ſuch an humour, whoſe diſcharge any irritation would have occaſioned. Thus, in proportion to the proximity of ſome humours in the inteſtinal tube, and the diſpoſition of the paſſages to convey them that way, do they require greater or leſſer vibrations or ſhakes of the fibres to fetch them out.

For this reaſon, the briſker cathartics, which vellicate the membranes, moſt of all, pump out, as it were, from all the meſenteric glands, and neighbouring parts, their contents, which, becauſe they abound ſo much with lymphatics, and viſcid watery humours, make the diſcharges thin and watery.

Thoſe which act in a ſomewhat lower degree, yet irritate enough to deterge and draw out a great deal of mucous and viſcid matter, which ſometimes by lodgment and want of due motion, changing into various colours, occaſions the different names of *phlegm* or *choler*: as the former therefore paſs for hydragogues, ſo do the latter for purgers of phlegm and choler. See Phlegm, Choler, *&c.*

But there is another principle beſides that of a ſtimulus, whereby a purging medicine is enabled to anſwer its intentions, *viz.* by fuſing the humours, and rendering them more fluid than before, whereby they are better fitted to paſs off by their proper emunctories—Thoſe which conſiſt of very ſubtile and active parts are not ſo ſenſible in the larger paſſages, becauſe of the great quantities of matter, which lay too great a load upon them, and make them unheeded; but when they are got into the blood in any conſiderable number, they divide and fuſe thoſe coheſions which obſtruct or move heavily along the capillaries, and ſcour the glands; inſomuch that every pulſation throws ſomething through the inteſtinal glands, which goes away by ſtool, that the refluent blood had waſhed away and brought back from all parts of the body.

Of this kind are all thoſe cathartics, which are ſaid to *purge* the joints, and are preſcribed in rheumatiſms, and arthritic pains, as the radix turpethi, and all the aloetics.—And this is the reaſon why purging medicines of this ſort are ſo eaſily changed into the moſt efficacious alteratives; for an alterative is a cathartic in a lower degree, or of a more remiſs operation.

Whatſoever brings ſuch particles to a ſecretory orifice, which is fitted for its paſſage, oftener, either by accelerating the blood's motion, or breaking it into more particles of that particular ſize and diſpoſition, will increaſe the ſecretion. According, therefore, to the difference of the parts where ſuch ſecretions are inlarged, as the glands of the inteſtines, kidneys, or ſkin, are the medicines, which are the inſtruments therein, called either *cathartics*, *diuretics*, or *diaphoretics*. See Alterative, Secretion, *&c.*

Dr. Quincy has made ſome improvements in the doctrine of *purging* medicines, their nature, manner of action, effects, and analogy with other medicines; with the circumſtances of their preparation, management, *&c.* in a diſcourſe inſerted in the *philoſoph. tranſact.* The ſubſtance of which we cannot do better than here ſubjoin.

In order hereto, it is to be premiſed, 1. That all thoſe parts of an animal body which are vaſcular, or through which any fluid paſſes from the inteſtines to the minuteſt fibre, are the ſeat of the operation of medicines. See Medicines.

2. That this whole courſe of circulation, or animal motion, is naturally diſtinguiſhed into three different ſtages, by the different capacities of the veſſels, and motions of their contents, each having its proper out-let; and that theſe are the ſeat of the three concoctions ſo often mentioned by phyſical writers: the firſt being the ſtomach and bowels, and having the anus for its emunctory; the ſecond all that ſpace within the blood's motion, ſo far as it retains its red colour, having the kidneys; and the third, all beyond that circuit, having the ſkin for an excretory organ. See Concoction, Emunctory, *&c.*

3. That every medicine which cauſes evacuation, is, in ſome ſenſe, a *purge*. See Evacuation.

4. That every *purge* operates either as a diſſolvent, by fuſing the juices, and increaſing the quantity fit for expulſion; or as a ſtimulus, by accelerating their motions ſo as to bring the matter fit for expulſion oftener to the ſecretory out-let; or both.

Theſe poſtulata are only premiſed, in order to prove this grand propoſition, that a change in the bulks, figures, and motions of the component particles of a purging medicine, will change the ſeat of its operation, and fit it for exertion in the larger or ſmaller veſſels, as thoſe mechanical affections are intended, or remitted.

For illuſtration hereof, it may be convenient to attend to the common way of making a *purge* operate, more or leſs, than it otherwiſe would do.

Subſtances, then, which are groſs and heavy, as thoſe conſiſting chiefly of ſaline and earthy particles; ſuch as tartar, manna, and the like, when reduced ſmaller by triture, or repeated ſolutions, operate more gently; but when acuated by acids, or any way made to expoſe their angles more plentifully to the membranes they become rougher, and ſooner take effect.

Reſinous medicines, as ſcammony, gamboge, jalap, and moſt vegetable productions, are more violent, and operate ſooner, when they are more tenacious and adheſive, as in their extracts; but gentler, when divided by hard brittle ſubſtances, ſuch as ſalt of tartar, ſugar, *&c.*

Medicines, which have in their compoſition ſulphur and ſalt, are more or leſs rough and ſpeedy in their operation, in proportion to their greater or leſſer participation of the ſaline ingredient, and the aſperity of its angles.—Of this kind are moſt minerals, and their preparations: it may be ſufficient to inſtance in the management of antimony and mercury; the firſt of theſe is by chymical analyſis known to be a compoſition of a ſubtile ſulphur and ſalt; and the more the ſaline part is ſet looſe by preparation, and *opening* the ſulphur, as it is commonly termed, the ſpeedier, and with the greater vehemence will it operate; whereas, in its more imperfect preparations, when the ſalts are cloſely wrapped up in their native ſulphur, it will hardly work at all, till it reaches the fartheſt ſtages of circulation. See Antimony.

Mercury *per ſe* is little known as a medicine; and its firſt preparation, which makes it into a ſublimate, ſo loads it with ſaline ſpiculæ, that it amounts even to a poiſon; but the more thoſe ſpiculæ are broken by triture, ſublimation, *&c.* the milder doth it operate, and if to the comminution of its points be added a ſulphur ſubtile enough to join it, it may be reduced to ſo mild a medicine, as not to be felt but in the laſt ſtage of operation. See Mercury, Salivation, *&c.*

This ſhort view may be ſufficient to ſhew, 1. That it is the too great aſperity and motion in a medicine, that will not ſuffer it to paſs the ſtomach, without irritating it into ſuch convulſions, as will throw it up again by vomit. See Emetic and Vomiting.

2. That a farther comminution, and ſmoothing its figure, will gain it admittance into the bowels, and cauſe it to operate, as a proper *purgative*, by ſtool.

3. That a yet farther remiſſion of theſe properties will convey it into the blood, and allow it there to promote evacuation by urine. See Urine and Diuretic.

And, laſtly, that a ſtill farther comminution will paſs it into the minuteſt canals, where, by the ſame properties, only in a lower degree, it will cauſe ſweat, or increaſe perſpiration. See Perspiration, Sweat, Diaphoretic, *&c.*

Hence it appears, that the more ſubtle medicines operate in the capillaries, and ſmalleſt fibres, by the ſame mechaniſm that the more groſs ones do in the common ſtream of the blood, when they go off by urine; or as the groſſeſt of all do in the greater paſſages, when they promote evacuation by ſtool.

Hence it is evident, that the ſkill of preparing and adminiſtring of medicines conſiſts in proportioning their manifeſt and known properties to the capacity and circumſtances of the part they are to operate in; and to intend or remit their mechanical affections, as they are ſooner or later to take place in the greater or ſmaller veſſels.

Of the firſt claſs there are few can be reduced ſmall enough to go beyond the larger paſſages, and none of them are worth the pains they require, to fit them farther than for diuretics: beſides, their natural diſpoſition to attract, and join with the ſerous part of the blood, whenever they get into that ſtage of motion, runs them off by the kidneys, before they can undergo comminution enough to get farther: but if by frequent repetitions of ſuch medicines, and an uncommon laxity of the paſſages, any parts are paſſed into the habit, their groſſneſs fouls the delicate ſtrainers, which are deſtined for their expulſion; and they lodge upon the glands and capillaries in ſuch manner, as to induce intermittents; which are obſervable in many perſons, after a long uſe of cream of tartar, the common cathartic ſalts, and the purging waters, eſpecially at the latter end of the ſummer, when the heat of the preceding ſeaſon has debilitated the ſolids, and left them under too great a relaxation.

Among the reſinous purges, there are many very powerful ones; but where their operation is deſired in the viſcera, blood, and remoter parts, they muſt be extremely divided; and this we find ſpirituous menſtruums will do, by taking up the moſt ſubtile parts only, and carrying them into the very ſmall paſſages, where they operate chiefly by fuſion; becauſe the ſoftneſs of ſuch ſubſtances cannot enable them, hardly in any degree, to act as ſtimuli, farther, at leaſt, than ordinary detergents. And thus we find that aloe, the chief of this tribe, goes fartheſt into the habit, and continues longeſt ere it operates, when managed with a ſpirituous menſtruum, as in the tinctura ſacra. The rad. turpethi, and colocynth likewiſe, with all of the vegetable kind, that will yield to a ſpirituous liquor, may, by that means, be carried into the fartheſt ſcenes of animal action; where they will prove efficacious medicines in caſes, which, with other management, they would never be able to reach: and on this account it muſt undoubtedly have been, that we frequently meet, in practical writers, with many materials of this ſort mentioned as alterants; the colocynth particularly by Helmont: for all medicines which operate in the fartheſt paſſages, they commonly include under that general appellation.

But the moſt efficacious purges, and thoſe which require the moſt ſkill, are procured from the mineral kingdom; theſe abound in ſolidity beyond any other materials, and therefore where-ever they are brought into action, neceſſarily excel in the quantity of impulſe: many of theſe therefore want not only the utmoſt comminution to carry them into the farther ſcenes of operation, but alſo ſome reſtraint of their aſperities and motions, to fit them for many intentions.—Thus ſublimate is not only to be much ſweetened, that is, ſmoothed in its points, to make it a ſafe purge in the larger veſſels; but if it be intended to go farther than the blood, and thoſe glands, which in that circuit it is moſt apt to be lodged upon when it ſalivates, it muſt not only be rendered very fine, but alſo be covered with ſuch ſubſtances as weaken its points, and make it paſs into the laſt ſubdiviſions of the conſtitution. To this purpoſe, the common practice wiſely contrives in diſtempers, which, according to the courſe of circulation, lie moſt remote, to wrap up the baſis of this medicine in ſulphurs, and ſuch-like ſubſtances, as follow it into its laſt diviſion, without giving it any aſperities to make it act as a ſtimulus. Thus, for all cutaneous foulneſſes, and habitual taints, the cinnabar, the æthiops, and all of that ſortment, are in readineſs; and that ordinary ſulphurs will cover and deaden the efficacies of mercurial preparations, ſo that they ſhall not operate, but in ſuch parts only, and in certain circumſtances, is demonſtrable in ordinary ſalivations, which are to be lowered by ſulphureous medicines.

Medicines from ſuch minerals where a ſalt and ſulphur are united by nature, as they are in ſome mercurials by art, as antimony, the native cinnabar, ſteel, &c. are manageable only upon the ſame principles; and the more they are deſigned to be carried into the habit, the more are they to be reſtrained by their natural or adventitious ſulphurs: ſteel, when opened by, and joined with, the points of acid liquors, operates the ſooner, and will ſometimes prove even emetic; but when it is covered with an additional ſulphur, it will go farther, and anſwer intentions much more remote; as is manifeſt in the common preparations of ſteel with tartar or vinegar, and with ſulphur.

This way of reaſoning on theſe occaſions ſeems the more juſt, from conſidering the texture of thoſe ſubſtances, which by a natural preparation are fitted for operation in the minuteſt part of an animal body; ſuch as thoſe of the aromatick kind, all which, more or leſs, according to their greater or leſſer degree of ſubtility and ſmoothneſs, promote a diaphoreſis: for theſe conſiſt of exquiſitely fine ſalts, covered with a moſt ſubtile ſulphur, as is demonſtrable by chymical analyſis; and the common ſal volatile oleoſum is an admirable contrivance upon the ſame foundation, where a very volatile animal ſalt is covered with a moſt exalted vegetable oil; whereby it is fitted to paſs into the minuteſt fibres, and make, as it were, a part of the animal ſpirits themſelves.

And here it may not be amiſs to obſerve, that all animal ſalts are very volatile, or eaſily rendered ſo; but when bare and naked, juſt as the fire draws them out, with a mixture alſo of its own particles in their compoſition, they are too pungent to be felt without painful ſenſations; and when ſoftened with a fine portion of ſomewhat of an oppoſite texture, which is ſmooth and yielding, they become moſt efficacious and ſafe ſudorifics.

On theſe conſiderations it likewiſe ceaſes to be a wonder, why the ſubtile ſalts of cantharides are more ſenſibly injurious to the bladder than any other parts, and why camphire prevents thoſe injuries; for the exquiſite ſmallneſs of thoſe ſpiculæ makes them imperceptible but in the moſt minute canals, into which the fibres compoſing the membranes of the bladder are known to be divided; and camphire blunts their irritations, becauſe its extreme ſubtility enables it to follow them into thoſe meanders, and ſheath their aſperities.

To this purpoſe is very remarkable what many now commonly practiſe in guarding even mercurials againſt their ſtimulating properties, and ſending them into the fineſt paſſages to operate by fuſion, and the bare force of impulſe: for not only calomel and the mercurius dulcis may be reſtrained from manifeſt operation in the wider paſſages, and the glands about the mouth; but even the mineral turbith, which of itſelf, in a ſmall doſe, will operate powerfully by vomit and ſtool, will not, when mixed with camphor, be ſo much felt in thoſe reſpects; but go into the fartheſt circuit of motion, and promote the cutaneous diſcharge in a more efficacious manner, than any medicine of leſs ſpecific gravity.—In this management, the camphor is to be mixed but a very little while before taking, otherwiſe it has not the effect; which appears to proceed from its great volatility, which makes it in a great meaſure exhale while it ſtands mixed in a medicine.

As to the doſes of *purgatives*, Dr. Cockburn attempts to determine them on the following ſuppoſitions.—1°. That no part of them operate but in the blood.—2°. That they operate there, by changing the blood, and other circulating fluids derived from it.

From which poſtulata he concludes, that in the ſame conſtitution of blood, the doſe required to produce the like effects, muſt be proportionable to the blood's quantity; ſo that where a certain doſe is required to alter one pound of blood, for inſtance, to a certain degree, there will be required a double doſe to alter two pounds to the ſame degree, and a triple doſe to three pounds, &c. And univerſally, if the quantity of blood b require the doſe d, the quantity $m b$ requires the doſe $m d$. For as $b : d :: mb : md$. See DOSE.

PURGATORY, PURGATORIUM, in the Romiſh church, a place where the juſt are ſuppoſed to ſuffer the pains due to their ſins, for which they have not ſatisfied in this world. See MERITS, ABSOLUTION, &c.

It is by the mercy of God, the indulgencies of the church, and the prayers of the faithful, that people are ſuppoſed to be delivered out of *purgatory*. See INDULGENCE, &c.

In Ireland is a place called St. Patric's *purgatory*, where, as the legend has it, at the prayers of St. Patric, biſhop of the place, there was made a viſible repreſentation of the pains which the wicked undergo after death, in order to deter ſinners, &c.

PURGE, in medicine, a term frequently uſed for a doſe of ſome purgative medicine. See PURGATION and PURGATIVE.

Butler's PURGING *ale*. See ALE.

PURIFICATION, in chymiſtry, &c. the act of *purifying* or refining natural bodies; or of ſeparating the feces and impurities therefrom. See PURGATION, REFINING, &c.

For the methods of *purifying* metals, gold, ſilver, iron, copper, tin, &c. See METAL, GOLD, SILVER, &c.

For the *purification* of ſemi-metals, minerals, and other matters, as antimony, ſulphur, camphor, ſaltpetre, &c. See ANTIMONY, SULPHUR, CAMPHOR, &c.

PURIFICATION, in matters of religion, denotes an offering made the prieſt by women riſing out of child-bed, ere they be re-admitted into the church.

By the law of Moſes, a woman, after bringing forth a male child, was unclean forty-days; after a female, eighty days: during which time ſhe was not to touch any thing holy, nor to go near the temple; but to continue within doors, ſeparate from all company and commerce of others.

This term expired, ſhe was to preſent herſelf at the temple, and at the door of the tabernacle to offer a lamb, as a holocauſt, and a pigeon or a turtle, which the prieſt taking, offered to God, and prayed for her, that ſhe might be *purified*.

This ceremony, which conſiſted of two things, a holocauſt, and a ſacrifice of expiation, was called טהר טהרה, *purificatio, purgatio*.

The holy Virgin, though, according to the fathers, exempt from the terms of the law, yet complied therewith; and at the time preſcribed went to the temple, and accompliſhed the law: in commemoration whereof, the church yearly ſolemnizes the feaſt of the purification of the Virgin, on the ſecond of February; called alſo the *feaſt of candlemas*. See CANDLEMAS.

The feaſt of the PURIFICATION ſeems to be very ancient. It is ordinarily ſaid to have been inſtituted in the time of Juſtinian, in the year 542. and this, on occaſion of a mortality which that year diſpeopled almoſt the whole city of Conſtantinople. Yet there are ſome who imagine it to have been obſerved before, though in another manner, and on a different day, from that fixed by Juſtinian, *viz.* between the circumciſion and epiphany.—The ſame day is the preſentation of our Saviour in the temple. See PRESENTATION.

PURIM*, a ſolemn feaſt held among the Jews on the 14th of March, in memory of their deliverance from the conſpiracy of Haman by Eſther. See ESTHER.

* The word is Hebrew, פּוּרים, *q. d.* lots.

PURITANS, a term anciently uſed for the Calviniſts of Great Britain, from their profeſſing to follow the pure word of God, in oppoſition to all traditions, human conſtitutions, and other authorities. See CALVINISM, PRESBYTERIAN, NON-CONFORMIST, SEPARATIST, TORY, WHIG, &c.

PURLIEU. See the article PURLUE.

PURLINS, in building, thoſe pieces of timber that lye acroſs the rafters on the inſide, to keep them from ſinking in the middle of their length. See RAFTER.

By the act of parliament for rebuilding London, it is provided, That all *purlins* from fifteen foot ſix inches to eighteen foot ſix inches long, be in their ſquare nine inches and eight inches.—And all in length from eighteen foot ſix inches to twenty-one foot ſix inches, be in their ſquare twelve inches and nine inches.

PURLUE*, PURLIEU, or POURALLEE, is all that ground near any foreſt, which being added to the ancient foreſt by our kings, was, by perambulation granted by ſome of their ſucceſſors, ſevered again from the ſame, and made *purlieu*, *i. e.* pure and free from the laws and obedience of the foreſt. See FOREST.

* The word is formed from the French *pur*, pure; and *lieu*, place.

A *purlieu*, or *pourallee*, is defined a circuit of ground adjoining to the foreſt, and circumſcribed with immoveable boundaries, known only by matter of record; which compaſs of ground was once foreſt, and afterwards diſafforeſted by the perambulations made for ſevering the new foreſt from the old. See PERAMBULATION.

Purlieus or *pourallees* commenced after the manner following:—King Henry I. at his acceſſion to the crown in 1154. took ſo much delight in the foreſts of this kingdom, that, not being contented with thoſe he found here, though many and large, he began to inlarge divers of them, and to afforeſt the lands of his ſubjects near adjoining to the ſame. See AFFORESTING.

His ſucceſſors Richard I. and Henry II. far from retrenching or reſtoring any thing, made ſtill further incroachments: and thus did the lands continue till the 17th year of king John; at which time the grievance being grown notorious, and generally felt by all degrees of people; divers noblemen and gentlemen beſought the king to grant, that they might have all thoſe new afforeſtations, made by his predeceſſors aforeſaid and himſelf, diſafforeſted again; and the king, after much ſolicitation, was at length prevailed on to ſubſcribe and ſeal ſuch articles concerning the liberties of the foreſt, as they then demanded; being for the moſt part ſuch as are now contained in the charter of the foreſt. See FOREST.

Hereupon, choice was made of divers noblemen, &c. to the number of twenty-five, who were ſworn, with others their aſſiſtants, to ſee the ſaid liberties, ſo granted and confirmed by the king, to be in every point obſerved.

But ere any thing was done to the purpoſe, king John died; and king Henry III. ſucceeding, freſh ſolicitations were made to him; who for the better accompliſhing of the ſaid diſafforeſtation, ordered inquiſitions to be made by ſubſtantial juries for ſevering all the new foreſts from the old: upon which two commiſſioners were ſent to take thoſe inquiſitions; in virtue whereof, many great woods and lands were not only diſafforeſted, but improved to arable land by the owners thereof. See DEFFORESTED.

After this charter was made and confirmed, ſome of theſe new afforeſtations were perambulated, and proper inquiſitions taken, and the certainty determined by matter of record, which were the old, and which the new: though it appears, that the greateſt part of the new afforeſtations were ſtill remaining during the life of king Henry III.

Under Edward I. freſh petitions and ſolicitations being ſet on foot, three biſhops, three earls, and three barons, were at length appointed to ſee thoſe perambulations performed and continued; who cauſed them to be made accordingly, and inquiſitions to be taken thereupon, and returned into the court of chancery; and all thoſe that were ancient foreſt, to be meered, and bounded with immoveable boundaries, to be known by matter of record for ever.

Thoſe woods and lands that had been newly afforeſted, the king likewiſe cauſed to be ſeparated from the old, and to be returned into the chancery by marks, meres, and bounds to be known, in like manner, by matter of record for ever.

Thus it appears how the *purlieus*, or *pourallees* had their firſt beginning; for all ſuch woods and lands as were afforeſted by Henry II. Richard I. or king John, and by perambulations ſevered from the ancient foreſts, were, and yet are called *pourallees*, *q. d.* woods and lands ſevered from the old foreſts, and diſafforeſted by perambulation; *pourallee* being the ſame as *perambulatio* in Latin. See PERAMBULATION.

But notwithſtanding ſuch new afforeſtations were diſafforeſted by perambulation, whereby the ſame became *pourallee*, or *purlieu*; yet they were not thereby ſo diſafforeſted as to every man, but that they do in ſome ſenſe continue foreſt ſtill, as to others.—For by the words of *charta de foreſta*, if the king has afforeſted any woods or lands of his ſubjects, to the damage of the proprietors, they ſhould forthwith be diſafforeſted again; that is, only as to thoſe perſons whoſe woods and lands they were; who, as the proper owners thereof, might ſell and cut down their woods at their own pleaſure, without any licence from the king; as alſo convert their meadows and paſtures into tillage, or otherwiſe improve their ground to the beſt advantage. So alſo they might hunt and chaſe the wild beaſt of the foreſt towards the ſame, &c. But no other perſon might claim ſuch benefit of hunting in the *pourallee*, beſide the proper owner of the ſoil thereof; who is left at liberty to ſuffer the *pourallee* to remain foreſt ſtill; as ſome, in effect, have thought moſt expedient, becauſe hereby intitled to the benefit of the common within the foreſt, which otherwiſe they were excluded from. Hence, if the beaſts chance to wander out of the foreſt into the *pourallee*, the king hath a property to them ſtill, againſt every man, but the owner of the ground wherein they are, who hath a ſpecial property in them, *ratione ſoli*; yet ſo as he may only take them by hunting, or chaſing with his grey-hounds or dogs, without any foreſtalling or foreſetting them in their courſe again towards the foreſt. See HUNTING, FORESTALLING, &c.

Beſide what has been hitherto ſaid of the difference between foreſt and *purlieu*, or *pourallee*, there is this farther diverſity, that all the woods and lands within the regard of the foreſt, are abſolutely within the bondage and charge of the foreſt, as well in reſpect of the owners thereof, as of any other perſon; for no one may cut down his own woods, or improve his own lands, within the regard of the foreſt, without licence from the king, or his chief juſtice in the eyre of the foreſt.—Neither ſhall any perſon hunt, chaſe, or moleſt the wild beaſt of the foreſt in his own ground, within the regard of the foreſt, without licence or warrant from the king, or his chief juſtice of the foreſt, ſo to do. See REGARD.

But thoſe whoſe grounds are within the *pourallees*, are not ſubject to theſe reſtrictions.—Yet are not the woods and lands in the *pourallees* abſolutely freed from the bondage of the foreſt in reſpect of the wild beaſts having their haunts therein, when they happen to ſtray out of the foreſt; but as they were once abſolutely foreſt, ſo they are ſtill conditionally ſo.

PURLUE *man*, or PURLIEU *man*, or POURALLEE *man*, is one who has land within the *purlue*; and is allowed or qualified to hunt or courſe within the ſame, though under certain reſtrictions. See PURLUE.

By ſtat. 13 Ric. II. he who may lawfully hunt in any *pourallee*, ought to have woods or lands of freehold within the *pourallee*, to the yearly value of 40 *s.*—By ſtat. Jac. I. he ought to have lands of inheritance of the yearly value of 10 *l.* or lands of freehold of the yearly value of 30 *l.* or have goods worth 200 *l.* or be the ſon of a knight, or baron, or perſon of a higher degree, or ſon and heir apparent of an eſquire.—But by a later act, Car. II. no man may keep grey-hounds within the *pourallee*, or elſewhere within England or Wales, unleſs he have a free warrant, or be lord of a manor, or ſuch a freeholder as is ſeized in his own right, or in right of his wife, lands, tenements, hereditaments, of the clear yearly value of 40 *l.* over and above all charges and repriſes of ſuch eſtate of inheritance; or of lands, tenements, or hereditaments, in his own right, or in right of his wife, for term of life or lives, of the yearly value of 80 *l.* over and above all charges and repriſes, or that is worth in goods or chattels 400 *l.* See GAME.

The *pourallee*, or *purlieu*, then, is ſaid to be for him that is ſo qualified: others, not qualified, and therefore not *purlieu-men*, yet having land in the *pourallee*, may, if they find any wild beaſt of the foreſt in their own grounds within the *pourallee*, chaſe them thereout with little dogs, but not with grey-hounds or other dogs.

Nor is the *purlieu-man* left at large to hunt at his own diſcretion; but tied down to ſeveral rules: as,

1. That he always begin his chaſe in his own ground; and that though he find ſuch wild beaſts in his own *pourallee*, and in reſpect thereof, hath a property in them, *ratione ſoli*, againſt all perſons but the king; yet ſuch his property is only on this condition, that he can ſlay them with his dogs in chaſe, without foreſtalling, before they can recover the foreſt.—Though they be within the liſt of the foreſt, before the dogs faſten on them; they are the king's, or other owner of the foreſt.

But if the *pourallee-man* firſt make his chaſe in his own freehold, he may purſue the ſame through every man's ground within the *pourallee*, provided he enter not into the foreſt.

2. If a *purlieu-man* begin his courſe in another man's ground, within the *pourallee*, and his dogs faſten on a wild beaſt, before it can get within the bounds of the foreſt, and the beaſt draws the dogs into the foreſt, and is there ſlain by them; here the *pourallee-man* ſhall not enter into the foreſt, nor take the beaſt ſo killed, becauſe his courſe was irregular from the beginning, as he could claim no property in the beaſt, *ratione ſoli*.

3. A *pourallee-man* may hunt in his own *pourallee*, with no more company than his own ſervants; neither may he appoint, licenſe, or warrant any other perſon, except his ſervants, to hunt by his commandment in his *pourallee*.

4. Every *pourallee-man* is forbidden by the laws of the foreſt, to hunt in his own grounds within the *pourallee*, every day, or oftener than three days in any one week, Sunday excepted.

5. Nor is any man to diſturb, or make a courſe after any deer found in his *pourallee*, within forty days after the king hath made a general hunting in the foreſt adjoining thereunto; becauſe then the wild beaſts of the foreſt come not into the *pourallees* of their own accord; but as they are forced into the ſame by the hunters, with clamours and blowing of horns: ſo that they fly thither for refuge.

6. No man ſhall hunt within ſeven miles of the borders of the foreſt, or in his own *pourallee*, within forty days next before the king hath iſſued out his proclamation, declaring his royal will and pleaſure to make a general hunting in that foreſt.

Inaſmuch as the *pourallees* were once, and in ſome ſenſe ſtill are, foreſt, it was neceſſary to have officers to attend, and take on them the charge of the preſervation of the game that may happen to wander out of the foreſt, into the *pourallees*; ſince otherwiſe the laws of the *pourallees* could not be executed, but the foreſt would ſoon be deſtroyed by the *pourallee-men*.

For this reaſon rangers were firſt appointed, who, though not officers in the foreſt, yet appertain thereto; for all officers in the foreſt have charge of the vert and veniſon of the foreſt; but a ranger hath no charge of vert, but only of veniſon coming out of the foreſt into the *pourallees*, his place of charge; from whence his office is to conduct the ſame back again into the foreſt. See Ranger.

This officer is appointed by the king, or his chief juſtice in eyre, and made by patent, with a fee commonly of 20, 30, or 40*l.* or more, by the year, payable out of the exchequer, as alſo certain fee-deer, both red and fallow, to be taken annually, at proper ſeaſons, out of the foreſt.

The ſubſtance of his oath is, to rechaſe, and with his hounds drive back, the wild beaſts of the foreſt, as often as they range out of the ſame into his *pourallee*; to preſent all unlawful hunting and hunters of wild beaſts of venery and chaſe, as well within the *pourallees*, as within the foreſt; and to preſent thoſe and other offences, at the next court of attachments or ſwanimote, which ſhall firſt happen.

Rangers, it is to be obſerved, belong only to ſuch *pourallees* as were once the woods and lands of the ſubject, and were afterwards diſafforeſted again, and ſo became *pourallees*. Hence, as there are ſome foreſts in England, which never had any inlaregment by new afforeſtations, and therefore have no *pourallees* at this day; there can be no rangers belonging to them.

PURPLE, Purpura, ϖορφυρα, a red colour, bordering on violet; dyed chiefly with cochineal, or ſcarlet in grain. See Colour; ſee alſo Red, Scarlet, Cochineal, &c.

Purple was much eſteemed among the ancients; eſpecially the Tyrian *purple*, which underwent more dyes than the reſt, and which was almoſt peculiar to emperors and kings. Yet this *purple* did not exceed that now in uſe; the chief reaſons why the former has been diſuſed, are, that the latter is both cheaper and finer.

The ancient *purple* was tinged or given with the blood or juice of a precious turbinated teſtaceous ſea-fiſh, called by the Greeks ϖορφυρα, and by the Latins *purpura*; whereof we have deſcriptions in ſeveral authors, and ſhells in moſt of the cabinets of the curious. See Dying.

In the ſeas of the Spaniſh Weſt-Indies about Nicoya, is found a ſhell-fiſh, which perfectly reſembles the ancient *purpura*, and in all probability is the very ſame: this fiſh, Gage tells us, uſually lives ſeven years; it hides itſelf a little before the dog-days, and continues to diſappear for 300 days running.

They are gathered plentifully in the ſpring, and by rubbing one againſt another, yield a kind of ſaliva or thick glair, reſembling ſoft wax: but the *purple* dye is in the throat of the fiſh; and the fineſt part in a little white vein;—the reſt of the body is of no uſe.—He adds, that the chief riches of Nicoya conſiſt in this fiſh. Cloth of Segovia, dyed with it, is ſold for twenty crowns the ell; and none but the greateſt Spaniſh lords uſe it.

Beſides the Indian *purple* fiſhes, we have others much nearer home. In the *Philoſoph. Tranſact.* we have an account of a *purple* fiſh diſcovered in 1686. by Mr. W. Cole, on the coaſts of Somerſetſhire, South-Whales, &c, where it is found in great abundance.

The fiſh, M. Reaumur obſerves, is a kind of buccinum, a name given by the ancients to all fiſhes whoſe ſhell bears any reſemblance to a hunting-horn; and it appears from Pliny, that part of the ancient *purple* was taken from this kind of ſhell-fiſh: ſo that this may be eſteemed a recovery of what had been ſuppoſed intirely loſt.

The method of obtaining the colour, the author deſcribes thus: —The ſhell, which is very hard, being broken, (with the mouth of the fiſh downwards, ſo as not to cruſh the body) and the broken pieces being picked off, there appears a white vein lying tranſverſely in a little furrow or cleft next the head of the fiſh.

In this vein is the *purple* matter lodged; ſome of which being laid on linen, appears at firſt of a light green colour; and if expoſed to the ſun, ſoon changes into a deep green, and in a few minutes into a ſea-green, and in a few more into a blue; thence it ſoon becomes of a *purpliſh* red, and in an hour more of a deep *purple* red.

And here the ſun's action terminates; but by waſhing in ſcalding water and ſoap, and drying it, the colour ripens to a moſt bright beautiful crimſon, which will bear waſhing admirably without any ſtypic. See Crimson.

The fiſh, he obſerves, is good food; and adds, that there are ſeveral kinds differing in ſize and ſhell, and alſo in the colour of the tinging liquor.—There are ſome found on the coaſts of Poictou.

M. Reaumur has diſcovered another very different kind of *purple*.—It is produced in oval grains about a quarter of an inch long, and about one thick, full of a white liquor bordering on yellow, which cover certain ſtones or ſands, about which the buccina of Poictou uſually aſſemble.

By the experiments M. Reaumur has made, it appears that theſe grains are neither the eggs of the buccinum, nor the ſeeds of any ſea-plants, nor any riſing plants, but the eggs of ſome other unknown fiſh.

Theſe grains being bruiſed on a white linen, at firſt only tinge it yellow and that inſenſibly; but in three or four minutes give it a very beautiful *purple* red, provided the linen be expoſed to the open air; for the air of a room, even though the windows be open, will not do.—This colour fades a little by repeated waſhings.

M. Reaumur concludes from ſome experiments he made, that the effect of the air on the liquor does not conſiſt in its taking away any particles thereof, nor in giving it any new ones, but only in its agitating it, and changing the arrangement of the parts that compoſe it.—He adds, that the liquor of the buccinum, and that of the grains, ſeem to be nearly of the ſame nature; except that the later is more watry, and only ſaline; whereas the other is hot and pungent.

The Caribbee iſlands have likewiſe their *purple* fiſh.—It is called *burgan*, being of the ſize of the end of the finger, and reſembling our periwinkles: its ſhell is of a browniſh azure, its fleſh white, its inteſtines of a very bright red, the colour whereof appears through the body, and it is this that dyes the froth, which it caſts when taken, and which is at firſt of a violet hue, bordering on blue.

To oblige them to yield the greater quantity of froth, they lay them on a plate, ſhake and beat them againſt one another; upon which the plate is immediately covered with the froth, which is received on a linen cloth, and becomes *purple* in proportion as it dries.

P. Labat obſerves, that if this be the real Tyrian *purple*, the ſecret of preparing and fixing it is loſt: this colour being found to dwindle and diſſipate, in proportion as the linen dyed with it is waſhed.

The ſame author gives us the deſcription of another *purple* dye produced by a plant growing in the Antilles.—The juice of this tree, when cut ſtanding, is of a blood-red, and communicates the ſame colour to cloths; though, like the former, it loſes much in waſhing.

Purple, in medicine.—The *purple fever*, *febris purpurea*, is a kind of plague, or a malignant fever diſcovering itſelf in eruptions on the ſkin like the bites of bugs or fleas, or like grains of millet, or the ſmall-pox; whence it is ſometimes alſo called the *ſpotted* and *milliary fever*. See Fever and Milliary.

The eruptions are red, orange, violet, azure, livid, or black; and when they riſe in great quantity, it is eſteemed a good ſign. —Sometimes they ſpread to a great extent, like eryſipelas's according to the quality of the poiſon. See Plague.

PURPRESTURE, in our ancient law-book. See Pourpresture.

PURPRISUM *, of the French *pourpris*, denotes a cloſe, or incloſure:—alſo the whole compaſs or extent of a manor or place.

* —*Donavi eis meum* purpriſum *de Kirkeham, & domos meas, & molendinum, & prata*, &c. Charta Waltera Eſpec. Priorat. de Kirkeham.

PURPURE, Pourpre, or Purple, in heraldry, according to ſome, is one of the five colours of armories, mixed or compounded of gules and azure bordering on violet; according to others, of a little black and much red colour. See Colour.

It is ſuppoſed a ſymbol of temperance, liberality, dignity, authority, faith, and piety,—Moſt authors in heraldry, as Favyn, Geliot, Monet, and Meneſtrier, do not allow *purple* for a colour in regard it is not ſimple, but compoſed of an equal mixture of four other colours.—They rather eſteem it a kind of intermediate tincture, ſometimes metal, and ſometimes colour: hence the Spaniards calls it *una miſtion:* ſo that one cannot lay it on metal and colour without falſifying the arms.

Add, that many take the *purple*, as it is accounted, on many ancient bearings, by which ſome of the moderns would evince the regularity and legitimacy of this colour in armory, to be no other than ſilver tarniſhed.

Spelman, however, in his Aſpilogia, allows *purple* the preference before all other colours, as having been an enſign of royalty for many ages; yet he allows it to have been excluded by the ancient heralds as only an imperfect colour.

It is repreſented in graving by diagonal lines drawn from the ſiniſter chief to the dexter baſe point.—*Vid. tab. heral. fig.* 81.

In the coats of noblemen it is called *amethyſt*, and in thoſe of princes, *mercury*.

PURPURATI, in our ancient hiſtorians, denote the ſons of emperors and kings. Neubrig. *lib.* 3. *cap.* 4. Malmsb. *lib.* 3.

PURREL, *anno* 35. Eliz. cap. 10. a liſt ordained to be made at the ends of kerſeys, to prevent deceit in diminiſhing their length.

PURSE, a manner of accounting; or, as ſome call it, a ſpecies of money of account, much uſed in the Levant; particularly at Conſtantinople. See MONEY *of account.*

The *purſe* conſiſts of about 500 dollars, or 120 pounds ſterling. It is ſo called, becauſe all the grand ſignior's treaſure in the ſeraglio is kept in leather bags of this value.

This method of accounting the Turks derive from the Greeks, and they from the Romans; the emperors whereof brought it to Conſtantinople, as appears from a letter of Conſtantine to Cecilian biſhop of Carthage, quoted by Euſebius and Nicephorus, wherein is this paſſage: —"Being reſolved to give "ſomething for the ſupport of the miniſters of the catholic "religion throughout the provinces of Africa, Numidia, and "Mauritania; I have written to Veſus, treaſurer-general of "Africa; and given him orders to pay you three thouſand "*folles*," i. e. *purſes*: for, as M. Fleury obſerves, we may call that *purſe* which the Latins called *follis*, which was a ſum of 250 ſilver denarii, amounting to about ſeven pounds ſixteen ſhillings, our money.

PURSER, an officer aboard a man of war, who receives her victuals from the victualler, and is to take care that it be in good condition, and well laid up, and ſtowed.

He is alſo to keep a liſt of the men and boys belonging to the ſhip, and to ſet down exactly the day of each man's admittance into pay; that the pay-maſter or treaſurer of the navy may iſſue out his disburſements, and pay off the men according to the *purſer*'s book.

PURSIVENESS, or PURSYNES, among farriers, *thickneſs of wind*, a name common to all thoſe diſeaſes in horſes which ariſe from obſtructions in the paſſages of the lungs. See WIND.

Purſiveneſs, ſometimes alſo called *broken wind*, may proceed from an ulcer, or ſome inward waſting of the lungs, wherein the ſmall veſſels are worn or abraded by the ſharpneſs or acrimony of the common diſcharges. See PHTHISIS.

The like diſorder may alſo ariſe from a ſtagnation, hindering the air from penetrating ſo as to lift up the lungs in the act of reſpiration; or from tough and mucilaginous matter ſeparated in the branches of the wind-pipe.

The uſual occaſions are cold, ſurfeits, and other diſeaſes not thoroughly carried off.—*Purſive* diſorders may alſo ariſe from unwholeſom food, bad air, and hard riding when a horſe is full. The ſigns are commonly a heaving and beating of the flanks; a wheezing and rattling. Sometimes the kernels about the throat will ſwell, and there will be a glandulous running at the noſe, which is the utmoſt ſtage of the diſeaſe, and uſually reputed deſperate. See GLANDERS.

PURSUIVANT. See the article POURSUIVANT.

PURVEYANCE. See the article POURVEYANCE.

PURVEYOR. See the article POURVEYOR.

PURVIEW *, a term frequently uſed by Sir Edward Coke for the body of an act of parliament, or that part which begins with *Be it enacted*, &c. as contradiſtinguiſhed from the *preamble*. See STATUTE.

* The word comes from the French *pourveu*, a gift, grant, proviſion, *&c.*

The ſtatute of 3 Hen. 7. ſtands upon a *preamble* and a *purview*. 12 *Rep.*

PURULENT, PURULENTUS, in medicine, ſometimes mixed with, or partaking of, pus. See PUS and SUPPURATION.

Phthiſical people frequently ſpit a *purulent* matter. See PHTHISIS.—In a dyſentery, the ſtools are *purulent*; when there is an ulcer in the reins or bladder, the urine is *purulent*.

PUS *, in medicine, a putrid matter, white and thick, formed of blood corrupted in a wound or ulcer, and iſſuing out of the lips thereof. See WOUND and ULCER.

* The word is Latin, *pus*, literally denoting ſnot, *&c.* formed of the Greek ϖυον, which ſignifies the ſame.

Wounds are always to be kept open while they ſuppurate, *i. e.* while they generate *pus*; for fear of ſhutting up the wolf in the ſheep-fold. See SUPPURATION.

PUSTULE, PUSTULA, a little pimple, or eruption, on the skin, full of pus; eſpecially ariſing in the ſmall and great pox. See EXANTHEMA.

PUTAGE *, PUTAGIUM, in our old-law-books, denotes whoredom or fornication on the part of the woman. See FORNICATION.

* The word is formed from the French *putte*, whore; *putagium*, q. d. *putam agere.*—*Quod autem generaliter ſolet dici*, putagium *hæreditatem non adimit; illud intelligendum eſt de* putagio *matris; quia filius hæres legitimus eſt, quem nuptiæ demonſtrant.* Glanv. lib. 7. cap. 12.

PUTANISM, PUTANISMO, an Italian term, naturalized by ſome Engliſh writers, ſignifying *whoredom*, or the life and condition of a courteſan. See COURTESAN.

The word we borrow immediately from the French, *putaniſme*, and they from the Italian, *puttana*, whore; of *putta*, girl.

PUTATIVE, *ſuppoſitive*, ſomething reputed to be what it really is not.

The word is ſeldom uſed but in the phraſe *putative father.*—Thus we ſay Joſeph was the *putative father of* Jeſus Chriſt. See FATHER.

PUTLOGS, or PUTLOCKS, in building, ſhort pieces of timber, about ſeven feet long, uſed in building ſcaffolds.—They lie at right angles to the wall, with one of their ends bearing upon it, and the other upon the ledgers or poles which lie parallel to the ſide of the wall of the building.

PUTREFACTION, or PUTRIFACTION, in phyſics, a ſlow ſort of corruption produced in natural bodies, generally by the moiſture of the air, or ſome other ambient fluid, which penetrating the pores, and being agitated therein, diſſolves and ſets at liberty ſome of the moſt ſubtile parts, particularly the ſalts and oils; and thus looſens and diſlocates the compages, quite changes the texture, and ſometimes the figure of the mixt. See CORRUPTION.

How much the air contributes to *putrefaction*, is evident hence, that bodies buried deep under earth, or in water out of any reach of air, ſhall remain for ages intire; which yet being expoſed to the open air, ſhall ſoon rot and moulder away. See SUBTERRANEOUS.

The like appears from ſucculent fruits, and other vegetable matters, which, for all their aptneſs to *putrefy*, will remain a long time unchanged *in vacuo*. See VACUUM.

The perpetual oſcillations of ſo elaſtic a fluid contained or ſhut up in the pores of a body, may be conceived ſufficient to induce this alteration in their form and texture; yet ſhould it rather ſeem, that the water or vapoury matter wherewith the proper air is impregnated, is the more immediate agent. Hence Acoſta obſerves, that in Peru, and others have obſerved the ſame in Egypt, where it very rarely rains, every thing will continue a long time uncorrupted; unleſs we will rather aſcribe the effect to the abundance of nitrous ſalt in the air of thoſe places, which is known to reſiſt *putrefaction*. See AIR, WATER, SALT, *&c.*

In effect, all *putrefactions*, both of animal and vegetable bodies, are affirmed by the learned Boerhaave to be performed by means of water alone: Take (ſays he) a pound of freſh fleſh, and keep it in a heat like that of our body, and in few days the *putrefaction* will be completed; but if you firſt drain out or exhale all the watry part from the ſame in ſome chymical veſſel; though the ſalt and oil remain, the fleſh will harden like a ſtone, and may be kept for ages without *putrefaction.*—Though when thus hardened, water poured on it, or even the common dew, will ſoon ſet it a *putrefying*.

By ſuch means, bread, fleſh, or the like foods, may be preſerved for ages; provided regard be had to the place: hence it is, that in dry countries, as Egypt, dead carcaſſes never *putrefy*, but dry and harden uncorrupted; as we ſee in the mummies found buried under the ſand. See MUMMY.

Even human blood, which naturally is ſo prone to *putrefaction*, if you deprive it of its watry part, may be kept for fifty years. Goat's blood we actually find kept ſo long in the ſhops, without corrupting; though if you diſſolve it in water, and expoſe it to a gentle warmth, it *putrefies* immediately.

PUTREFACTION, in chymiſtry, denotes a ſpontaneous kind of operation, whereby vegetable or other ſubſtances, in virtue of their own heat and moiſture, are diſſolved, and turned into ſubſtances of a higher, *e. gr.* and animal nature. See ANIMAL and VEGETABLE.

Proceſs of vegetable PUTREFACTION.—Throw together any of the tender, green, and ſucculent parts of recent vegetables, whether acid or alkaline, in a large heap, in the warm open air, and preſs them down with an additional weight, if their own be inconſiderable; and the middle part of the heap will in a little time ſpontaneouſly conceive a ſmall degree of heat, and paſs ſucceſſively through the other degrees, till it arrive at a ſtate of ebullition, and be perfectly *putrefied*.

In the ſpace of three days, from the firſt putting them together, they will yield a heat, perceiveable by the hand, equal to that of a human body in a healthy ſtate; by the fifth the heat will be too great for the hand to bear without pain; and, laſtly, by the ſixth, ſeventh, or eighth day, the juices will generally appear ready to boil, and ſometimes the matter will even flame and burn away.

By this ſpontaneous operation, the vegetable acquires an abominably putrid, ſtercoraceous, or cadaverous taſte and odour; and turns intirely into one ſoft, ſimilar, pappy maſs, or craſſamentum, greatly reſembling fetid human excrement in the ſcent, and *putrefied* fleſh in the taſte.

If now this fetid matter, thus obtained, be directly, whilſt it remains in it's fetid ſtate, committed to a glaſs retort, and diſtilled with proper degrees of fire, there will come over, 1. A water impregnated with an urinous ſpirit, perfectly like that obtainable from animal ſubjects, and ſeparable by a freſh diſtillation ſlowly made in a tall glaſs, into elementary water, and a large quantity of pure, white, volatile, dry, alkaline ſalt, not to be diſtinguiſhed from animal ſalts. 2. A volatile, alkaline, oily ſalt, that ſhoots into glebes. 3. An exceedingly volatile and a thick fetid oil, both which are intirely like thoſe of animals. And, laſtly, the remainder being calcined in an open fire, affords not the leaſt particle of fixt ſalt: juſt as if the ſubject had really been of the animal, and not of the vegetable kingdom. See SALT.

This proceſs is truly univerſal, and holds equally in all kinds of vegetables, though ever ſo different in their nature and virtue. Experiments have been made in the coldeſt and moſt ſucculent or watry plants, ſuch as purſlain, ſorrel, *&c.* as well as with the hotteſt or moſt acrimonious, ſuch as the ſpurges, *&c.* and it was always found to ſucceed; but the ſooner, as the vegetable employed contained the greater quantity of oil: though with the ſame phænomena.

It will likewiſe ſucceed with dry vegetables, provided they be moiſtened with water before they are thrown into heaps: and thus we ſometimes ſee, that ſtacks of hay will ſpontaneouſly take fire, and blaze away; eſpecially if it was not well dried in the making.

It is ſurpriſing to conſider, that by this means the difference betwixt vegetables may be intirely taken away, and the whole kingdom thereof reduced to the ſame common nature; ſo that wormwood and tanſy, for inſtance, or ſorrel and ſcurvygraſs, ſhall appear as one and the ſame thing; and this thing appear no otherwiſe than *putrefied* fleſh.

Though ſorrel be famed for its power of preſerving the animal fluids uncorrupted whilſt they are circulating in the body, and ſcordium for its embalming virtue, as continuing it in a ſtate of incorruption after death; yet even theſe plants are themſelves thus eaſily corrupted and changed into ſuch a kind of *putrefied* fleſh, as it is their virtue to prevent.

This Boerhaave conſiders as a general law of nature, wiſely eſtabliſhed to produce wonderful changes in the world, and prevent the inaction and decreaſe of matter in our globe; this active principle or medium giving an eaſy and reciprocal tranſition of vegetable into animal ſubſtances, and animal into vegetable.

Hence we are given to underſtand the nature and uſes of *putrefaction*, with its difference from *fermentation*, both in regard of the ſubject, cauſe, and effect.—Vegetables alone are the ſubject of fermentation; but both vegetables and animals of *putrefaction*. Fermentation alſo requires, that its ſubject be firſt reduced to the form of a liquid, or at leaſt made capable of floating in one, before it can obtain; whereas *putrefaction* only ſucceeds when its ſubject is half dry, or barely moiſt: which is the reaſon why muſt, put up in a wooden veſſel, does not *putrefy*; whilſt the grapes from which it was expreſſed, being thrown in heaps, would preſently conceive heat, and run into a ſtate of *putrefaction*.

We ſee alſo, that vegetable *putrefaction* is begun and promoted with heat, and finiſhed with coction, which requires a degree of heat much greater than that excited by fermentation, as being capable of cauſing an ebullition in the plant, and even of turning it into flame: as, indeed, the immediate cauſe of fermentation is the motion of the air intercepted between the fluid and viſcous parts of the fermenting liquor; but the cauſe of *putrefaction* is fire itſelf, collected or included within the *putrefying* ſubject. See FIRE and HEAT.

Again, the effects of fermentation are the production of flowers or yeaſt, the converſion of the ſaline part of the fermenting body into tartar, or an acrimonious, acid, and fixed kind of ſalt, and of oils, into an inflammable ſpirit retaining ſomething of the nature of the vegetable; but *putrefaction* makes all the acid ſalts volatile and alkaline; renders the oils not ſpirituous, but abominably fetid; utterly deſtroys what makes the ſpecific difference between one ſubject and another; and converts them wholly into a ſoft pulpy maſs, of an animal nature, without the leaſt ſigns of any fixed ſalt, though the recent vegetable would, by calcination at the firſt, have afforded a large proportion. *Putrefaction*, in fine, makes nearly the ſame kind of alteration in the whole ſubject, as it would undergo by paſſing through a ſound animal body, ſuffering all the actions thereof, and being at length turned into the form of excrement. See FERMENTATION.

This operation may let us a little into the nature of animal digeſtion, or the change which the aliment ſuffers in the human body.—For the change our vegetable foods undergo in the body, being ſuch as brings them to be of the ſame nature, and afford the ſame principles with the change induced by *putrefaction*, is a preſumption, that digeſtion is nothing elſe; at leaſt, it apparently comes nearer thereto, than to fermentation. See DIGESTION.

PUTRID, PUTRIDUS, ſomething rotten or putrefied. See PUTREFACTION.

Thus we ſay, *putrid* fleſh:—a *putrid* humour:—*putrid* limbs, *i. e.* mortified ones, are to be cut off. See MORTIFICATION.

PUTRID *fever* is a kind of fever, wherein the humours, or part of them, have ſo little circulary motion, that they fall into an inteſtine one, and putrefy. See FEVER.

This is frequently the caſe after great evacuation, or exceſſive heat; where there is ſuch a ſcarcity of ſpirits, that the ſolids do not vibrate ſufficiently to keep the fluids in their due velocity.—In theſe caſes the pulſe is low, and the fleſh cooler than natural at firſt.

PUTRID *ulcer*. See the article ULCER.

PUTTY ſometimes denotes powder of calcined tin, uſed in poliſhing, and giving the laſt gloſs to works of iron and ſteel. See TIN and EMERY.

PUTTY is alſo uſed to denote *ſpodium*. See SPODIUM.

PUTTY, in its popular ſenſe, denotes a cinericious kind of paſte, compounded of whiting and linſeed-oil beaten together to the conſiſtence of a tough dough:—uſed by glaſiers for faſtening the ſquares of glaſs in ſaſh-windows, *&c.* and by painters, to ſtop up the crevices and clifts in timber and wainſcot, to prevent the wet from getting in, and ruining the work.

PUTURA*, a cuſtom claimed by the keepers of foreſts, and ſometimes bailiffs of hundreds, to take man's meat, horſe's meat, and dog's meat, of the tenants and inhabitants, gratis, within the perambulation of the foreſt, hundred, *&c.* See PURLIEU, PERAMBULATION, *&c.*

* *Johannes clamat unam* puturam *in prioratu de Penewoſtham, qui eſt quædam cella abbatiæ de Eveſham pro ſe & miniſtris, equis & garcionibus ſuis, per unum diem & duas noctes, de tribus ſeptimanis in tres ſeptimanas, viz. de victualibus, ut & eſculentis & potulentis, ad coſtas prioratus prædicti indebite.*——Placit. apud Preſton. 17. Edv. 3.

This cuſtom within the liberty of Knaresburg was long ſince turned into the payment of four pence, *pro putura*.

The land ſubject to this ſervice, is called *terra puturata*. The learned Somner erred in his expoſition of this word.

PYANEPSIA, πυανεψια, in antiquity, a feaſt celebrated by the Athenians in the month *pyanepſion*, which, according to the generality of the critics, was their fourth month, and correſponding to our September. See FEAST.

Plutarch refers the inſtitution of this feaſt to Theſeus, who, at his arrival from Crete, made a kind of ſacrifice to Apollo of all the proviſions remaining in his veſſel; putting them all into a kettle, boiling them together, and eating them with his ſix companions; which cuſtom was afterwards continued.—The ſcholiaſt of Ariſtophanes ſays, it was to acquit himſelf of a vow he made to Apollo in a tempeſt.

M. Baudelot writes the word *puanepſia*; and takes it to be a feaſt inſtituted in memory of Theſeus's return after killing the Minotaur. See MINOTAUR.

The Greeks vary as to the origin and ſignification of the word *pyanepſion*, whence the feaſt is denominated.—Harpocration calls it *pæanopſia*; he adds, that others call it *panopſia*, becauſe then the fruits all appear to the eye.—Heſychius writes *pyanepſia*; and derives it from πυανον, bean, and εψω, *coquo:* becauſe in this feaſt the Athenians gathered their beans, and made a kind of broth of them.

PYCNOSTYL*, πυκνοστυλος, in the ancient architecture, a building where the columns ſtand very cloſe to one another; one diameter and a half of the column being only allowed for the intercolumnation. See INTERCOLUMNATION.

* The word is formed from the Greek πυκνος, *cloſe*, *denſe*, and στυλος, *column*.

The *pycnoſtyle*, is the ſmalleſt of all the intercolumnations mentioned by Vitruvius.—Some make it the ſame with *ſyſtyle*; others diſtinguiſh the latter, by its allowing half a module more in the Corinthian intercolumnation.

The *pycnoſtyle*, Mr. Evelyn obſerves, chiefly belonged to the compoſite order, and was uſed before the moſt magnificent buildings; as at preſent in the periſtyle of St. Peter's at Rome, conſiſting of near 300 columns, and ſuch as yet remain of the ancients among the late diſcovered ruins of Palmyra.

PYCNOSTICKS*, *incraſſants*, or medicines of an aqueous nature, which have the faculty of cooling and condenſing, or thickening the humours. See CONDENSATION.

* The word in the original Greek, πυκνωτικον, ſignifies ſomething that has the power of thickening.

Purſlain, the nenuphar or water-lily, ſolanum, *&c.* are ranked among *pycnotics*.

PYGME, πυγμη, the length or extent between the elbow and extremity of the hand, the firſt being ſhut; called alſo *cubit*. See CUBIT.

PYGMY*, PYGMÆUS, πυγμαιος, dwarf, or perſon of exceeding ſmall ſtature, not exceeding a cubit in height. See DWARF and GIANT. See alſo PIGMY.

* The word is formed from the Greek πυγμη, *cubit*. See CUBIT.

The appellation is given among the ancients to a fabulous nation ſaid to have inhabited Thrace, who generated and brought forth young at five years of age, and were old at eight; famous for the bloody war they waged with the cranes.

PYLING *the ground* for foundations. See FOUNDATION and PALLIFICATION.

PYLORUS*, in anatomy, the right and lower orifice of the ſtomach, whereby it diſcharges itſelf into the inteſtines.—See *tab. anat.* (Splanch.) *fig.* 2. *lit.* *c*, *e.* See alſo STOMACH and INTESTINES.

* The word is Greek, πυλωρος, where it primarily ſignifies *janitor*, or door-keeper.

The *pylorus* is ſituate on the right ſide of the ſtomach, and paſſes by an oblique aſcent to the duodenum, to prevent the too precipitate paſſage of the aliment out of the ſtomach. See DUODENUM.

For this end it is likewiſe furniſhed with an extraordinary ſeries of fibres, to conſtringe it more than any other part: theſe running round it ſerve as a kind of ſphincter, which is opened by the contraction of the ſtomach, and the appulſe of the chyle. See DIGESTION, CHYLIFICATION, *&c.*

At the bottom of the *pylorus* is a large cavity, which Willis calls *antrum pylori*, and conceives its uſe to be, to keep the food firſt digeſted, till the latter taken into the ſtomach be digeſted; though, if what Wharton obſerves be true, *viz.* that there are lacteals in the bottom of the ſtomach, ſuch a proviſion ſhould ſeem unneceſſary. See LACTEAL.

PYONY *water*. See the article WATER.

PYRAMID, πυραμις, in geometry, a ſolid ſtanding on a ſquare, triangular, or polygonal baſis, and terminating, at-top, in a point; or a body whoſe baſe is a regular rectilinear figure, and whoſe ſides are plain triangles; their ſeveral vertices meeting together in one point. See SOLID.

Euclid defines it a ſolid figure, conſiſting of ſeveral triangles, whoſe baſes are all in the ſame plane, and have one common vertex. See TRIANGLE and VERTEX.

Wolfius defines it a ſolid, bounded by as many triangles, ABC, DCB, and ADB, terminating in one point D; as the baſe ABC has ſides, *Tab. geomet. fig.* 78.

The *pyramid* is ſaid to be *triangular, quadrangular, quinquangular*, &c. as the baſe is triangular, quadrangular, *&c.*—The *pyramid* may be called a ſquare, triangular, *&c.* cone; or the cone, a round *pyramid.* See CONE.

Properties of the PYRAMID.—1. All *pyramids* and cones ſtanding on the ſame baſe, and having the ſame altitude, are demonſtrated to be equal.

2. A triangular *pyramid* is the third part of a priſm, ſtanding on the ſame baſe, and of the ſame altitude. See PRISM.

3. Hence, ſince every multangular may be divided into triangulars; every *pyramid* is the third part of a priſm, ſtanding on the ſame baſis, and of the ſame altitude.

4. If a *pyramid* be cut by a plane, *abc*, parallel to its baſe ABC; the former plane or baſe will be ſimilar to the latter.

5. All *pyramids*, priſms, cylinders, *&c.* are in a ratio compounded of their baſes and altitudes: the baſes, therefore, being equal, they are in proportion to their altitudes; and the altitudes being equal, in proportion to their baſes.

6. *Pyramids*, priſms, cylinders, cones, and other ſimilar bodies, are in a triplicate ratio of their homologous ſides.

7. Equal *pyramids*, &c. reciprocate their baſes and altitudes, *i. e.* the altitude of the one is to that of the other, as the baſe of the one to that of the other, *&c.*

8. A ſphere is equal to a *pyramid*, whoſe baſe is equal to the ſurface, and its height to the radius of the ſphere.

To meaſure the ſurface and ſolidity of a PYRAMID.—Find the ſolidity of a priſm, that has the ſame baſe with the given *pyramid*. See PRISM.—And divide this by three; the quotient will be the ſolidity of the *pyramid.*

Suppoſe, *v. gr.* the ſolidity of the priſm be found 67010328, the ſolidity of the *pyramid* will be thus found 22336770.

The ſurface of a *pyramid* is had, by finding the areas both of the baſe ABC, and of the lateral triangles ACD, CBD, BDA. See TRIANGLE. The ſum of theſe is the area of the *pyramid.*

The external ſurface of a right *pyramid*, ſtanding on a regular polygonal baſe, is equal to the altitude of one of the triangles which compoſe it, multiplied by the whole circumference of the baſe of the *pyramid.*

To deſcribe a PYRAMID *on a plane.*—1. Draw the baſe, *v. gr.* the triangle ABC (if the *pyramid* required be triangular); ſo as that the ſide AB, ſuppoſed to be turned behind, be not expreſſed. 2. On AC and CB, conſtruct the triangles ADC, and CDB, meeting in any aſſumed or determined point, *v. gr.* D; and draw AD, CD, BD: then will ADBC be a triangular *pyramid.*

To conſtruct a PYRAMID *of paſt-board, &c.*—Suppoſe, *v. gr.* a triangular *pyramid* required. 1. With the radius AB, deſcribe an arch BE, (*fig.* 79.) and thereto apply three equal chords, BC, CD, and DE. 2. On CD conſtruct an equilateral triangle DFC; and draw the right lines AD and AC. This paſt-board, *&c.* being cut off by the contour of the figure, what remains within will turn up into a *pyramid.*

Truncated PYRAMID. See the article TRUNCATED.

Fruſtum of a PYRAMID. See the article FRUSTUM.

PYRAMID*, in architecture, denotes a ſolid maſſive edifice, which from a ſquare, triangular, or other baſe, riſes diminiſhing to a point or vortex.

* Some derive the word from πυρος, *wheat*, and αμαω, *colligo*; pretending that the firſt *pyramids* were built by the Patriarch Joſeph for granaries.—But Villalpandus, with much better reaſon, derives the word from πυρ, *fire*; becauſe ending in a point like flame.

When they are very narrow at bottom, *i. e.* their baſe very ſmall, they are called *obelisks*, and *needles*. See OBELISK.

Pyramids are ſometimes erected to preſerve the memory of ſingular events, and ſometimes to tranſmit to poſterity the glory and magnificence of princes; but as they are the ſymbol of immortality, they are more commonly uſed as funeral monuments. See MONUMENT.

Such is that of Ceſtius at Rome; and thoſe other celebrated ones of Egypt, as famous for the hugeneſs of their ſize, as their antiquity.

Theſe laſt are all ſquare in their baſes; and it is a thing has been frequently propoſed, to eſtabliſh a fixed meaſure from them, to be thereby tranſmitted to poſterity.—See their deſcriptions, meaſures, *&c.* in Thevenot, Pietro della Valle, Graves, *&c.*

Among the Egyptians, the *pyramid* is ſaid to have been a ſymbol of human life; the beginning whereof is repreſented by the baſe, and the end by the apex: on which account it was, they uſed to erect them on ſepulchres. Herodotus.

Scenography of a PYRAMID. See the article SCENOGRAPHY.

Optic PYRAMID. See the article OPTIC *pyramid.*

PYRAMIDAL *fountain*. See the article FOUNTAIN.

PYRAMIDAL *mirrors*. See the article MIRROUR.

PYRAMIDAL *numbers* are the ſums of polygonal numbers, collected after the ſame manner as the polygonal numbers, themſelves are extracted from arithmetical progreſſions. See POLYGONAL *number*, &c. See alſo NUMBER.

Theſe are particularly called *firſt pyramidals.*—The ſums of firſt *pyramidals* are called *ſecond pyramidals.*—The ſums of thoſe *third pyramidals.*—, &c. ad infinitum.

Particularly, thoſe ariſing from triangular numbers are called *prime triangular pyramidals*; thoſe ariſing from pentagonal numbers are called *prime pentagonal pyramidals*, &c.

From the manner of ſumming up pentagonal numbers, it appears evidently, how the prime *pyramidal* numbers are found; *viz.* $\frac{(a-2)n^3+3n-(a-5)n,}{6}$ expreſſes all the prime *pyramidals.*

PYRAMIDALE *corpus*, in anatomy, a plexus of blood-veſſels on the back of the teſticles; thus called from its form: and from its ſtructure alſo called *corpus varicoſum* and *pampiniforme.* See CORPUS and VARICOSUM.

It conſiſts of innumerable little veins, communicating with each other, and forming a kind of net-work; which, at length uniting, terminate in one vein, by which the blood is conveyed into them all.

The origin of this plexus is from the ſpermatic veins, which, a little above the teſticles, ſplit into ſeveral branches; which again uniting ſeveral times, form the *corpus pyramidale.* See TESTICLE and SPERMATIC.

PYRAMIDALES *papillæ*. See the article PAPILLÆ *pyramidales.*

PYRAMIDALIS, in anatomy, denotes a ſmall muſcle of the abdomen, lying on the lower part of the rectus.—It has its name from its figure, and its origin from the margin of the os pubis, with a pretty broad fleſhy head, whence it grows gradually narrower, till it end in a ſmall round tendon in the linea alba; ſometimes almoſt at the navel.—See *tab. anat.* (Myol.) *fig.* 1. *n.* 46. *fig.* 2. *n.* 31.

This muſcle is ſometimes ſingle, ſometimes it has its fellow, and ſometimes they are both wanting.

PYRAMIDOID, called alſo *parabolic ſpindle*, a ſolid figure formed by the revolution of a ſemi-parabola round one of its ordinates.

According to the method of indiviſibles, this may be conceived to conſiſt of an infinite ſeries of circles, whoſe diameters are all parallel to the axis of the revolving parabola.

The *parabolic ſpindle* is equal to $\frac{8}{15}$, of its circumſcribing cylinder.

PYRATE. See the article PIRATE.

PYRENOIDES*, *proceſſus*, in anatomy, a proceſs of the ſecond vertebra of the neck; called alſo *odontoides* and *dentiformis*, or the tooth-like proceſs. See VERTEBRA and ODONTOIDES.

* The word is Greek, πυρηνοειδης formed of πυρην, *nucleus*, kernel or berry, ειδος, figure.

PYRETHRUM, *pellitory of Spain*, an acrid medicinal root, brought from Tunis and Italy; of an hot, diſcutient quality: uſed as an alexipharmic and phlegmagogue; as alſo to aſſwage the tooth-ach, and in the compoſition of vinegar.

It is of a moderate length, the thickneſs of the little finger, greyiſh without, whitiſh within, and of a ſharp burning taſte.

It is pretended it took its name from Pyrrhus king of Epirus; but there is no great occaſion for having recourſe to a myſtery, its burning quality being ſufficient to give it the name *pyrethrum*, from the Greek, πυρ, fire.—It muſt be choſen new, dry, hard to break, *&c.*

It is called a ſalivary root, becauſe, being held in the mouth, its pungency promotes the evacuation of ſaliva.

PYRETICS*, medicines good againſt fevers. See FEVER.

* The word is formed from the Geek πυρετος, *fever*, of πυρ *fire.*

PYRIFORMIS, in anatomy, a muſcle of the thigh, receiving its name from its figure, which reſembles that of a pear.—It is alſo called *iliacus externus*, from its ſituation.—See *tab. anat.* (Myol.) *fig.* 7. *n.* 21. 22. See ILIACUS.

Its beginning is round and fleſhy, from the inferior and internal part of the os ſacrum, where it reſpects the pelvis of the abdomen; and deſcending obliquely along the great ſinus of the os ilium, above the acute proceſs of the iſchium, and joining with the glutæus medius, is inſerted by a round tendon into the ſuperior part of the root of the great trochanter.—This moves the os femoris ſomewhat upwards, and turns it outwards.

PYRITES*, in phyſiology, a ſulphurous inflammable kind of ſtone or mineral, compoſed of an acid ſalt, incorporated with an oily or bituminous matter. See MINERAL.

* The word is Greek, πυριτης, *q. d.* fireſtone, formed of πυρ, fire; a denomination given it on account of its inflammability, which is ſuch that by colliſion it will yield ſparks of fire.

Pyrites bears a near affinity to marcaſite, with which the generality of authors confound it.—Dr. Woodward makes this diſtinction between the two, that *pyrites* is reſtrained to the nodules, or thoſe pieces found lodged in ſtrata of another kind; and marcaſite to thoſe found in ſtrata of the ſame kind.—Add, that the marcaſite frequently contains arſenic, which the *pyrites* does rarely, if ever. See MARCASITE.

Pyrites has always a metalline part in it, and ſometimes a cretaceous or okerous part.—In proportion as any of theſe prevails, the body commences a ſulphur, alum, or vitriol. See VITRIOL, COPPERAS, SULPHUR, *&c.*

The metal in *pyrites* is chiefly iron; ſometimes there is copper in it, and always a little gold, rarely ſilver, and never lead or tin. See METAL.

Dr. Slare tells us of a heap of *pyrites* conſiſting of two or three hundred tons, which being covered up from the air five or ſix months took fire, and burnt for a week. Some of it looked like melted metal, others like red-hot ſtones. He adds, it emitted a moſt noiſom ſmoke.

Dr. Liſter attributes thunder, earthquakes, *&c.* to the ſulphurous and inflammable breath of the *pyrites.* See THUNDER, EARTHQUAKE, EXHALATION, *&c.*

PYRITES is applied by ſome authors to the marcaſites of all metals; the names whereof are varied according to the metals they partake of. See MARCASITE.

Thus *chryſitis* is that of gold; *argyritis* that of ſilver; *ſideritis* that of iron; *chalcitis* that of copper; *molybditis* that of lead, *&c.* See CHALCITIS, *&c.*

PYROBOLOGY. See the article PYROTECHNIA.

PYROENUS* is a term ſometimes uſed for rectified ſpirit of wine; thus called becauſe made by fire, or rather becauſe rendered of a fiery nature. See SPIRIT and RECTIFICATION.

* The word is of Greek compoſition, formed of πυρ, *fire,* and οινος, *wine.*

PYROET, PYROUET, or rather PIROUETTE, in the manage. See PIROUETTE.

PYROMANCY, πυρομαντεια, a kind of divination, performed by means of fire. See DIVINATION.

The ancients imagined, they could foretel futurity by inſpecting fire and flame: to this end they conſidered its direction, or which way it turned.—Sometimes they added other matters to the fire, *e. gr.* a veſſel full of urine, with its neck bound about with wool, watching narrowly on which ſide it burſt, and thence taking their augury.

Sometimes they threw pitch on it, and if it took fire immediately, eſteemed it a good augury.

PYROTECHNY*, πυροτεχνια, the art of fire, or a ſcience which teaches the management and application of fire in ſeveral operations. See FIRE.

* The word is formed from the Greek, πυρ, *fire,* and τεχνη, *art.*

Pyrotechny is of two kinds, military and chimical.

Military PYROTECHNY is the doctrine of artificial fire-works and fire-arms, teaching the ſtructure and uſe both of thoſe uſed in war for the attacking of fortifications, *&c.* as gun-powder, cannons, bombs, granadoes, carcaſſes, mines, fuſees, *&c.* and thoſe made for amuſement-ſake, as rockets, ſtars, ſerpents, *&c.* See FIRE *arm,* ORDINANCE, *&c.*

Some call *pyrotechny* by the name *artillery*; though that word is uſually confined to the inſtruments uſed in war. See ARTILLERY.—Others chuſe to call it *pyrobology*, or rather *pyroballogy, q. d.* the art of miſſile fires; from the Greek πυρ, fire, and βαλλειν, to caſt, throw. See GUNNERY, PROJECTILE, *&c.*

Wolfius has reduced *pyrotechnia* into a kind of mixt mathematical art: indeed it will not allow of geometrical demonſtrations; but he brings it to tolerable rules and reaſons: whereas before it had uſed to be treated by authors at random, and without regard to any reaſons at all. See MATHEMATICS.

See the elements of *military pyrotechny* under the ſeveral inſtruments and operations; CANNON, BOMB, ROCKET, GUNPOWDER, *&c.*

Chymical PYROTECHNIA is the art of managing and applying fire in diſtillations, calcinations, and other operations of chymiſtry. See CHYMISTRY and OPERATION.

Some reckon a third kind of *pyrotechnia, &c.* the art of fuſing, refining, and preparing metals. See METAL, FUSION, REFINING, *&c.*

PYROTECHNICAL *ſpunge.* See the article SPUNGE.

PYROTICS*, πυρωτικα, in medicine, remedies either actually or potentially hot; and which, accordingly, will burn the fleſh, and raiſe an eſchar. See CAUSTIC and ESCHAROTIC.

* The word is formed from the Greek πυρ, *fire.*

PYROUET. See the article PIROUETTE.

PYRRHICHA, Πυρριχη, in antiquity, a kind of exerciſe on horſe-back; or a feigned combat, for the exerciſe of the cavalry. See EXERCISE.

It was thus called from its inventor Pyrrhichus, or Pyrrhus of Cydonia, who firſt taught the Cretans to march in meaſure and cadence to battle, and to obſerve the pace of the Pyrrhic foot.—Others derive the name from Pyrrhus ſon of Achilles, who inſtituted this exerciſe at the obſequies of his father. Ariſtotle ſays, that it was Achilles himſelf invented it.

The Romans alſo called it *ludus Trojanus,* the Trojan game; and Aulus Gellius, *decurſus.*—It is doubtleſs this exerciſe that we ſee repreſented on medals by two cavaliers in front running with lances, and the word *decurſio* in the exergum.

PYRRICHIUS, πυρριχιος, in the Greek and Latin poetry, a foot conſiſting of two ſyllables, both ſhort;—as *deus.* See FOOT. Among the ancients this foot is alſo called *periambus*; by others *hegemona.* Quintil. l. 9. c. 4. Plot. de metr. p. 2665.

PYRRHONIANS, PYRRHONEANS, or PYRRHONISTS, a ſect of ancient philoſophers, ſo called from their founder Pyrrho. See PHILOSOPHER.

The diſtinguiſhing character of this philoſopher was, that he profeſſed to doubt of every thing, maintaining, that men only judge of truth and falſhood from appearances which deceive. See DOUBTING.

On this principle he kept himſelf in continual ſuſpenſion of mind, never determining on any thing; to avoid the inconveniences of error, and falſe judgments. See ERROR, FALSEHOOD, *&c.*

Thoſe now diſtinguiſhed by the name of *Pyrrhonians,* or *Sceptics,* are perſons who, from the great number of things that are dark and obſcure, and from the averſion they bear to popular credulity, maintain, that there is nothing certain in the world. See SCEPTICS.

The truth is, *Pyrrhoniſm* has ſome foundation in nature: we do not judge of things from their real eſſences, but from their relations to ourſelves. Moſt of our ideas we receive by means of our ſenſes; but our ſenſes are not given us to judge of the eſſences, but of the relations of things to ourſelves; *i. e.* how they may affect us ſo as to do us good or harm. See SENSATION, RELATION, SENSE, *&c.*

Thus, *e. gr.* our eyes do not give us the real magnitudes of objects, but their relative ones only. See VISION and VISIBLE. See alſo BODY and MATTER.

The Academics differed from the *Pyrrhonians,* in that they owned there were ſome things more like or akin to truth than others, which the *Pyrrhonians* peremptorily denied. See ACADEMICS.

Le Clerc obſerves, that the *Pyrrhonians,* in affirming that there is nothing certain, were the moſt aſſuming and deciſive of all philoſophers; ſince they muſt have firſt examined all things, to be able to determine preciſely, that all things are uncertain.

It may be added, that the very principle of the *Pyrrhonians* deſtroys itſelf: for if there be nothing certain, then muſt that dogma itſelf be precarious; and if no one thing be more probable, or liker to truth than another, why ſhould the principle of the *Pyrrhonians* be believed preferably to the oppoſite one? ſince itſelf is come at in the ſame way as our other knowledge. See KNOWLEDGE, ACATALEPSIA, *&c.*

PYTHAGORAS'*s table.* See the article TABLE.

PYTHAGOREANS, or PYTHAGORIC *ſyſtem,* among the ancients, was the ſame with the Copernican ſyſtem among the moderns. See SYSTEM.

It was thus called, as having been maintained and cultivated by Pythagoras and his followers; not that it was invented by him, for it was much older. See COPERNICAN *ſyſtem.*

PYTHOGAREANS, a ſect of ancient philoſophers, who adhered to the doctrines of Pythagoras. See PHILOSOPHER.

The founder of this ſect was of Samos, the ſon of a lapidary, and pupil of Pherecydes, who flouriſhed about the ſeventh olympiad, *i. e.* about 500 years before Chriſt.

This ſect was alſo called the *Italick ſect,* or *Italick ſchool,* becauſe Pythagoras, after travelling into Egypt, Chaldea, and even into the Indies, to inform his underſtanding, returning home to his own country, and there unable to bear the tyranny of Polycrates, or Syloſon, retired into the eaſtern part of Italy, then called the Greater Greece, and there taught and formed his ſect. See ITALIC.

He is held to have excelled in every part of ſcience: Laertius ſays, among the Chaldees and Hebrews he learnt divination, and the interpreting of dreams; in Egypt he learnt all the myſteries of the prieſts, and the whole ſyſtem of ſymbolical knowledge, with all their theology.—Porphyry adds, that he learnt the mathematical ſciences in his travels; geometry from the Egyptians, the doctrine of numbers and proportions from the Phœnicians, and aſtronomy from the Chaldeans; morality and theology he learnt chiefly from the magi.

He was the firſt who aſſumed the modeſt title *philoſopher*; the ſages till his time having borne the arrogant appellation σοφοι. See PHILOSOPHER and SOPHIST.

Jamblichus obſerves, that in Phœnicia he converſed with the prophets and philoſophers, the ſucceſſors of Mochus the phyſiologiſt; which Mochus Selden and ſome others will have to be Moſes.

His ſchool in Italy was at Crotona, where he is ſaid to have been attended by no leſs than 600 ſcholars.—His houſe was called the temple of Ceres, and the ſtreet where it ſtood the muſeum. See MUSEUM.

Out of this ſchool proceeded the greateſt philoſophers and legiſlators, Zaleucus, Charondas, Archytas.—Porphyry ſays, as ſoon as he arrived in Italy he had an auditory of two thouſand people, to whom he explained the laws of nature, reaſon, and juſtice.

He endeavoured to aſſwage the paſſions of the mind with verſes and numbers; and made a practice of compoſing his mind every morning by his harp, frequently ſinging the pæans of Thales. See MUSIC.—Exerciſes of the body alſo made a conſiderable part of his diſcipline. See GYMNASTICS, *&c.*

His ſchool became ſo popular, that cities and people committed, their republics to the government of his ſcholars.—At length Porphyry adds, envy ſtiring up ſedition againſt them, they were oppreſſed; and, in time, their learning, which they ever kept ſecret, was loſt; except ſome difficult things learnt by rote by the crowd of hearers: for Pythagoras never committed any thing to writing.

Beſide his public ſchool, Pythagoras had a college in his own houſe, which he called κοινοβιον, *cœnobium:* in this were two orders or claſſes of ſcholars, εξωτερικοι, *exoterici*, called alſo *auſcultantes*; and εσωτερικοι, *intrinſeci.* — The former were novices and probationers, who were kept under a long examen, and even impoſed a quinquennial ſilence, to teach them modeſty and attention, according to Apuleius; or, according to Clemens Alexandrinus, to teach them to abſtract their minds from ſenſible objects, and enure them to the pure contemplation of the deity.

The latter were called *genuini*, *perfecti*, *mathematici*, and *Pythagoreans* by way of eminence. Theſe alone were let into the arcana and depths of the real Pythagoric diſcipline.

Clemens obſerves, that theſe orders correſponded very exactly to thoſe among the Hebrews: for in the ſchools of the prophets were two claſſes, *viz.* the ſons of the prophets, who were the ſcholars; and the doctors or maſters, who were alſo called *perfecti:* and among the levites, the novices or tyro's, who had their quinquennial exerciſes, by way of preparation. Laſtly, even among the proſelytes there were two orders; *exoterici*, or proſelytes of the gate; and *intrinſeci* or *perfecti*, proſelytes of the covenant. He adds, it is highly probable, that Pythagoras himſelf had been a proſelyte of the gate, if not of the covenant.

Gale endeavours to prove, that Pythagoras borrowed his philoſophy from that of the Jews; to this end producing the authorities of many of the fathers and ancient authors, and even pointing out the tracks and footſteeps of Moſes in ſeveral parts of Pythagoras's doctrine.

Pythagoras taught, that God is one; that he is a moſt ſimple, incorruptible, and inviſible being; and therefore only to be worſhipped with a pure mind, with the ſimpleſt rites, and thoſe preſcribed by himſelf.—Laertius obſerves, that he made unity the principle of all things; hence aroſe duality, *&c.* See UNITY, *&c.*

In his converſation with the Egyptians, he learnt abundance of ſecrets about numbers; to which he attributed ſo much, that he even attempted to explain all things in nature by numbers.—In effect it was the common opinion of the ancient philoſophers, that the ſpecies of things have to each other the nature and relation of numbers; and that the univerſe and all things therein, were produced according to certain numbers, inherent in the Creator's mind. See ARITHMETIC.

Hence Porphyry obſerves, the *Pythagoreans* ſtudied the doctrine of numbers with great attention: ſince the incorporeal forms, and firſt principles of things, *i. e.* the divine ideas, could not be delivered in words, they had recourſe to demonſtration by numbers; and thus called the common reaſon and cauſe of unity, identity, and equality, by the name *one.*

Pythagoras further taught, that there is a relation or kinſhip between the gods and man, and therefore that the gods take care of man.—Which, Clemens Alexandrinus ſays, is apparently borrowed from the Chriſtian doctrine of providence. See PROVIDENCE.

Pythagoras alſo aſſerted a metempſychoſis, or tranſmigration of ſouls; and therefore the immortality of the ſoul. See METEMPSYCHOSIS.

He alſo taught, that virtue is harmony, health, and every good thing; and that God, and therefore all things, conſiſt of harmony. See HARMONY.

PYTHAGORIC *theorem*, or *propoſition*, is the 47th of the firſt book of Euclid. See TRIANGLE and HYPOTHENUSE.

PYTHAGORIC *tetractys.* See the article TETRACTYS.

PYTHAGORIC *abacus.* See the article ABACUS.

PYTHIA, or PYTHIAN, in antiquity, the prieſteſs of Apollo, by whom he delivered oracles. See ORACLE.

She was thus called from the god himſelf, who was intitled *Apollo Pythius*, from his ſlaying the ſerpent Python; or, as others will have it, απο τȣ πυθεσθαι, becauſe Apollo, the ſun, is the cauſe of rottenneſs; or, according to others, from πυνθανομαι, *I hear*, becauſe people went to hear and conſult his oracles.

The prieſteſs was to be a pure virgin.—She ſat on the covercle, or lid, of a brazen veſſel, mounted on a tripod; and thence, after a violent enthuſiaſm, delivered her oracles, or rather explained thoſe of the god; *i. e.* rehearſed a few ambiguous and obſcure verſes, which were taken for oracles.

All the *Pythiæ* did not ſeem to have had the ſame talent at poetry, or memory enough to retain their leſſon.—Plutarch and Strabo make mention of poets, who were kept in pay, as interpreters of Jupiter, *&c.*

PYTHIA, or PYTHIAN *games*, were ſolemn games inſtituted in honour of Apollo, and in memory of his killing the ſerpent Python with his arrows. See GAMES.

The *pythia* were celebrated in Macedonia, in a place called *Pythium.*—They were the next in fame after the Olympic games, but were more ancient than they; for it is pretended they were inſtituted immediately after the defeat of the ſerpent.—They were held every two years, about the month Elaphebolion, which anſwered to our February.

The *pythia* were alſo celebrated at Delphos; and it was theſe were the moſt renowned.—A part of Pindar's poems were compoſed in praiſe of the victors in the Pythian games. See PINDARIC.

The critics are divided on the ſubject of the ſerpent Python.—The poets ſay, that Juno made uſe of it to perſecute Latona, and prevent her bringing into the world Apollo and *Diana*, whom ſhe had conceived of Jupiter; and that it was for this reaſon Apollo killed it.

Strabo ſays, it was no other than a famous villain, one Draco, that Apollo ridded the world of.—Dickinſon, in his Delphi Phœnicizantes, maintains the Python of the Greeks to be the Typhon of the Phœnicians; and the Typhon of the Phœnicians to be the Og of ſcripture; and Apollo, who ſlew it, he will have to be Joſhua.

PYXIS *, *nautica*, in navigation, the ſeaman's compaſs. See COMPASS.

PYXIS, among anatomiſts, is alſo uſed for the cavity of the hip-bone. See ACETABULUM.

---

* The word is Greek, πυξις, where it literally ſignifies a *box.*

Q.

Q, A conſonant, and the ſixteenth letter of the alphabet. See LETTER and ALPHABET.

The *Q* has this peculiar to it, that it is always followed by an *U*. See U.

The *Q* is formed from the Hebrew ק, *Koph*; which moſt other languagues have borrowed; though ſome of them have rejected it again, particularly the Greeks, who now only retain it as a numeral character, called κοϖπα επισημον.

In effect, there is that reſemblance between the *Q* and *C*, in ſome Languages, and *K* in others; that many grammarians, in imitation of the Greeks, baniſh the *Q* as a ſuperfluous letter. Papias even affirms, that all the Latin words now wrote with a *Q*, were wrote among the ancient Romans with a *C*: but we want better authorities. For though that may hold in many caſes, inſomuch that we ſtill write indifferently *quur* or *cur*, *cum* or *quum*, *quotidie* or *cotidie*, &c. Yet does it not thence follow, that they wrote *cis*, *cæ*, *cid*, for *quis*, *quæ*, *quid*.—What inſcriptions authorize ſuch a reading?

Far from this, the ancients ſometimes ſubſtituted *Q* for *C*; and wrote *quojus*, *quos*, for *cujus*, *cus*, &c. See C.

Varro, however, and ſome other grammarians, as we are told by Cenſorinus, *&c.* would never uſe the *Q*. The truth is, it's uſe or diſuſe ſeems to have been ſo little ſettled and agreed on, that the poets uſed the *Q* or *C* indifferently, as beſt ſuited their meaſures; it being a rule, that the *Q* joined the two following vowels into one ſyllable; and that the *C* imported them to be divided.

Hence it is, that Lucretius uſes *cuiret* for three ſyllables, in lieu of *quiret*; *acua* for *aqua*, and that Plautus uſes *relicuum* for *reliquum*; as in *quod dedi datum non vellem relicuum non*; where the *cuum* muſt be two ſyllables, otherwiſe the Trochaic verſe will be lame of a foot.

In the French the ſound of the *Q* and *K* are ſo near akin, that ſome of their niceſt authors think the former might be ſpared.—Ramus adds, that till the eſtabliſhment of royal profeſſors in the univerſity of Paris under Francis I, they always uſed *Q* in the Latin the ſame as in the French; pronouncing *kis*, *kalis*, *kantus*, &c. for *quis*, *qualis*, *quantus*, See K.

Some very learned men make *Q* a double letter, as well as *K*, and *X*—According to them, *Q* is evidently a *C* and *U* joined together—It is not enough that the ſound is the ſame; but they ſee the traces of the *CU* in the figure of the *Q*; the *V* being only laid obliquely, ſo as to come within the cavity of the *C*; as *C* <.

To confirm this, they ſay the ancients wrote *qi*, *qæ*, *qid*. Though Joſ. Scaliger, Littleton, *&c.* think this no proof of the point; for in Gruter's inſcriptions, we find not only the *Q*, but alſo the *C*, put for *QU*; as *Cintus*, *Quintus*, *ſicis* for *ſiquis*, &c. Yet no body ever imagined the *C* a double letter. See DOUBLE *Letter*.

Q among the ancients was a numeral letter, ſignifiying 500; as in the verſe,

> Q *velut A cum D quingentos vult numerare.*

A daſh over it, as $\overline{Q}$, denoted it to ſignifiy five hundred thouſand. See A.

Q is alſo uſed as an abbreviature in ſeveral arts—*Q. Pl.* in phyſicians bills, ſtand for *quantum placet*, or *quantum vis*, as much as you pleaſe of a thing.

Q. S. for *quantum ſufficit*, or as much as is neceſſary.

Q. E. D. among mathematicians, ſignifies *quod erat demonſtrandum*, which was to be demonſtrated.

Q. E. F. *quod erat faciendum*, which was to be done.

Q. D. is alſo frequently uſed among grammarians, *&c.* for *quaſi dictum*, as if it were ſaid, *&c.* or as who ſhould ſay.

QUACK, in medicine. See EMPIRIC.

QUADRA, in building, any ſquare border, or frame, incompaſſing a baſſo-relievo, pannel, painters or other work.

The word is alſo uſed abuſively for a frame or border of another form; as round, oval, or the like.

QUADRAGESIMA, a term ſometimes uſed for the time of lent; becauſe conſiſting of forty days. See LENT.

Hence, ſome monks are ſaid to lead a *Quadrageſimal* life; or to live on *Quadrageſimal* food all the year.

QUADRAGESIMA *ſunday*, is the firſt ſunday in lent; ſo called becauſe it is about the fortieth day before eaſter. See EASTER.

On the ſame account, the three preceding ſundays, are called *Quinquageſima*, *Sexageſima*, and *Septuageſima*. See QUINQUAGESIMA, *&c.*

QUADRAGESIMALS, QUADRAGESIMALIA, denote *Mid-lent* contributions, or offerings. See OBLATION, *&c.*

It was an ancient cuſtom for people to viſit their mother-church on *Mid-lent* ſunday, and to make their offerings at the high altar: and the like was alſo done in Whitſon-week—But as theſe later oblations, *&c.* were ſometimes commuted for by a payment of *Pentecoſtals*, or *Whitſon-farthings*: ſo were the former alſo changed into a cuſtomary payment, called *Quadrageſimals*, *Denarii Quadrageſimales*, and ſometimes *Lætare Jeruſalem*, from a hymn ſo called, ſung on that day, beginning, *Jeruſalem Mater omnium*, *&c.* See PENTECOSTAL, *&c.*

QUADRANGLE, in geometry, a quadrangular, or quadrilateral figure; or a figure which has four ſides, or four angles. See FIGURE and QUADRILATERAL.

To the claſs of *Quadrangles*, or *Quadrangular figures*, belong the *Square*, *Parallelogram*, *Trapezium*, *Rhombus*, and *Rhomboides*. See SQUARE, PARALLELOGRAM, RHOMBUS, *&c.*

A Square, *&c.* is a regular *Quadrangle*—A Trapezium an irregular one. See TRAPEZIUM.

Quadrangular figures are not proper for fortification, the flanks and flanked angles being too ſmall. See FORTIFICATION, BASTION, *&c.*

QUADRANTS, in antiquity, the fourth part of the As or Pound. See AS and POUND.

QUADRANS, in our cuſtoms, is the fourth part of a penny: or, a farthing. See PENNY and FARTHING.

QUADRANT, QUADRANS, in geometry, an arch of a circle containing 90 degrees, or one fourth of the intire periphery. See ARCH and CIRCLE. See alſo DEGREE.

Sometimes, alſo, the ſpace or area included between this arch and two radii, drawn from the centre to each extremity thereof, is called a *Quadrant*, or more properly *Quadrantal ſpace*; as being a quarter of the intire circle. See SECTOR.

QUADRANT, alſo denotes a mathematical inſtrument, of great uſe in navigation and aſtronomy; for the taking of altitudes, angles, *&c.* See ALTITUDE and ANGLE.

The *Quadrant* is variouſly contrived, and furniſhed with various apparatus, according to the various uſes it is intended for; but they all have this in common, that they conſiſt of a *Quadrant*, or quarter of a circle, whoſe limb is divided into 90 degrees; that they have a plummet ſuſpended from the centre, and are furniſhed with Pinnulæ, or ſights, through which to look. See SIGHTS, &c.

The principal, moſt uſual, and uſeful *Quadrants*, are the *Common* or *Surveying Quadrant*, *Aſtronomical Quadrant*, *Herodictical Quadrant*, *Gunter's Quadrant*, *Sutton*'s or *Collins*'s *Quadrant*, and the *Sinical Quadrant*.

The common or Surveying QUADRANT, (repreſented *Tab. Surveying*, *fig.* 30.) is made of braſs, wood, or other matter; uſually 12 or 15 inches radius—Its circular limb is divided into 90°, and each of thoſe ſubdivided into as many equal parts as the ſpace will allow; either diagonally, or otherwiſe—On one edge, or ſemidiameter, are fixed two immoveable ſights; and in the angle, or centre, is hung a thread with a plummet. To the centre is likewiſe, ſometimes, fixed a label, or moveable index, bearing two other ſights like the index of a teleſcope—And in lieu of the immoveable ſights, is ſometimes fitted a teleſcope; though this more properly belongs to the aſtronomical *Quadrant*.

On the under ſide, or face of the inſtrument, is fitted a ball and ſocket; by means whereof, it may be put in any poſition for uſe. See BALL *and Socket*.

Beſides the eſſentials of the *Quadrant*, there is frequently added on the face near the centre, a kind of compartiment, called the *Quadrat*, or *Geometrical ſquare*; as in the figure—This, in ſome meaſure, making a diſtinct inſtrument of itſelf; ſee its deſcription and uſe under the article QUADRAT.

The *Quadrant* is to be uſed in different ſituations, according to the dimenſions to be taken—To obſerve heights and depths, its plane is diſpoſed at right angles to the horizon; to take horizontal diſtances, the plane is diſpoſed parallel thereto.

Heights and diſtances, again, may be taken two ways: *viz.* by means of the fixed ſights and plummet, and by the label.

Uſe of the ſurveying QUADRANT—*To take the height*, or *depth of an object*, with the fixed ſights and plummet—Place the *Quadrant* vertically, and the eye under the ſight next the arch of the *Quadrant*: thus direct the inſtrument to the object, *v. gr.* the top of a tower, till the viſual rays thereof ſtrike through the ſights upon the eye.

This done, the portion of the arch intercepted between the thread and the ſemidiameter, whereon the ſights are faſtened, ſhews the complement of the object's height above the horizon, or its diſtance from the zenith; and the other portion of the arch intercepted between the thread and the other ſemidiameter, ſhews the height itſelf of the object above the horizon.

The ſame arch likewiſe gives the quantity of the angle made by the uſual ray, and a horizontal line parallel to the baſe of the tower.

Note, to obſerve depths, the eye muſt be placed over that ſight next the centre of the *Quadrant*.

From the height, or depth of the object, in degrees thus found, which ſuppoſe 35°, 35′, and the diſtance of the foot of the object from the place of obſervation carefully meaſured, which ſuppoſe 47 foot; its height or depth in feet, yards, *&c.* is eaſily determined by the moſt common caſe in trigonometry. See TRIANGLE.

For we have here, in a triangle, one ſide given, *viz.* the line meaſured; and we have all the angles: for that of the tower is always ſuppoſed a right angle; the other two therefore are equal to another right angle; but the angle obſerved is 35°, 35′; therefore the other is 54°, 25′. See ANGLE.

The caſe then will be reduced to this; as the ſine of 54°, 25′, is to 47 feet; ſo is the ſine of 35°, 35′, to a 4th term, *viz.* 33½ feet: to which add the height of the obſerver's eye. ſuppoſed 5 foot, the ſum 38½ feet, is the height of the tower required.

The further Uſe of the QUADRANT *in taking of altitudes of objects, both acceſſible and inacceſſible*; ſee under the article ALTITUDE.

Uſe of the QUADRANT *in taking heights and diſtances by the index and ſights.*—To take *e. gr.* a height, as that of a tower, whoſe baſe is acceſſible—Place the plane of the inſtrument at right angles to the plane of the horizon, and one of its edges parallel thereto, by means of the plummet, which in that caſe will hang down along the other—In this ſituation turn the index, till through the ſight you ſee the top of the tower; and the arch of the limb of the *Quadrant* between that ſide thereof parallel to the horizon, and the index, will be the height of the tower in degrees: whence, and from the diſtance meaſured as before, its height in feet, *&c.* may be found by calculation, as in the former caſe; or without calculation, by drawing, from the data, on paper, a triangle ſimilar to the great one, whoſe baſe is the diſtance, and its perpendicular meaſured on the ſcale, the height of the tower. See SCALE.

Uſe of the QUADRANT *in meaſuring horizontal diſtances*—Though the *Quadrant* be a leſs proper inſtrument for this purpoſe than a theodolite, ſemi-circle, or the like, by reaſon angles greater than *Quadrants* cannot be taken hereby; yet neceſſity ſometimes obliges perſons to have recourſe to it.

The manner of its application herein is the ſame with that of the ſemi-circle: all the difference between the two inſtruments conſiſting in this, that the one is an arch of 180°, and can therefore take an angle of any quantity; and the other only an arch of 90°, and therefore confined to angles of that quantity. See, therefore, SEMI-CIRCLE.

Aſtronomical QUADRANT, is a large *Quadrant*, uſually made of braſs, ſometimes of wooden bars, only faced with plates of iron, or the like; having its limb curiouſly divided, diagonally or otherwiſe, into degrees and minutes, and even ſeconds, if poſſible; with plain ſights fixed to one ſide of it, or inſtead thereof a teleſcope; and an index moving about the centre, carrying either plain ſights, or a teleſcope.

Theſe *Quadrants* are of principal uſe in taking obſervations of the ſun, planets, or fixed ſtars. See OBSERVATION.

The ancients uſed only plain ſights; but the moderns have found it of great benefit to uſe teleſcopes inſtead of them. See SIGHT and TELESCOPE.

Add, that the contrivance of moving the index, by the help of a ſcrew on the edge of the limb, and of readily and eaſily directing it, and the *Quadrant* upon it's pedeſtal, to any deſired phænomenon, by means of the ſcrews and dented wheels, is a ſtill greater improvement of the inſtrument.

The particulars of the mechaniſm whereby this is effected, would afford a very dry and intricate, as well as uſeleſs detail; which we ſhall omit, as being ſufficiently known among the inſtrument-makers: and in lieu thereof, content ourſelves with giving a figure or repreſentation. See *Tab. Aſtronomy*, *fig.* 53.

The uſe of this inſtrument is obvious—Being adjuſted as above, and turned horizontally round on its axis, till through the moveable teleſcope the object be ſeen to fall in with the point of interſection of the croſs bars; the degrees cut by the index give the altitude required. See TELESCOPE.

Horodictical QUADRANT, is a pretty, commodious inſtrument, thus called from its uſe in telling the hour of the day. See HOUR and DIAL.

Its conſtruction is ſo ſimple and eaſy, and its application ſo ready, that we ſhall deſcribe both; for the uſe of ſome who may want other conveniencies.

Conſtruction and uſe of the Horodictical QUADRANT—From the centre of the *Quadrant* C, (*Tab. Aſtron. fig.* 54.) whoſe limb AB is divided into 90°; deſcribe ſeven concentric circles at intervals at pleaſure; and to theſe add the ſigns of the zodiac in the order they are repreſented in the ſcheme. 2. Applying a ruler to the centre C, and the limb AB, mark upon the ſeveral parallels the degrees correſponding to the altitude of the ſun when therein, for the given hours; connect the points belonging to the ſame hour with a curve line, to which add the number of the hour—To the radius CA, fit a couple of ſights, and to the centre of the *Quadrant* C, tie a thread with a plummet, and upon the thread a bead to ſlide.

If now the bead be brought to the parallel wherein the ſun is, and the *Quadrant* directed to the ſun till a viſual ray paſs through the ſights, the bead will ſhew the hour.

For the plummet in this ſituation cuts all the parallels in the degrees correſponding to the ſun's altitude: ſince, then, the bead is in the parallel which the ſun then deſcribes, and through the degrees of altitude to which the ſun is elevated every hour there paſs hour lines; the bead muſt ſhew the preſent hour. —Some perſons who are not mighty nice, repreſent the hour-lines by arches of circles, or even by ſtreight lines; and that without any ſenſible error.

Gunter's QUADRANT, is a kind of *Quadrant* (repreſented *Tab. Aſtronomy*, *fig.* 55.) invented by our countryman Edm. Gunter.

This, beſide the graduated limb, fixed ſights, and a plummet, as the other *Quadrants*, has, likewiſe, a ſtereographical projection of the ſphere on the plane of the equinoctial, with the eye placed on one of the poles; by which, beſides the common uſes of other *Quadrants*, ſeveral uſeful queſtions in aſtronomy, *&c.* are eaſily ſolved.

Uſe of Gunter's QUADRANT. 1. *To find the ſun's meridian altitude for any given day*; *or the day of the month for any given meridian altitude.*—Lay the thread to the day of the month in the ſcale next the limb; the degree it cuts in the limb is the ſun's meridian altitude.

Thus, the thread being laid on the 15 of May, cuts 59°, 30′, the altitude ſought—And contrarily, the thread being ſet to the meridian altitude, will ſhew the day of the month.

2. *To find the hour of the day*—Having put the bead (which ſlides on the thread) to the ſun's place in the ecliptic, obſerve the ſun's altitude by the *Quadrant*; then, if the thread be laid over the ſame in the limb, the bead will fall upon the hour required.

Thus, ſuppoſe on the 10th of April, the ſun being then in the beginning of Taurus, I obſerve the ſun's altitude by the *Quadrant*, to be 36°; I place the bead to the beginning of Taurus in the ecliptic, and lay the thread over 36° of the limb; and find the bead to fall upon the hour-line marked 3 and 9; accordingly the hour is either 9 in the morning, or three in the afternoon—Again, laying the bead on the hour given (having firſt rectified or put it to the ſun's place) the degree cut by the thread on the limb, gives the altitude.

Note, the bead may be rectified otherwiſe, *viz.* by bringing the thread to the day of the month, and the bead to the hour-line of 12.

3. *To find the ſun's declination from his place given*; *and contrarywiſe*—Set the bead to the ſun's place in the ecliptic; move the thread to the line of declination ET, and the bead will cut the degree of declination required—Contrarily, the bead being adjuſted to a given declination, and the thread moved to the ecliptic, the bead will cut the ſun's place.

4. *The ſun's place being given, to find his right aſcenſion*; *or contrarily*—Lay the thread on the ſun's place in the ecliptic, and the degree it cuts on the limb is the right aſcenſion ſought —Contrarily, laying the thread on the right aſcenſion, it cuts the ſun's place in the ecliptic.

5. *The ſun's altitude being given, to find his azimuth*; *and contrarywiſe*—Rectify the bead for the time (as in the ſecond article) and obſerve the ſun's altitude: bring the thread to the complement of that altitude; thus the bead will give the azimuth ſought, among the azimuth lines.

6. *To find the hour of the night from ſome of the five ſtars laid down on the Quadrant*—1. Put the bead to the ſtar you intend to obſerve, and find how many hours it is off the meridian, (by article 2.) then from the right aſcenſion of the ſtar, ſubſtract the ſun's right aſcenſion converted into hours; and mark the difference: which difference added to the obſerved hour of the ſtar from the meridian, ſhews how many hours the ſun is gone from the meridian, which is the hour of the night.

Suppoſe, *e. gr.* on the 15th of May, the ſun's being in the fourth degree of Gemini, I ſet the bead to Arcturus; and obſerving his altitude, find him to be in the weſt about 52° high, and the bead to fall on the hour-line of two after noon: then will the hour be 11 hours 50 minutes paſt noon, or 10 minutes ſhort of midnight.

For 62°, the ſun's right aſcenſion converted into time, makes 4 hours 8 minutes, which ſubſtracted from 13 hours 58 minutes, the right aſcenſion of Arcturus, the remainder will be 9 hours 50 minutes; which added to 2 hours, the obſerved diſtance of Arcturus from the meridian, ſhews the hour of the night to be 11 hours 50 minutes.

Sutton's QUADRANT, ſometimes, alſo, called *Collins's pocket*

QUADRANT—One of the beſt of Mr. Sutton's *Quadrants*, (repreſented *Tab. Aſtronomy, fig.* 56) is a ſtereographic projection of one quarter of the ſphere between the tropics, upon the plane of the equinoctial, the eye being in the north pole.

It is fitted to the latitude of London—The lines running from the right hand to the left are parallels of altitude, and thoſe croſſing them are azimuths: the leſs of the two circles bounding the projection is ¼ of the tropic of Capricorn, the greater ¼ of that of Cancer—The two ecliptics are drawn from a point on the left edge of the *Quadrant*, with the characters of the ſigns upon them; and the two horizons are drawn from the ſame point—The limb is divided both into degrees, and time; and by having the ſun's altitude, the hour of the day may be here found to a minute.

The quadrantal arches next the centre contain the calendar of months; and under them, in another arch, is the ſun's declination.

On the projection are placed ſeveral of the moſt noted fixed ſtars between the tropics, and the next below the projection is the *Quadrat*, and line of ſhadows. See QUADRAT.

Uſe of Sutton's or Collins's **QUADRANT**—*To find the time of ſun-riſing or ſetting, his amplitude, azimuth, hour of the day*, &c.—Lay the thread over the day and the month, and bring the bead to the proper ecliptic, either that of ſummer or winter, according to the ſeaſon; (which is called rectifying) then, moving the thread, bring the bead to the horizon; in which caſe the thread will cut the limb in the time of the ſun's riſing or ſetting, before, or after ſix; and at the ſame time the bead will cut the horizon in the degrees of the ſun's amplitude.

Again, obſerving the ſun's altitude with the *Quadrant*, and ſuppoſing it found 45° on the 24th of April; lay the thread over the 24th of April; bring the bead to the ſummer ecliptic, and carry it to the parallel of altitude 45°. In which caſe the thread will cut the limb at 55°, 15′, and the hour will be ſeen among the hour-lines to be either 41′ paſt nine in the morning, or 19′ paſt two in the afternoon.

Laſtly, the bead among the azimuths ſhews the ſun's diſtance from the ſouth, *viz.* 50°, 41′.

But note, that if the ſun's altitude be leſs than what it is at ſix o'clock, the operation muſt be performed among thoſe parallels above the upper horizon; the bead being rectified to the winter ecliptic.

Sinical **QUADRANT**, is an inſtrument of uſe in navigation—It is repreſented *Tab. Navigation, fig.* 18. and conſiſts of ſeveral concentric quadrantal arches, divided into eight equal parts by radii with parallel right lines croſſing each other at right angles.

Now, any of the arches, *e. gr.* BC may be accounted a *Quadrant* of any of the great circles of the ſphere, chiefly of the horizon, and meridian; if, then, BC be taken for a *Quadrant, e. gr.* of the horizon; either of the ſides, *e. gr.* AB, may repreſent the meridian; and the other, AC will repreſent a parallel, or line of eaſt and weſt; and all the other lines parallel to AB will alſo be meridians; and all thoſe parallel to AC, eaſt and weſt parallels, or eaſt and weſt lines.

Again, the eight ſpaces into which the arches are divided by the radii, repreſent the eight points of the compaſs in a quarter of the horizon; each containing 11°, 15′.

The arch BC is likewiſe divided into 90°, and each degree ſubdivided into 12′ diagonal-wiſe.

To the center is fixed a thread, as AL; which being laid over any degree of the *Quadrant*, ſerves to divide the horizon.

If the *Sinical Quadrant* be taken for a fourth part of the meridian; one ſide thereof, AB, may be taken for the common radius of the meridian and the equator; and then the other, AC, will be half the axis of the world—The degrees of the circumference BC will repreſent degrees of latitude, and the parallels to the ſide AB, aſſumed from every point of latitude to the axis AC, will be radii of the parallels of latitude, as likewiſe the ſine complements of thoſe latitudes.

Suppoſe, then, it be required to find the degrees of longitude contained in 83 of the leſſer leagues, in the parallel of 48°—Lay the thread over 48° of latitude on the circumference, and count thence the 83 leagues, or AB, beginning at A: this will terminate in H, allowing every ſmall interval, four leagues. Then tracing out the parallel HG, from the point H to the thread; the part AG of the thread ſhews that 125 greater, or equinoctial leagues, make 6°, 15′; and therefore that the 83 leſſer leagues AH which make the difference of longitude of the courſe, and are equal to the radius of the parallel GI, make 6°, 15′ of the ſaid parallel.

If the ſhip ſail an oblique courſe, ſuch courſe, beſides the north and ſouth greater leagues, gives leſſer leagues eaſterly and weſterly; to be reduced to degrees of longitude of the equator—But theſe leagues being made neither on the parallel of departure, nor on that of arrival, but in all the intermediate ones; we muſt find a mean proportional parallel between them.

To find this, we have on the inſtrument *a ſcale of croſs Latitudes*. Suppoſe, then, it were required to find a mean parallel between the parallels of 40° and 60°. With your compaſſes take the middle between the 40th and 60th degree on the ſcale: this middle point will terminate againſt the 51ſt degree, which is the mean parallel required.

Uſe of the Sinical **QUADRANT** is to form triangles upon, ſimilar to thoſe made by a ſhip's way, with the meridian and parallels; the ſides of which triangles are meaſured by the equal intervals between the concentric *Quadrants*, and the lines N. and S. E. and W.

The lines and arches are diſtinguiſhed, every fifth, by a broader line; ſo that if each interval be taken for one league, there will be five between one broad line and another,

Now, ſuppoſe a ſhip to have ſailed 150 leagues north-eaſt, one fourth north; which is the third point, and makes an angle of 33°, 45′, with the north part of the meridian—Here are given two things, *viz.* the courſe, and diſtance ſailed, by which a triangle may be formed on the inſtrument, ſimilar to that made by the ſhip's courſe, and her longitude and latitude; and hence may the unknown parts of the triangle be found. See TRIANGLE.

Thus, ſuppoſing the centre A to repreſent the place of departure; count, by means of the concentric arches, along the point the ſhip ſailed in, as AD, 150 leagues from A to D: then is the point D the place the ſhip is arrived at; which note.—This done, let DE be parallel to the ſide; and then there will be formed a right angled triangle AED, ſimilar to that of the ſhip's courſe, difference of longitude, and latitude: the ſide AE gives 125 leagues for the difference of latitude northwards, which makes 6°, 15′; and the ſide DE gives 83 leſſer leagues anſwering to the parallels; which being reduced, as ſhewn above, gives the difference of longitude—And thus is the whole triangle found.

QUADRANT, in Gunnery, called alſo the *Gunner's Square*, is an inſtrument ſerving to elevate or point cannons, mortars, &c. according to the places they are to be levelled or directed to. See MORTAR, LEVEL, &c.

It conſiſts of two branches, made of braſs or wood; one about a foot long, 8 lines broad, and one line in thickneſs; the other four inches long, and the ſame thickneſs and breadth as the former—Between theſe branches is a *Quadrant* divided into 90 degrees, beginning from the ſhorter branch, and furniſhed with thread and plummet. See its figure repreſented *Tab. Fortification, fig.* 4.

The uſe of this inſtrument is eaſy; nothing more being required but to place the longeſt branch in the mouth of the cannon or mortar, and elevate or lower it, till the thread cuts the degree neceſſary to hit a propoſed object.

Sometimes, alſo, on one of the ſurfaces of the long branch is noted the diviſion of diameters, and weights of iron bullets; as alſo the bores of pieces. See ORDNANCE, CALIBER, &c.

QUADRANT *of Altitude*, is an appendage of the artificial globe; conſiſting of a lamina, or ſlip of braſs, the length of a *Quadrant* of one of the great circles of the globe; and divided into 90 degrees.

At the end where the diviſion terminates, is a nut rivetted on and furniſhed with a ſcrew, by means whereof the inſtrument is fitted on to the meridian; and moveable round upon the rivet, to all points of the horizon. See its figure in *Tab. Aſtronomy, fig.* 61.

Its uſe is to ſerve as a ſcale in meaſuring of altitudes, amplitudes, azimuths, &c. See the manner of it's application under the uſe of the globe.

QUADRANTAL, in antiquity, a veſſel in uſe among the Romans for the meaſuring of liquids. See MEASURE.

It was at firſt called *Amphora*; afterwards *Quadrantal*, from its form, which was ſquare every way, like a die. See AMPHORA.

Its capacity was 80 libræ, or pounds of water, which made 48 ſextaries, 2 urnæ, or 8 congii. See CONGIUS.

QUADRANTAL *Space*, in geometry. See QUADRANT.

QUADRANTAL *Triangle*, is a ſpherical triangle, one of whoſe ſides at leaſt is a quadrant of a circle; and one of its angles a right angle. See SPHERICAL *Triangle*.

QUADRANTATA *Terræ*, in our ancient law-books is uſed for a quarter of an acre; now called a *Rood*. See ACRE and ROOD. See alſo FARDINGDEAL.

QUADRAT, QUADRATUM, called alſo *Geometrical Square* or *Line of ſhadows*, is an additional member on the face of the common Gunter's and Sutton's *Quadrants*; of ſome uſe in taking altitudes, &c. See QUADRANT.

The *Quadrat* KLH, (*Tab. Aſtronomy, fig.* 55.) has each of its ſides divided into 100 equal parts, commencing from the extremes; ſo as the number 100 falls on the angle; and repreſenting tangents to the arch of the limb.

The diviſions are diſtinguiſhed by little lines from 5 to 5, and by numbers from 10 to 10; and the diviſions being occaſionally produced a-croſs, form a kind of lattice, conſiſting of 10000 little ſquares.

The proportion here, is, as radius is to the tangent of the angle of altitude at the place of obſervation (*i. e.* to the parts of the *Quadrat* cut by the thread) ſo is the diſtance between the ſtation and foot of the object, to its height above the eye. See ALTITUDE.

Uſe of the QUADRAT, *geometrical ſquare*, or *line of ſhadows*—1. The *Quadrant* being vertically placed, and the ſights directed to the top of the tower, or other object whoſe height is required; if the thread cut the ſide of the *Quadrat* marked *right ſhadows*, the diſtance from the baſe of the tower to the point of ſtation is leſs than the tower's height—If the thread fall on the diagonal of the ſquare, the diſtance is juſt equal to the height—If it fall on that ſide marked *verſed ſhadows*, the diſtance exceeds the height.

Hence, meaſuring the diſtance, the height is found by the *Rule of three*; inaſmuch as there are three terms given—Indeed, their diſpoſition is not always the ſame; for when the thread cuts the ſide of *right ſhadows*, the firſt term in the *Rule of three* ought to be that part of the ſide cut by the thread; the ſecond the ſide of the ſquare; and the third the diſtance meaſured—If the thread cut the other ſide, the firſt term is the whole ſide of the ſquare, the ſecond the parts of the ſide cut by the thread, and the third the diſtance.

For an inſtance of each—Suppoſe, *e. gr.* in looking at the top of a ſteeple the thread cut the ſide of *right ſhadows* in the point 40, and that the diſtance meaſures 20 poles; the caſe then will ſtand thus: as 40 is to 100, ſo is 20 to a fourth term, which I find to be 50; the height of the ſteeple in poles. Again, ſuppoſing the thread to fall on the other ſide, in the point 50, and the diſtance to meaſure 35 poles; the terms are to be diſpoſed thus: as 100 is to 60; ſo is 35 to a fourth term, *viz.* 21, the height required.

Uſe of the QUADRAT *without calculation*—The preceding caſes may be performed without calculation where the diviſions of the ſquare are produced both ways, ſo as to form the area into little ſquares.

Thus, ſuppoſe, 1. The thread to fall on 40 in the ſide of *right ſhadows*, and the diſtance be meaſured 20 poles; ſeek among the little ſquares for that perpendicular to the ſide which is 20 parts from the thread; this perpendicular will cut the ſide of the ſquare next the centre, in the point 50, which is the height required in poles.

2. If the thread cut the ſide of the *verſed ſhadows* in the point 60, and the diſtance be 35 poles; count 35 parts on the ſide of the *Quadrat* from the centre; count alſo the diviſions of the perpendicular from the point 35 to the thread, which will be 21, the height of the tower in poles.

Note, in all caſes, the height of the centre of the inſtrument is to be added. See farther under SHADOW.

QUADRAT, in aſtrology, called alſo QUARTILE, an aſpect of the heavenly bodies, wherein they are diſtant from each other, a quadrant or ninety degrees. See ASPECT.

This is held a malignat aſpect. See QUARTILE.

QUADRAT, in printing, is a ſort of ſpace; that is, a piece of metal, caſt like the letters, to be uſed occaſionally in compoſing, in order to form the intervals between words, at the ends of lines, &c. See PRINTING.

There are *Quadrats* of divers ſizes, as *m Quadrats*, *n Quadrats*, &c. which are reſpectively of the dimenſions of ſuch letters.

QUADRATA *Legio*, among the Romans, was a legion conſiſting of 4000 men. See LEGION.

QUADRATIC *Equation*, is an equation wherein the unknown quantity is of two dimenſions *i. e.* the ſquare of the root, or number ſought—As is, $x^2=a+b^2$. See EQUATION.

Quadratic equations are of two kinds; *ſimple*, or *pure*; and *adfected*.

Simple or *pure* QUADRATICS, are thoſe where the ſquare of the unknown root is equal to the abſolute number given: as in $aa=36$; $ee=146$; $yy=133225$.

The reſolution of theſe is eaſy; it being apparent that nothing more is required than to extract the ſquare-root out of the number or known quantity. See EXTRACTION.

Thus the value of a in the firſt equation is equal to 6; in the ſecond $e=12$, and a little more, as being a ſurd root; and in the third example $y=365$. See ROOT.

Adfected QUADRATICS, are thoſe which between the higheſt power of the unknown number, and the abſolute number given, have ſome intermediate powet of the unknown number: as, $aa+2\,ba=100$. See ADFECTED.

All equations of this rank are in one or other of the following forms: *viz.* $aa+ad=\mathrm{R}$. $aa-ad=\mathrm{R}$. $ad-aa=\mathrm{R}$.

There are ſeveral methods of extracting the roots of *adfected Quadratics*; the moſt convenient is that of Harriot.—Suppoſe $x^2+ax=+b^2$; here x being aſſumed as a part of the root; a, the known quantity of the ſecond term, will be double the other part; and therefore half of a is the other part—The ſquare thereof, will be completed by adding one fourth of aa; which done, the root of the ſquare may be extracted thus:

$$\begin{array}{l}
\qquad\qquad x^2+ax=.\,b^2 \\
\qquad\qquad\qquad \tfrac{1}{4}a\,a\,\tfrac{1}{4}\,a\,a \text{ add.} \\
\hline
x^2. \quad ax. \quad \tfrac{1}{4}a^2=\tfrac{1}{4}a^2. \quad b^2 \\
\hline
x^2. \quad \tfrac{1}{2}a=\surd\ (\tfrac{1}{4}a^2. \quad b^2) \\
\hline
x=.\,\tfrac{1}{2}a.\ \surd\ (\tfrac{1}{4}a^2. \quad b^2)
\end{array}$$

In lieu of the characters + and —, we here uſe points; to avoid the neceſſity of diſtinguiſhing ſeveral caſes. See RESOLUTION.

Conſtruction of QUADRATIC *Equations*; See CONSTRUCTION.

QUADRATING *of a piece*, among gunners, is the ſeeing that a piece of ordnance be duly placed, and poized in its carriages; that its wheels be of an equal height, &c. See CARRIAGE, ORDNANCE, CANNON, &c.

QUADRATO-CUBUS, QUADRATO-QUADRATO-CUBUS, and QUADRATO-CUBO-CUBUS, are names uſed by Diophantus, Vieta, Oughtred, and others, for the 5th, 7th, and 8th powers of numbers. See POWERS.

QUADRATO-QUADRATUM, or *Biquadratum*, the fourth power of numbers; or the product of the cube multiplied by the root. See POWER.

QUADRATRIX, in geometry, a mechanical line, by means whereof we can find right lines equal to the circumference of circles, or other curves, and of the ſeveral parts thereof. See CIRCLE, QUADRATURE, &c.

Or, more accurately, the *Quadratrix of a curve*, is a tranſcendental curve deſcribed on the ſame axis, the ſemiordinates whereof being given, the quadrature of the correſpondent parts in the other curve, are likewiſe given. See CURVE.

Thus, *e. gr.* the curve AND, (*Tab. Analyſis*, *fig.* 21.) may be called the *Quadratrix* of the *Parabola* AMC, ſince it is demonſtrated that APMA is$=$PN², or APMA$=$AP. PN, or APMA$=$PN. *a*, &c.

The moſt eminent of theſe *Quadratrices* are, that of Dinoſtrates, and that of Mr. Tſchirnhauſen for the circle; and that of Mr. Perks for the hyperbola.

QUADRATRIX *of Dinoſtrates*, is a curve, AM*mm*, (*Tab. Analyſis*, *fig.* 22.) whereby the quadrature of the circle is effected, though not geometrically, but mechanically; thus called from its inventor Dinoſtrates.

Its geneſis is thus—Divide the *Quadrantal* arch ANB into any number of equal parts; in N*n*, &c. by a continual biſſection—divide the radius AC into the ſame number of parts in the points P*p*, &c. Draw radii CN, *cn*, &c.—Laſtly, on the points P*p*, &c. erect perpendiculars PM, *pm*, &c. the curve formed by connecting theſe lines is the *Quadratrix of Dinoſtrates*.

Here, from the conſtruction, AB : AN : : AC : AP; and therefore, if AB$=a$, AC$=b$, AN$=x$, AP$=y$; $ax=by$. See QUADRATURE.

QUADRATRIX *Tſchirnhauſiana*, is a tranſcendental curve AM*mm* B, (*fig.* 23.) whereby the quadrature of the circle is likewiſe effected; invented by Mr. Tſchirnhauſen, in imitation of that of Dinoſtrates.

It's geneſis is thus conceived—Divide the quadrant ANB, and its radius AC into equal parts, as in the former; and from the points P, *p*, &c. draw the right lines PM, *pm*, &c. parallel to CB; and from the points N, *n*, &c. the right lines NM, *nm*, &c. parallel to AC—The points AM*m*, &c. being connected, the *Quadratrix* is formed; wherein AB : AN : : AC : AP.

Here again, ſince AB : AN : : AC : AP; if AB$=a$, and AC$=b$, AN$=x$, and AP$=y$; $ax=by$. See QUADRATURE.

QUADRATUM *Cubi*, QUADRATO-QUADRATO-QUADRATUM, and QUADRATUM *Surdeſolidi*, &c. are names uſed by the Arabs for the 6th, 8th, and 10th powers of numbers. See POWERS.

QUADRATURE, QUADRATURA, in geometry, the act of ſquaring; or of reducing a figure to a ſquare; or finding a ſquare equal to a figure propoſed. See FIGURE and SQUARE.

Thus, the finding of a ſquare containing juſt as much ſurface, or area as a circle, an ellipſis, a triangle, or other figure, is called the *Quadrature* of a circle, an ellipſis, a triangle, or the like. See CIRCLE, &c.

The *Quadrature* of rectilinear figures comes under the common geometry; as amounting to no more than the finding their areas, or ſuperficies; which are in effect their ſquares, See AREA.

Squares of equal areas are here eaſily had, by only extracting the roots of the areas thus found: and on ſuch root as a ſide constructing a ſquare. See SQUARE. See alſo the particular method of finding the areas or ſquares, under each particular figure, as TRIANGLE, PARALLELOGRAM, TRAPEZIUM, &c.

The *Quadrature of curves*, that is, the meaſuring of their area, or the finding a rectilinear ſpace equal to a curvilinear

linear ſpace, is a matter of much deeper ſpeculation; and makes a part of the higher geometry. See GEOMETRY.

Though the *Quadrature*, eſpecially of the circle, be a thing many of the firſt rate mathematicians among the ancients were very ſolicitous about, (ſee QUADRATURE *of the circle*) yet nothing in this kind has been done ſo conſiderable, as in and ſince the middle of the laſt century; when, *viz.* in the year 1657, Mr. Neil and my lord Brounker, and afterwards, in the ſame year, Sir Chriſtopher Wren, geometrically demonſtrated the quality of ſome curves to a ſtraight line.

Soon after this, others at home and abroad, did the like in other curves; and not long afterwards the thing was brought under an analytical calculus, the firſt ſpecimen whereof ever publiſhed was given by Mercator in 1688, in a demonſtration of my lord Brounker's *Quadrature* of the hyperbola by Dr. Wallis's reduction of a fraction into an infinite ſeries by diviſion. See QUADRATURE *of the parabola.*

Though it appears by the way that Sir Iſaac Newton had before diſcovered a method of attaining the quantity of all quadrable curves analytically by his method of fluxions, before the year 1668. See FLUXIONS.

It is conteſted betweeen Sir Chriſtopher Wren and Mr. Huygens which of the two firſt found the *Quadrature* of any determinate cycloidal ſpace—Mr. Leibnitz afterwards found that of another ſpace; and Mr. Bernoulli in 1699, diſcovered the *Quadrature* of an infinity of cycloidal ſpaces, not only ſegments, but alſo ſectors, *&c.* See QUADRATURE *of the cycloid*, QUADRATURE *of the lune*, &c.

QUADRATURE *of the circle*, or *the finding a ſquare equal to a given circle*, is a problem that has employed the mathematicians of all ages; but ſtill in vain. See CIRCLE.

It depends on the ratio of the diameter to the periphery, which was never yet determined in preciſe numbers. See DIAMETER, *&c.*

Were this ratio known, (which would imply the circumference's being expreſſed by ſome affection of the diameter; and, of conſequence, that it were equal to a right line) the *Quadrature of the circle* were effected: it being demonſtrated, that the area of a circle is equal to a rectangular triangle, whoſe two ſides comprehending the right angle, are the radius, and a right line equal to the circumference—So that to ſquare the circle, all that is required is to rectify it. See CIRCUMFERENCE and RECTIFICATION.

Many have approached very near this ratio—Archimedes ſeems to have been one of the firſt who attempted it; which he did by means of regular polygons inſcribed and circumſcribed; and by uſing polygons of 96 ſides, fixed the ratio as 7 to 22. See POLYGON.

Some of the moderns have come nearer, particularly Lud. à Ceulen, who with infinite induſtry found, at length, that ſuppoſing the diameter 1, the circumference is leſs than 3.14159265358979323846264338387950; but yet greater than the ſame number, if the laſt cypher be turned into an unit.

Strict geometry here failing, authors have had recourſe to other means; and particularly, to a ſort of curves, called *Quadratrices:* but theſe being mechanical curves, inſtead of geometrical ones, or rather tranſcendental inſtead of algebraical ones, the problem is not fairly ſolved thereby. See TRANSCENDENTAL, MECHANICAL, *&c.* QUADRATRIX.

Hence, recourſe has been had, by others, to analytics—and the problem attempted by three ſorts of algebraic calculations—The firſt gives a kind of tranſcendental *Quadratures*, by equations of indefinite degrees: as if x^x+x be equal to 30, and x be ſought, it will be found to be 3; becauſe 3^9+3, is $27+3$, or 30.—The ſecond by vulgar numbers, though irrationally ſuch; or by the roots of common equations, which for the general *Quadrature*, or its ſectors, is impoſſible—The third by means of certain ſeries, exhibiting the quantity of a circle by a progreſſion of terms.

Arithmetic, in effect, affords us very accurate and intelligible expreſſions for all rational numbers; but it is defective as to irrationals; which are infinitely more numerous than the former: there being *e. gr.* an infinity of them between 1 and 2. The root of 2, which is a mean proportional between 1 and 2, is a very obſcure idea; and its magnitude is ſuch, as that if you would expreſs it in rational numbers, which alone are clearly intelligible, you may ſtill approach nearer and nearer its exact value, but never ariſe preciſely at it.

Thus, if for the value of the root of 2, you firſt put 1, it is viſibly too little; if, then, you add $\frac{1}{2}$, it is too much; for the ſquare of $1+\frac{1}{2}$, or of $\frac{3}{2}$, exceeds 2. If, again, you take away $\frac{1}{4}$, you will find you have taken too much; and if you will return $\frac{1}{16}$, the ſum will be too great—Thus, may you proceed to infinity, without ever finding a number to ſtop at.

Now theſe numbers, thus found, being diſpoſed in their proper order, what may we call an *infinite ſeries.* See SERIES.

Farther, of infinite ſeries's there are ſome which only yield a finite ſum, as $\frac{1}{2}$, $\frac{1}{4}$, $\frac{1}{8}$, *&c.* and in general all ſuch as decreaſe in geometrical progreſſion—And there are others, on the contrary, which make an infinite ſum; as the harmonical progreſſion, $\frac{1}{2}$, $\frac{1}{3}$, $\frac{1}{4}$, *&c.* See PROGRESSION.

But, here, we have only to do with the former, as expreſſing a finite magnitude; yet cannot even the ſum of theſe be always found—Thus, we are certain, that it is impoſſible to find the ſum of the ſeries expreſſing the root of 2.

Geometry, however, is free from the impoſſibility arithmetic labours under, of expreſſing irrational numbers.—Thus, the diagonal of a ſquare, whoſe ſide is 1, expreſſes the root of 2. See DIAGONAL.

Yet in other magnitudes, geometry itſelf may fall under the ſame difficulty with arithmetic—For it is poſſible there may be right lines which cannot be expreſſed but by an infinite ſeries of ſimilar lines, whoſe ſum it may be impoſſible to find. In effect, the right lines which ſhould be equal to curves, are frequently of this kind—In ſearching, *e. gr.* for a right line equal to the circumference of a circle, we find that the diameter being put 1, the circumference will be $\frac{4}{1}-$, $\frac{4}{3}+$, $\frac{4}{5}-$, $\frac{4}{7}+$, $\frac{4}{9}$, *&c.* making an infinite ſeries of fractions, whoſe numerator is always 4, and the denominators in the natural ſeries of the uneven numbers; and all theſe terms, alternately, too great, and too little.

Could the ſum of this ſeries be found, it would give the *Quadrature of the circle*; but this is not yet done; nor is it at all probable it ever will be done—That, however, is not yet demonſtrated; nor of conſequence, is the *Quadrature of the circle* yet demonſtrated impoſſible.

To this it may be added, that as the ſame magnitude may be expreſſed by ſeveral different ſeries, it is poſſible the circumference of the circle may be expreſſed in ſome other ſeries, whoſe ſum may be found—We have two infinite ſeries, expreſſing the ratio of the circumference to the diameter, though indefinitely, as above—The firſt diſcovered by Sir Iſaac Newton; where the diameter being but 1, the circumference, is $4-\frac{1}{6}-\frac{1}{40}-\frac{1}{112}$, *&c.*—The ſecond, diſcovered by Mr. Leibnitz; where the diameter being one, the circumference, is $4-\frac{1}{3}+\frac{1}{5}-\frac{1}{7}+\frac{1}{9}$, *&c.* The inveſtigation of each of which ſeries, by the *calculus integralis*, is as follows.

Sir Iſaac Newton's QUADRATURE *of the circle*; or the inveſtigation of his ſeries, for ſquaring the circle—If the radius of the circle, $AC=1$ (*Tab. Analyſis, fig.* 24.) $CP=x$, $y=\sqrt{(1-x^2)}$ and $\sqrt{(1-x^2}=1-\frac{1}{2}x^2-\frac{1}{8}x^4-\frac{1}{16}x^6-\frac{5}{128}x^8-\frac{7}{256}-x^{10}$ *&c.* to infinity. Then will

$ydx=dx-\frac{1}{2}x^2dx-\frac{1}{8}x^4dx-\frac{1}{16}x^6dx-\frac{5}{128}-x^8dx-\frac{7}{256}-x^{10}dx-$, to infinity.

$\int ydx=x-\frac{1}{6}x3-\frac{1}{40}x^5-\frac{1}{112}x^7-\frac{5}{1152}x^9-\frac{7}{2816}x^{11}$, to infinity.

When x becomes equal to the radius CA, the ſpace DCPM degenerates into a quadrant. Subſtituting, therefore, 1 for x, the quadrant will be $1-\frac{1}{6}-\frac{1}{40}-\frac{1}{112}-\frac{5}{1152}-\frac{7}{2816}$, *&c. in infinitum.*—Which ſame ſeries will meaſure the entire area of the circle, the diameter being 1.

Mr. Leibnitz's QUADRATURE *of the circle*—Let the tangent KB (*Tab. Analyſis, fig.* 25.) $=x$, $BC=1$; and the ſecant AC, infinitely near another CK, and the little arch KL be drawn with the radius CK; then will $AK=dx$, $KC=\sqrt{(1+x^2.)}$ Now ſince the angles at B and L, are right angles; and by reaſon of the infinitely ſmall angle KCL, the angle $BKC=KAC$; we ſhall have

$$KC:BC::KA:KL.$$

$$\sqrt{(1+x^2)}:1::dx:\frac{dx}{\sqrt{(1+x^2)}}$$

Farther, $CK:KL::CM:mM$

$$\sqrt{(1+x^2)}:\frac{dx}{\sqrt{(1+x^2)}}::1:\frac{dx}{1+x^2}.$$

Therefore the ſector $CMm=\frac{1}{2}dx:(1+x^2)=\frac{1}{2}(dx-x^2dx+x^4dx-x^6dx+x^8dx-x^{10}dx$, *&c.*) whence by the integral calculus, we find the ſector BCM, whoſe tangent $KB=x\frac{1}{2}x-\frac{1}{6}x^3+\frac{1}{10}x^5-\frac{1}{14}x^7+\frac{1}{18}x^9-\frac{1}{22}x^{11}$, *&c. in infinitum.* And therefore if BM be the octant of the circle, or an arch of 45°, the ſector will be $\frac{1}{2}-\frac{1}{6}+\frac{1}{10}-\frac{1}{14}$, *&c. in infinitum.* The double, therefore, of this ſeries, $1-\frac{1}{3}+\frac{1}{5}-\frac{1}{7}+\frac{1}{9}-\frac{1}{11}$, *&c. in infinitum*, is the quadrant of the circle; or if the diameter be $=1$, the entire area of the circle.

QUADRATURE *of the lunes*—Though a definite *Quadrature* of the entire circle, was never yet given; yet there have been various portions of it ſquared—The firſt partial *Quadrature* was given by Hippocrates of Chio; who ſquared a portion called, from its figure, the *lune*, or *lunuld.* See LUNE, where the *Quadrature* is ſhewn.

This *Quadrature* has no dependance on that of the circle; but then it only extends to the entire lune, or its half; if you would ſquare any portion thereof, at pleaſure, the *Quadrature* of the circle comes in the way.

Yet ſome of the modern geometers have found the *Quadrature* of any portion of the lune at pleaſure, independently of the *Quadrature* of the circle; though ſtill ſubject to a certain reſtriction which prevents the *Quadrature* from being perfect, and, as the geometricians call it, abſolute and indefinite.

In 1701, the marquis de l'Hôpital publiſhed a new manner of ſquaring the parts of the lune taken different ways, and under different conditions—though this, too, is imperfect in the ſame manner as the others.

QUADRATURE *of the ellipſis*—The *ellipſis*, too, is a curve whoſe preciſe *Quadrature* in definite terms is not yet effected. We have here therefore, as before, recourſe to a ſeries.

Let AC (*Tab. Analyſis, fig.* 26.) $=a$ GC $=c$ PC $=x$. Then will

$$y^2=c^2=(a^2-x^2):a^2$$
$$y=c\sqrt{}\ (a^2-x^2):a$$

But $\sqrt{}[a^2-x^2]=a-\frac{x^2}{2a}-\frac{x^4}{8a^3}-\frac{x^6}{16a^5}-\frac{5x^8}{128a^7}-\frac{7x^{10}}{256a^9}$ &c. *in infinitum*. Therefore, $ydx=cdx\frac{cx^2dx}{2a^2}-\frac{cx^4dx}{8a^4}-\frac{cx^6dx}{16a^6}-\frac{5cx^8dx}{128a^8}-\frac{7cx^{10}dx}{256a^{10}}$ &c. *in infinitum.*

if then for x be put a; the quadrant of the ellipſis will be $ac-\frac{1}{8}ac-\frac{1}{40}ac-\frac{1}{112}ac-\frac{5}{1152}ac-\frac{7}{2816}ac$, &c. *in infinitum.* Which ſame ſeries exhibits the entire area of the ellipſis, if a denote the intire axis.

Hence, 1. If $\sqrt{}\ ac=1$; the area of the ellipſis $=1-\frac{1}{6}-\frac{1}{40}-\frac{1}{112}-\frac{5}{1152}-\frac{7}{2816}$, &c. *in infinitum:* whence it is evident that an ellipſis is equal to a circle whoſe diameter is a mean proportional between the conjugate axis of the ellipſis. 2. Hence, alſo, an ellipſis is to a circle whoſe diameter is equal to the greater axis, as ac to a^2; that this, as c to a, or as the leſs axis to the greater. Hence, laſtly, having the *Quadrature* of the circle, we ſhall likewiſe have that of the ellipſis, and on the contrary.

QUADRATURE *of the parabola*—For the parabola we have a *Quadratrix* or tranſcendent curve, which gives its ſquares. See QUADRATRIX.

But it may be likewiſe had thus:

$ax=y^2$ See PARABOLA.

$$a^{1:2}x^{1:2}=y$$
$$ydx=a^{1:2}x^{1:2}dx$$
$$\int ydx=a^{1:2}x^{3:2}=\tfrac{2}{3}\sqrt{}\ ax^3=\tfrac{2}{3}\sqrt{}\ x^2y^2=\tfrac{2}{3}xy.$$

Hence, the parabolic ſpace is to the rectangle of the ſemiordinate into the abſciſſe as $\frac{2}{3}xy$ to xy; that is, as 2 to 3.

Note, If a curve be not ſuppoſed deſcribed, but only an equation to it given, ſo as it does not appear *e. gr.* where the origin of x is to be fixed, we are to put $x=o$ in the integral, and expunging what are multiplied by x, add to it the remainder, if there be any, under the contrary ſign; to have the *Quadrature* ſought.

QUADRATURE *of the hyperbola*—For this, too, we have a *Quadratrix*, invented by Mr. Perks. See QUADRATRIX.

The analytical *Quadrature* was firſt given by N. Mercator of Holſtein, the firſt inventor of infinite ſeries's. But Mercator finding his ſeries by diviſion; Sir Iſaac Newton and Mr. Leibnitz improved upon his method; the one ſeeking them by the extraction of roots, the other by a ſeries preſuppoſed. See SERIES.

Mercator's QUADRATURE *of the hyperbola between its aſymptotes*—Since in an hyperbola within the aſymptotes, $a^2=by+xy$; or if $a=b=1$, (which may be ſuppoſed, ſince the determination of b is arbitrary.)

Then will
$$1=y+xy$$
$$1:(1+x)=y$$

That is (the diviſion being actually performed)

$$y=1-x+x^2-x^3+x^4-x^5+x^6,\ \&c.$$
$$ydx=dx-xdx+x^2dx-x^3dx+x^4dx-x^5-dx+x^6dx,\ \&c.$$
$$\int ydx=x-\tfrac{1}{2}x^2+\tfrac{1}{3}x^3-\tfrac{1}{4}x^4+\tfrac{1}{5}x^5-\tfrac{1}{6}x^6+\tfrac{1}{7}x^7,\ \&c.$$

in infinitum.

QUADRATURE *of the cycloid*—Since TP (*Tab. Analyſis, fig.* 27.) $=$ PM; in the triangle PMT, the angles M and T will be equal; and conſequently, TPQ $=2$M. But the meaſure of the angle APQ is the half arch AP; which likewiſe meaſures the angle TPA. Therefore APQ $=$ TMP $=$ MmS, by reaſon MP and mq are parallel.

Wherefore, ſince the angles at S and Q are right angles, we have

$$AQ:QP::MS:mS$$

Let, then, AQ $=x$, AB $=1$; then will PQ $=\sqrt{}\ (x-xx)$ and mS $=dx\sqrt{}\ (x-xx):x$. But it is ſhewn, that $\sqrt{}\ (x-xx)=x^{1:2}-\frac{1}{2}x^{3:2}-\frac{1}{8}x^{5:2}-\frac{1}{16}x^{7:9}$ &c. *in infinitum.* Therefore, $dx\sqrt{}\ (x-xx):x=$ (the numerators of the exponents being diminiſhed by two units in the diviſion by x) $x^{-1:2}dx-\frac{1}{2}:x^{1:2}dx-\frac{1}{8}x^{3:2}dx-\frac{1}{16}x^{5:2}dx$, &c. *in infinitum.* Whoſe ſum $2x^{1:2}-\frac{1}{3}x^{3:2}-\frac{1}{20}x^{5:2}-\frac{1}{56}x^{7:2}$, &c. *in infinitum*, is the ſemiordinate of the cycloid QM referred to the axis AP. Hence, QMdx, or the element QMSq of the cycloidical ſpace AMQ $=2x^{1:2}dx-\frac{1}{3}x^{3:2}dx-\frac{1}{20}x^{5:2}dx-\frac{1}{56}x^{7:2}dx$, &c. *in infinitum.* Whoſe ſum $=\frac{4}{3}x^{3:2}-\frac{2}{15}x^{5:2}-\frac{1}{70}x^{7:2}-\frac{1}{252}x^{9:2}$, &c. *in infinitum*, expreſſes the ſegment of the cycloid AMQ.

If then mS $=g$G $=dx\sqrt{}\ (x-xx):x$ be multiplied into GM $=$ AQ $=x$; we ſhall find the element GMHG of the area AMG $=dx\sqrt{}\ (x-xx.)$ Which being the ſame with the element of the ſegment of the circle APQ, the ſpace AMG will be equal to the ſegment of the circle APQ; and conſequently, the area ADC equal to the ſemicircle APB.

Hence, ſince CB is equal to the ſemiperiphery of the circle; if that $=p$ and AB $=a$; the rectangle BCDA $=ap$; and the ſemicircle APB, and conſequently, the external cycloidical ſpace ADC $=\frac{1}{4}ap$. Therefore the area of the ſemicycloid ACB $=\frac{1}{4}ap$, and AMCBPA $=\frac{1}{2}ap$. Conſequently, the area of the cycloid is triple of the generating circle.

QUADATURE *of the logiſtic, or logarithmic curve*—Let the ſubtangent PT (*Tab. Analyſis, fig.* 28.) $=a$, PM $=x$ P$p=dx$; then will

$$ydx:dy=a$$
$$ydx=ady$$
$$\int ydx=ay$$

Wherefore the indeterminate ſpace HPMI, is equal to the rectangle of PM into PT.

Hence, 1. Let QS $=z$; then will the indeterminate ſpace ISQH $=az$; and, conſequently, SMPQ $=ay-az=a(y-z)$; that is, the ſpace intercepted between the two logiſtic ſemiordinates is equal to the rectangle of the ſubtangent into the difference of the ſemiordinates.

2. Therefore the ſpace BAPM, is to the ſpace PMSQ as the difference of the ſemiordinates AB and PM, to the difference of the ſemiordinates PM and SQ.

QUADRATURE *of des Cartes's curve*, which is defined by the equation, $b^2:x^2::b-x:y$.

Since;
$$b^2y=bx^2-x^3$$
$$y=(bx^2-x^3):b^2$$
$$ydx=(bx^2dx-x^3dx):b^2$$
$$\int ydx=x^3:3b-x^4:4b^2$$

QUADRATURE *of all curves comprehended under the general equation*, $y=x\sqrt{}^m\ (x+a)$

Since $y=(x+a)^{1:m}$
$$ydx=dx(x+a)^{1:m}$$

To render the element integrable; ſuppoſe,
$$(x+a)^{1:m}=v$$
Then will $x+a=v^m$
$$dx=mv^{m-1}dv$$
$$ydx=mv^m dv$$

$\int ydx=\frac{mv^m}{m+1}+1=\frac{m}{m+1}(x+a)\sqrt{}^m(x+a.)$ Let $x=o$: The Remainder $\frac{m}{m+1}a\sqrt{}^m a$. Whence, the area of the curve $\frac{m}{m+1}(x+a)\sqrt{}^m(x+a)-ma\sqrt{}^m a$.

QUADRATURE, in aſtronomy, that aſpect, or ſituation of the moon, when ſhe is 90° diſtant from the ſun. See MOON.

Or, the *Quadrature* is when ſhe is in a middle point of her orbit, between the points of conjunction and oppoſition; which happens twice in each revolution, *viz.* in the firſt and third quarter. See ORBIT, OPPOSITION, and CONJUNCTION.

When the moon is in her *Quadrature*, ſhe exhibits that phaſis which we call the half moon, *i. e.* ſhe ſhines with juſt half her face; and is ſaid to be biſected, or dichotomized. See PHASIS and DICHOTOMY.

In the moon's progreſs from the ſyzygies to her *Quadrature*, her gravity towards the earth is continually increaſing by the action of the ſun; and her motion retarded for the ſame reaſon—Her motion, then, in her orbit is ſloweſt as her gravity to the earth is greateſt when in the *Quadratures.* See GRAVITY.

In her receſs from the *Quadratures* to the ſyzygies, the gravity continually decreaſes, and the velocity increaſes.

The ratio is thus: as radius is to the ſum, or difference of one and an half the co-ſine of double the diſtance of the moon from the ſyzygy, and half the radius; ſo is the addition of gravity in the *Quadratures* to the diminution or encreaſe thereof in any other ſituation. See SYZYGY.

Hence the moon's orbit is more convex in the *Quadratures*, than in the ſyzygies; and hence the circular figure of the moon's orbit is changed into an oval, whoſe greater axis goes through the *Quadratures*; and hence alſo, the moon is leſs diſtant from the earth at the ſyzygies, and more at the *Quadratures.* See ORBIT.

It is no wonder, therefore, that the moon approach nearer the earth when her gravity is diminiſhed; that exceſs not being the immediate effect of this diminution, but of the inflexion of the orbit towards the *Quadratures.*

In the *Quadratures*, and within 35 degrees thereof, the apſides of the moon go backwards, or move *in antecedentia*; but forwards in the ſyzygies. See APSIDES.

The moon's orbit undergoes various alterations in each revolution—Its excentricity is the greateſt when the line of the apſides is in the ſyzygies; leaſt, when in the *Quadratures.* See EXCENTRICITY.

Conſidering one intire revolution, the nodes move ſlower and ſlower as the moon approaches the *Quadratures*, and reſt when ſhe is therein: but conſidering ſeveral revolutions, the nodes go back faſteſt in the *Quadratures.* See NODE.

The inclination of the plane of the moon's orbit increaſes as the nodes go from the ſyzygies, and is greateſt when the nodes are in the *Quadratures.* See INCLINATION.

QUADRATURE-*lines*, or *lines of* QUADRATURE, are two lines frequently placed on Gunter's ſector.

They are marked with the letter Q, and the figures, 5, 6, 7, 8, 9, 10; of which Q ſignifies the ſide of the ſquare, and the other figures the ſides of polygons of 5, 6, 7, *&c.* ſides—S there ſtands for the ſemi-diameter of a circle, and 90 for a line equal to 90° in circumference. See SECTOR.

QUADRATUS, in anatomy, a name applied to ſeveral muſcles, in reſpect of their ſquare figure, as the Palmaris and Pronators.

—There is alſo a QUADRATUS *femoris*, a member of the muſcle Quadrigeminus, ariſing from the apophyſis of the iſchium, and maintaining an equal breadth and bulk to its inſertion juſt below the great trochanter.—See *Tab. Anat.* (*Myol.*) *fig.* 7. *n.* 25.

This aſſiſts with the other muſcles of the Quadrigeminus, to turn the thigh outwards. See QUADRIGEMINUS.

QUADRATUS *genæ*, or *maxillæ inferioris*, called alſo *montanus*, and (on account of its breadth) *platyſma ragoides*, is a ſquare muſcle lying immediately under the ſkin of the neck, thence called alſo *ſubcutaneus.*—It ariſes thin and membranous from the upper part of the ſpines of the vertebræ of the neck and the ſkin of the ſuperior parts of the cucullaris and pectoral muſcle; whence, ſpreading over the neck, it becomes fleſhy, and is inſerted partly into the os hyoides, and partly into the under edge of the lower jaw—It adheres firmly to the panniculus carnoſus; from which it is not ſeparated without difficulty; and was not anciently diſtinguiſhed from it—It ſerves to pull the lower jaw downward and awry.

QUADRELS, in building, a kind of artificial ſtones, perfectly ſquare, whence their name, made of a chalky, or whitiſh and pliable earth, *&c.* dried in the ſhade for two years. See BRICK and STONE.

They were formerly in great requeſt among the Italian architects.

QUADRIGA*, in antiquity, a carr, or chariot drawn by four horſes. See CARR.

* The word is formed from the Latin, *quatuor*, four, and *jugum* yoke. See BIGA.

Various are the accounts we have of the author of the *Quadriga*—Cicero makes it the invention of Minerva.—Hyginus attributes it to Erichthonius IV. king of the Athenians; which ſentiment Virgil follows in his *Georgics*, lib. iii. v. 113. Æſchylus gives Prometheus the honour thereof—Tertullian, *de Spectac.* l. ix. ſays it was invented among the Argians, by Trochilus, in honour of Juno; and at Rome, by Romulus, in honour of Mars, or Quirinus. Ado of Vienne, *Chronic. Act.* 3. will have it to have been invented by one Procidus, about the time of the eſtabliſhment of the kingdom of Athens. Laziardales, *Hiſt. Univerſ. Epitom.* l. xxiv. ſays the ſame of Triptolemus.—Laſtly, if there be not opinions enough already, Herodotus gives us another; and ſays the Greeks borrowed it from the Lybians—Pliny tells us, that his ſeal was a *Quadriga*, lib. xvi. See SEAL.

On the reverſes of medals we frequently ſee victory, or the emperor, in a *Quadriga*, holding the reins of the horſes; whence theſe coins are called among the curious, *nummi Quadrigati* and *victoriati.* See MEDAL.

QUADRIGEMINUS, in anatomy, a muſcle, or rather aſſemblage of four muſcles; ſerving to turn the thigh outward. See THIGH.

The firſt of the conſtituent muſcles of the *Quadrigeminus*, is the pyriformis; the ſecond and third the gemini; and the fourth quadratus femoris. See each deſcribed under its proper article, PYRIFORMIS, GEMINI, *&c.*

QUADRILATERAL, in geometry, a figure whoſe perimeter conſiſts of four right lines, making four angles; whence it is alſo called a *Quadrangular* figure. See QUADRANGULAR.

If the ſeveral angles be right, the figure is a *rectangular Quadrilateral*—If oblique, an *oblique-angular Quadrilateral.* See RECTANGULAR, *&c.*

If the ſides of a *Quadrilateral* be equal, and the angles right, the figure is a *ſquare.* See SQUARE.

If the ſides be equal, but the angles unequal, the figure is a *rhombus.* See RHOMBUS.

If the angles be equal, and the ſides unequal, the figure is a *rectangle.* See RECTANGLE.

If only the oppoſite angles and ſides be equal, the *Quadrilateral* is a *rhomboides.* See RHOMBOIDES.

If the oppoſite angles and ſides be unequal, the *Quadrilateral* is a *trapezium.* See TRAPEZIUM.

The two oppoſite angles of any *Quadrilateral* figure inſcribed in a circle, always make two right angles. See INSCRIBED.

QUADRILL*, QUADRILLA, a little troop or company of cavaliers, pompouſly dreſſed and mounted; for the performance of carrouſals, juſts, turnaments, runnings at the ring, and other gallant divertiſements. See JUST, TURNAMENT, *&c.*

* The word is borrowed from the Italian, being a diminutive of *Squadra*, a company of ſoldiers ranged in a ſquare: for *Squadrare* is, properly, to diſpoſe any thing ſquare; whence their *Quadriglia*, the French *Squadrille* and *Quadrille*, and our *Quadrill*—It is not fifty years ſince the French wrote *Squadrille* and *Eſquadrille.*

A regular carrouſal is to have at leaſt four, and at moſt twelve, *Quadrills.* See CARROUSAL.

Of theſe *Quadrills*, each is to conſiſt of at leaſt three cavaliers, and at moſt of twelve.

The *Quadrills* are diſtinguiſhed by the form of their habits, or the diverſity of their colours. See COLOUR, LIVERY, FACTION, *&c.*

QUADRIPARTITION, the dividing by four; or a taking of the fourth part of any number, or quantity. See DIVISION, PARTITION, *&c.*

Hence *Quadripartite*, &c ſomething divided into four. See DEED and INDENTURE.

QUADRIREME, QUADRIREMIS, a galley, or veſſel, with four oars on a ſide. See GALLEY.

QUADRUGATA *terræ*, in old law records, denotes a teamland; or ſo much as can be tilled with four horſes. See PLOUGH-LAND.

QUADRUPED, QUADRUPES, in natural hiſtory, a four-footed beaſt: or a perfect, hairy, viviparous animal, having but four feet. See ANIMAL.

There is a great analogy between the ſtructure of *Quadrupeds*, and that of man—The principal differences reſult from their different poſture; and are ſeen in the legs, heads, necks, ſtomachs, hearts, and the nerves. See FOOT, HEAD, NECK, STOMACH, &c.

Quadrupeds are divided by Mr. Ray, into thoſe which are hoofed, *ungulata*, and clawed or digitate, *unguiculata.*

Hoofed QUADRUPEDS, are either,

I. *Whole-hoofed*, *ſolidipeda*, Μονοχηλα, Μονυχα, *ſolidungula*: as the horſe, aſs, the onager or wild aſs; the mule and the zebra of Africa, or the fine ſtriped Indian or African aſs, almoſt like a mule in form and ſtature. See HOOF.

Of the whole-hoofed kind, Ariſtotle has obſerved, that no one hath two horns—(he might have ſaid any horns) no one hath the talus, or aſtragalus, nor have the males any appearance of breaſts. See HORN.

II. *Cloven-footed*, and that either 1°. into two diviſions only; as the Δίχηλα, or biſulcate kind, which are again ſubdivided into ſuch as are, firſt,

Ruminant, Μηρυκάζοντα, that is, ſuch as chew the cud; and theſe either have hollow and perpetual horns, as the bull, ſheep, and goat-kind; or deciduous horns, as the hart and deer-kind, which uſually ſhed their horns annually. See RUMINANT and HEAD.

Of the *bull-kind* are reckoned theſe: the common *bos* or bullock, of which the male is *taurus*, the female *vacca:* the German *urus*, *urochs*, or *aurochs:* the *biſon:* the *bonaſus:* the *bubalus*, or *bufalo:* the *bos Africanus* of Bellonius, *Obſ.* l. ii. c. 50. which he takes to be the *bubalus* of the ancients.

Of the *ſheep-kind*, beſides the common ſort, are reckoned the Arabian *ovis laticauda*, whoſe tail is ſometimes of 30 pound weight; the *ovis ſtrepſiceros cretica Bellonii*; the *ovis Africana*, with ſhort hair inſtead of wool; the *ovis Guineenſis*, or *Angolenſis* of Marcgrave, *Hiſt. Braſil.* l. vi. c. x.

Of the *goat-kind*, are, beſide the common *capra domeſtica*; the *ibex*, or German ſteinbock, found in the tops of the Alps; the *rupicapra*, French chamois, or German goms; the *gazella Africana*, or antelope; the *gazella Indica*; the *capra ſylveſtris Africana Grimmii*; *the capra mambrina*, or *Syriaca* of Geſner; the *buſelaphus*, or *moſchelaphus Caii* in Geſner; the *tragelaphus Caii* in Geſner; &c.

Of the *hart* or *deer-kind*, are reckoned, the *cervus*, Ἔλαφος, or red deer; the *cervus platyceros* or *palmatus*, the fallow deer; *alce* or the elk; *rangifer*, the rain-deer; the *axis Plinii*, according to Bellonius; the *caprea Plinii*, the *cuguacu-etc*, and *cuguacu-zapara* of Marcgrave; the *caprea Groenlandica.*

Secondly, of *cloven-footed* animals into two parts only, and which do not chew the cud, there is only the hog and ſwine-kind: under this head, beſides the common ſwine, are reckoned the wild boar, or ſwine; the *porcus Guineenſis Marcgravii*;

gravii; the *porcus Indicus*, called *babyrouſſa*; the *tajaca* or *aper mexicanus moſchiferus* of Dr. Tyſon, called by Marcgrave, *tajaca cunagoara*, by others *quauhtla coymalt*, and *quapizotl*, and by Acoſta and ſome others *zaino*.

2°. There are ſome *Quadrupedes*, whoſe hoof is cloven into four diviſions; and theſe ſeem to be not ruminant: as the rhinoceros, the hippopotamus, the tapijerete of Braſil, the capy-bara of Braſil, and the animal moſchiferum.

Clawed or *digitate* QUADRUPEDS—Of this kind, there are, firſt, a ſort whoſe claws are not divided or ſeparated, but adhering to one another, covered with one common ſkin, but with obtuſe nails, ſticking out round the margin of the foot; as the elephant, which is anomalous, and not clearly referable to this kind, or to that of cloven-footed *Quadrupeds*.

A ſecond ſpecies of this *digitate-kind* of *Quadrupeds*, which has only two claws, is that of camels; and though theſe have no horns, they both ruminate, and have alſo the four ſtomachs of horned ruminant animals.

Of the Camel, or dromedary there are two ſorts; one having but one bunch on the back, the other two.

To this kind alſo belong the Peruvian *glama*, which ſome have reckoned among the ſheep-kind; as alſo the *pacos*, the *ovis Indica*, or *Peruviana vulgo*, much leſs than the *glama*.

A third ſpecies of this *unguiculate-kind* includes ſuch animals, as the Greeks called Πλατυωνυχα, and Ανθρωπομορφα, which have the foot divided into many claws, with broad nails on them; as the ape and monkey kind.

Of theſe, ſome have no tails, and are called *ſimiæ*, or apes: others have tails, and are called monkeys, *cercopitheci*; and ſuch as has either long or ſhort tails, if they are of a larger ſize, are called *papiones*, or baboons—There are great numbers and varieties of this ſpecies of *Quadrupeds*; of which naturaliſts have deſcribed theſe: *viz.* the *orang outang*, or *homo ſylveſtris* of Dr. Tyſon, deſcribed by him in a particular diſcourſe: the *guarita* of Braſil, *Marcgravii*; the *cagui* of Braſil, greater and leſſer; the *cay* of the ſame region, deſcribed by Lerius; the *caitaia* of the ſame country; the *cercopithecus barbatus Guineenſis*, two or three ſorts of it; the *cercopithecus angolenſis major*; the *cercopithecus non barbatus Cluſii*; the *cercopithecus Cluſ.* called *ſagouin*: laſtly, if apes and monkeys have their ſnouts very prominent like dogs, they are called *cynocephali*.

A fourth ſpecies of this *unguiculate-kind*, is when though the claws are many, yet they are not covered at the end with broad flat nails, like monkeys or apes; but are rather like the talons of hawks, *&c.* crooked, and ſharp-pointed.

Theſe, in reſpect of their teeth, may be divided into ſuch as have many dentes primores, or inciſores, (that is, cutting teeth) in each jaw, of which there are two ſorts; a greater, which either have a ſhort, round head, as the cat-kind; or a leſſer ſort, having a long ſlender body, with very ſhort legs, as the weaſel or vermin-kind.—There are alſo ſome of this ſpecies of *Quadrupeds*, which have only two large remarkable teeth in each jaw: theſe are the hare-kind, and live only upon herbs, graſs, *&c.*

Of the *cat-kind* of *Quadrupeds* are reckoned to be the lion, the tyger, the *pardalis*, which male is *pardus*, and female *panthera*, the leopard; the *lupus cervarius*, or lynx; the *catus pardus*, or cat-a-mountain; the common cat; and the bear.

Of the *dog-kind* are reckoned the wolf; the *lupus aureus* or jackall; beſides the common dog, of which kind they enumerate, the maſtive; the *canis Venaticus graius*, *Græcus*, or *Scoticus*, the greyhound; *graius Hibernicus*, or the Iriſh greyhound; the *canis Venaticus ſagax*, *indagator*, *ſpectator ferarum*, &c. the hound; *canis Venaticus Hiſpanicus* or *Aviarius*, the ſpaniel for land or water; *vertagus* or tumbler; *canis* Οικȣρος, or *domeſticus*, the houſe-dog; *canis melitæus*, or the lap-dog; *canis getulus* or *Iſlandicus*, the ſhock: and of all theſe ſorts there are many varieties of mongrels, and hybridous breeds.

Another ſort of the dog-kind is the fox; the animal *zibethicum*, or civet-cat, as it is corruptly called, but by it's teeth and ſnout, is plainly of the *dog-tribe*; the *American coati*, or *rackooon*, or *rattoon*; the *yzquiepate*; the *carigueya*, *maritucaca*, *carigoy*, *ropoza* or *poſſum*; the *taxus* or *meles*; the badger, grey, or pate; the *lutra* or otter; the *phoca*, ſea-calf, or ſeale; the *equus marinus*, morſe, or ſea-horſe, miſtaken by ſome for the *hippopotamus*; the Dutch call him *walras*, the Danes and Iſlanders *roſmarus*; laſtly, the *manati* or *vacca marina*, the ſea-cow.

Of the *vermin*, or *weaſel-kind* of *Quadrupeds*, is, firſt, the *muſtela vulgaris*, the common weaſel, in Yorkſhire called *foumart* or *fitcher*, γαλεη; the *viverra Indica*, called *quel* and *quirpele*; and another ſort called *mungo*, and *mungathia*, of a reddiſh grey: the *muſtela*, *ermine*, or *ſtoat*, if white: and *muſtela ſylveſtris*, the ferret; *putorius*, the pole-cat; *martes* or *foyna*, the martin or martlet; *muſtela zibellina* the ſable; laſtly, the *genetta*; and the *ichneumon Belloni*.

Of the *hare-kind* of *Quadrupeds*, are firſt, *lepus*, or the common hare: *cuniculus*, the rabbet or coney; *tapeti*, or Braſil coney, and the *aperea* of Braſil; the *hyſtrix*, or porcupine, and the *hyſtrix Americanus*, or *cuanda* of Braſil; caſtor, fiber, or the beaver; *ſciurus vulg.* or ſquirrel: the Virginian, Zeylandic, Barbary, and American flying ſquirrel; *mus domeſticus*, major and minor, the common rat and mouſe: to theſe alſo may be referred *mus major aquaticus*, the water-rat; the musk-rat, *mus avellanarum*, major and minor; the dormouſe or ſleeper, *mus noricus*, *Cricetus*, *Alpinus ſeu Marmotta*; the *cavia cobaya*, or *cuniculus Americanus*, the Guinea-pig; the *agati*, and *paca* of Braſil; the *mus Norwegicus*, or *leming*; the *glis Geſneri*, or the *rell*; the *mus Indicus*, &c.

Anomalous QUADRUPEDS—To theſe ſeveral kinds, the following anomalous ones muſt alſo be added.

(1) Such four footed viviparous animals, as have a longiſh ſnout, with their feet divided into many claws, and toes, and having teeth; as the *echinus terreſtris*, or common urchin, or hedge-hog; *erinaceus Indicus albus*; *tatu* or *armadillo prima* of Marcgrave; *tatuete* of Braſil, or the ſecond ſpecies of the *armadillo*, according to Marcgrave; *tatu apara*, his third ſpecies of *armadillo*; *Tatu Muſtelinus*, *Soc. Reg. Muſ.* the weaſel-headed *armadillo*; *talpa*, the mole, warp, or moldwarp; *mus araneus*, ſhrew, hardyſhrew, ſhrew-mouſe.

(2) *Quadrupedous* and viviparous animals with a longiſh ſnout, having their feet divided into many claws or toes, but without teeth; as the *tamandua-guacu* of Braſil, *Marcgravii*; *urſus formicarius Cardani*, the great ant-bear; the *tamanduai* of Braſil, or Marcgrave's leſſer ant-bear.

(3). *Anomalous flying Quadrupeds*, with a ſhorter ſnout, and their feet divided as above; being of the bat-kind, or flittermice; of which there are ſeveral ſizes and different forms.

(4.) There is one very anomalous animal which has but three claws on each foot; and that is the aſs, or *ignavus* of Marcgrave, the ſloth or ſluggard.

(5.) Viviparous and ſanguineous *Quadrupeds*, breathing with lungs, but having only one ventricle in the heart; as the *rana aquatica*, the frog or froſh; *rana arborea*, *ſeu ranunculus viridis*, the ſmall tree or green frog; *bufo*, *ſive rubeta*, the toad; *teſtudo*, the tortoiſe, in Greek, χελωνη; of theſe there are land and water ones, and many different ſpecies in foreign parts. See TORTOISE.

(6) *Oviparous Quadrupeds*, with a long tail ſtretched out horizontally, are the lizard-kind; as *lacertus omnium maximus*, the crocodile, *cordylus*, *ſive caudiverbera*, *uramaſtix Græcis*, larger than the green lizard; *tapayaxin Novæ Hiſpaniæ*; *lacertus orbicularis* of Hernandez; *lacertus vulgaris*, the common eft, ſwift, or newt; *lacertus viridis*, the green lizard; *lacertus fucetanus Aldrovandi*, at Rome and Naples called the *tarantula*; *lacertus Indicus*, called *ſenembi* and *inguana*; *lacertus Braſilienſis*, called *tejuguacu*, and *temapara* by Marcgrave; the *taraguira*, *ameira*, *toraguico*, *Acuraba*, *Americima*, *Curapopepa*, *Teiunbam*, &c. of Marcgrave; the *lacertus Indicus*; the *ſcincus*, or *crocodilus terreſtris*; the *ſeps*, or *lacerta chocidica*, a kind of footed ſerpent; *ſtellio*, the ſwift, or ſpotted lizard; *ſalamandra terreſtris*; *ſalamandra aquatica*, the water eft; *lacerta volans Indica*; and the *chamælion*, or camelion.

QUADRUPLE, a ſum or number multiplied by four, or taken four times. See RATIO and MULTIPLE.

QUADRUPLE is particularly uſed for a gold coin, worth four times as much as that whereof it is the *Quadruple*.

The *Quadruple* of the Spaniſh piſtole is a piece of four piſtoles, worth about three pounds twelve ſhillings ſterling, called alſo *double doubloon*.

The *Quadruple* of the louis d'or is only equal to two louis d'ors or French piſtoles, or one pound thirteen ſhillings ſterling. See PISTOLE.

QUÆ *plura*, a writ that anciently lay where inquiſition had been made by an eſcheator, of ſuch lands or tenements, as any man died ſeized of, and all was ſuppoſed not to be found by the office. See ESCHEATOR.

This writ was to enquire what more lands or tenements the party died ſeized of.—But it is now made uſeleſs by taking away the court of wards and offices.

QUÆ *ſervitia*. See PER *quæ ſervitia*.

QUESTA, in our ancient writers denotes an indulgence, or remiſſion of penance; expoſed to ſale by the popes. See INDULGENCE and QUÆSTIONARII.

QUÆSTIONARII*, in our ancient law-books, were people who went about with indulgences from door to door, deſiring charity either for themſelves or others. See INDULGENCE.

* Matt. Weſt, obſerves, 1240, that the king, *Terram ſuam per Papales* Quæſtionarios, *depauperari &c. permiſit.*

QUÆSTUS*, in law, is that eſtate, or thoſe effects which a man hath by acquiſition, or purchaſe; in contradiſtinction to *hæreditas*, which is what he hath by deſcent. See ACQUEST and GOODS.

* Glanv. lib. vii. *aut habet hæreditatem tantum, vel* quæſtum *tantum, aut hæreditatem &* quæſtum,

QUAKERS, a religious ſect, who made their appearance in England, during the time of the inter-regnum. See SECT.

They took their origin from George Fox, an illiterate perſon, born at Draiton in Leiceſterſhire; and by profeſſion a ſhoemaker.

The accounts of thoſe times tell us, that as he wrought at his trade, he uſed to meditate much on the ſcriptures; which, with his ſolitary courſe of life, improving his natural melancholy, he began at length to have viſions; and, in conſequence thereof, ſet up for a preacher.

The new prophet propoſed but few articles of faith; dwelt moſtly on morality; preached mutual charity, the love of God, and a deep attention to the inner motions and ſecret workings of the ſpirit—He would have a ſimple worſhip, and religion without any ceremonies; making it a principal point to wait, in profound ſilence, the motion and direction of the holy ſpirit.

The genius of the times, the novelty of the doctrine, and the great appearance of devotion in the man, ſoon gained him diſciples; and ſome unuſual ſhakings and convulſions which they were ſeized withal at their firſt meetings, procured them the appellation *Quakers*.

They profeſs a great auſterity of behaviour; a ſingular probity and uprightneſs in their dealings; a demureneſs and gravity of countenance; a coldneſs and ſparingneſs of diſcourſe, to have time to weigh what they ſay; a great deal of frugality in their tables, and of plainneſs in their dreſs.

They declaim much againſt the intereſted views of the Engliſh miniſters; blame all war, and ſet aſide all uſe of oaths, as prohibited under the goſpel. See AFFIRMATION.

According to the genius of riſing ſects, an eager zeal at firſt led them to ſome extravagancies: they would run about the ſtreets naked; and were frequently in priſon for interrupting the miniſters in ſervice time.

One of their company, Naylor, is ſaid to have had the impiety to allow his followers to call him ſon of God, ſon of juſtice, and king of Iſrael; to ſtrew garments before him, and hale him at his entry into Briſtol, with Hoſanna ſon of David. He had his trial for the ſame, was whipped for blaſphemy, and excommunicated by the reſt.

Beſide other penalties inflicted on them, they were laughed at, and rallied in writing, and expoſed on the theatre: but they deſpiſed alike both the preſs and the priſon, and formed their ſect, maugre all oppoſition of both; and under the direction of Fox, Dewſbury, and others, grew from a looſe, undiſciplined multitude, into a regular body, with ſtated laws and polity; which they retain with great œconomy to this day.

The modern *Quakers* retain nothing of the extravagancies charged on their leaders; having approved themſelves a ſober, quiet people, of exemplary morals, and remarkably charitable and friendly to each other.

Their doctrines are not eaſily collected; at leaſt, not eaſily repreſented out of their own terms, which appear ſomewhat ambiguous.

They hold Chriſt to be a light which hath lighted every man; and that whoever will ſoberly and ſeriouſly turn into himſelf with a ſincere deſire to know and practiſe his duty, will not fail to find there a ſufficient director; a ray from the fountain of light illuminating the underſtanding, and aſſiſting to diſtinguiſh good from evil.

They add, that ſuch as follow the directions and convictions of this light, ſhall be holy and acceptable to God; and that this was the end of Chriſt's coming into the world—That ſo far as they follow this light, they ſhall be infallible; and that it is not opinions, or ſpeculations, or notions of what is true, or ſubſcription of articles or formula's of faith, how ſoundly ſoever worded, that make a man a true believer or chriſtian; but a conformity of mind and practice to the will of God, according to the manifeſtation and dictates of this divine principle of light within them.

Our Saviour's injunction about baptiſm they underſtand, in a figurative ſenſe, of a converſion and change of the heart; and wholly neglect the outward ſign—Water-baptiſm they hold was only John's; that it was no more than a type or figure, fitted for the infant-ſtate of the goſpel; and therefore now uſeleſs, in a diſpenſation, which is ſpiritual and inward.

The ſame they hold of the ſupper; alledging, that both allude to old Jewiſh practices, and were uſed as types or ſignifications of a near and accompliſhing work—They add, that the communion of ſaints conſiſts only in a participation of the ſame divine principle, ſhewing itſelf in an unity of ſpirit.

As to miniſtry and ordinances, they deny that any are to be uſed of man's wit, or will, or carnal invention, or imitation; or other than what the inward principle directs them to—Accordingly, they have no perſons ſet apart for the miniſtry; but without diſtinction of quality or ſex, every one who is of ſober life, and approved converſation, and believes him or herſelf called or moved thereto, is permitted to ſpeak and propheſy in their aſſemblies.

They own the ſcriptures to be given by divine inſpiration, and allow them the appellation of the form of ſound words; but refuſe to call them the *word of God*, as being a denomination properly attributed to Chriſt alone—They add, that what makes them more ſcrupulous in this reſpect, is, that people are apt to be hereby led to think that if they have the ſcriptures, they have all; and ſo look for no farther word or light.

They acknowledge the holy three that bear record in heaven, father, word, and ſpirit; but reject the ſchool-terms, trinity, diſtinct, perſons, hypoſtaſes, &c. as not ſcriptural, and as apt to convey too groſs ideas.

They have been even charged with denying the incarnation, our Saviour's humanity, divinity, plenary ſatisfaction, and the reſurrection of the dead: but this is injurious to them; and all that can be juſtly ſaid, is, that they do not allow of them in the ſame ſenſe, or ſpeak of them in the ſame terms, as is commonly done among others—They allow the incarnation, and that the Godhead dwelt bodily in Jeſus; and yet many of them ſay, there is no Chriſt but what is within them: whence it ſhould ſeem their notion of the incarnation only implied this, that the light, which they call the Chriſt within, dwelt in the man Jeſus Chriſt fully—Their reaſoning, here, is, that Chriſt as God, not being diviſible, the meaſure or manifeſtation of the ſpirit of Chriſt in us, is a manifeſtation of the ſame Chriſt which dwelt bodily and fully in the man Jeſus Chriſt.

They are ſilent as to the hypoſtatical union; and ſome of them are charged with allegorizing away the whole hiſtory of the crucifixion, the reſurrection, and aſcenſion; though their beſt and moſt approved writers have been very explicit in their acknowledgment of the reality of the hiſtory.

They decline the uſe of modes or forms of civility; expreſſing their reſpect to their ſuperiors no other way but by obeying all juſt laws under their government.

The ſyſtem of *Quakeriſm* is laid down in fifteen theſes, by Robert Barclay, in a well writ apology addreſſed to king Charles II. Their hiſtory, writ in low Dutch by William Sewel, and ſince tranſlated into Engliſh, traces them from the beginning to the year 1717—A hiſtory of this pleople was alſo publiſhed *An.* 1695, by Gerard Croeſe; but that author is by them accuſed as having miſrepreſented facts, and in many reſpects done them injuſtice.

As to diſcipline and polity; the affairs of the communion are all managed under a democratical government, by rules eſtabliſhed by common conſent; and this principally at their meetings, whereof they have many kinds; *viz. monthly, quarterly, yearly, ſecond day's meetings, meetings of ſufferings, &c.*

Their *monthly* and *quarterly meetings* are held in their reſpective counties—To theſe deputies are ſent from the ſeveral particular meetings—Here inquiry is made into the ſtate of each meeting; who ſtand faſt to the rules and orders, and who backſlide; who pay tithes, and church rates, and who ſuffer for non-payment of either; who are married by prieſts, &c. and accordingly they proceed to cenſure, or incourage—Here, too, they excommunicate, and here receive again into communion; of all which things exact regiſters are kept.

From theſe meetings appeals lie to their yearly ones, which are always held in London, and conſiſt of three orders or claſſes; *viz.* repreſentatives ſent from the quarterly meetings; correſpondents for the ſeveral counties, and foreign countries; and miniſters, or preachers.—Hither are tranſmitted accounts of what has been tranſacted in all the monthly and quarterly meetings over all the world—Here are meaſures concerted, and directions given as to behaviour about tithes, and rates, providing for the poor, compoſing differences, &c.—Here public accounts are audited, and proper inſtructions given to the deputies to be obſerved at their return, and a yearly epiſtle of admonitions diſpatched to be read in all the monthly and quarterly meetings throughout the world.

The *ſecond day's meeting*, is a ſtanding committee conſiſting of the principal preachers in and about the city, who meet every monday, to concert particular caſes, and exigencies relating to the body, happening between the yearly meetings; particularly to examine, approve, licenſe, &c. all books printed in their behalf.

The *meeting of ſufferings* is held every week, and conſiſts of the correſpondents for each county—Its buſineſs is to receive complaints from ſuch as have ſuffered for non-payment of tithes and rates, and to procure them relief, either by ſending them money, for which they have a ſettled fund, or by ſoliciting their cauſes above, or both.

QUALE *Jus*, was an ancient writ judicial, which lay where a religious perſon had judgment to recover land; before execution was made of the judgment.

This writ was iſſued forth to the eſcheator between judgment and execution, to enquire whether the religious perſon had right to recover, or whether the judgment were obtained by colluſion between the demandant and tenant; to the intent that the true lords were not defrauded.

QUALIFICATOR, in the canon-law, a divine appointed to qualify, or declare the quality of, a propoſition brought before an eccleſiaſtical tribunal; chiefly before the inquiſition.

The *Qualificators* of the office are not judges; they only give their ſentiments on the propoſitions preſented to them—It is the inquiſitors that judge. See INQUISITION.

QUALITY, QUALITAS, that affection of a thing whence it is denominated ſuch; or that which occaſions a thing to affect our ſenſes in this or that manner, and gives it this or that denomination. See AFFECTION.

Thus, that power in fire, whatever it be, whereby it excites in us the ſenſation of heat, ſince it is that whence the fire is denominated hot, is called the *Quality* of fire. See HEAT.

The word *Quality*, *Qualitas*, is ſaid to have been firſt introduced into the Latin by Cicero: till his time the Romans ſtudiouſly avoided uſing a term which denoted an abſtract; and in lieu thereof, only conſidered the concrete, ſignified by *Quale*—The like is obſerved of the ancient Greeks, who did not uſe ποιότης, but ποιον. See ABSTRACT and ABSTRACTION.

Quality, it is to be obſerved, is an ambiguous term; and has been applied to ſome things which ought rather to have been looked upon as ſtates of matter, or aſſemblages of ſeveral *Qualities*; as life, health, beauty, *&c.*

There are, alſo, other attributes, as ſize, ſhape, motion, and the reſt, uſually reckoned among *Qualities*, which might more conveniently be ranked among the primary modes of the parts of matter; ſince from theſe ſimple attributes, all the *Qualities* are derived. See MODE.

The ancient ſchool philoſophers diſtinguiſh *Quality* in the general, which they call *metaphyſical* and *prædicamental Quality*, into *eſſential* and *accidental*—The moderns, more uſually, into *ſpiritual* and *corporeal.*

Spiritual QUALITIES, or QUALITIES *of the ſoul*, are affections of the mind, conſidered as in this, or that habitude or diſpoſition—Of theſe, they make two kinds; the one belonging to the underſtanding, the other to the will: of the former kind are knowledge, opinion, certainty, doubting, *&c.* Of the latter, are all the moral virtues and vices. See UNDERSTANDING, WILL, KNOWLEDGE, IGNORANCE, OPINION, *&c.* See alſo VIRTUE, *&c.*

Corporeal or phyſical QUALITIES, are what we chiefly conſider under this denomination, and to which the definition above laid down is accommodated.

Philoſophers are divided as to the nature of theſe *Qualities*, or what they are in the body—The general language of the peripatetic ſchool, is, that they are things diſtinct from the bodies themſelves; are ſuperadded to them, or flow from their ſubſtantial forms: on which principle, they hold *Qualities* to be real, and denominate them *accidents*; ſuppoſing them to be inherent in ſubſtances, though not in the relation of parts, but to be ſuſtained thereby as in a ſubject, and incapable of ſubſiſting without them—In effect, the Thomiſts define *Qualities* to be accidents following or ariſing from the form; in the ſame manner as quantity is an accident following or ariſing from the ſubſtance. See FORM, ACCIDENT, QUANTITY, *&c.*

The moderns abſolutely explode the notion of *Qualities* diſtinct from the body; and inſiſt, that the powers whereby bodies excite in us the ideas of ſuch *Qualities* are no other than the mechanical affections of the bodies themſelves, *viz.* the figure, magnitude, motion, *&c.* of the parts whereof they conſiſt. See MECHANICAL.

The principal conſiderations inſiſted on by the retainers to real *Qualities* are, that theſe powers may be actually ſeparated from the ſubſtances they inhere in; as we ſee in light, heat, *&c.* That from theſe very *Qualities* conſidered as ſo many determinations ariſes a very great diverſity in bodies: and that bodies, according to the diverſity of their *Qualities*, affect our ſenſes differently.

The adherents to the experimental way, on the contrary, account for all the *Qualities* of bodies from mechanical cauſes.

Thus all the Phænomena of a clock, the motion of its wheels, its hands, *&c.* whereby it ſtrikes the hour, points the minute, day, moon's age, *&c.* do all evidently ariſe from the ſingle ſpring; which we never imagine to have any particular powers whereby it ſhould be enabled to make ſuch diſcoveries; nor any other principle but that one of elaſticity—Again, when the ſmith who firſt invented locks and keys, had made his firſt lock, it was only a piece of iron, forged into a particular ſhape; and when, afterwards, he made a key to it, that alſo, conſidered in itſelf, was nothing but a piece of iron of a determinate figure; but as theſe two pieces of iron might now be applied to one another, after a certain manner, and, as there was a congruity betwixt the wards of the lock, and thoſe of the key, they now each obtain a new capacity; and it became a principal part of the notion and definition of a lock, that it was capable of being made to open and ſhut, by that other piece of iron called a key; and it was looked on as a peculiar faculty and power in the key to be fit to open and ſhut the lock—And yet by theſe new attributes there was not added any real or phyſical entity, either to the lock or the key; each of them remaining the ſame piece of iron, juſt ſo ſhaped, as it was before. And, again, when the ſmith made other keys of different ſizes, or with different wards; though the firſt lock could not be opened with any of thoſe keys, yet, that indiſpoſition was nothing new in the lock, or diſtinct from the figure it had before theſe keys were made.

Why, then, may we not conceive, that ſenſible *Qualities*, though, by virtue of a certain congruity or incongruity in point of figure, texture, or other mechanical properties, the portions of matter they modify are enabled to produce various effects, on account whereof the bodies are ſaid to be endowed with *Qualities*; yet, they are not in the bodies endowed with them, any real or diſtinct entities, or differing from the matter itſelf of ſuch a determinate bigneſs, ſhape, and other mechanical modifications?

Thus, though the modern goldſmiths and refiners reckon it among the moſt diſtinguiſhed *Qualities* of gold, that it is diſſoluble in aqua regia, whilſt aqua fortis will not work upon it; yet theſe attributes are not in the gold any thing diſtinct from its peculiar texture; nor is the gold we have now of any other nature than it was in Pliny's time, when aqua fortis and aqua regia were unknown.

If another menſtruum, of which Mr. Boyle ſuggeſts he was poſſeſſed, ſhould be invented to diſſolve pure gold in part, and change it into a different metalline body; there would then ariſe another new property, whereby to diſtinguiſh this from other metals: yet the nature of gold is not at all different now from what it was before the diſcovery of this laſt menſtruum.

There are bodies neither cathartic nor ſudorific, with ſome of which gold being joined acquires a purgative virtue, and with others a power to procure ſweat.—Nature herſelf ſometimes produces things, that have no relation to others: and art, eſpecially if aſſiſted by chemiſtry, may cauſe ſo many new productions, that no man can tell, but the moſt familiar bodies may have multitudes of *Qualities* he dreams not of, which will hardly be imagined real phyſical entities.

We all know that the ſun hath a power to harden clay, ſoften wax, melt butter, thaw ice, turn water into vapour, make air expand itſelf in weather-glaſſes, contribute to blanch linen, render the white skin of the face ſwarthy, and mowed graſs yellow, ripen fruit, hatch the eggs of ſilk-worms, caterpillers, *&c.* and perform many other things, ſome of which ſeem contrary to others; yet theſe are not diſtinct powers, or faculties in the ſun, but only the production of its heat, diverſified by the different textures of the body it chances to work on, and the condition of the other ſubſtances concerned in the operation—And, therefore, whether or no the ſun, in ſome caſes, has any influence at all diſtinct from its light and heat, we ſee that all the phænomena mentioned are producible by the heat of common fire, duly applied and regulated. *Boyle of Forms and Qualities.*

Some of the ancients, and particularly the Peripatetics, diſtinguiſhed *Qualities* into *ſenſible* and *occult.*

Senſible, or *manifeſt* QUALITIES, are thoſe ariſing from certain modifications of matter, and which become immediately objects of our ſenſes—Such are all thoſe above mentioned.

Though, in ſtrictneſs, thoſe only are ſaid to be *ſenſible Qualities* which affect ſome one ſenſe alone; as colour does the eye, ſound the ear, *&c.*

Theſe are ſometimes, alſo, called *tangible Qualities*, by reaſon they only produce their effect, *i. e.* excite their ideas in us when contiguous, or in contact with the organ.

Occult QUALITIES, are certain latent powers ariſing from the ſpecific forms of things, whereof no rational ſolution can be given on any principles of phyſics. See OCCULT.

Senſible Qualities are uſually ſubdivided into *primary* and *ſecondary.*

Primary, or *general* QUALITIES, are ſuch as are found in all bodies; or which agree to all matter, conſidered as matter, and therefore to the elements themſelves—Such are extenſion, figure, motion, reſt, ſolidity, impenetrability, and number. See BODY, FIGURE, SOLIDITY, *&c.*

Secondary, or *particular* QUALITIES are ſuch as reſult from a compoſition or mixture of elements, and do not agree to body as body, but as a mixt—Such are light, heat, cold, colour, ſound, taſte, ſmell, hardneſs, ſoftneſs, fluidity, firmneſs, roughneſs, ſmoothneſs, opacity, tranſparency, *&c.*

According to Ariſtotle and the Peripatetics, the primary, or elementary *Qualities*, are thoſe of the four elements themſelves; *viz.* heat, cold, moiſture, and drineſs. See ELEMENT.

The ſecondary *Qualities*, according to the ſame, are all the reſt; which are combinations or aſſemblages of the former elementary ones; as colour, odour, taſte, *&c.*

To give an idea of Ariſtotle's method of accounting for theſe ſecondary *Qualities* from his primary ones, we ſhall inſtance in his account of colour—All colours, then, ſays he, are generated of a mixture of the four elementary *Qualities*:

white, *e. gr.* is produced when the humidity ſurmounts the heat, as in old men, who grow grey: black is produced when the humidity dries off, as in walls, ciſterns, *&c.* red, *&c.*

Among the ſchool-philoſophers we meet with other diviſions of *Qualities*; as *active*, and *paſſive*; *real* and *intentional.*

Active QUALITIES, are thoſe by virtue whereof effects and operations are actually produced on other bodies duly diſpoſed with reſpect thereto—Such are the heat of fire, the moiſture of water, *&c.*

Paſſive QUALITIES are thoſe whereby bodies are diſpoſed to receive the action of others—Such are inflammability in oil, *&c.*

Real QUALITIES are thoſe which remain in the ſubject; and only act on things adjacent thereto—As fire in a piece of iron not ignited, *&c.*

Intentional QUALITIES are thoſe which iſſue from the ſubject, and operate at a diſtance—Such is the light emitted from the ſun, *&c.*

But the moderns are agreed that either all *Qualities* are real, or all alike intentional—So that the diſtinction is impertinent.

However ignorant we may be of the nature of *Qualities*, or the manner of their operation; yet we know the laws of their intention, and remiſſion—Dr. Keil demonſtrates that every *Quality*, which is propagated *in orbem*, ſuch as light, heat, cold, odour, *&c.* has its efficacy increaſed, or abated in a duplicate ratio of the diſtances from the centre of radiation or exertion of the *Quality*, reciprocally.

Thus, let A (*Tab. Geometry*, *fig.* 80.) be a centre from whence any *Quality* exerts itſelf round about, according to the right lines A *e*, A *f*, *&c.* The efficacy of the *Quality*, be it heat, cold, odour, *&c.* will be (at equal diſtances from A) as the ſpiſſitude or denſity of the rays A *b*, A *c*, A *d*. But the rays within the inner circle, or rather ſpherical ſuperficies, *b c d* H, when they come to be extended to the other ſpherical ſurface, *e f g* K, will be much leſs cloſe than before, and that in the reciprocal proportion of the ſpaces they take up; that is, if the outer ſurface be double of the inner, the rays there will be but half as thick: But ſince ſpherical ſuperficies are as the ſquares of their radii, therefore the efficacy of the *Quality* in the inner ſurface will be to that of the outer, As A *e* ſquare, to A *b* ſquare. *Q. E. D.*

Sir Iſaac Newton lays it down as one of the rules of philoſophizing, that thoſe *Qualities* of bodies which are incapable of being intended and remitted, and which are found to obtain in all bodies wherein the experiment could ever be tried, are to be eſteemed univerſal *Qualities* of all bodies. See PHILOSOPHIZING.

Chymical QUALITIES—One may diſtinguiſh phyſical *Qualities*, with Mr. Boyle, into *firſt*, *ſecond*, and *third*; to the two laſt of which may be referred ſeveral *Qualities* not treated of by the writers of phyſical ſyſtems; and theſe for diſtinction ſake, may, ſome of them, be ſtiled the *chymical Qualities* of things, becauſe Ariſtotle and the ſchoolmen, being unacquainted with them, they have been principally introduced by means of chymical operations and experiments: as fumigation, amalgamation, cupellation, volatilization, precipitation, *&c.* See CHEMISTRY.

By theſe operations, among other means, corporeal things come to appear volatile or fixed, ſoluble or inſoluble in ſome menſtrua, amalgamable orun amalgamable, *&c.* which as well deſerve the name of *Quality*, as ſeveral other attributes, to which it is allowed.

To theſe chymical *Qualities* ſome others might be added, which, becauſe of the uſe that phyſicians principally make of them, may be called *medical Qualities*, whereby ſome ſubſtances received into the human body, are reſolving, diſcuſſing, ſuppurating, abſterſive, *&c.* For though ſome faculties of medicines, as thoſe of heating, cooling, drying, attenuating, purging, *&c.* may be conveniently referred to the firſt, ſecond, or third *Qualities*, mentioned by naturaliſts; whilſt others are reckoned occult; yet as ſeveral of them ought not to be referred to the *Qualities* whereto they are often aſcribed; ſo the handling of them may be looked upon as a deſideratum, and deſerves a diſtinct place in natural philoſophy. See MEDICINE; ſee alſo PURGATIVE, *&c.*

Coſmical QUALITIES, ſee COSMICAL *Quality*.

QUALITY is alſo uſed for a kind of title given to certain perſons in regard of their territories, ſignories, or other pretenſions. See TITLE.

Thus the king of Great Britain takes the *Quality* of king of France: the king of Poland that of king of Sweden: the king of Sardinia that of king of Cypreſs and Jeruſalem: the czars of Ruſſia and kings of Spain have whole pages of *Qualities*—The emperor of China aſſumes the *Quality* of ſon of the ſun.

QUAM *diu ſe bene geſſerit*, a clauſe frequent in letters patents, or grants of offices, to ſecure them ſo long as the perſon they are granted to, ſhall not be guilty of abuſing the ſame. See OFFICE, *&c.*

Thus, *e. gr.* we find it in thoſe given to the barons of the exchequer; where it intimates that they ſhall hold the ſame as long as they ſhall behave themſelves well: which is to be reſtrained to matters of their offices; and ſignifies no more than the law would have implied, had the office been granted expreſly for life. See BARON.

A grant therefore with this clauſe, is equivalent to a grant for life. See JUDGE, JUSTICE, *&c.*

QUANTITY, QUANTITAS, any thing capable of eſtimation, or menſuration; or, which being compared with another thing of the ſame kind, may be ſaid to be greater, or leſs, than it; equal, or unequal to, it. See MEASURE.

Mathematics is the ſcience or doctrine of *Quantity*. See MATHEMATICS.

Quantity is a general attribute, applied in a very different manner to things of very different nature; whence it is impoſſible to give any univerſal definition thereof.

Quantity is applied both to things, and to modes; and this either ſingularly, to one; or plurally to ſeveral—In the firſt caſe it is called *magnitude*, in the latter *multitude*. See MAGNITUDE, *&c.*

Quantity may be reduced to four claſſes, *viz.*

Moral QUANTITY, which depends on the manners of men, and the free determination of their wills—As the prices and values of things: degrees of dignity and power, good and evil, merit and demerit, rewards and puniſhments, *&c.*

Notional QUANTITY, ariſing from the operation of the underſtanding only—Such as the largeneſs or narrowneſs of the capacity of the mind, and its conceptions—In logic, univerſals, prædicaments, *&c.*—In grammar, the *Quantity* and meaſure of ſyllables, accents, tones, *&c.*

Phyſical, or *natural* QUANTITY, which is of two kinds; 1. That which nature furniſhes us with in matter, and its extenſion. See BODY and EXTENSION—And, 2. In the powers, and properties of natural bodies; as gravity, motion, light, heat, cold, rarity, denſity, *&c.* See MOTION, GRAVITY, *&c.*

Tranſcendental QUANTITY, as duration, the continuation of any being, exiſtence, time, *&c.* See DURATION, TIME, *&c.*

Quantity is alſo popularly diſtinguiſhed into *continued* and *diſcrete.*

Continued QUANTITY, is when the parts are connected together—This, again, is of two kinds; either *ſucceſſive* and *improper*, as time. See TIME.

Or *permanent* and *proper*, as ſpace See SPACE.

Diſcrete QUANTITY, is when the parts whereof it conſiſts, exiſt diſtinctly and unconnected together; which makes what we call *number**. See DISCRETE.

Permanent Quantity is farther diſtinguiſhable into length, breadth, and depth. See LINE, SURFACE, and SOLID.

Wolfius ſeems to give us a more preciſe notion of mathematical *Quantity*, and its two ſpecies of diſcrete and continued—Whatever is referred to unity in the ſame manner as one right line to another, is what we call *Quantity*, or number in general. See NUMBER.

If, now, the thing be referred to a given unit, as 3, it is called a determinate number: if to unity in the general, or at large, it is called a *Quantity*; which, on this principle, is the ſame with indeterminate number.

Thus, *e. gr.* the breadth of a river is accounted a *Quantity*: If, then, it be enquired how great it is? to conceive its *Quantity* we take ſome unit at pleaſure, and ſeek the relation of the breadth hereto; and according to the different unit aſſumed, expreſs the breadth of the river in a different determinate number.

The breadth of the river, therefore, is a *Quantity* conſidered as referred to a vague unit, or to unity at large; but the unit being determined, the thing is underſtood by a determinate number.

In this ſenſe, algebra is the arithmetic of *Quantities*. See ALGEBRA.

QUANTITY *of motion*, in mechanics, is of two kinds, *viz.* of momentary motion, and of entire motion.

QUANTITY *of entire motion*—The Carteſians define the entire motion as the momentary one, by the factum of the maſs,

* The notion of continued quantity, and its difference from diſcrete, appears to ſome without foundation—Mr Machin conſiders all mathematical quantity, or that for which any ſymbol is put, as nothing elſe but number, with regard to ſome meaſure which is conſidered as one. For that we cannot know preciſely how much any thing is but by means of number. The notion of continued quantity without regard to any meaſure is indiſtinct and confuſed: And tho' ſome ſpecies of ſuch quantity conſidered phyſically, may be deſcribed by motion, as lines by the motion of points, and ſurfaces by the motion of lines; yet the magnitudes or mathematical quantities are not made by the motion, but by numbering according to a meaſure. *Vid. Phil. Tranſ.* No. 447. p. 228.

or quantity of matter, into the velocity; but ſince motion is a ſucceſſive being, and has no parts co-exiſting together, its *Quantity* ought to be eſtimated by the aggregate of the ſeveral parts exiſting ſucceſſively; and is therefore equal to the factum of the momenta into the time.

QUANTITY *of momentary motion*, is the factum of the velocity into the maſs; or a meaſure ariſing from the joint conſideration of the *Quantity* of matter, and the velocity of the motion of the body; the motion of any whole being the ſum or aggregate of the motion in all the ſeveral parts. See MOTION.

Hence, in a body twice as great as another, moved with an equal velocity, the *Quantity* of motion is double; if the velocity be double alſo, the *Quantity* of the motion will be quadruple. Hence the *Quantity* of momentary motion coincides with what we call momentum, or impetus of a moving body. See MOMENTUM.

In the colliſion of bodies, the *Quantity* of momentary motion, which is found by taking the ſum of motions tending the ſame way, or their difference if they tend towards contrary parts; is not at all changed by any actions of the bodies on one another. See PERCUSSION.

QUANTITY *of matter* in any body, is the product of the denſity into the bulk; or a *Quantity* ariſing from the joint conſideration of its magnitude and denſity. See MATTER.

As, if a body be twice as denſe, and take up twice as much ſpace as another, it will be four times as great.

This *Quantity* of matter is the beſt diſcoverable by the abſolute weight of bodies. See MASS, WEIGHT, *&c.*

QUANTITY *infinite*—Though the idea of magnitude infinitely great, or ſuch as exceeds any aſſignable *Quantity*, does include a negation of limits; yet are not all ſuch magnitudes equal amongſt themſelves; but beſides infinite length, and infinite area, there are no leſs than three ſeveral ſorts of infinite ſolidity; all of which are quantities *ſui generis*; and thoſe of each ſpecies are in given proportions. See INFINITE.

Infinite length, or a line infinitely long, is to be conſidered, either as beginning at a point, and ſo infinitely extended one way; or elſe both ways from the ſame point: in which caſe the one, which is a beginning of infinity, is one half of the whole, which is the ſum of the beginning and ceaſing infinity, or infinity *à parte ante*, and *à parte poſt*, which is analogous to eternity in time or duration; in which there is always as much to follow, as is paſt any point or moment of time. See ETERNITY.

Nor does the addition or ſubſtraction of time, length or ſpace of time, alter the caſe, either as to infinity or eternity; ſince neither the one or the other can be any part of the whole.

As to infinite ſurface or area, any right line infinitely extended both ways on an infinite plane, divides that plane into equal parts, the one to the right, and the other to the left of the ſaid line; but if from any point in ſuch a plane, two right lines be infinitely extended, ſo as to make an angle; the infinite area, intercepted between theſe infinite right lines, is to the whole infinite plane, as the arch of a circle drawn on the point of concourſe of thoſe lines as a centre, intercepted between the ſaid lines, is to the circumference of the circle; or as the degrees of the angle to the 360 degrees of a circle.

For an example—Two infinite right lines meeting at a right angle on an infinite plane, do include a quarter part of the whole infinite area of ſuch a plane: if two parallel infinite lines be ſuppoſed drawn on ſuch an infinite plane, the area intercepted between them will be likewiſe infinite; but at the ſame time will be infinitely leſs than the ſpace intercepted between two infinite lines, that are inclined, though with never ſo ſmall an angle, for that in the one caſe the given finite diſtance of the parallel lines diminiſhes the infinity in one degree of dimenſion; whereas in a ſector, there is infinity in both dimenſions; and conſequently the *Quantities* are one infinitely greater than the other, and there is no proportion between them.

From the ſame conſideration ariſe three ſeveral ſpecies of infinite ſpace or ſolidity; for a parallelepiped, or a cylinder infinitely long, is greater than any finite magnitude, how great ſoever; all ſuch ſolids ſuppoſed to be formed on a given baſis, are in proportion to one another, as thoſe baſes. But if two of thoſe three demenſions are wanting, as in the ſpace intercepted between two parallel planes infinitely extended, and at a finite diſtance; or with infinite length and breadth, have a finite thickneſs; all ſuch ſolids ſhall be as the given finite diſtances one to another.

But theſe *Quantities*, though infinitely greater than the other, are yet infinitely leſs than any of thoſe wherein all the three dimenſions are infinite—Such are the ſpaces intercepted between two inclined planes infinitely extended; the ſpace intercepted by the ſurface of a cone, or the ſides of a pyramid, likewiſe infinitely continued, *&c.* of all which, notwithſtanding the proportions one to another, and to the *το ϖαν*, or vaſt abyſs of infinite ſpace (wherein is the locus of all things that are, or can be; or to the ſolid of infini length, breadth, and thickneſs taken all manner of ways) are eaſily aſſignable—For the ſpace between two planes is to the whole, as the angle of thoſe planes to the 360 degrees of the circle. As for cones and pyramids, they are as the ſpherical ſurface intercepted by them, is to the ſurface of the ſphere; and therefore cones are as the verſed ſines of half their angles, to the diameter of the circle: theſe three ſorts of infinite *Quantity* are analogous to a line, ſurface, and ſolid; and, like them, cannot be compared, or have any proportion one to another. See the article INFINITE.

QUANTITIES, in algebra, are indeterminate numbers, or things referred to unity in general. See NUMBER.

Quantities are properly the ſubject of algebra; which is wholly converſant in the computation of ſuch *Quantities.* See ALGEBRA, and CALCUS.

Given Quantities are uſed to be noted by the firſt letters of the alphabet *a*, *b*, *c*, *d*, &c. the *Quantities* ſought by the laſt *z*, *y*, *x*, &c. See CHARACTERS.

Algebraical Quantities are chiefly of two kinds; *poſitive*, and *negative.*

Poſitive or *affirmative* QUANTITIES are thoſe which are greater than nothing; and which are effected with the ſign + prefixed; or ſuppoſed to be ſo. See POSITIVE.

Negative, or *privative* QUANTITIES are thoſe leſs than nothing; which are affected with the ſign — prefixed. See NEGATIVE and PRIVATIVE.

Hence, 1. Since + is the ſign of addition, and — the ſign of ſubſtraction; a poſitive *Quantity* is produced by adding any real *Quantity* to nothing; *e. gr.* $0+3=+3$; and $0+a=+a$. And a privative *Quantity* is produced by ſubſtracting any real *Quantity* out of nothing; *e. gr.* $0-3=-3$; and $0-a=-a$.

For an illuſtration—Suppoſe when you are quite deſtitute of money, ſomebody gives you an hundred pieces; you have then an hundred pieces more than nothing; which pieces conſtitute a poſitive *Quantity.*

On the contrary, ſuppoſe you have no money, yet owe an hundred pieces; you have then an hundred pieces *leſs* than nothing; for you muſt pay an hundred pieces to have juſt nothing. This debt is a negative *Quantity.*

Thus in local motion, progreſs may be called a poſitive *Quantity*, and regreſs a negative one; becauſe the firſt increaſes, and the ſecond diminiſhes the ſpace paſſed over.

And in geometry, if a line drawn towards any part be accounted an affirmative *Quantity*, another the contrary way will be a negative one.

Privative *Quantities*, therefore, are the defects of the poſitive *Quantities* whereby they are underſtood; and, conſequently are no real *Quantities:* for we meaſure the defect by the *Quantity* defective; and thus it becomes intelligible.

Since one defect may exceed another, (*e. gr.* if ſeven be wanting, the defect is greater than if only three be wanting) and ſince privative *Quantities* are the defect of real *Quantities*; one privative *Quantity* being taken a certain number of times, may exceed another. Wherefore privative *Quantities* are homogeneous to one another.

But ſince the defects of a poſitive *Quantity* taken any number of times can never exceed the poſitive *Quantity*, but grow ſtill the more deficient; privative *Quantities* are heterogeneous to poſitive ones.

Since, then, privative *Quantities* are heterogeneous to poſitive ones, homogeneous to privative ones; there can be no ratio between a privative and a poſitive *Quantity*, but there is a ratio between privative ones. *E. gr.* $-3^a : -5^a :: 3 : 5$. The ratio, here, is the ſame as if the *Quantities* were poſitive. But it may be noted, that between 1 and −1, and between −1 and 1, the ratio is very different.

Commenſurable QUANTITIES. See COMMENSURABLE.

Compound QUANTITIES. See the article COMPOUND.

Exponential QUANTITY. See the article EXPONENTIAL.

Like QUANTITY. See the article LIKE.

Simple QUANTITIES. See the article SIMPLE.

Tranſcendental QUANTITIES. See TRANSCENDENTAL.

Variable QUANTITIES. See the article VARIABLE.

Addition of QUANTITIES.—1°. If the *Quantities* denoted by the ſame letter be affected with the ſame ſign, the numbers prefixed to them are added as in common arithmetic.

2°. If they be affected with different ſigns, the addition is changed into ſubſtraction; and to the remainder is prefixed the ſign of the greater.

3°. *Quantities* denoted by different letters, are added by means of the ſign +, as in the following example:

$$\begin{array}{l} 4a+2b-2c-5d-g \\ \underline{5a-2b+6c+2d-3g} \\ 9a+4c-3d \text{———} 4g \end{array} \qquad \begin{array}{r} a-b \\ \underline{c} \\ a-b+c \end{array}$$

Subſtraction of QUANTITIES. See SUBSTRACTION.

Multiplication and diviſion of QUANTITIES. See MULTIPLICATION and DIVISION.

Combination of QUANTITIES. See COMBINATION.

In

If a poſitive *Quantity* be multiplied, or divided by another poſitive *Quantity*, the reſult is a poſitive *Quantity*.

2. If a negative *Quantity* be multiplied, or divided by a poſitive, the reſult is a negative.

3. If a negative *Quantity* be multiplied, or divided by another negative, the reſult is a poſitive.

4. If a poſitive *Quantity* be multiplied, or divided by a negative, the reſult is a negative *Quantity*.

QUANTITY, in grammar, denotes the meaſure, or magnitude of the ſyllables; or, that which determines them to be called long, or ſhort. See MEASURE, and SYLLABLE.

This *Quantity* is the object of proſody; and it is the regard to this that diſtinguiſhes verſe from proſe. See VERSE and PROSODY.

The œconomy and arrangement of the *Quantities*, *i. e.* the diſtribution of long and ſhort ſyllables, make what we call the *number*. See NUMBERS, RHYTHMUS, CADENCE, *&c.*

The *Quantities* are uſed to be diſtinguiſhed among grammarians by the characters ◡ *ſhort*, and – *long*. See CHARACTER and ACCENT.

The proportion betwixt the long and ſhort ſyllables may be generally fixed the ſame as between the crotchet and quaver in muſic; *viz.* as 2 to 1. See TIME.

In moſt languages there are ſome ſyllables whoſe *Quantities* vary, as the meaſure requires; as in the Engliſh rĕcōrd and rēcŏrd.

Some authors confound the *Quantities* with the accent: but the difference is glaring; the former being the length or ſhortneſs of a ſyllable, the latter the raiſing or falling of the voice. See ACCENT.

From two *Quantities*, *viz.* long and ſhort ſyllables, ariſe all the varieties of poetic feet, which are very great. Horace alone uſes no leſs than twenty-eight. Yet the Greeks went vaſtly beyond the Romans in this reſpect—In effect, as many ways as two *Quantities* may be varied by compoſition, and tranſpoſition from two to ſix ſyllables, ſo many different feet have the Greek poets contrived and that under diſtinct names, to the number of 124. Though it is the opinion of ſome of the learned, that poetical numbers may be ſufficiently explained from the feet of two or three ſyllables, into which the reſt may be reſolved. See FOOT.

The feet formed by the ancients of the long and ſhort ſyllables immediately, are the *ſpondee*, conſiſting of two long ſyllables; the *pyrrhic* of two ſhort ones; the *trochee*, of a long and ſhort ſyllable; and the *iambic*, of a ſhort and long ſyllable. See SPONDEE, TROCHEE, IAMBIC, *&c.*

Thoſe of two ſyllables are the *moloſſus*, conſiſting of three long ſyllables; the *tribrach* of three ſhort ones; the *dactyl* of one long and two ſhort ſyllables; and the *anapeſt* of two ſhort and one long ſyllable. See DACTYL, ANAPEST, TRIBRACH, *&c.*

The Engliſh tongue admits of no feet above two ſyllables, though both the Latin and Greek allow of ſix.

Our heroic verſes conſiſt of five long and five ſhort ſyllables intermixed alternately; though not ſo ſtrictly but that the order may be diſpenſed withal. Dryden varies them with admirable beauty; ſometimes his heroic verſe begins with a long ſyllable followed by two ſhort ones.

The truth is, the *Quantity* of the ſyllables is but little fixed in the modern tongues; and there is ſtill leſs regard had to it in the compoſition of modern verſes—The want of feet or rather the ſhortneſs and uniformity of our feet, makes a world of difference between the numbers of the ancient and modern verſe. Our poets are fettered, and their fetters are ſo ſhort, but two poor links, that it is no wonder they can make no extraordinary motions.

The ancients ſubſiſted by their *Quantities* alone; ſo well were they diſtinguiſhed, and ſuch a variety and harmony did they afford! Our *Quantities* make ſuch poor muſic, that we are forced to call in the Gothic aids of rhime to diſtinguiſh our verſe from proſe. See ODE.

Yet have attempts been made to ſettle our verſe on the ancient and natural footing of *Quantities*, in excluſion of rhime, and with ſuch ſucceſs too, (witneſs the immortal *Paradiſe Loſt*) as ſeems to leave the practice of rhiming inexcuſable—The French have likewiſe attempted the ſame in their tongue, particularly Jodelet, and after him Paſquier, Paſſerat, and Rapin; but they have all failed. See RHIME.

QUANTITY *of a Degree.* See the article DEGREE.

QUANTITY *of an eclipſe.* See ECLIPSE.

QUANTUM *meruit* an action upon the caſe, grounded upon a promiſe to pay a man for doing ſo much as he ſhould deſerve or merit.

QUARANTAIN *, in old law-books wrote QUARENTENE, and QUARANTENA, denotes the ſpace of forty days.

The term is borrowed from the French *quarentain*; and is ſometimes uſed for the time of lent. See LENT.

QUARANTAIN *of the king*, denotes a truce of forty days appointed by St. Louis, during which it was expreſly forbid to take any revenge of the relation or friends of people who had fought, wounded, or affronted each other in words.

QUARANTAIN is more particularly uſed for the term of forty days, which veſſels, coming from places ſuſpected of contagion, are obliged to wait in certain places appointed, to air themſelves before they come into port. See PLAGUE.

QUARANTAIN, or **QUARANTINE**, **QUARANTENA**, in law, denotes a benefit allowed by the laws of England to the widow of a man dying ſeized of land; whereby ſhe may challenge to continue in his capital meſſuage, or chief manſion-houſe (ſo it be not a caſtle) for the ſpace of forty days after his deceaſe.

If the heir, or any other perſon attempt to eject her, ſhe may have the writ *de quarantena habenda*; which lies for a widow to enjoy her *Quarantain*.

QUARANTAIN is alſo uſed for a meaſure or extent of land, containing forty perches.

QUARANTIA, in the Venetian polity, a court of judicature compoſed of forty judges.

The Venetians have an old civil *Quarantia*, new civil *Quarantia*, and criminal *Quarantia*.

The criminal *Quarantia* takes cognizance of all crimes except thoſe againſt the ſtate, which belong to the council of ten—The new civil *quarantia* judges of appeals made from ſentences paſſed by judges out of the city—The old civil *Quarantia* takes cognizance of appeals from ſentences of ſubaltern judges in the city.

QUARE EJECIT *infra terminum*, a writ which lies for a leſſee in caſe he be caſt out of his farm before his term be expired, againſt the leſſor, or feoffee that ejects him. See LEASE.

It differs from ejectione firmæ, in that the former lies where the leſſor, after the leaſe made, enfeoffees another who ejects the leſſee; whereas the ejectione firmæ lies againſt any other ſtranger that ejects him.

The effect is the ſame in both, *viz.* the recovery of the reſidue of the term. See EJECTIONE *Firmæ*.

QUARE IMPEDIT, a writ which lies for him who has purchaſed an advowſon, againſt him that diſturbs him in the right thereof, by preſenting a clerk thereto when the church is void. See ADVOWSON.

It differs from the aſſiſe of darrein preſentment, *ultimæ præſentationis*, which lies where a man or his anceſtors formerly preſented; this other lying for him who is the purchaſer himſelf—Where a man may have the aſſiſe, he may have this writ; but not contrarywiſe. See ASSISA.

QUARE INCUMBRAVIT, a writ which lies againſt the biſhop, who, within ſix months after the vacancy of a benefice, confers it on his clerk, while two others are contending at law for the right of preſenting. See PRESENTATION, *&c.*

QUARE NON ADMISIT, a writ which lies againſt the biſhop for refuſing to admit his clerk who has recovered in a plea of advowſon, on pretence of lapſe, *&c.*

QUARE NON PERMITTIT, is a writ that lies for one who has a right to preſent for a turn againſt the proprietary.

QUARE OBSTRUXIT, a writ that lies for him who having right to paſs through his neighbour's grounds, cannot enjoy the ſame by reaſon the owner has fenced it up.

QUARERA, or **QUARATIA**. See QUARRY.

QUARREL, **QUERELA**, in law. See QUERELA.

Quarrel ſeems properly to relate to perſonal actions, or at moſt to mixed, wherein the plaintiff is called *Querens*, and in all declarations of treſpaſs it is ſaid, *Queritur*. See ACTION, PLAINTIFF, *&c.*

Yet if a man releaſe all *Quarrels* or *Querels* (a man's own deed being taken moſt ſtrongly againſt himſelf) *Quarrel* includes all actions; and accordingly all actions, both real and perſonal are hereby releaſed. See RELEASE and DOUBLE.

QUARREL *, *of glaſs*. See the article QUARRY.

QUARRY, a place under ground, out of which are dug marble, free-ſtone, ſlate, lime-ſtone, or other matters proper for building. See STONE, MARBLE, SLATE, *&c.*

For *quarries* of free-ſtone, they firſt open a hole in manner of a well, twelve or fourteen foot in diameter; and the rubbiſh drawn out with a windlaſs in large oſier baskets, they heap up all around; placing their wheel, which is to draw up the ſtones, thereupon.

As the hole advances, and their common ladder becomes too ſhort, they apply a particular ladder for the purpoſe—When they have got through the earth, and are arrived at the firſt bank, or ſtratum; they begin to apply their wheel and baskets to diſcharge the ſtones as faſt as they dig through them. They uſually find ſeven of theſe different ſtrata, or beds of ſtones, of different heights, and ſerving for different purpoſes; though the number as well as order wherein they follow is various. See STRATA.

---

* *Quatuor Carucatas terræ arabilis, continentes in Longitudine* 8 Quarentenas, *&* 8 Quarentenas *in Latitudine*. Chart. Withlaſii Reg. Merc. apud Ingulf.

Quarantena *in London ponetur pro reſpectu habend. pro* 40 *Dies poſt ſummonitionem per breve Regis ut conſulant, &c. ſi ſibi viderint expedire.* MS. de temp. *Ed.* 3.

* The word is formed by diminution from the Latin *quadratum*, or the French *quarre*, ſquare; or, perhaps, immediately from the Italian *quadrello*, little ſquare.

As to the drawing of the ſtone, *i. e.* the freeing it from the bed, they find that common ſtones, at leaſt the ſofter kinds, as they lie, have two grains; a cleaving grain running parallel with the horizon, and a breaking grain perpendicular thereto—After uncoping, *i. e.* clearing the earth from off it, they obſerve by the grain where the ſtone will cleave, and there drive in a good number of wedges till they have thus cleft it from the reſt of the rock.

This done, they proceed to break it: in order to which, applying the ruler to it at both ends, (ten, *e. gr.* or twelve inches apart, according to the uſes the ſtone is intended for) they ſtrike a line, and by this cut a little channel with their ſtone-ax; and in the channel ſet five or ſix wedges (ſuppoſing the ſtone three or four foot) driving them in very carefully, with gentle blows, and ſtill keeping them equally forward.

Having thus broke the ſtone in length, (which they are able to do to half an inch of any ſize) applying a ſquare to the ſtraight ſide, they ſtrike a line, and proceed as before to break it in breadth.

This method of drawing is found vaſtly preferable to that where the ſtones are broken at random—One load of the former is found to do the buſineſs of a load and an half of the latter.

But it may be obſerved, that this cleaving grain being generally wanting in the harder ſtones, to break up theſe in the *Quarries*, they have great heavy ſtone-axes wherewith they work down a deep channel into the ſtone, and into this channel, atop, lay two iron bars, driving their iron wedges between theſe bars.

Some in drawing of ſtone, eſpecially the very hard kind, make uſe of gun-powder, and with very good effect—In order to which, making a ſmall perforation pretty deep into the body of the rock, ſo as to have that thickneſs of rock over it judged proper to be blown up at once; at the farther end of the perforation they diſpoſe a convenient quantity of gun-powder, filling up all the reſt with ſtones and rubbiſh ſtrongly rammed in, except a little ſpace for the train—By this means is the rock blown in ſeveral pieces, moſt of them not too unweildy for a workman to manage. See GUN-POWDER.

QUARRY, QUARREL*, in glaziery, a pane, or piece of glaſs cut in a diamond form. See GLASS.

* The word ſeems formed by corruption from *Quarrel*, (which ſee) unleſs we will ſuppoſe it to come immediately from the French *quarre*, ſquare.

Quarries or *Quarrels* of glaſs are of two kinds, *viz.* ſquare, and long; each whereof is of different ſizes, expreſſed by the number of pieces which make a foot of glaſs, *viz.* 8ths, 10ths, 12ths, 15ths, 18ths, and 20ths; but all the ſizes are cut to the ſame angle, the accute angle being 77° 19′ in the ſquare *Quarries*, and 67° 22′ in the long ones. See GLASS.

QUARRY, in falconry, is the game or fowl which the hawk is in purſuit of, or has killed. See HAWK and HAWKING.

QUARRY, among hunters, is ſometimes uſed for part of the viſcera of the beaſt taken; given by way of reward to the hounds. See HUNTING.

QUART, q. d. *fourth*, in muſic, fencing, gaming, *&c.* See FOURTH, QUARTER, GUARD, PIQUET, *&c.*

QUART is particularly uſed for a diminutive meaſure, containing one fourth or quarter of ſome other meaſure. See MEASURE.

The Engliſh *Quart* is a fourth of a gallon, or two pints; the Roman *Quart*, or *Quartarius*, was the fourth part of a congius. See GALLON, PINT, CONGIUS, *&c.*

The French, from whom we borrow the word, beſides their *Quart*, or *pot* of two pints, have various other *Quarts*, diſtinguiſhed by the whole whereof they are quarters; as *Quart de Muid*, *Quart de Boiſſeau*. See MUID and BUSHELL. They have alſo their *Quart* of a yard, *&c.* See QUARTER.

QUARTAN, QUARTANA, in medicine, an intermitting fever, or ague, where the fit returns every third day. See FEVER, AGUE, *&c.*

It is called *Quartan*, that is, *fourth*, by reaſon the two ſick days are reckoned, which, with the two intermitting ones, make four. See TERTIAN.

QUARTATION, among refiners, a method of purifying gold, by melting three parts of ſilver with one of gold; and then caſting the mixture into aqua fortis; which diſſolving the ſilver leaves the gold at bottom, in form of a black powder. See REFINING.

Quartation is what we more uſually call *parting*, or the *depart*. See DEPART; ſee alſo GOLD, *&c.*

QUARTELOIS, CARTELOIS, or *cotucæ*, ſurtouts, or upper quarters with coats of arms quartered on them, wore by the ancient knights in their military expeditions. See COAT *of arms*, &c.

QUARTER, the fourth part of a whole, or integer divided into four equal portions. See FOURTH.

In working of fractions the *Quarter* is expreſſed by ¼, three *Quarters* by ¾. See FRACTION.

QUARTER, in weights, is a fourth part of the quintal, or hundred weight. See QUINTAL.

The *Quarter* is 28 pounds, avoirdupois. See HUNDRED *Weight*, POUND, AVOIRDUPOIS, *&c.*

QUARTER* is alſo a dry meaſure containing of corn 8 buſhels ſtriked; of coals the fourth part of a chaldron. See MEASURE, BUSHEL, and CHALDRON.

* *Quarterium frumenti conſtat ex octo Buſſellis.* Fleta. l. 2.

QUARTER in law, QUARTERIUM *anni*, is the fourth part of a year. See YEAR.

Hence the days whereon thoſe *Quarters* ſtatedly commence, are called *Quarter-days*. See DAY.

Quarter-days are the 25th of March called Lady-day; the 24th of June, called Midſummer-day; the 29th of September called, Michaelmaſs-day; and the 25th of December, or Chriſtmaſs-day.

QUARTER in aſtronomy—The moon's period, or lunation, is divided into four ſtages, or *Quarters*; containing each from ſeven to eight days. See MOON and LUNATION.

The firſt *Quarter* is from the new moon to the quadrature; the ſecond thence to the full moon, *&c.* See QUADRATURE, *&c.*

QUARTER in heraldry, is ſometimes uſed for a ſcutcheon, or coat of arms. See ESCUTCHEON.

In this ſenſe there are ſixteen *Quarters* required to prove nobility, in companies or orders where none but nobles are admitted. See NOBILITY.

The word *Quarters*, required as a proof of nobility, is derived hence, that they uſed anciently to put the coats of arms of the father, mother, grand-father, and grand mother, on the four corners of the tomb of the deceaſed—In Flanders and Germany we frequently ſee tombs that have eight, ſixteen, and even thirty-two *Quarters*. See TOMB.

QUARTER is alſo applied to the parts, or members of the firſt diviſion of a coat that is quartered, or divided into four *Quarters*; as in *Tab. Herald. fig.* 45. See QUARTERING.

The king of Great Britain in the firſt *Quarter* bears gules three lions paſſant or, *&c.*—In the ſecond *Quarter* he bears azure three flowers de lys, *&c.*

Franc QUARTER, is a *Quarter* ſingle, or alone; which is to poſſeſs one fourth part of the field.

This makes one of the honourable ordinaries of a coat. See ORDINARY.

QUARTER in navigation—A *Quarter* of a point, wind, or rhumb, is the fourth part of a cardinal point, wind or rhumb; or of the diſtance between two cardinal points, winds, *&c.* See POINT, WIND, and RHUMB.

The *Quarter* contains an arch of 11°, 15′.—The *Quarter* is what Wolfius, with regard to the other diviſions, calls a ſecondary point of the ſecond order. See CARDINAL *point*, *&c.*

QUARTER *of a ſhip*, is that part of the ſhip's hull, which lieth from the ſteerage-room to the tranſom. See SHIP.

QUARTER is alſo uſed for a canton, or diviſion of a city; conſiſting of ſeveral ranges of buildings, *&c.* ſeparated from ſome other *Quarter* by a river, a great ſtreet, or other boundary.

Such are the twenty *Quarters* of the city of Paris—Ancient Rome was divided ſeveral times, under its ſeveral augmentations, into *Quarters* called *regions*; as may be obſerved in the topographies of Aurelius Nictor, Onuphrius Panvinius, Marillan, Pyrro Ligorio, Boiſſard, and other antiquaries.

In many cities there are commiſſaries of the *Quarter*, appointed to look to the policy thereof—The prior of the Caporions accounts himſelf the chief, and colonel of the fourteen regions, or *Quarters* of Rome. *Muſcarat. p.* 134.

Franchiſe of QUARTERS. See the article FRANCHISE.

QUARTER in war, the place allotted to certain forces to live, lodge, and encamp upon, during a ſiege, or the like. See CAMP.

The general's *Quarter* is that where the general lodges and incamps in perſon—They uſed to make lines of communication, to join the ſeveral *Quarters* together, See LINE.

QUARTERS at a ſiege are the incampments on the principal paſſages about a place, ſerving to ſtop the avenues and prevent relief and convoys. See SIEGE.

QUARTER is alſo uſed for any lodgment made in the field or campaign out of a ſiege—Thus they ſay, the general has extended his *Quarters* a good way—The enemy coming by made him contract his *Quarters*.

Winter QUARTERS, is the place allotted troops to paſs the winter ſeaſon in—Wherein theſe differ from garriſons, ſee GARRISON.

Winter QUARTERS is alſo uſed for the time the troops continue in this lodgment; and for the advantage the captains make thereof—Thus they ſay, ſuch a regiment was put to winter *Winter-quarters* in ſuch a village—The *Winter-quarters* only held three months—Each captain will make at leaſt a thouſand crowns of his *Winter-quarters*.

In Spain they have alſo *Summer-quarters.*

QUARTER *of aſſembly*, is the place of rendezvous, where the troops are to meet and draw up to march in a body. See RENDEZVOUS and PARADE.

QUARTERS *of refreſhment*, is ſome well provided fertile ſpot, to which troops that have been much fatigued and haraſſed, are ſent to recover their ſtrength, or health; even during the ſeaſon of the campaign.

There are alſo *Quarters* aſſigned for the huckſters, and their equipage.

QUARTER alſo denotes the ſafety, and good treatment promiſed to perſons, or troops that ſurrender, and lay down their arms—Thus they ſay, the enemy begged *Quarter*.

The phraſe took its riſe from an agreement anciently made between the Dutch and Spaniards, that the ranſom of an officer or ſoldier, ſhould be a quarter of his pay—Hence, to beg *Quarter* was to offer a quarter of their pay for their ſafety; and to refuſe *Quarter* was not to accept of that compoſition for their ranſom. See RANSOM.

QUARTERS in building, thoſe ſlight upright pieces of timber, placed between the punchions and poſts; uſed to lath upon.

They are of two kinds, *ſingle* and *double*—The *ſingle Quarters* are ſawn to two inches thick and four inches broad; the *double* four inches ſquare.

QUARTERS in a clock, are little bells which ſound the *Quarters* of an hour. See CLOCK, HOUR, *&c.*

QUARTER-BULLET, a bullet quartered into four or eight parts. See BULLET, SHOOT, *&c.*

QUARTER-DAY, ſee the article QUARTER.

QUARTER-DECK, of a ſhip, is that aloft the ſteerage, reaching to the round-houſe.—See *Tab. Ship. fig.* 2. *lit.* O. See alſo DECK.

QUARTERED *Counter*. See the article COUNTERQUARTERED.

QUARTERIDGE, money paid quarterly, or by the quarter.

QUARTERING, in the ſea-language—When a ſhip under ſail goes at large, neither by a wind nor before a wind, but as it were betwixt both; ſhe is ſaid to go *Quartering*. See SAILING.

The term is alſo uſed when a ſhip ſails with quarter winds. See QUARTER-*Wind*.

QUARTERING, in gunnery, is when a piece of ordnance is ſo traverſed, that it will ſhoot on the ſame line, or on the ſame point of the compaſs as the ſhip's quarter bears.

QUARTERING, in heraldry, the act of dividing a coat into four or more quarters, or *Quarterings*; by parting, couping, *&c. i. e.* by perpendicular and horizontal lines, *&c.* See QUARTER and QUARTERLY.

The king of Great Britain quarters with Great Britain, France, Ireland, Brunſwick, *&c.* See QUARTERLY.

Colombiere reckons twelve ſorts of *Quarterings*; but other authors give us more—*viz.* Party per pale, dividing the eſcutcheon from top to bottom. See PALE.—Party per croſs, dividing it from ſide to ſide. See CROSS.—Party of ſix pieces, when the eſcutcheon is divided into ſix parts or quarters—Party of ten; of twelve; of ſixteen; of twenty; and of thirty-two, when there are ſo many partitions reſpectively.

Others give the diviſions in another manner: as—Party per croſs—per pale—per chief—per pale inclave—per bend dexter—per bend ſiniſter—per chevron—barry bendy of eight pieces—paleways of ſix pieces—barry of ſix pieces—barry of eight pieces—bendy of ſix—checky—fuſilly, or lozengy—paly bendy, or bendy lozengy—barry bendy lozengy, or bend lozengy—gyronny—barry lozengy counterchanged—waved of ſix pieces—barry nebule of ſix pieces—party per ſaltier—party per pale in point. *See farther under their reſpective articles.*

Counter QUARTERING *a coat*, is when the quarters are quartered over again, or ſubdivided each into four.

There are *counter-quartered* coats which have twenty or twenty-five quarters.

QUARTERING is alſo applied to the partitions or compartments themſelves, that is, the ſeveral coats borne on an eſcutcheon, or the ſeveral diviſions made in it, when the arms of ſeveral families are to be placed on the ſame ſhield, on account of intermarriages, or the like. See QUARTER, ESCUTCHEON, SHIELD, *&c.*

Colombiere obſerves, that thirty-two is the greateſt number uſed in France, but that the Engliſh and Germans ſome times extend to forty; as a teſtimony of the truth whereof, he ſays, he ſaw the eſcutcheon of the earl of Leiceſter, embaſſador extraordinary in France in the year 1639, divided into the number of forty; and ſome he affirms, do go on to ſixty four ſeveral coats.

But a multitude of quarters makes a confuſion; and accordingly all the writers of armory cry out againſt it as an abuſe—The firſt inſtance of *Quartering* whereof we have any account, is ſaid to be in the arms of Renatus, king of Sicily, *&c.* in the year 1435, who quartered the arms of Sicily, Arragon, Jeruſalem, *&c.* William Wickley obſerves, that ſuch *Quarterings* are much properer for a pedigree to be locked up in a cheſt, and occaſionally produced as an evidence for the clearing or aſcertaining of alliances of families, or titles to lands, *&c.* than to be borne as a cognizance.

In blazoning, when the *Quartering* is performed per croſs, the two quarters atop are numbered the firſt and ſecond; and thoſe at bottom the third and fourth; beginning to tell on the right ſide—When the *Quartering* is by a ſaltier, *&c.* the chief and point are the firſt and ſecond quarters, the right ſide the third, the left the fourth.

QUARTERING is ſometimes alſo uſed for the diſtinguiſhing of younger brothers from elder. See DIFFERENCE.

QUARTERIZATION*, QUARTERING, part of the puniſhment of a traitor, by dividing his body into four quarters.

* *Walſingham* in *Ric.* 2. *Auditum & confeſſum turpiſſima ſcelera tractationi, ſuſpendio, decollationi, exenteracioni &* Quarterizationi *adjudicavit.*

QUARTERLY, in heraldry. A perſon is ſaid to bear *Quarterly*, when he bears arms quartered. See QUARTERING.

The king of Great Britain bears *Quarterly* of four; in the firſt quarter, gules, *&c.* Great Britain: in the ſecond, azure, *&c.* Ireland, *&c.*

QUARTER-MASTER, an Officer in the army, whoſe buſineſs is to look after the quarters of the ſoldiers, whereof there are ſeveral kinds; *viz.*—The

QUARTER-MASTER *general*, whoſe buſineſs is to provide good quarters for the whole army. See QUARTERS.

QUARTER-MASTER *of foot*, he who is to provide quarters for a regiment of foot. See REGIMENT.

QUARTER-MASTER, *of horſe*, he who is to provide quarters for a troop of horſe. See TROOP.

QUARTER-MASTER, is alſo an Officer aboard a ſhip of which there are more or fewer according to her burthens, Their buſineſs is to rummage in the hold on all occaſion, to overlook the ſteward in his delivery of victuals to the cook, and in his pumping and drawing out the beer; and in general to take care there be no waſte.

The *Quarter-maſter*, or *Quarteer*, is alſo to mind the ſhip's loading, which is the buſineſs he is chiefly employed about. See CARGO, *&c.*

QUARTERN, QUARTERON, a diminutive of *Quart*; ſignifying a quarter of a pint; as a quart does a quarter of a gallon. See QUART.

QUARTER-ROUND, in architecture, is a term uſed by the workmen for any projecting moulding in general, whoſe contour is a perfect quadrant, or quarter of a circle, or approaches near that figure—See *Tab. Archit. Fig.* 5. See alſo MOULDING.

The architects uſually call it *ovolo*; Vitruvius, the *echinus*. See OVOLO, ECHINUS, BOULTIN, *&c.*

QUARTER-SESSIONS, a court held quarterly, by the juſtices of peace of each county, alternately in the chief town thereof as appointed by the cuſtos rotulorum. See SESSIONS, JUSTICE, *&c.*

Hither the grand inqueſt, or jury of the county is ſummoned to appear, who upon oath are to enquire of all traitors, heretics, thieves, murderers, coiners, rioters, *&c.* See INQUEST.

Thoſe who appear to be guilty are by the ſaid juſtices committed to priſon, to be tried at the next aſſizes, when the judges go their circuits. See JUDGE, ASSIZE, *&c.*

QUARTER-STAFF, a long ſtaff or pole, bore by foreſters, park-keepers, *&c*, as a badge of their office; and occaſionally uſed as a weapon.

QUARTER-WHEELING, or QUARTER *of converſion* in the military art, is the motion whereby the front of a body of men turned round to where the flank was; this making a *quarter* of a circle. See CONVERSION, WHEEL, *&c.*

If it be done to the right, the man in the right hand angle keeps his ground, and faces about, while the reſt wheel; if to the left, the left hand man keeps his place, *&c.* See EVOLUTION.

QUARTER-WIND, at ſea, is a lateral or ſide wind; or a wind which does not blow in ſtern, but a little aſide of it. See WIND.

Properly the *Quarter-wind* is that which comes in abaft the main maſt ſhrouds, even with the quarter of the ſhip.

The *Quarter-wind* is the beſt of all winds, as bearing into all the ſails; whereas a wind blowing full in ſtern, is kept off by the ſails of the mizzen. See SAILING.

QUARTILE, an aſpect of the planets when they are three ſigns or 90 degrees diſtant from each other. See ASPECT and SEMI-QUARTILE.

The *Quartile* aſpect is marked thus □. See CHARACTER.

QUARTO, or 4to, a book whereof four leaves, or eight pages, make a ſheet. See VOLUME, BOOK-BINDING, *&c.*

QUARTO-DECIMANS, QUARTO-DECIMANI, an ancient ſect in the church, who maintained that Eaſter was always to be celebrated conformably to the cuſtom of the Jews, on the fourteenth day of the moon in the month of March, whenſoever that day fell out. See EASTER.

And hence their name *Quarto-decimani*, *q. d.* fourteenthers. See PASSOVER.

The Aſiatics were mightily attached to this opinion, pretending it was built on the authority of St. John, who was their apoſtle; and pope Victor could never bring them to obedience in this point, though he was upon the point of excommunicating them —Some are of opinion he actually did excommunicate them, but it is more probable he contented himſelf with menaces.

Polycrates, biſhop of Epheſus, wrote a long and warm letter, in the name of all the biſhops of Aſia, to Victor and the church of Rome, wherein he explained at large the uſage of thoſe churches with regard to the celebration of Eaſter; and maintained, that herein they only followed a conſtant tradition that had obtained immutably among them from the time of the apoſtle St. John, who died at Epheſus — But the pope not ſatisfied with this anſwer of Polycrates, had proceeded to excommunication, but that ſome of the moſt eminent biſhops, among the reſt Irenæus, interpoſed, and diſſuaded him from diſturbing the peace of the church by excommunicating a people for adhering to what they accounted a tradition.

QUASHING, in law, the overthrowing, and annulling a thing. See ANNULLING.

An array returned by one that has no franchiſe, ſhall be *Quaſhed. Coke on Littl.* fol. 156.

QUASI-CONTRACT, in the civil-law, an act which has not the ſtrict form of a contract, but yet has the force thereof. See CONTRACT.

In a contract there muſt be the mutual conſent of both parties; whereas in a *Quaſi-contract*, one party may be bound or obligated to the other without having given his conſent to the act whereby he is obliged.

For an example—I have done your buſineſs, in your abſence, without your procuration; and it has ſucceeded to your advantage: I have then an action againſt you for the recovery of what I have disburſed, and you an action againſt me to make me give an account of my adminiſtration: which amounts to a *Quaſi-contract*.

QUASI-CRIME, or QUASI-DELICT, in the civil-law, the action of a perſon who does damage, or evil involuntarily.

The reparation of *Quaſi-crimes* conſiſts in making good the damages with intereſt.

QUASI-MODO *ſunday*, *low Eaſter-Sunday*, or the next ſunday after Eaſter; thus called from the initial words of the introit of the maſs for the day, *Quaſi modo geniti Infantes.* See SUNDAY.

In ancient deeds theſe words were ſignified by *q. m. g.*

QUATER-COUSINS, QUATRE-COUSINS; fourth couſins, or the laſt degree of kindred. See COUSIN, DEGREE, CONSANGUINITY, *&c.*

Hence, when perſons are at variance, it is ſaid they are not *Quater*, or *cater-couſins.*

QUATRE-NATIONS, q. d. *four nations*, the denomination of a college founded in 1661, by cardinal Mazarin; for the education and maintenance of ſixty children, natives of the four countries conquered by the king, *viz.* fifteen for Pignerol and Italy, fifteen for Alſatia, twenty for Flanders, and ten for Rouſſillon. See COLLEGE.

QUATUOR *homines præpoſiti.* See PRÆPOSITI.

QUATUOR-VIR, in antiquity, frequently wrote IIII. VIR, a Roman magiſtrate who had three collegues joined with him in the ſame adminiſtration. See DECEMVIR.

To the *Quatuor-viri* was committed the charge of conducting and ſettling the colonies ſent into the provinces. See COLONY.

Upon unlucky accidents, and other dangerous affairs, it was uſual to create *Quatuor-viri* with commiſſion to take care *ne quid detrimenti Reſpublica caperet*, that the republic were not prejudiced.

There were alſo *Quatuor-viri* appointed to inſpect and take care of repairs, *&c.*

QUAVER, in muſic, a meaſure of time, equal to one half of the crochet, or one eighth of the ſemibreve. See TIME and SEMIQUAVER.

The *Quaver* is marked by the character 𝅘𝅥𝅮. See CHARACTER.

The Engliſh *Quaver* makes what the French call *crochue* crotchet; becauſe of the hook at bottom. See CROTCHET.

The *Quaver* is divided into two ſemiquavers noted 𝅘𝅥𝅯, and four demiſemiquavers marked 𝅘𝅥𝅰.

QUAVERING, in muſic, the act of trilling, or ſhaking; or the running a diviſion with the voice. See DIVISION.

QUAY, *Kay*, a ſpace of ground paved on the ſhore of a river, or port; deſtined for the loading and unloading of merchandize. See WHARF and KAY.

QUEEN * *Regina*, a woman who holds the crown of a realm, ſingly and by right of blood. See CROWN.

* The Word *Queen* is derived from the Saxon, Cƿen, *cwen* *uxor*, the wife of any one, but applied by way of excellency to the wife of the king only; whence ſhe was anciently called the *King's Queen*; the Weſt-ſaxons having no other name for a *Queen*, but the *king's wiſe*, *Aſſer. de Ælfred rebus, &c.*—She alſo was called *lady*, in Saxon, hlæfdiᵹ; juſt as *madame*, or *mademoiſelle*, are ſtill uſed for the wife and daughter of the duke of Orleans———

The name *Queen* is alſo given by way of courteſy to her that is married to the king; called, by way of diſtinction, *Queen conſort*—In reſpect whereof the former is called *Queen regnant.*

The widow of a king is alſo called *Queen*, but with the addition of *Dowager*. See DOWAGER.

In the firſt ſenſe, *Queen* is in all conſtruction the ſame with *king*, and has the ſame power and prerogative in all reſpects that the king has. See KING and PREROGATIVE.

The *Queen conſort* is inferior, and a perſon diſtinct from and a ſubject of the king—In England, though ſhe be a feme covert, yet may ſhe ſue, and be ſued in her own name, may make leaſes, and grants, *&c.* as a feme ſole. See WIFE and FEME.

She has ſeveral other prerogatives—Though an alien, ſhe may purchaſe lands in fee-ſimple, without either naturalization, or denization; ſhe may preſent to a benefice; nor is plenarty a bar againſt her more than againſt the king—She ſhall not be amerced if ſhe be non-ſuited in any action; may not be impleaded till firſt petitioned.

To conſpire her death, or violate her chaſtity is high-treaſon.

She has an ancient peculiar revenue, called *Queen-gold.* See QUEEN-GOLD.—Beſides a very large dower, with a royal court, and officers apart.

The *Queen dowager* has this particular, that ſhe loſes not her dignity though ſhe marry a private gentleman—Thus queen Katherine, widow of Henry V. being married to Owen ap Theodore, Eſq; maintained her action as *queen* of England — Much leſs does a *Queen* regnant follow her husband's condition, or is ſubject as other *Queens*, but is ſovereign to her own husband, as queen Mary was to king Philip; unleſs it be otherwiſe appointed by parliament.

QUEEN-GOLD, *aurum reginæ*, a royal revenue, belonging to the queen of England, during her marriage to the king, and payable by divers perſons (upon ſeveral grants of the king) by way of oblation out of fines, amounting to ten marks, or upwards, *viz.* one full tenth part above the entire fine, or ten pounds for every hundred pounds fine, on pardons and contracts, or agreements. See FINE.

This becomes a real debt to the *Queen*, by the name of *aurum reginæ*, upon the party's bare agreement with the king for a fine, and recording it; without any farther promiſe or contract for this tenth part extraordinary.

QUEEN'S *bench.* See KING'S *bench*, &c.

QUE-ESTATE, in law, a plea whereby a man entitling himſelf to land, *&c.* ſaith, that the ſame eſtate which another had, he now has from him.

Thus, *e. gr.* the plaintiff alledges, that ſuch four perſons were ſeized of lands, whereunto the advowſon in queſtion belonged in fee; and who did preſent to it, and that afterwards the church was vacant, *que eſtate*— i. e. *which eſtate* he now has, and by virtue thereof preſents, *&c.*

QUE EST MEME, in law, a term uſed in actions of treſpaſs, *&c.* for a direct juſtification of the very act complained of by the plaintiff as a wrong. See TRESPASS.

Thus in an action upon the caſe, the plaintiff ſaying the lord threatened his tenants at will in ſuch ſort, as he forced them to give up their lands; the lord in his defence pleads, that he ſaid to them, if they would not depart, he would ſue them at law—*Que eſt meme*, *i. e.* this being the ſame threatning that he uſed, the defence his good.

QUERELA, *Quarrel*, in law, denotes an action or declaration preferred in any court of juſtice.

In an action where the plaintiff is called *Querens*, *i. e.* complainant, is brief, complaint, or declaration, is called *Querela*. See QUARREL.

QUERELA *audita.* See the article AUDITA.

QUERELA *coram rege & concilio*, a writ whereby one is called to juſtify a complaint of a treſpaſs made to the king himſelf; before the king and his council.

QUERPO. See the article CUERPO.

QUERRIES, or EQUERRIES. See EQUERRY.

Gentleman of the QUERRY, is an officer appointed to hold the king's ſtirrup, when he mounts on horſeback.

QUEST*, or INQUEST, an inquiſition, or inquiry made upon oath of an impannelled jury. See INQUEST and JURY.

* The word is formed of the French *quête*, ſearch, of the Latin *quæſitum*, a thing ſought.

QUEST, in hunting, the ſeeking out of hounds; or the venting and winding of ſpaniels. See HOUND, HUNTING, *&c.*

QUESTION, QUÆSTIO, in logic, *&c.* a propoſition, whoſe truth a perſon being inquiſitive about, propoſes it, by way of interrogation, to another. See PROPOSITION, TRUTH, INTERROGATION, *&c.*

Logical queſtions are variouſly diſtributed; the ordinary diviſion is into *firſt* or *primary Queſtions*; as, *quid eſt*, what is ſuch a thing?—And *ſecondary*, which ariſe out of the former; as, how is it?

Quodlibetical QUESTION. See QUODLIBETICAL.

QUESTION, in law—The *Queſtion de jure* is generally to be diſtinguiſhed from the *Queſtion de facto*. See DE FACTO, *&c.*

QUEST-MEN, perſons choſe yearly in each ward, to enquire into abuſes, and miſdemeanors, eſpecially ſuch as relate to weights, and meaſures.

QUESTOR*, QUÆSTOR, an officer in ancient Rome, who had the care of the publick treaſure. See TREASURE.

* The word is formed *à quærendo*, ſeeking, ſearching.

The *Queſtor-ſhip*, *Quæſtura*, is very ancient, as having been eſtabliſhed under the kings—In the time of the republic, the ſenate appointed *Queſtors* in each province, to aſſiſt the proconſuls, as lieutenants or treaſurers, in the adminiſtration of the revenues: but under the emperors, there was properly but one *queſtor*, or treaſurer general of the empire: thoſe other inferior, or ſubordinate *queſtors* were then called aſſiſtants of the *queſtor*, *adjutores quæſtoris*.

The *queſtors's* office was originally confined to the army.—They paid the ſoldiery, took charge of moneys coming by ſpoil and plunder, *&c.*

At length there were new ones erected to reſide in the city, and receive the public money, taxes, tribute, *&c.*—Their number was increaſed as the empire encreaſed: Sylla augmented it to twenty.

There was alſo another kind of *queſtors* whoſe office was to enquire into and take cognizance of capital crimes.

QUESTOR *ſacri palatii*, or of the *ſacred palace*, was one of the firſt dignities under the emperors of Conſtantinople.

It was this *queſtor* that ſubſcribed the reſcripts of the emperor, and the anſwers to the petitions and ſupplications preſented to him—He drew up and ſigned the laws and conſtitutions which the emperor thought fit to publiſh; and took care of the adminiſtration of juſtice.

Some compare his function to that of our lord high chancellor—It was uſually one of the juris conſulti that was charged with this office; it being required that he ſhould know the laws of the empire, be able to preſcribe and ſee them executed, and judge of cauſes brought by way of appeal before the emperor.

Conſtantine was the firſt who erected *queſtors* of the ſacred palace. See PALACE.

QUESTUS, or QUÆSTUS. See QUÆSTUS.

QUESTUS *eſt nobis*, a writ of nuſance, which by Stat. 15. Edw. I. lies againſt him to whom a houſe, or other thing that breeds a nuſance is deſcended, or alienated; whereas before that ſtatute, the action lay only againſt him who firſt levied, or cauſed the nuſance, to the damage of his neighbour. See NUSANCE.

QUEUE, in heraldry, the tail of a beaſt. See TAIL.

If a lion have a forked tail, he is blazoned by *double-queued*.

QUEUE D'ARONDE, q. d. *Swallow's-tail*, in fortification, a term applied to outworks, when narrower at the george than the face or front; *i. e.* where the ſides open towards the campaign, and contract towards the george. See HORN-WORK and TENAILLE.

The name is occaſioned by its reſemblance in figure to a ſwallow's tail, which the French call *queue d'aronde*.

Of this kind are ſome ſingle as well as double tenailles; and ſome horn-works whoſe ſides are not parallel. See TENAILLE.

On the contrary, when the ſides are leſs than the george, the work is called *contre queue d'aronde*.

QUEUE *d'aronde*, in carpentry, a method of jointing. See DOVE-*Tail*.

QUIA, in logic. See the article REASON.

QUIA *improvide*, a ſuperſedeas granted in many caſes where a writ is erroneouſly ſued out, or miſ-awarded. See WRIT.

Such is that granted in behalf of a clerk of the chancery ſued againſt the privilege of the court, in the common-pleas, and purſued to the exigent.

QUICKEST *deſcent*, *line*. See DESCENT.

QUICK-*lime*. See LIME.

QUICK-*pulſe*. See the article PULSE.

QUICKSET *hedge*. See the article HEDGE.

QUICKSILVER, a very ponderous fluid mineral, by the chemiſts called *mercury*—For the method of gaining, preparing it, *&c.* with its properties, uſes, *&c.* See MERCURY.

Virgin QUICKSILVER. See the article VIRGIN.

QUID, *what*, in the ſchools, is uſed to denote the definition of a thing. See DEFINITION.

It is thus called by reaſon the definition anſwers to the queſtion, *quid eſt*, what is it? See QUESTION.

Hence we have two kinds of *quids*, nominal, *quid nominis*; and real, *quid rei*.

QUID *pro quo*, in law, *q. d.* what for what, denotes the giving one thing of value for another: or the mutual conſideration and performance of both parties to a contract. *Kitchin.*

QUID *pro quo*, or QUI *pro quo*, is alſo uſed in phyſic to expreſs a miſtake of an apothecary, in adminiſtring one medicine for another; or in uſing an ingredient in a compoſition different from that preſcribed. See SUCCEDANEUM.

In propriety, *quid pro quo*, is a miſtake in the phyſician's bill, where *quid* is wrote for *quo*, one thing for another; or of the apothecary in reading *quid* for *quo*, and giving the patient the wrong medicine. See PRESCRIPTION.

Hence the term is in the general extended to all blunders or miſtakes committed in medicine, either in the preſcription, the preparation, or application of remedies.

A northern phyſician in a printed theſis on *quid pro quo's* owns ingenuouſly, that they are very frequent—He diſtinguiſhes very accurately a great variety of kinds of *quid pro quo's*; ſome with regard to the operation, others with regard to the ſubject, and others with regard to their form, or effects.

The firſt comprehends the *quid pro quo's* of the phyſician, the ſecond thoſe of the patient, the third thoſe of the apothecary.

He adds *quid pro quo's* of the chirurgeon, *quid pro quo's* of the cook; *quid pro quo's* of the nurſe, *&c.* Nor does he omit that there are ſalutary *quid pro quo's*, dangerous *quid pro quo's*, indifferent *quid pro quo's*, *&c.*—God preſerve us from *quid pro quo's*.

QUIDDANY, QUIDDENY, (of the Latin *cydonium*, or *cydoniatum*) a conſerve of quinces. See MARMELADE.

QUIDDITY, QUIDDITAS, in the ſchools, a word of the ſame ſignification with *eſſence*. See ESSENCE.

The name is derived hence, that it is by the eſſence of a thing that it is *tale quid*, ſuch a *quid*, or very thing; and not another—When upon ſeeing, or hearing the name of a thing whoſe nature, *&c.* we are unacquainted withal, we aſk, *quid eſt?* what is it? we mean no more by the interrogation, but that we deſire to have its nature and eſſence explained by a Definition—Whence *quiddity* is uſually defined the eſſence known or expreſſed in a Definition. See DEFINITION.

And hence what is eſſential to a thing is ſaid to be *quiddative*—As *quiddative* knowledge, *&c.*

QUID PRO QUO. See the article QUID.

QUIESCENT, ſomething at reſt. See REST.

QUIETISM, the ſentiments of the *Quietiſts*, a religious ſect which made a great noiſe towards the cloſe of the laſt century. See MYSTICKS, QUAKERS, *&c.*

Molinos, a Spaniſh prieſt, who died at Rome in the priſon of the inquiſition, paſſes for the author of *quietiſm*; and yet the Illuminati in Spain had taught ſomething like it before. See ILLUMINED.

The name is taken from a ſort of abſolute reſt, and inaction, which the ſoul is ſuppoſed to be in, when arrived at the ſtate of perfection, which in their language is called *the unitive life*—To arrive at this, a man is firſt to paſs through the purgative way; that is, through a courſe of obedience, inſpired by the fear of hell: hence he is to proceed into the illuminative way, before he arrive at perfection; to go through cruel combats, and violent pains; *i. e.* not only the uſual drineſſes of the ſoul, and the common privations of grace, but infernal pains: he believes himſelf damned; and the perſuaſion that he is ſo, continues upon him very ſtrongly ſeveral years: St Francis des Sailes, ſay the *quietiſts*, was ſo fully convinced thereof, that he would not allow any body to contradict him therein—But the man is, at length, ſufficiently paid for all this; by the embraces of God, and his own deification.

Theſe ſentiments of the *quietiſts*, with regard to God, are wonderfully pure, and diſintereſted—They love him for himſelf, on account of his own perfections, independently of any rewards or puniſhments: the ſoul acquieſces in the will of God, even at the time when he precipitates it into hell; inſomuch that inſtead of ſtopping him on this occaſion, B. Angelo de Foligny cry'd out, *Haſte, Lord, to caſt me into hell: do not delay, if thou haſt abandoned me, but finiſh my deſtruction, and plunge me into the abyſs.*

At length, the ſoul, after long travail, enters into reſt, into a perfect *quietude*—Here it is wholly employed in contemplating its God; it acts no more, thinks no more, deſires no more; but lies perfectly open, and at large, to receive the grace of God, who by means thereof drives it where it will, and as he will.

In this ſtate, it no longer needs prayers or hymns, or vows; prayers where the ſpirit labours, and the mouth opens, are the lot of the weak, and the imperfect: the ſoul of the ſaint is, as it were, laid in the boſom, and between the arms of its God, where, without making any motion, or exerting any action, it waits, and receives the divine graces—It, then, becomes happy: quitting the exiſtence it before had, it is now changed, it is transformed, and, as it were, ſunk and ſwallowed up in the divine being, inſomuch as not to know or perceive its being diſtinguiſhed from God himſelf. Fenel. *Max. des ſaints.*

QUIETISTS, the diſciples of Mich. de Molinos; or the adherents to the opinions delivered in the article Quietism.

QUIETUS, *freed*, or *acquitted*; a term uſed by the clerk, of the pipe, and the auditors in the exchequer, in their acquittances or diſcharges given to accomptants; which uſually conclude with the words *abinde receſſit quietus:* which is called a *quietus eſt*.

A *quietus eſt* granted to a ſheriff diſcharges him of all accounts due to the king. See Sheriff, Account, &c.

QUINAQUINA. See the article Quinquina.

QUINARIUS, Quinary, in antiquity, a little roman coin, equal to half the denarius. See Coin.

The *quinarius* was properly the Roman half-penny. See Denarius and Penny.

Medaliſts indeed uſe the term *quinarius* in the general for a medal of any matter, not exceeding the ſize of our ſixpence; but F. Chamillart, in an expreſs diſſertation, ſhews this to be an abuſe—The ſilver coins, current under the republick, he ſhews, were two: the one weighing a drachm, and called *denarius*, as containing ten as's, the other weighing half a drachm, and called *quinarius*, as containing five as's: which coins continued on the ſame footing under the emperors. See As.

Hence the origin of the word *quinarius*; and hence, in propriety, it is only the ſilver medal of the weight of half a drachm that the name belongs to; the Romans having never given it to any other ſpecies of the ſame ſize therewith—It is only by way of analogy, therefore, that the moderns apply it to the medals of gold, or copper, of the ſame ſize with the ſilver *quinarius*; thoſe of gold being fixed at a value much above, and thoſe of braſs much below five as's.

The only relation between theſe *quinarii*, is, that the gold *quinary* is the half of a gold medal as to weight and value, and the braſs *quinary* half a braſs medal, as the ſilver *quinary* is half a ſilver one.

Hence a ſeries of *quinaries* ſhould ſeem at leaſt as neceſſary in the cabinets of the curious, as the ſeries of great medals; they being all equally different ſpecies of money, which teach us how many kinds of pieces there were of any metal current in commerce. See Series.

Add to this, ſays our author, that the *quinaries* were of a finer and more finiſhed coin than the other medals, being wrought by the hands of the maſters; which ſeems owing to the nicety required in engraving whole figures in ſo ſmall compaſs. He adds, that though *quinaries* are very ſcarce, yet M. the duke of Maine has almoſt a complete ſet of them.

QUINCUNX, *quinque unicæ*, denotes a thing that conſiſts of five twelfth parts of another. See Uncia and As.

Quincunx is chiefly uſed in gardening, for a plantation of trees, diſpoſed originally in a ſquare; conſiſting of five trees, one at each corner, and a fifth in the middle; which diſpoſition repeated again and again, forms a regular grove, wood, or wilderneſs, and then viewed by an angle of the ſquare, or parallelogram, preſents equal and parallel alleys.

Or, the *quincunx* is the figure of a plantation of trees diſpoſed in ſeveral rows, both length and breadthwiſe; in ſuch manner as that the firſt tree of the ſecond row commences in the centre of the ſquare formed by the two firſt trees of the firſt row, and the two firſt of the third: reſembling the figure of a five at cards—The fineſt manner of planting trees to form a grove, is in the *quincunx*. See Grove. It is of this kind of *quincunx* that Cicero ſpeaks in his *Cato major*; and Quintilian, lib. 8. cap. 3.

The modern *quincunxs*, Daviler obſerves, are made like thoſe of the ancients, except for the fifth tree, which is now generally diſuſed; ſo that, being as it were, netted, and their allies viewed by the ſide of the rectangle, they form a perfect chequer.

Quincunx, in aſtronomy, &c. denotes a poſition, or aſpect of the planets when diſtant from eachother 150 degrees, or five ſigns. See Aspect.

QUINDECAGON*, in geometry, a plain figure which has fifteen ſides and fifteen angles. See Figure.

* The word is formed ſomewhat irregularly, from the Latin, *quinque*, five; and the Greek, δεκα, ten; and γωνια, angle —*Pentedecagon* would be more regular.

If the ſides be all equal, it is a regular *quindecagon*. See Regular.

Euclid ſhews how to inſcribe it in a circle, Prop. 16. l. 4. And the ſide of a regular *quindecagon* ſo deſcribed, is equal in power to the half-difference between the ſide of the equilateral triangle, and the ſide of the pentagon; and alſo to the difference of the perpendiculars let fall on both ſides, taken together.

QUINDECIM-VIR, XV-VIR, a Roman magiſtrate, who had fourteen collegues joined with him in the ſame function.

Under Tarquin the Proud, there were firſt two magiſtrates erected to take care of the ſacrifices to be performed; theſe were called *duumviri*. See Duumvir—Their number, at length, grew to ten, and then they were called *decemviri*. See Decemvir—In the time of Cicero it had reached to fifteen, when they aſſumed the name of *quindecimviri:* and though their number grew to forty afterwards, yet Servius obſerves, on the ſixth of the Æneid, that their name never changed, but they ſtill continued to be called *quindecimviri*.

It was they examined the Sibyls books, and were the interpreters thereof; yet they never did this but by expreſs order of the ſenate, declared by a ſenatus-conſultum—They alſo preſided at the ſacrifices, and other extraordinary ceremonies of religion. See Sibyl and Sacrifice.

On medals, a dolphin joined with a tripod marks the prieſthood of the *quindecimviri*; who, to publiſh their ſolemn ſacrifices, uſed, the eve thereof, to carry a dolphin at the end of a pole, throughout the city; that fiſh being eſteemed ſacred to Apollo, as the crow was among birds.

QUINI-SEXTA, in eccleſiaſtical hiſtory, denotes a council held at Conſtantinople in the year 692; called alſo the council in *Trullo*, and by the Greeks *Penthecte*, *q. d.* five ſixth; as intimating that it was only a ſupplement of the two preceding councils. Though, in propriety, Fleury obſerves, it was a council itſelf. See Council.

Marſhall obſerves, that the fifth and ſixth general councils having made no canons, the Orientals judged it neceſſary to ſupply that defect by this; ſo that the 102 canons falſly attributed to thoſe, were, in reality, made here. See Trullo.

QUINQUAGENARIUS, among the Romans, was an officer in the army who had the command of a company of fifty men.

Quinquagenarius, was alſo an officer of policy, who had the inſpection of fifty houſes, or families.

In the ancient monaſteries, *quinquagenarius* was a ſuperior who had fifty monks under his guidance.

QUINQUAGESIMA-SUNDAY, *ſhrove-ſunday*; thus called, as being about the fiftieth day before eaſter. See Shrovetide.

Anciently they uſed *quinquageſima* for whitſunday, and for the fifty days between eaſter and whitſunday; but to diſtinguiſh this *quinquageſima* from that before eaſter, it was called the *paſcal quinquageſima*. See Whitsunday.

QUINQUANNION, Quinquennium, in the French cuſtoms, a reſpite of five years which inſolvent debtors formerly obtained by virtue of the king's letters, to have time for the payment of their debts. See Respite.

When the thing intended was only to prevent the ſale of their effects at an under value, the term of one year was ordinarily granted, called the benefit of *annion*.

But when the debtor would avoid the ſurrendring of his effects upon proving that he was reduced by poverty, loſſes, &c. to make uſe of this expedient, the term of five years was granted, called the benefit of *quinquannion*.

QUINQUATRIA, in antiquity, a name given the feaſts of Minerva, otherwiſe called *Panathenæa*. See Panathenæa.

Some think they were termed *quinquatria* becauſe they laſted five days; but others with more reaſon, becauſe they fell out five days after the ides of the month.

QUINQUENNALIA, in antiquity, games, or feaſts celebrated every five years, in honour of the deified emperors. See Game, Feast, Apotheosis, &c.

The *quinquennalia* began to be expreſſed on medals about the middle of the third century—F. Pagi produces a medal wherein are engraved thoſe of the emperor Poſthumus; they are not found in any medals of his predeceſſors.

QUINQUENNALIS, in antiquity, a magiſtrate in the colonies, and municipal cities of the Roman commonwealth; much the ſame with ædile at Rome. See Ædile, and Colony, &c.

They were not thus called from their continuing in their office five years; but becauſe they were elected every fifth year, to preſide at the cenſus, and to receive the declaration each citizen made of his effects. See Census.

QUINQUE *Portus*, the five cinque ports; which are, Haſtings, Romney, Hythe, Dover, and Sandwich—To the firſt hereof alſo belong Winchelſea and Rye, which are eſteemed members of the cinque-ports. See Cinque-Ports.

* *Servitum quod barones* quinque portuum *præſcriptorum recognoſcunt facere ad ſummonitionem regis per annum, ſi contigerit per* 15 *dies ad cuſtum eorum proprium; ita quod primus dies computatur a die quo vela navium erexerunt, uſque partes ad quas tendere debent, vel ulterius quam diu rex voluerit ad cuſtum ejus.* Thorn.

QUINQUE-VIR, frequently wrote V-VIR, a Roman magiſtrate, who had four collegues joined with him in the ſame function.

There were various kinds of officers thus denominated—Pomponius the lawyer mentions *quinqueviri* on this, and on that ſide of the Tiber, eſtabliſhed for the adminiſtration of juſtice in the night time, in lieu of the ordinary magiſtrates, who were not judged proper to run up and down the ſtreets in the dark.

Roſinus tells us, that it was ſometimes the *quinqueviri* who conducted the colonies, and divided the lands aſſigned them, among the ſeveral families. See COLONY.

Sometimes the Epulones were five in number; in which caſe they were called *quinqueviri*. See EPULO.

QUINQUEVIRI *monetarii* were officers firſt erected under the conſulate of Valerius Poplicola, to moderate the exceſſive uſury, or intereſt, which creditors or bankers uſed to exact upon the people. See USURY.

QUINQUINA, QUINAQUINA, called alſo *China Chinæ*, and *Kin Kina*, a medicinal bark brought from the Weſt Indies; called alſo by way of eminency, the *bark*; and *cortex Peruvianus*, the Peruvian bark, from the country whence it is brought; and popularly the *jeſuits bark*, becauſe at its firſt introduction chiefly ſold and adminiſtred by the jeſuits. See CORTEX.

The tree which yields this bark grows in divers provinces of Peru, but chiefly Quenca, Ayavaca, and Loxa. The beſt and fineſt comes from the mountains 14 leagues round the city of Loxa.

The tree that produces the *quinaquina* is tall, and its trunk thicker than a man's thigh, tapering from the root upwards, but without any branches till near its top, where they grow regular as if lopped by art, and with the leaves form an exact hemiſphere—The bark is blackiſh on the outſide, but ſometimes mixed with white ſpots, where grows a kind of moſs by the Spaniards called *Barbos*—Its leaves reſemble the leaves of our plumb-trees.

The Spaniards diſtinguiſh four ſorts of this precious bark, *viz.* the *Caſcarilla colorada*, or reddiſh bark: *Amarylla*, or yellowiſh: *Creſpilla* or curling: and *Blanca*, whitiſh.

The *Colorada*, and *Amarylla* are reckoned the beſt: The *Creſpilla*[*] is the produce of the ſame ſort of tree only growing in a cold, froſty climate, which impairs the quality of the bark, and renders it whitiſh on the outſide, the cinnamon coloured within, and unfit for medicinal uſe.—For the *blanca*, it is procured from another ſpecies of the tree, of a much bigger trunk, the leaves of a lighter green colour, and the bark of a very thick ſpongeous ſubſtance, whitiſh on the outſide; being withal ſo tough as to require the force of an ax to ſlice it from the tree—When firſt cut down it is as bitter as the beſt ſort, and has then the ſame virtue in the cure of intermitting fevers; but when dry and kept any length of time it grows inſipid and good for nothing. In reality, both ſorts are found to have much ſurer and quicker effects when green, than when dry; ſo that the Europeans only come in for the ſecond virtues: what is worſe, the bad ſort is in great plenty, and the good very ſcarce, and hard to come at: for which reaſon, with a little of the fine bark ſent yearly to Panama for Europe, large quantities of the worſe ſort are mixed.

The ſeaſon for cutting the bark is in Auguſt, the only dry time in the country. The cutters are Indians, provided each with a large knife and a bag. When they have ſliced down the bark as high as they can reach, they faſten ſhort ſticks with withs to the tree at proper diſtances, like the ſteps of a ladder, and thus mount and ſlice to the very top; when the bag is full they carry it to the low country to a neighbouring hut to dry, which is done by ſpreading it in the open air, and frequently turning it—If it happen to have been cut wet, they carry it directly to the low country to dry; otherwiſe it loſes its colour, turns black and rots—After a tree has been barked it requires 18 or 20 years to grow again.

Mr. Arrot, a ſcotch ſurgeon, who had gathered the bark in the place where it grows, and from whom we received this account by means of Mr Gray, now at Carthagena, is of opinion that the better ſort of bark will ſoon be at an end, or at leaſt inacceſſible, partly by reaſon of its diſtance from any inhabited place, and the impenetrability of the woods where it grows, and partly by the want of Indians to cut it, whoſe race through the cruelties of the Spaniards is like to be totally extinct. See *Philoſoph. Tranſact.* N°. 446. p. 81. ſeq.

The *quinquina* was but little known in Europe till the year 1640—The jeſuits of Rome firſt brought it in vogue in Spain, and Italy in 1649; and in 1650, the cardinal de Lugo, of that order, brought it into France.

It was at firſt ſold for its weight in gold: when reduced into powder, it is by foreigners called the *cardinals powder*; among us uſually, the *jeſuits powder*, *pulvis patrum*.

It met with a world of oppoſition at firſt—Chiflet and Plempius diſtinguiſhed themſelves againſt it. But it is now almoſt univerſally allowed one of the greateſt and beſt remedies within the whole province of medicine.

Some call the gentian-root the European *quinquina*, becauſe good againſt intermitting fevers. See GENTIAN.

QUINSEY, QUINZY, or QUINCY, in medicine. See ANGINA and QUINZY.

QUINSIEME, QUINZIEME, in our old law-books. See FIFTEENTH.

QUINT, a ſequence of five cards of the ſame colour. See SEQUENCE, PICQUET, *&c.*

QUINTA ESSENTIA; ſee QUINTESSENCE.

QUINTAIN, QUINTENA, in antient cuſtoms, a poſt driven into the ground, with a buckler fixed to it, for the performance of military exerciſes on horſeback, throwing of darts, breaking of lances, *&c.*

Matth. Paris deſcribes the *quintain* as a kind of mark, formed like a man from the navel upwards, holding a ſhield in his left hand, and in his right a ſword or ſtick; the whole ſo fitted as to turn round on its foot, and ſo as that a cavalier running a-tilt againſt it with a lance, if he hit it in the breaſt, it whiſk'd round, and, unleſs he were very dexterous, ſtruck him with the ſword held in the other hand.

In other places, a-top of a poſt, was erected a ſlender beam fitted to turn round a ſpindle; at one of whoſe ends was a ſloap or flat board, and at the other a bag of ſand, or dirt—The ſport was, with a long ſtaff, or wooden lance, to ride a-tilt at the board, and to be either ſo ſkilful or lucky to eſcape the blow of the ſand-bag.

This ſome take to be the ſame with the *arietum levatio*, frequently prohibited in our old ſynods and epiſcopal conſtitutions.

The cuſtom is ſtill retained in Shropſhire, and ſome other counties, among the nuptial ſolemnities—He that breaks the moſt poles againſt the *quintain* has the prize, which was antiently a peacock, now a garland.

Some derive the word from an ancient game called *quintus*; others from a man of the name Quintus.

The Vallus and Paſſus mentioned in Cæſar, are taken, by Vigenere, for a kind of *quintain*, or wooden man fixed up as an adverſary, or man of ſtraw, to prove one's dexterity againſt.

Mention is made of this exerciſe in the code, *de aleatoribus*, and in the Paratitles of Cujas on the ſame—Juvenal ſpeaks of women engaging therein:

Aut quis non vidit vulnera Pali?

QUINTAIN was alſo a right which the lord had to oblige all the millers, watermen, and other young people unmarried, to come before his caſtle every three year, and break ſeveral lances, or poles, againſt a poſt, or wooden man for his diverſion.

QUINTAL, in commerce, the weight of an hundred pounds. See HUNDRED and WEIGHT.

The *quintal* admits of ſome difference in different places, according as the pound conſiſts of more or fewer ounces, and as the ounce is lighter or heavier. See POUND and OUNCE.

Thus, *e. gr.* the Paris *quintal*, or hundred, yields 123 pounds at Montpelier; and the Montpelier hundred only 81 pounds at Paris—The *quintal* of Conſtantinople is eſteemed the heavieſt of all thoſe uſed in the Levant. It contains 45 ocquas, the ocquas weighing two Dutch pounds $\frac{9}{10}$; ſo that the *quintal* is equal to 112 pounds $\frac{3}{4}$ of Amſterdam, 124 pounds of Venice, and 160 of Leghorn.

The Engliſh *quintal* uſually conſiſts of 112 pounds avoirdupois, and is divided into four quarters. See QUARTER.

QUINTAL was alſo formerly uſed for a weight of lead, iron, or other common metal, uſually equal to an hundred pounds, at ſixcore to the hundred.

QUINTESSENCE, QUINTA-ESSENTIA, in chemiſtry, a preparation conſiſting of the eſſential oil of ſome vegetable ſubſtance, mixed and incorporated with ſpirit of wine. See OIL, *&c.*

Thus, on a proper quantity, *e. gr.* of eſſential oil of fennel, pouring twelve times the quantity of pure alcohol prepared *per ſe*; they inſtantly unite into one ſimilar liquor, which is the *quinteſſence* thereof.

The ancients were perfectly unacquainted with the method of diſſolving oil in ſpirit of wine; and even ſome of the moderns have queſtioned its reality: but the certainty of the thing is eaſily proved from the inſtance above.

If ſuch *quinteſſence* be ſeveral times digeſted, cohobated, *&c.* the oil will at length be broke ſo fine, as, like the ſpirit itſelf, perfectly to mix with water; which is one of the moſt extraordinary effects in all chemiſtry. See SPIRIT, SULPHUR, *&c.*

After the like manner is made a *quinteſſence* of camphor, by only reducing it into a powder, and pouring on it ſpirit of wine. See CAMPHOR.

---

[*] The ſmall bark which curls up like ſticks of cinnamon, and which in England is much eſteemed as being ſuppoſed to be ſent from the branches of the tree, and therefore more efficacious in the cure of Fevers, is only the bark of the younger trees; which being very thin curls in this manner—For the bark of the branches it is never gathered: It would not compenſate the charge of cutting.

Quinteſſences thus prepared are of great medicinal virtues; as may appear from the pure and potent ingredients uſed in the compoſition, which retain, in a great degree, all the virtues of the plants they are procured from: and hence their denomination. See ESSENCE.

Boerhaave thinks they might properly be called vegetable ſulphurs made potable, and raiſed to their utmoſt degree of power and efficacy. See SULPHUR.

Dry *quinteſſences* may be made from the liquid ones, by adding to them ſome eſſential oil of the ſame vegetable from whence the liquid *quinteſſence* was procured, with a little ſugar; all mixed together, and diſtilled by a gentle heat till all the moiſture is come over: the matter remaining is a dry *quinteſſence.*

This form is principally uſed for travellers, ſailors, *&c.* inaſmuch as it renders the *quinteſſence* portable; ſo that the quantity, *e. gr.* of a pin's point, ſhall be an efficacious medicine.

QUINTESSENCE, in alchymy, is a myſterious term ſignifying the fifth, or laſt and higheſt eſſence, or power of a natural body.

This is ſuppoſed to be, as it were, the ſoul drawn from the groſs body and it's four elements, by a moſt perfect diſtillation; and by means hereof, the thing is ſaid to be ſpiritualized, *i. e.* rendered exceedingly pure, ſpirituous, and, as it were, incorruptible. *Dict. Hermetique.*

The ancients, who allowed nothing to be real but what has a body, would have the ſoul of man to be a fifth element, a kind of *quinteſſence* without a name, unknown here below, indiviſible, immoveable, all cœleſtial, and divine. *Fenelon.*

QUINTESSENCE *of the elements*, is the hermetical mercury. See MERCURY.

QUINT-EXACT, in old law-books, the laſt call of the defendant ſued to an outlawry—If he appear not to it, he is by the judgment of the coroners returned outlawed; if a feme, waived. See EXIGENT, OUTLAWRY, WAIF, *&c.*

QUINTILE, QUNITILIS, in aſtronomy, an aſpect of the planets, when they are 72 degrees diſtant from one another, or a fifth part of the zodiac. See ASPECT, CHARACTER, BIQUINTILE, SEMIQUINTILE, and SESQUIQUINTILE.

QUINTILIANS, QUINTILIANI, a ſect of ancient heretics, the ſame with Pepuzians; thus called from their propheteſs *Quintilia.* See PEPUSIAN.

In this ſect the women were admitted to perform the ſacerdotal and epiſcopal functions; grounding their practice on that paſſage of St. Paul to the Galatians, where he ſays, *That in Chriſt there is no diſtinction of males and females.*

They attributed extraordinary gifts to Eve, for having firſt eaten of the tree of knowledge; told mighty things of Mary the ſiſter of Moſes, as having been a propheteſs, *&c.* they added, that Philip the deacon had four daughters, who were all propheteſſes, and doubtleſs of their ſect.

In their aſſemblies, it was uſual to ſee the virgins enter in white robes perſonating propheteſſes—The *Quintilians* bore a good deal of reſemblance to the modern quakers. See QUAKER.

QUINZY *, a diſeaſe which ſtops the freedom of reſpiration and deglutition. See RESPIRATION.

* The word is formed from the French *ſquinance*, or Italian *ſquinantia*, or *eſquinancia*; and theſe again from the Greek συναγχη, of αγχω, I ſuffocate.

The *quinzy*, by phyſicians alſo called *angina*, conſiſts in an inflammation of the throat, and particularly of the muſcles of the larynx or pharynx, which exactly cloſing the chinks thereof, prevent the air from paſſing in and out of the trachea, and the food from being ſwallowed and conveyed into the ſtomach. See ANGINA.

If any ſymptoms appear on the outſide of the throat, the *Quinzy* is ſaid to be *external*—If none appear, *internal.*

The *quinzy* is alſo divided into *true* and *ſpurious*—the true is always accompanied with a fever: the baſtard or ſpurious *quinzy* is free from it.

They are cauſed by a defluxion of blood, either pure or bilious, from the branches of the carotid arteries; and there cauſing a phlegmon, either a ſimple or an eriſipelatous one.

In the external *quinzy* before any ſuppuration appears, recourſe is had to repeated venæſection in the jugulars—Veſicatories and cupping are alſo uſed with emollient gargles, *&c.*

The *quinzy* is of all others the moſt dangerous, when the tumour is neither perceivable on the inſide nor the out. That appearing on the outſide is the moſt curable. In violent *quinzies*, recourſe ſhould be had to laryngotomy or bronchotomy, which though rarely practiſed, may yet be uſed with ſafety. See BRONCHOTOMY, *&c.*

QUIRE of paper, of the French *Cahier*; the quantity of 24 or 25 ſheets. See PAPER.

QUIRISTER, or CHORISTER, *Choriſta*, a perſon appointed to ſing in the quire, or choir of a cathedral. See CHOIR, CHANTOR, CATHEDRAL, ANTHEM, *&c.*

QUIRINALIA, in antiquity, feaſts celebrated among the Romans in honour of Romulus, who was called Quirinus. See QUIRITES.

The *quirinalia*, called alſo *ſtultorum feriæ*, were held on the 13th of the kalends of March, *i. e.* on our 17th of February.

QUIRITES, in antiquity, an appellation given to the people of Rome, chiefly the common citizens, as diſtinguiſhed from the ſoldiery.

It took its riſe from the *Curites*, the inhabitants of the Sabin town *Cures*; on this occaſion Romulus, and Tatius king of the Sabins, having united their two people, and their two ſtates into one; upon Romulus's death and deification, the Sabins, outdoing the Romans in number, became maſters of the councils; and accordingly appointed that Romulus ſhould be denominated *Quirinus*, from Cures a city of the Sabins, or rather from *Quirinus*, the name of a god worſhipped in that city.

From the new *Quirinus*, all the people came afterwards to be called *quirites*; unleſs we will ſuppoſe that the ſame authority which denominated Romulus *Quirinus*, from Cures, did alſo denominate the people *quirites*; immediately from the Curites. Some authors derive the word *quirinus* from *curis*, which in the Sabin tongue ſignified a pike or halbert—Struvius adds, that Romulus was always painted with a pike in his hand.

QUIRK, in building, a piece of ground taken out of any regular ground-plat, or floor.

Thus, if the ground-plat were ſquare, or oblong; and a piece be taken out of a corner, to make a court, or yard, *&c.* the piece is called a *quirk.* See REDUCT.

QUIS, in natural hiſtory, a kind of marcaſite of copper, from which the Roman vitriol is drawn. See MARCASITE and VITRIOL.

It is more frequently called *Pyrites.* See PYRITES.

QUIT-CLAIM, a releaſe, or quitting one's claim or pretenſions to a thing. See CLAIM.

QUIT-RENT, q. d. *quiet-rent*, a certain ſmall rent, payable yearly, by the tenants of moſt manors in token of ſubjection; upon the payment whereof they are quiet and free. See MANOR, *&c.*

In ſome ancient records it is written *white-rent*; becauſe paid in ſilver, to diſtinguiſh it from rent-corn, rent-pepper, *&c.* See RENT.

QUITTANCE. See the article ACQUITTANCE.

QUITTER-BONE, among farriers, a hard, round ſwelling, upon the coronet of a horſe's foot; or between the heel and the quarter. See HOOF.

Or, it is an impoſtume breeding between the hoof and coffin-bone, on the upper part; and ſhewing it ſelf by a ſwelling on the coronet.

Sometimes it is occaſioned by gravel under the ſhoe, or by a bruiſe, ſtab, prick of a nail; or from peccant humours deſcending to that place; or a blow, ſtrain, or over-reach, *&c.*

It occaſions the horſe to halt much, and the ſwelling grows viſible, and comes to a head in four or five days, and breaks out with matter at a little deep hole, like a fiſtula.

QUOD *clerici non eligantur in officio*, is a writ that lies for a clerk, who by reaſon of ſome land he hath, is made, or like to be made, a bailiff, beadle, reeve, or ſuch like officer. See CLERICO *infra ſacros*, *&c.*

QUOD *medium* See the article MEDIUM.

QUOD *non permittat.* See CONSUETUDINIBUS *&* *Servitiis.*

QUOD *perſona nec præbendarii*, *&c.* a writ that lies for ſpiritual perſons, when diſtrained in their ſpiritual poſſeſſions, for the payment of a fifteenth, with the reſt of the pariſh. See FIFTEENTH.

QUODLIBETICAL *queſtion*, *quæſtio* QUODLIBETICA, a college term for a theſis, or problem anciently propoſed to be debated in the ſchools, out of curioſity and entertainment, rather than for the ſettling of any uſeful point. See THESIS, QUESTION, *&c.*

The term is formed from the Latin *quodlibet*, any thing, what you pleaſe; and ſo well ſatisfied were the publick with the impertinencies of theſe queſtions, that the term *quodlibet* has been ſince retained to ſignify any little ridiculous quibble.

QUOIL, QUOYL, or COILE, in the ſea-langague—A cable is ſaid to be *quoiled*, when it is laid round in a ring, one turn over another on the deck of a ſhip. See CABLE.

In the middle of ſuch a ring or *quoile*, is a good place to lay ſhot in, more ſafe there than in lockers along the ſide, where the enemy's ſhot may not fall into it.

QUOIN *, or COIN, a-board a ſhip, is a wedge faſtened on the deck, cloſe to the breech of the carriage of a gun, to keep it firm up to the ſhip's ſide, and prevent its rolling. See COIN.

* The word is formed from the French *coin*, of the Latin *cuneus*, wedge. See WEDGE.

Cantic QUOINS are ſhort, three-legged *quoins*, put between caſks to keep them ſteady.

QUOINS, in architecture, denote the corners of brick or ſtone walls. See WALL.

The word is particularly uſed for the ſtones in the corners of brick-buildings—When theſe ſtand out beyond the brick-work (their edges being chamfered off) they are called *ruſtic quoins.* See RUSTIC.

QUOITS, a kind of exerciſe or game, known among ancients under the name of *diſcus.* See DISC; ſee alſo EXERCISE and GAME.

QUO JURE, a writ that lies for him who has land, wherein another challengeth common of paſture time out of mind: its deſign is to compel the party to ſhew by what right or title he challengeth it.

QUO MINUS is alſo a writ which lies for the king's farmer or debtor in the court of exchequer, againſt him to whom he ſelleth any thing by way of bargain, touching his farm; or againſt whom he hath any cauſe of perſonal action—For that by the vendee's detaining any due from him, the farmer is made leſs able to pay the king's rent.

Quo minus, is alſo a writ that lies for him who has a grant of houſe-bote in another man's wood, againſt the granter making ſuch waſte, as that the grantee cannot enjoy his grant. See HOUSE *bote.*

QUORUM, a term frequently mentioned in our ſtatutes, and often uſed in commiſſions, both of peace, and others. See COMMISSION, PEACE, &c.

It is thus called from the words in the commiſſion, *quorum* A. B. *unum eſſe volumus.*

For an example—Where a commiſſion is directed to ſeven perſons, or to any three of them, whereof A. B. and C. D. to be two; there A. B. and C. D. are ſaid to be of the *quorum,* becauſe the reſt cannot proceed without them.

So a juſtice of the peace and *quorum,* is one, without whom the reſt of the juſtices in ſome caſes cannot proceed. See JUSTICE.

QUOTATION, in literature, a *citation*; or a paſſage rehearſed expreſly in one author from another. See CITATION.

Quotations are uſed to be diſtinguiſhed by inverted comma's, thus; "Half an age ago *quotations* were wonderfully com-"mon; and Ovid and Catullus came every day with the "pandects to the aſſiſtance of the widow and the orphan." —*La Bruyere.*

The manner of quoting by book, and chapter, or ſection, is chiefly affected by men of erudition: But it was abuſed: This method ought only to obtain where the whole chapter or ſection is expreſly on the ſubject. On other occaſions, quoting by page is more commodious; except in claſſicks and other ancient writings, whereof there are many editions in different forms, where this method is of little uſe, unleſs the edition be alſo ſpecified.

The *quotations from the old teſtament,* found in the new, have occaſioned infinite doubt, diſpute, and criticiſm—The apoſtles are frequently referring to the old teſtament, and quoting paſſages and prophecies thence as fulfilled in our Saviour; yet theſe paſſages, thus quoted, are frequently either not found in the old teſtament, or are not urged in the new according to the literal and obvious ſenſe they ſeemed to bear in the old.

A late ingenious author, in an eſſay upon the truth of the chriſtian religion, frankly owns, that the Evangeliſts ſometimes apply to the Meſſiah paſſages of the old teſtament, which, as they lie in our preſent copies, plainly relate to ſome other perſon, or thing—This is evident, *e. gr.* in the paſſage, Matt. ii. 15. *Out of Egypt have I called my ſon*; which is quoted from Hoſea xi. where it is plainly underſtood of the coming of the Iſraelites out of Egypt. See PROPHECY.

This proves a heavy obſtacle in the way of chriſtianity, which the divines, commentators, critics, &c. have long laboured to remove, though by very different means.

Some have recourſe to a double completion; and imagine, that though the prophecies were primarily accompliſhed in other events, yet they might have a ſecondary one in the Meſſiah: but others ſet aſide a double completion, except where the prophet himſelf declares as much, as making all prophecy uſeleſs. See ACCOMPLISHMENT.

The generality chuſe therefore to have recourſe to an allegorical, or typical, or ſpiritual meaning in the prophecies, &c. and ſuppoſe them to have been thus underſtood among the ancient Jews, thus fulfilled in our Saviour, and thus applied by the apoſtles. See TYPE.

In effect, the jewiſh rabbins, it is allowed, took a world of liberty in quoting and interpreting ſcripture; and it is ſuppoſed the apoſtles might follow thoſe rules in their quotations. See RABBIN.

Accordingly, M. Surenhuſius, Hebrew profeſſor at Amſterdam, has endeavoured to retrieve thoſe rules, long ſince loſt, in an expreſs treatiſe on this ſubject, publiſhed in 1713. this author obſerves a great deal of difference implied in the different forms of *quoting* uſed by the ſacred writings: as, *It has been ſaid*; *it is written, that it might be fulfilled which was ſpoken by the prophets*; *the ſcripture ſays*; *ſee what is ſaid*; *the ſcripture foreſeeing*; *is it not written,* &c.—He adds, that the books of the old teſtament having been diſpoſed in a different order at different times, and having had different names, it is thence that a book or writer is ſometimes confounded with another.

For the rules of *quoting* and interpreting practiſed among the rabbins, he gives us ten; recovered with much ſtudy from the Thalmud, and the ancient Jewiſh doctors: inſtances whereof he gives us in the writings of the apoſtles; and by thoſe rules he endeavours to explain and juſtify all the *quotations* made from the old teſtament in the new.

The rules are, 1. reading the words not according to the points placed under them, but according to others ſubſtituted in their ſtead; as is done by St. Peter, Acts iii. 3. by Stephen, Acts vii. 43. and by Paul, 1 Cor. xv. 54. 2 Cor. viii. 15, &c.

The ſecond is by changing the letters; as is done by Paul, Rom. ix. 33. 1 Cor. xi. 9. Heb. viii. 9. and x. 5. and by Stephen, Acts vii. 43.

The third is by changing both letters and points, as is done by Paul, Acts xiii. 41. and 2 Cor. viii. 15.—The fourth is adding ſome letters, and taking away others.

The fifth, tranſpoſing words and letters—The ſixth is dividing one word into two—The ſeventh, adding other words to make the ſenſe more clear—The eighth, changing the order of the words—The ninth, changing the order of the words, and adding other words. Both of which are done by the apoſtles—Laſtly, changing the order of words, adding words, and retrenching words; which is a method often uſed by St. Paul.

Other authors, as biſhop Kidder, M. le Clerc, M. Sykes, &c. ſolve the difficulty another way—That uſual form of *quotation* among the evangeliſts, "That it might be fulfilled "which was ſpoken by the prophets," according to theſe authors, means no more than an accommodation of the prophets words to the caſe in hand. See ACCOMMODATION.

The word πληρωθη, *fulfilled,* does not neceſſarily determine us to ſuch a ſenſe, as if the evangeliſts deſigned to ſpeak of a prediction of future events *accompliſhed*; but may barely expreſs an accommodation of borrowed words—In effect, ſays biſhop Kidder, a ſcripture may be ſaid to be *fulfilled* two ways; *properly,* as when that which was foretold comes to paſs; and *improperly,* by way of accommodation, as when an event happens to any place or people like to what fell out ſome time before—And that it is thus St. Matthew ſays on occaſion of the murder of the innocents, that, then was fulfilled what was ſpoken by the prophet in Jeremy, *In Rama was a voice heard,* &c.

This interpretation is confirmed by M. le Clerc, who obſerves that the Jews, in their language uſed to ſay, that a paſſage of ſcripture was *fulfilled,* as often as any thing happened which it might be applied to,: ſo that the evangeliſt Matthew, who was a Hebrew, and wrote as it is commonly ſuppoſed, in that language, intended no more in the paſſage juſt cited, but that a thing happened to which one might apply what Jeremy had formerly ſaid on another occaſion.

Accordingly, ſays Mr. Sykes, the evangeliſts in citing that paſſage of Iſaiah, *Behold a virgin ſhall be with child,* &c. only uſe it as words of that prophet remarkably agreeing to the miraculous birth of Jeſus, and not as a prophecy of his birth. It may be added, that this way of ſpeaking was not unknown among the heathen writers—Thus, in Ælian, Diogenes Sinopenſis uſed continually to ſay of himſelf, that he fulfilled and underwent all the curſes of tragedy.

QUOTIDIAN, QUOTIDIANA, in medicine, an intermitting fever, or ague, the acceſs whereof returns every day. See FEVER and AGUE.

QUOTIENT*, QUOTIENS, in arithmetic, the number reſulting from the diviſion of a greater number by a ſmaller; and which ſhews how often the ſmaller is contained in the greater, or how oft the diviſor is contained in the dividend. See DIVISION.

* The word is formed from the Latin, *quoties, q. d.* How often is ſuch a number contained in ſuch another?

In diviſion, as the diviſor is to the dividend; ſo is unity to the *quotient*—Thus the *Quotient* of 12 divided by 3 is 4; which is thus diſpoſed, 3) 12 (4 *Quotient.*

QUOUSQUE—*Execution with a* QUOUSQUE. See EXECUTION.

QUO WARRANTO, a writ that lies againſt him who uſurps any franchiſe, or liberty againſt the king; as to have waife, ſtray, fair, market, court-baron, leet, or ſuch like, without good title.

It alſo lies for miſ-uſer or non-uſer of privileges granted—And even, according to Bracton, againſt him that intrudeth himſelf as heir into land. See INTRUSION.

QUOYL, ſee the article QUOIL.

R,

R, A liquid conſonant, and the ſeventeenth letter of the alphabet. See LETTER and ALPHABET.

The grammarians hold it a ſemi-vowel; eſpecially in the Greek, where, in common with the other vowels, it admits an aſperate, &c, though whether the aſpirate ſhould be ſounded before or after it, is ſome doubt. We find Inſtances of each.

Thus ῥεδη the Latins wrote *rheda*; and ῥοδον the Æolians wrote βροδον—The ancient Goths, and Teutones, Littleton obſerves, prefixed *h* to *r*. See H.

The Hebrews allow the *r* the privilege of a gutteral, that is they never double it, which yet is done by the Arabs, Greeks, and Latins, &c. See GUTTURAL.

Perſius calls the *r*, *litera canina*, becauſe the dogs ſeem to pronounce it in ſnarling: Yet it ſhould ſeem to have had a ſofter ſound among the Romans, than among us, by its being frequently interpoſed to prevent the claſhing of vowels: as in *rarus* from ἀραιος, *nurus* from νυος, *murex* from μυαξ, *mus murus* from μυς μυος; and this ſoftneſs was ſuch as frequenly occaſioned its being dropt as uſeleſs in writing.

Thus for *Hetruſci* they frequently wrote *Thuſci*, and even *Tuſci*; and for *ſurſum*, *rurſus*, *prorſus*; *ſuſum*, *ruſus*, *proſus*. In effect there was that agreement between the ſound of the *s* and *r*, that as the Romans avoided the doubling of their conſonants, it was no wonder they here dropped the *r*; the *s* ſupplying the place of both. Hence too it came to paſs, that what they at firſt pronounced, *Aſa*, *Aſena*, *Caſmen*, was afterwards, *Ara*, *Arena*, *Carmen*; and thoſe firſt named *Fuſii* and *Valeſii* were afterwards called *Furii* and *Valerii*. Cicero tells us, the *Papirii* were firſt called *Papiſii*; and even fixes the time when the change was made, *viz.* in the year of Rome 415. Feſtus adds, that *olera pignora plurima*, were anciently written *oleſa*, *pignoſa*, *pluſima*. See S.

From the ſame ſoftneſs of the ſound of the *r*, it came to be uſed indifferently with the *l*, in many words, *e. gr. latiaris* and *latialis*, *palilia* and *parilia*, &c.

Though the *r* more frequently degenerated into *l*; thus *remures* became changed into *lemures*, *interlego*, *perluceo* into *intelligo* and *pelluceo*, *frater* into *fratellus*, &c. and the ſame is ſometimes done between *n* and *r*, as *æreus* and *æneus*, &c. See L.

R, was anciently a numeral letter, ſignifying 80; according to the verſe,

Octoginta dabit tibi R, *ſiquis numerabit.*

When a daſh was added a-top, as R̄, it ſignified 80 thouſand. The Greek *r*, ρ, ſignified an hundred.

R, or ℞ in medicinal preſcription, ſtands for *recipe*, take. See RECIPE. See alſo CHARACTER.

RABATE in faulconry—A hawk is ſometimes ſaid to *rabate*, when by the motion of the hand of the bearer, the lure, call, &c. ſhe leaves purſuing her prey, or quarry; and recovers the fiſt. See RECLAIMING, HAWK, HAWKING, LURE, &c.

RABATE in commerce. REBATE.

RABBETING, in carpentry, the plaining or cutting of channels, or grooves, in boards. See PLANE.

In ſhip-carpentry, it ſignifies the letting in of the planks of the ſhip into the keel; which in the rake, and run of a ſhip, is hollowed away, that the planks may join the cloſer.

RABBET-*plane*. See the article *Rabbet*-PLANE.

RABBI*, or RABBIN, a doctor of the Jewiſh law. See DOCTOR, and RABBINIST.

* The word in its original רבי ſignifies *maſter*. See MASTER.

The words *rabbi* and *rabbin*, have the ſame ſignification; yet is there ſome difference in their uſe.—When we ſpeak abſolutely, and without applying the term to any proper name, we ſay *rabbin*, not *rabbi*. Thus, we ſay, it would be unjuſt to attribute to the ancient *rabbins* all the notions of the modern ones.

On the other hand, when we prefix the term to the proper name of ſome Jewiſh doctor, we ſay *rabbi*, not *rabbin*: as *rabbi* Saloman Jarchi is of this opinion.

Yet *rabbi* having no plural, we ſay, the *rabbins* Juda Chiug, and Juda ben Chabin, are the authors of two ancient Hebrew grammars.

The modern *rabbins* are entitled to a good deal of reſpect among the Jews: they have the firſt places in the ſynagogues; they determine all matters and controverſies of religion, and very frequently pronounce upon civil affairs. They have even a power to excommunicate the diſobedient.

They retain a vaſt number of ſuperſtitious traditions, from the writings of their predeceſſors; which they obſerve as ſcrupulouſly as the law of Moſes. See TRADITION. See alſo TALMUD.

The ancient *rabbins* were infinite dealers in allegories. Their writings are almoſt wholly allegorical, particularly their comments and interpretations of the ſcripture; See CABBALA.

They had a great number of rules, and forms of interpreting and quoting, which ſome modern writers ſuppoſe to have been followed by the apoſtles, in their interpretation, and quotation of the prophecies of the old teſtament, in the new. See PROPHECY.

The loſs of theſe rules Dr. Stanhope, Dr. Jenkins, &c. lament, as what in all probability would reconcile the jaring paſſages in the old and new teſtament. Surenhuſius, Hebrew profeſſor at Amſterdam, imagines he has retrieved thoſe rules from the ancient Jewiſh writers.

The *rabbins*, he obſerves, interpreted ſcripture in ſuch a manner as to change the literal ſenſe into a more noble and ſpiritual ſenſe. To this end, he ſays, they uſed ten ways of quoting and explaining the old teſtament; inſtances of each whereof he gives in the writings of the apoſtles.

They conſiſt in changing the points; the letters; both letters and points; adding and taking away letters; tranſpoſing words and letters; dividing one word one into two; adding words; changing the order, &c. See QUOTATION.

RABBINICAL *character*. See the article CHARACTER.

RABBINICAL *Hebrew*. See the article HEBREW.

RABBINIST, a follower of the doctrine of the rabbins; in contradiction to *caraite*. See CARAITE.

Father Simon contends for *rabbaniſt*, or *rabbanite*, inſtead of *rabbiniſt*; in effect, the former are apparently preferable to the latter; the word being derived from the Hebrew *rabbanim*, which is the name of the ſect, and which the Jews uſe to diſtinguiſh their doctors from thoſe of the *caraite* Jews. See RABBI.

Rabbiniſt, then, ſignifies a Jewiſh doctor who adheres to the traditions of his fathers; not ſimply a rabbin or doctor; for the *caraites* who oppoſe thoſe traditions, have their rabbins as well as the other Jews. See TRADITION, and TALMUD.

RABDOIDES,	See	RHABDOIDES.
RABDOLOGY,		RHABDOLOGY,
RABDOMANCY,		RHABDOMANCY,

RABINET, a ſmall piece of ordnance, between a falconet and a baſe. Its dimenſions, &c. ſee under CANON.

RACA, or RACHA, a Syriac term, found in the goſpel of St. Matthew, ch. v. 22. and preſerved in moſt tranſlations.

Father Simon obſerves that the Greek tranſlator of St. Matthew's goſpel retained the Syriac *raca* which he found in the original, by reaſon it was very common among the Jews. And St. Jerom, Luther, the Engliſh tranſlators, thoſe of Geneva, Louvain, Port-Royal, &c. ſtill preſerve it in their reſpective languages.

F. Bouhours chuſes rather to expreſs the ſenſe thereof in a ſort of paraphraſe, thus: he that ſays to his brother *homme de peu de ſene*, *man of little underſtanding*, ſhall deſerve to be condemned by the tribunal of the council, &c.

Moſt tranſlators, except the Engliſh, and F. Simon, for *raca* write *racha*: but the former orthography ſeems the beſt founded; all the Latin copies having *raca*, and all the Greek ones ρακα, or, with Heſychius, ρακκα, which is the ſame: all we mean, but St. Irenæus, and Beza's copy, now at Cambridge, which have ραχα—In effect, the origin of the word ſhews it ſhould be *raca*; as coming from the Syriac רקא, *raca*, of the Hebrew רק *rek*, empty, ſhallow.

RACCOURCY, in heraldry, ſignifies the ſame as *coupy*, that is, cut off, or ſhortened; and denotes a croſs or other ordinary, when it does not extend to the edges of the eſcutcheon, as they do when abſolutely named, without ſuch diſtinction. See COUPED.

RACE*, in geneaology, lineage, or extraction continued from father to ſon. See LINE.

* The word is French, formed from the Latin, *radix*, *root*; as intimating the root of the genealogical tree.

In ſeveral orders of knighthood, as in that of Malta, &c. the candidates muſt prove a nobility of four *races*, or deſcents. See DESCENT.

In ſome republics the magiſtrates are to prove themſelves of plebian *race*, to be qualified.

The French reckon their kings by *races*; as, the firſt *race*, the ſecond *race*, the third *race*. We alſo ſay the *race* of the Ottomans, the Arſacides, the Ptolemys, &c. See DYNASTY.

D'Hervieux obſerves that it is uſual to put the female canary bird to the male goldfinch, linnet, or the like, to breed; but, for his part, he ſhould chuſe to put the male canary-bird to the female goldfinch, linnet, *&c.* becauſe the male uſually *races* more than the female, *i. e.* the young ones take more after the male than after the female.

RACHA. See the article RACA.

RACHITIS, or rather RHACHITIS, in medicine, a diſeaſe affecting the bones of children; more uſually called the *rickets*, See RICKETS.

RACK, an engine furniſhed with chords, *&c.* for extorting confeſſion from delinquents. See TORTURE.

The duke of Exeter, conſtable of the tower under Henry VI. with the duke of Suffolk, and others, having a deſign to introduce the civil law into England; for a beginning, the *rack*, or *brake* allowed in many caſes by the civil law, was firſt brought to the tower, where it is ſtill preſerved—In thoſe days, the *rack* was called the duke of Exeter's daughter.

RACK, in the manage, a pace wherein a horſe neither trots nor ambles, but ſhuffles as it were between both. See PACE.

The *racking pace* is much the ſame as the amble; only that it is a ſwifter time and a ſhorter tread. See AMBLE.

To RACK *wines*, &c. is to draw them from off their lees, after having ſtood long enough to clear and ſettle. See WINE.

Hence RACK-*vintage* is frequently uſed for the ſecond voyage our wine merchants uſe to make into France for racked wines; whence they uſed to return about the end of December.

RACKET*, a kind of bat, to ſtrike the ball withal at tennis; conſiſting uſually of a lattice, or net-work of cat-gut, ſtrained very tight over a circle of wood, with a handle or ſhaft of a moderate length. See TENNIS.

* The word is formed from the French, *raquette*, which *Menage* derives from the Latin, *raketta*, a diminutive of *rete* net; whence alſo *reticum*, and *reticulum*.

Paſquier obſerves, that anciently they uſed no *rackets* at tennis, but plaid with the palm of the hand; and hence, he conjectures it is, that the French call tennis-play, *jeu de paume*—He adds, that *rackets* were not introduced till a little before his time.

RACKET, is alſo a machine, which the ſavages of Canada bind to their feet, to walk more commodiouſly over the ſnow; made much in the manner of a tennis-racket.

Its figure is a lozenge, whereof the two obtuſe angles are rounded off. It is bound about with very fine thongs of leather, the maſhes whereof are much ſmaller and cloſer than thoſe of our rackets.

In the middle is fitted a kind of ſhoe, lined with wool, or hair; to be tied on to the ankle: by which means the feet are prevented from ſinking in the ſnow.—*Rackets* oblige the perſon to take very long ſteps, and as we ſay, to walk a great pace, to keep them from knocking againſt each other.

RADIAL *curves*, is a denomination given by ſome authors to curves of the ſpiral kind, whoſe ordinates, if they may be ſo called, do all terminate in the centre of the including circle, and appear like ſo many *radii* of that circle; whence the name. See CURVE. See alſo SPIRAL.

RADIALIS, or RADIÆUS *extenſor*, in anatomy. See EXTENSOR *carpi*.

RADIALIS, or RADIÆUS *flexor*. See FLEXOR *carpi*.

RADIANT *point*, or RADIATING *point*, is any point of a viſible object, whence rays proceed. See RAY, and POINT.

Every *radiant point* diffuſes innumerable rays all around: but only thoſe *radiants* are viſible, from which right lines may be drawn to the pupil; becauſe the rays are all right lines.

All the rays proceeding from the ſame *radiant* continually diverge; the chryſtallin collects or reunites them again. See DIVERGING. See alſo CHRYSTALLIN, and VISION.

Every ray is ſuppoſed to carry with it the ſpecies, or image of the *radiant*. See SPECIES and IMAGE.

RADIATED, in botany, an epithet applied to round flat flowers, conſiſting of a diſk, and, a ſingle row of longiſh pointed leaves, ranged all around it in manner of rays, or ſpokes. See FLOWER.

Radiated flowers, are properly ſuch as have ſeveral ſemiflorets ſet round a diſk, ſo as to reſemble a *radiant* ſtar: ſuch are daizy, camomile-flowers, *&c.* Theſe are ſometimes alſo called *radiated diſcous-flowers*. See DISCOUS.

The word is alſo uſed in ſpeaking of medals, and in heraldry, where the ancient crowns are called *radiated crowns*, *coronæ radiatæ*. See CROWN.

RADIATION, in phyſic, the action of a body diffuſing rays of light, as from a center. See RAY.

Every viſible body is a *radiating* body; it being purely by means of its rays that it affects the eye. See VISION.

Yet no body can *radiate*, unleſs it be either luminous or illuminated; ſince the rays it diffuſes muſt either be its own, or it muſt receive them from another body. Therefore nobody is viſible unleſs it be either luminous or illuminated. See VISIBLE, LIGHT, COLOUR, *&c.*

The ſurface of a *radiating* body may be conceived as conſiſting of radiant-points. See RADIANT-*point*.

Place of RADIATION is that ſpace, in a tranſparent body, or medium, through which a viſible body *radiates*. See MEDIUM, *&c.* See alſo PLACE.

RADIATION, or IRRADIATION, is alſo uſed by ſome authors to expreſs the manner of the motion of the animal ſpirits; on a ſuppoſition that they are diffuſed from the brain towards all parts of the body, through the little canals of the nerves, as light is from a lucid body. See SPIRIT, and IRRADIATION.

But in lieu of a *radiation*, many of the moderns rather incline to the opinion of the circulation of the ſpirits. See CIRCULATION.

RADICAL, RADICALIS, in phyſics, *&c.* ſomething ſerving as a baſis or foundation; or which, like a *root*, is the ſource, or principle whence any thing ariſes. See ROOT.

The ſchools talk much of a *radical moiſture* inherent in the ſeeds of all animals, which nouriſhes and preſerves the vital heat or flame, as oil does a lamp; and which when exhauſted, life is extinguiſhed. See FLAME, *&c.*

Dr. Quincy obſerves that this *radical moiſture* is a mere chimera; unleſs we thereby mean the maſs of blood which is the promptuary whence all the other juices and humours are derived; and which, while it circulates, ſuſtains life, *&c.* See HEAT. See alſo LIFE, BLOOD, *&c.*

In grammar, we uſe the term, *radical words*, for roots and primitives; in oppoſition to compounds and derivatives. See ROOT and PRIMITIVE.

RADICAL *ſign*, in algebra, the ſign or character of the root of a quantity. See ROOT.

$\sqrt{}$ is the character of radicality, and expreſſes the ſquare root; $\sqrt[3]{}$ the cube root, *&c.* See CHARACTER.

RADICATION, in phyſic, the action whereby plants take root, or ſhoot out roots. See ROOT.

The French royal academy of ſciences have made a good number of curious obſervations on the germination and *radication* of plants. See VEGETATION, SEED, PLANTING, PERPENDICULARITY, *&c.*

RADICLE, RADICULA, *little root*; in botany, is a little point diſcovered by the microſcope in all ſeeds, which in the growth of the plant becomes the root. See ROOT. See alſo SEED.

When, in ſowing, the *radicle* happens to light loweſt, it is no wonder the root ſhould ſpread itſelf under ground, and the ſtem of the plant riſe up perpendicularly: but when the *radicle* falls uppermoſt, by what means it is, that it changes its poſition to favour the aſcent of the ſtem, is one of the wonders of vegetation: A more particular account whereof ſee under the article PERPENDICULARITY.

RADII *brevis*. See the article BREVIS.

RADIOMETER, a name which ſome writers give to the *radius Aſtronomicus*, or Jacob's *ſtaff*. See CROSS-STAFF.

RADIUS*, RAY, in geometry, the ſemidiameter of the circle; or a right line drawn from the center to the circumference. See SEMIDIAMETER, *&c.*

* The word is derived from the Greeks ῥαβδος, *rod.*—Fleta uſes the word *radius*, for a *furrow*.

The *radius* is alſo called, eſpecially in trigonometry, *ſinus totus*, *whole ſine*. See SINE.

It is implied in the definition of a circle, and it is apparent from its conſtruction, that all the *radii* of the ſame circle are equal. See CIRCLE.

RADIUS, in the higher geometry—RADIUS *of the evoluta*, RADIUS *curvedinis*, or RADIUS *oſculi*, is the right line CM, *Tab. Analyſis*, *fig.* 12. repreſenting a thread, by whoſe evolution from off the curve BC, whereon it was wound, the curve A M *m* is formed. See EVOLUTA and OSCULUM.

RADIUS *aſtronomicus*, an inſtrument properly called Jacob's *ſtaff*, or *croſs-ſtaff*. See CROSS-*ſtaff*.

RADIUS in optics. See the article RAY.

RADIUS, in mechanics, is applied to the ſpokes of a wheel; becauſe iſſuing like rays from the centre thereof. See WHEEL.

RADIUS, in anatomy, is a long ſlender bone of the arm, deſcending along with the ulna from the elbow to the wriſt; called alſo, *focile minus*, the *leſſer focile*—See *Tab. Anat.* (*Oſteol.*) *fig.* 3. *n.* 7. 7. ** &c. *fig.* 7. *n.* 9. See alſo FOCILE.

The *radius* only touches the ulna at it's extremities; at the upper whereof it is both received by, and alſo receives it; making by both articulations, an imperfect kind of ginglymus. See ULNA.

The upper end, rolling upon the ulna, is covered with a cartilage; and has a-top, a ſmall round ſinus, which receives the outer proceſs of the humerus: the lower end is thicker than the upper, and has beſides the lateral ſinus, two other ſinus's at its extremity, which receive the bones of the wriſt.

The *radius* and ulna are both a little crooked; by which means they are kept a-part, excepting at their extremities; and are tied together by a ſtrong membranous ligament. See ARM.

The *radius* has four proper muſcles, beſides the biceps common to it and the ulna: the proper are two pronators, and two ſupinators. See PRONATOR and SUPINATOR. See alſo BICEPS.

RADIX, Ῥιζα, root. See the article ROOT.

RADIX is uſed among ſome anatomiſts, for the ſole of the foot. See FOOT.

RADIX, among grammarians. See RADICAL.

RAD-KNIGHTS. See the article REDMANS.

RADMANS. See the article REDMANS.

RAFFLING *, a ſort of game with three dice, wherein he who throws the greateſt pair, or pair royal, in three caſts, wins the prize or ſtake. See GAME and GAMING.

* The word probably comes from the baſe Latin, *ruſtare*, to *rifle*, plunder, take all away.

The *raffle* is properly the doublet or triple: a *raffle* of aces, or duces carries it againſt mere points.

RAFFLING is alſo uſed when a company of perſons club to the purchaſe of a commodity; and he that throws the higheſt on three dice takes it.

RAFTERS, in building, are pieces of timber, which ſtanding by pairs upon the reaſon, meet in an angle at the top, and form the roof of a building. See ROOF.

It is a rule in architecture, that no *rafters* ſhould ſtand farther than twelve inches from one another.

For the ſizes or ſcantlings of *rafters*, it is provided by act of parliament, that *principal rafters* from 12 foot 6 inches, to 14 foot 6 inches long, be 5 inches broad at top, and 8 at the bottom, and 6 inches thick—Thoſe from 14 6, to 18 6 long, to be 9 inches broad at the foot, 7 a-top, and 7 thick — And thoſe from 18 6, to 21 6, to be ten inches broad at the foot, 8 a-top, and 8 thick,

Single rafters, 6 foot 6 inches long, to be 4 and 3 inches in their ſquare—Thoſe 8 foot long muſt be 4 ½ and 3 ¼ inches ſquare.

RAG, or **RAKE**, among hunters, denotes a company, or herd of young colts.

RAGGED *hawk*, in falconry, is a hawk that hath it's feathers broken. See HAWK.

RAGGED, in heraldry. See the article RAGULED.

RAGGULED. See the article RAGULED.

RAGMAN's-*roll*, or **RAGIMUND's-*roll***. See ROLL.

RAGOûT, or **RAGOO**, a ſauce, or ſeaſoning, to rouſe or recover the appetite when languiſhing, or loſt.

The term is French, but naturalized—It is alſo uſed for any high-ſeaſoned diſh, prepared of fleſh, fiſh, greens, or the like, by ſtewing them with the addition of bacon, ſalt, pepper, cloves and the like.

We have *ragoos* of beef, of cray-fiſh, of gibblets, of aſparagus, of endive, of cocks-combs, of gammon, of celery, &c.

The ancients had a ragoût, called *garum*, made of the putrefied guts of a certain fiſh, which they kept till it diſſolved by mere force of corruption into a ſanies: this was held ſuch a valuable dainty among them, that Pliny obſerves, it's price equalled that of the richeſt perfumes.

RAGULED, or **RAGGED**, in heraldry, is applied to an ordinary, *e. gr.* a croſs, whoſe out-lines are jagged or knotted. (*Tab. Herald. fig.* 48.)

He beareth ſable, a croſs *raguled*, or, by the name of *Sloway*.

Ragged differs from indented, in that the latter is regular, and the former not. See INDENTED.

The bearing is very ancient: Julius Cæſar gave for his badge, a boar's head, on a *ragged* ſtaff.

RAGULED is ſometimes alſo uſed in the ſenſe of *truncated*, or *couped*, and applied to a branch that is ſawed from the tree; or a ſtock ſawed from it's root.

RAJA, an Indian appellation given to a kind of idolatrous princes, the remains of thoſe that ruled there before the conqueſt of the Moguls.

There are ſome *Rajas* who ſtill retain a kind of ſovereignty in the mountains: the Indians call them *Rai*; the Perſians, plurally, *Raian*; our travellers *Rajas*, or *Ragias*.

The chief lords of the Moguls, *viz.* the vice-roys, governors of provinces, and chief miniſters of ſtate, F. Catrou obſerves, are called *Ombras*; and the idolatrous *Rajas*, or Indian lords who governed petty ſtates before the conqueſt of their country, hold the ſame rank at court with the Omhras.

All the difference is, that the children of the *Rajas* ſucceed their fathers in the ſhew of the ſovereignty left them; whereas the children of the Mahometan lords loſe all in loſing their fathers.

The Indians account four ages from the beginning of the world; and in the ſecond, which laſted 1296000 years, they hold the *Rajas* or Kchatrys had their riſe; a noble caſt; though inferior to the Bramins. See BRAMIN. — Vice then began to creep into the world; men only lived to 300 years, and their ſtature was reduced, &c. *Lett. Edif. & Cur.* See AGE.

RAIL, in architecture, is applied variouſly; particularly, to Thoſe pieces of timber, which lie horizontally between the pannels of wainſcot, over and under them. See PANNEL, WAINSCOT, &c.

The word is alſo applied to thoſe pieces of timber which lie over and under ballufters in balconies, ſtair-caſes, &c. See BALLUSTER.

Alſo, to the pieces of timber that lie horizontally from poſt to poſt in fences with pales or without

RAIN, a very frequent and uſeful meteor, deſcending from above in form of drops of water. See METEOR and DROP.

Rain is, apparently, a precipitated cloud; as clouds are nothing but vapours raiſed from moiſture, waters, &c. See CLOUD.

And vapours are demonſtratively nothing elſe but little bubbles or veſiculæ detached from the waters, by the power of the ſolar, or ſubterraneous heat, or both. See VAPOUR.

Theſe veſiculæ being ſpecifically lighter than the atmoſphere, are buoyed up thereby, until they arrive at a region where the air is a juſt balance with them; and here they float, till by ſome new agent they are converted into clouds, and thence either into rain, ſnow, hail, miſt, or the like. See SNOW, HAIL, &c.

But the agent in this formation of the clouds into *rain*, &c. is a little controverted: the generality will have it the cold, which conſtantly occupying the ſuperior regions of the air, chills and condenſes the veſiculæ, at their arrival from a warmer quarter; congregates them together, and occaſions ſeveral of them to coaleſce into little maſſes: by this means their quantity of matter increaſing in a greater proportion than their ſurface, they become an overload to the thin air, and accordingly deſcend in rain.

Mr. Derham accounts for the precipitation, hence; that the veſiculæ being full of air, when they meet with a colder air than that they contain, their air is contracted into a leſs ſpace, and conſequently the watery ſhell or caſe rendered thicker, ſo as to become heavier than the air, &c. See COLD.

Others only allow the cold a part in the action, and bring in the winds as ſharers with it: indeed it is clear, that a wind blowing againſt a cloud will drive it's veſiculæ upon one another, by which means ſeveral of them coaleſcing as before, will be enabled to deſcend; and the effect will be ſtill more conſiderable if two oppoſite winds blow towards the ſame place. Add to this, that clouds already formed, happening to be aggravated by freſh acceſſions of vapour continually aſcending, may thence be enabled to deſcend. See WIND.

Yet, the grand cauſe, according to Rohault, is ſtill behind: that author conceives it to be the heat of the air, which after continuing for ſome time near the earth, is at length carried up on high by a wind, and there thawing the ſnowy villi, or flocks of the half frozen veſiculæ, reduces them into drops; which coaleſcing, deſcend, and have their diſſolution perfected in their progreſs through the lower and warmer ſtages of the atmoſphere.

Others, as Dr. Clark, &c. aſcribe this deſcent of the clouds rather to an alteration of the atmoſphere, than of the veſiculæ; and ſuppoſe it to ariſe from a diminution of the ſpring or elaſtic force of the air. See ELASTICITY.

This elaſticity, which depends chiefly or wholly on the terrene exhalations, being weakened, the atmoſphere ſinks under it's burthen; and the clouds fall, on the common principle of precipitation. See PRECIPITATION.

Now, the little veſiculæ by any, or all, theſe means, being once upon the deſcent, will perſiſt therein, notwithſtanding the increaſe of reſiſtance they every moment meet withal in their progreſs through ſtill denſer and denſer parts of the atmoſphere.

For, as they all tend toward the ſame point, *viz.* the centre of the earth, the farther they fall, the more coalitions will they make; and the more coalitions, the more matter will there be under the ſame ſurface; the ſurface only increaſing as the ſquares, but the ſolidity as the cubes; and the more matter under the ſame ſurface, the leſs friction or reſiſtance there will be to the ſame matter. See BAROMETER.

Thus, if the cold, the wind, &c. happen to act early enough to precipitate the aſcending veſiculæ, before they are arrived at any conſiderable height; the coalitions being few in ſo ſhort a deſcent, the drops will be proportionably ſmall: and thus is formed what we call *dew*. See DEW.

If the vapours prove more copious, and riſe a little higher, we have a *miſt* or *fog*. See FOG.

A little higher ſtill, and they produce a *ſmall rain*, &c.

If they neither meet with cold, nor wind enough to condenſe or diſſipate them; they form a heavy, thick, dark ſky; which laſts ſometimes ſeveral weeks. See WEATHER.

Hence we may account for many of the phænomena of the weather: *e. gr.* why a cold is always a wet ſummer; and a warm, a dry one? becauſe the principle of precipitation is had in the one caſe, and wanting in the other.

Why we have ordinarily moſt *rain* about the equinoxes? becauſe the vapours ariſe more plentifully than ordinarily in the ſpring, as the earth becomes looſened from the brumal conſtipations; and becauſe as the ſun recedes from us in autumn; the cold increaſing, the vapours that had lingered above during the ſummer heats, are now diſpatched down, &c.

Why a ſettled, thick, cloſe ſky ſcarce ever *rains* till it have been firſt clear? becauſe the equally diffuſed vapours muſt firſt be condenſed, and congregated into ſeparate clouds, to lay the foundations of *rain*; by which means the reſt of the face of heaven is left open, and pervious to the rays of the ſun, *&c.* See WEATHER.

For other phænomena of *rain*, as thy relate to the weather-glaſs, ſee BAROMETER.

As to the *quantity of rain* that falls; its proportion in ſeveral places at the ſame time, and in the ſame place at ſeveral times, we have ſtore of obſervations, journals, *&c.* in the Memoirs of the French academy, the Philoſ. Tranſ. &c. an idea whereof will not be unacceptable.

Upon meaſuring, then, the *rain* falling yearly; it's depth, at a medium, is found as in the following table:

Depth of RAIN *falling yearly, and its proportion in ſeveral places.*

	Inches.
At Townley in Lancaſhire, obſerved by Mr. Townley	42½
Upminſter in Eſſex, by Mr. Derham, - - - -	19¼
Zurich in Switzerland, by Dr. Scheuchzer, - -	32¼
Piſa in Italy, by Dr. Mich. Ang. Tilli, - -	43¼
Paris in France, by M. de la Hire, - - -	19
Liſle in Flanders, by M. de Vauban. - - -	24

Proportions of the RAIN *of ſeveral years to one another.*

	At Upminſter.		At Paris.	
1700	19 Inch.	03 Cent.	21 Inch.	38 Cent.

Præternatural-RAINS, or *ſhowers*, as *of blood*, &c. are very frequent in our annals, and even natural hiſtories; yet if ſtrictly pried into, will be all found other things than *rain*. *Bloody-rains*, Dr. Merret obſerves, are certainly nothing elſe but the excrements of inſects.—Accordingly, Gaſſendus gives an inſtance of a bloody *rain* in France, which terrified the people; but which Peireſc found to be only red drops coming from a ſort of butterfly that flew about in great numbers, as he concluded from ſeeing ſuch red drops come from them, from the drops not being laid on buildings or the outer ſurface of ſtones, *&c.* but in cavities and holes, and from thoſe walls only being tinged therewith that were next the fields, not thoſe in the ſtreets, and the former only to a little height, ſuch as butterflies are uſed to fly to.

The ſame Dr. Merret adds, that it is moſt evident the *rains of wheat* are nothing but ivy-berries, ſwallowed by the ſtarling, and again caſt forth by ſtool—An inſtance of ſuch a *rain* we have in the Philoſ. Tranſ. from the country about Briſtol, by Mr. W. Cole; who, upon examining the drops, found them to be the ſeeds of ivy-berries, blown down by fierce winds from towers, churches, chimneys, walls, *&c.* where they had been left by birds, chiefly ſtarlings and choughs.

The French have a tradition of a *rain of ſtones*, in a plain ſix or ſeven leagues long between Arles and Marſeilles, called *la Crau*, which is now quite covered therewith—The fable has it, that Hercules in his engagement with Albion and Bregion, in favour of Neptune, wanting darts was aſſiſted by Jupiter with a ſhower of theſe ſtones, ſeen to this day—Another account of their origin, ſee under the article STONE.

Freezing RAIN. See the article FREEZING.

RAINS, in the ſea language, denotes all that tract of ſea to the northward of the equator, between 4 and 10 degrees of latitude; and lying between the meridian of Cape Verde, and that of the eaſtermoſt iſlands of the ſame name.

It takes its name from the almoſt continual calms, conſtant *rains*, and thunder and lightning to a great degree, found there. The winds, when they do blow, are only ſmall uncertain guſts, and ſhift about all round the compaſs; ſo that ſhips are ſometimes here detained a long while, and can make but little way. See WIND, *&c.*

RAIN-BOW, IRIS, or ſimply the *Bow*, a meteor in form of a party-coloured arch or ſemicircle, exhibited in a rainy ſky, oppoſite to the ſun; by the refraction of his rays in the droops of falling rain. See METEOR, RAIN, and REFRACTION.

There is alſo a ſecondary or fainter *bow*, uſually ſeen inveſting the former, at ſome diſtance; and among naturaliſts we read of *lunar rainbows*, *marine rainbows*, &c.

The *rainbow*, Sir Iſaac Newton obſerves, never appears but where it rains in the ſun-ſhine; and may be repreſented artificially, by contriving water to fall in little drops like rain, through which the ſun ſhining, exhibits a *bow* to a ſpectator placed between the ſun and the drops; eſpecially if a dark body, *e. gr.* a black cloth be diſpoſed beyond the drops.

Anton. de Dominis firſt accounted for the *rain-bow*, in 1611: he explained at large how it was formed, by refraction and reflection of the ſun-beams in ſpherical drops of water; and confirmed his explications by experiments made with glaſs globes, *&c.* full of water. Wherein he was followed by Des Cartes, who mended and improved on his account: but as they were both in the dark as to the true origin of colours, their explications are defective, and in ſome things erroneous; which it is one of the glories of the Newtonian doctrine of colours, to ſupply and correct.

Theory of the RAIN-BOW—To conceive the origin of the *rain-bow*, let us conſider what will befal rays of light coming from a very remote body, *e. gr.* the ſun; and falling on a globe of water, ſuch as we know a drop of rain to be.

Suppoſe then ADKN (*Tab. Optics, fig.* 45.) to be a drop of rain, and the lines EF, BA, ON, to be rays of light coming from the centre of the Sun, which, by reaſon of the immenſe diſtance of the Sun, we conceive to be parallel. See *Parallel*-RAY.

Now the ray B A being the only one that falls perpendicularly on the ſurface of the water; and all the reſt obliquely; it is eaſily inferred that all the other rays will be refracted towards the perpendicular. See REFRACTION.

Thus the ray EF, and others accompanying it, will not go on ſtraight to K; but as they arrive at HI, deflect from F to K, where ſome of them, probably, eſcaping into the air, the reſt are reflected upon the line K N, ſo as to make the angles of incidence and reflection equal. See REFLECTION.

Farther, as the ray K N, and thoſe accompanying it, fall obliquely upon the ſurface of the globule; they cannot paſs out into the air, without being refracted, ſo as to recede from the perpendicular LM; and therefore will not proceed ſtraight to Y, but deflect to P.

It may be here obſerved, that ſome of the rays arriving at N, do not paſs out into the air, but are again reflected to Q; where being refracted like the reſt, they do not proceed right to Z, but declining from the perpendicular T V, are carried to R: but ſince we here only regard the rays as they may affect the eye placed a little below the drop, *e. gr.* at P, thoſe which deflect from N to Q, we ſet aſide as uſeleſs, becauſe they never come at the eye. On the contrary, it is to be obſerved, that there are other rays, as 2, 3, and the like; which being reflected from 3 to 4, thence to 5, and from 5 to 6 may at length arrive at the eye placed beneath the drop.

Thus much is obvious: but to determine preciſely the quantities of refraction of each ray, there muſt be a calculation; by ſuch calculation it appears that the rays which fall on the quadrant AD, are continued in lines, like thoſe here drawn in the drop ADKN; wherein there are three things very conſiderable: *Firſt*, that the two refractions of the rays in their ingreſs and egreſs are both the ſame way, ſo that the latter does not deſtroy the effect of the former. *Secondly*, That of all the rays paſſing out of AN; NP, and thoſe adjoining to it, are the only ones capable of affecting the ſenſe; as being ſufficiently cloſe or contiguous; and becauſe coming out parallel: whereas the reſt are divaricated, and diſperſed too far to have any ſenſible effect, at leaſt to produce any thing ſo vivid as the colours of the bow. *Thirdly*. That the ray NP has ſhade or darkneſs under it: for ſince there is no ray comes out of the ſurface N 4; it is the ſame thing as if the part were covered with an opake body. We might add, that the ſame ray NP has darkneſs above it; ſince the rays that are above it are ineffectual; and ſignify no more than if there were none at all.

Add to theſe, that all the effectual rays have the ſame point of reflection, *i. e.* the parallel and contiguous rays, which alone are effectual after refraction, will all meet in the ſame point of the circumference; and be reflected thence to the eye.

Farther it appears by calculation, that the angle ONP, included between the ray NP, and the line ON drawn from the centre of the ſun, which is the angle whereby the *rainbow* is diſtant from the oppoſite point of the ſun, and which makes the *ſemidiameter of the bow*; contains 41°, 30′. The method of determining it ſee hereafter.

But ſince beſides thoſe rays coming from the centre of the ſun to the drop of water, there are many more from the ſeveral points of its ſurface; there are a great many other effectual rays to be conſidered; eſpecially that from the uppermoſt, and that from the loweſt part of the ſun's body.

Since then, the apparent diameter of the ſun is about 16 ſeconds, it follows that an effectual ray from the upper part of the ſun will fall higher than the ray E F, by 16 ſeconds: this does the ray G H, (*fig*. 46.) which being refracted as much as E F, deflects to I, thence to L, and at length emerging equally refracted with the ray N P, proceeds to M; and makes an angle ONM, of 41°, 14′, with the line ON.

In like manner the effectual ray Q R, coming from the loweſt part of the ſun, falls on the point R, 16 minutes lower than the point F, on which the ray EF falls; and being refracted declines to S; whence it is reflected to T; where emerging into the air, it proceeds to V; ſo, as the line TV, and the ray O T contain an angle of 41° and 46′.

Again, upon computing the deflections of the rays, which, like that 23 (*Fig*. 45.) coming from the centre of the ſun, and being received into the lower part of the drop, we have ſuppoſed to be twice reflected, and twice refracted, and to enter the eye by lines like that 67 (*Fig*. 47.); we find that which may be accounted effectual, as 67, with the line 86 drawn from the centre of the ſun, contains an angle 867, of about 52 degrees: whence it follows that the effectual ray from the higheſt part of the ſun, with the ſame line 86 includes an angle leſs by 16 minutes; and that from the loweſt part of the ſun, an angle greater by 16 minutes.

Thus, ſince A B C D E F is the path of the efficacious ray from the higheſt part of the ſun to the eye in F; the angle 86 F becomes of about fifty one degrees, and forty four minutes. In like manner, ſince G H I K L M is the way of an effectual ray from the loweſt part of the ſun to the eye, the angle 86 M becomes nearly of fifty two degrees, and ſixteen minutes.

Since then we admit ſeveral rays to be effectual, beſide thoſe from the centre of the ſun; what we have ſaid of the *ſhade* will need ſome alteration: for of the three rays deſcribed (*Fig*. 45 and 46.) only the two extreme ones will have a ſhadow joined to them, and that only on the outer ſide. Hence it is evident that theſe rays are perfectly diſpoſed to exhibit all the colours of the priſm.

For the great quantity of denſe or intenſe light, *i. e.* the bundle of rays collected together in a certain point, *v. gr.* in the point of reflection of the effectual rays, may be accounted as a lucid or radiant body, terminated all around by *ſhade*. But the ſeveral rays thus emitted to the eye are both of different colours, that is, fitted to excite in us the ideas of different colours, and are differently refracted out of the water into air, notwithſtanding their falling alike upon the refracting ſurface. See Colour, *&c.*

Hence it follows that the different or heterogenous rays will be ſeparated from one another, and will tend ſeparate ways; and the homogenous rays will be collected, and tend the ſame way: And therefore this lucid point of the drop, wherein the refraction is effected, will appear fringed, or bordered with ſeveral colours; that is, *red*, *green* and *blue* colours will ariſe from the extremes of the red, green and blue rays of the ſun tranſmitted to the eye from ſeveral drops one higher than another; after the ſame manner as is done in viewing lucid, or other bodies through a priſm. See Prism.

Thus, adds Sir Iſaac Newton, the rays that differ in refrangibility will emerge at different angles; and conſequently, according to their different degrees of refrangibility, emerging moſt copiouſly at different angles, will exhibit different colours in different places. See Refrangibility.

A great number then of theſe little globules, being diffuſed in the air, will fill the whole ſpace with theſe different colours; provided they be ſo diſpoſed as that effectual rays may come from them to the eye; and thus will the *rainbow* at length ariſe.

Now to determine what that *diſpoſition* muſt be; ſuppoſe a right line drawn, from the centre of the ſun through the eye of the ſpectator, as the line VX, (*Fig*. 46.) called the *line of aſpect*: being drawn from ſo remote a point, it may be eſteemed parallel to all other lines drawn from the ſame point: but a right line falling on two parallels makes the alternate angles. See Alternate.

If, then, an indefinite number of lines be imagined drawn from the ſpectator's eye to a part oppoſite to the ſun where it rains; which lines make different angles with the line of aſpect, equal to the angles of refraction of the differently refrangible rays, *e. gr.* angles of 41°, 46′, and of 41°, 30′, and of 41°, and 40′. Theſe lines falling on drops of rain illumined by the ſun, will make angles of the ſame magnitude with rays drawn from the centre of the ſun to the ſame drops. And therefore the lines thus drawn from the eye will repreſent the effectual rays that occaſion the ſenſation of any colour.

That, *e. gr.* making an angle of 41°, 46′, repreſenting the leaſt refrangible or red rays of the ſeveral drops, and of 41°, 40′, the moſt refrangible or violet rays: the intermediate colours and refrangibilities will be found in the intermediate ſpace. See Red, *&c.*

Now, it is known that the eye being placed in the vertex of a cone, ſees objects upon its ſurface as if they were in a circle; and the eye of our ſpectator is here in the common vertex of ſeveral cones, formed by the ſeveral kinds of efficacious rays, with the line of aſpect. And in the ſurface of that whoſe angle at the vertex or eye is the greateſt, and wherein the others are included, are thoſe drops or parts of drops which appear red; and in the ſurface of that cone whoſe angle is leaſt, are the purple drops: and in the intermediate cones are the green, blue, *&c.* drops. Hence then ſeveral kinds of the drops muſt appear as if diſpoſed into ſo many circular coloured faſciæ or arches, as we ſee in the *rainbow*.

This part of the ſolution Sir Iſaac Newton expreſſes more artfully thus: ſuppoſe O (*Fig*. 48.) the eye, and O P a line parallel to the ſun's rays, and let P O E, P O F be angles of 40°, 17′, and 42°, 2′. And ſuppoſe the angles to turn about their common ſide O P, with their other ſides OE and OF, they will deſcribe the bounds or verges of the *rainbow*.

For, if E, F be drops placed any where in the conical ſurface deſcribed by O E, O F; and be illuminated by the ſun's rays S E, S F; the angle S E O being equal to the angle POE or 40°, 17′, ſhall be the greateſt angle in which the moſt refrangible rays can, after reflection, be refracted to the eye; and therefore all the drops in the line O E ſhall ſend the moſt refrangible rays moſt copiouſly to the eye, and thereby ſtrike the ſenſes with the deepeſt violet colour in that region.

And in like manner the angle S F O being = to the angle POF = 42°, 2′, ſhall be the greateſt, in which the leaſt refrangible rays after one reflection can emerge out of the drops; and theſe rays ſhall come moſt copiouſly to the eye, from the drops in the line OF, and ſtrike the ſenſes with the deepeſt red colour in that region.

And by the ſame argument the rays, which have intermediate degrees of refrangibility, ſhall come moſt copiouſly from drops between E and F, and ſo ſtrike the ſenſes with the intermediate colours, in the order which their degrees of refrangibility require; that is, in the progreſs from E to F, or from the inſide of the bow to the outſide, in this order, *violet*, *indico*, *blue*, *green*, *yellow*, *orange*, *red*: though the violet, by the mixture of the white light of the clouds, will appear faint, and incline to a purple.

And ſince the lines O E, O F may be ſituated any where in the abovementioned conical ſurface; what is ſaid of the drops and colours in theſe lines is to be underſtood of the drops and colours throughout the whole ſuperficies. Thus is the *primary* or *inner bow* formed.

Secondary, or *outer* Rainbow— As to the ſecondary or fainter *bow* uſually ſurrounding the former; in aſſigning what drops would appear coloured, we excluded ſuch lines as drawn from the eye, making angles a little greater than 42°, 2′, ſhould fall upon; but not ſuch as ſhould contain angles much greater.

For, if an indefinite number of ſuch lines be drawn from the ſpectator's eye, ſome whereof make angles of 50°, 57′, with the line of aſpect; *e. gr.* O G; other angles of 54°, 7′, *e. gr.* O H; thoſe drops whereon theſe lines fall, muſt of neceſſity exhibit colours. Particularly thoſe of 50°, 57′.

E. gr. the drop G will appear red; the line G O being the ſame with an effectual ray, which, after two reflections and two refractions, exhibits a red colour. Again, thoſe drops which receive lines of 54°. 7′, *e. gr.* the drop H will appear purple, the line O H being the ſame with an effectual ray which, after two reflections and two refractions, exhibits purple.

Now there being a ſufficient number of theſe drops, it is evident there muſt be a *ſecond rainbow*, formed after the like manner as the firſt.

Thus Sir Iſaac Newton: in the leaſt refrangible rays, the leaſt angle at which a drop can ſend effectual rays after two reflections, is found by computation to be 50°, 57′, and in the moſt refrangible the leaſt angle is found 54°, 7′.

Suppoſe, then, O the place of the eye, as before, and P O G, P O H to be angles of 50°, 57′; and 54°, 7′. And theſe angles to be turned about their common ſide O P; with their other ſides O G, O H, they will deſcribe the verges or borders of the *rainbow*, CHDG.

For if GH be drops placed any where in the conical ſuperficies deſcribed by OG, OH, and being illuminated by the ſun's rays; the angle SGO being equal to the angle POG or 50°, 57′, ſhall be the leaſt angle, in which the then leaſt refrangible rays, can, after two reflections, emerge out of the drops; and therefore the leaſt refrangible rays ſhall come moſt copiouſly to the eye from the drops in the line O G, and ſtrike the ſenſes with the deepeſt red in that region.

And the angle S H O being equal to P O H, 54°, 7′, ſhall be the leaſt angle in which the moſt refrangible rays, after two reflections, can emerge out of the drops; and therefore thoſe rays ſhall come moſt copiouſly to the eye from the drops in the line O H, and ſo ſtrike the ſenſes with the deepeſt violet in that region.

And by the ſame argument, the drops in the region between G and H, ſhall ſtrike the ſenſes with the intermediate colours, in the order which their degrees of refrangibility require; that is, in the progreſs from G to H, or from the inſide of the bow to the outer, in this order: *red, orange, yellow, green, blue, indico, violet.*

And ſince the lines O G, O H, may be ſituated any where in the conical ſurface; what is ſaid of the drops and colours in theſe lines, is to be underſtood of the drops and colours every where in theſe ſuperficies.

Thus are formed two bows, an *interior* and ſtronger, by one reflection; and an *exterior* and fainter by two; the light becoming weaker and weaker by every reflection.

Their colours will lie in a contrary order to one another; the firſt having the red without, and the purple within; and the ſecond the purple without and red within; and ſo of the reſt.

Artificial RAINBOW — This doctrine of the *rainbow* is confirmed by an eaſy experiment: for upon hanging up a glaſs globe full of water in the ſun-ſhine, and viewing it in ſuch a poſture as that the rays which come from the globe to the eye, may, with the ſun's rays, include an angle either of 42°, or 50°; if *e. gr.* the angle be about 42°, the ſpectator, ſuppoſed at O, will ſee a full red colour in that ſide of the globe oppoſite to the ſun, as at F. And if that angle be made a little leſs, ſuppoſe by depreſſing the globule to E, the other colours, yellow, blue and green, will appear ſucceſſively, in the ſame ſide of the globe, alſo exceedingly bright.

But if the angle be made about 50°, ſuppoſe by raiſing the globule G, there will appear a red coulour in that ſide of the globe towards the ſun; though that ſomewhat faint; and if the angle be made greater, ſuppoſe by raiſing the globe to H; the red will change ſucceſſively to the other colours, yellow, green, and blue.

The ſame thing is obſerved in letting the globe reſt, and raiſing, or depreſſing the eye to make the angle of a juſt magnitude.

Dimenſion of the RAINBOW—Des Cartes firſt determined it's diameter by a tentative, and indirect method; laying it down that the magnitude of the bow depends on the degree of refraction of the fluid; and aſſuming the ratio of the ſine of incidence to that of refraction, to be in water as 250 to 187. See REFRACTION.

But Dr. Halley has ſince, in the *Philoſoph. Tranſ.* given us a ſimple, direct method of determining the diameter of the *rainbow* from the ratio of refraction of the fluid being given; or *vice verſa*, the diameter of the *rainbow* being given, to determine the refractive power of the fluid. The praxis is as follows.

Firſt, *The ratio of refraction being given; to find the angles of incidence, and refraction of a ray which becomes effectual after any given number of reflections*—Suppoſe any given line as A C (*Tab. Optics, Fig.* 49.) which divide in D; ſo, as that A C be to A D in the ratio of refraction; and again divide it in E, ſo as A C be to A E as the given number of reflections increaſed by unity, is to unity; with the diameter CE deſcribe a ſemicircle C B E, and from the centre A with the radius A D deſcribe an arch D B interſecting the ſemicircle in B. Then drawing A B, C B; A B C or it's complement to two right angles, will be the angle of incidence; and A C B the angle of refraction required.

Secondly, *The ratio of refraction, and any angle of incidence being given to find the angle which a ray of light emerging out of a refracting ſphere, after a given number of reflections, makes with the line of aſpect, or an incident ray; and conſequently to find the diameter of the rainbow* — The angle of incidence, and the ratio of refraction being given, the angle of refraction is given; which angle being multiplied by double the number of reflections increaſed by 2, and double the angle of incidence ſubſtracted from the product, the angle remaining is the angle ſought.

Thus ſuppoſing, the ratio of refraction to be, as Sir Iſaac Newton has determined it, *viz.* as 108 to 81, in the red rays, as 109 to 81 for the blue rays, *&c.* the preceding problem will give the diſtance of the colours in the

I. RAINBOW,	Red	42°	11′	The ſpectator's back being turned to the ſun.
	Violet	40	16	
II. RAINBOW,	Red	50	58	
	Violet	54	9	

If the angle made by a ray after three or four reflections, were required, and therefore the diameters of the third and fourth *rainbow*, (which are ſcarce ever ſeen, by reaſon of the great diminution of the rays, by ſo many repeated reflections) they will be found,

III. RAINBOW,	Red	41°	37′	The ſpectator being turned towards the ſun.
	Violet	37	9	
IV. RAINBOW,	Red	43	52	
	Violet	49	34	

Hence, the *breadth of the rainbows* is eaſily found: for the greateſt ſemidiameter of the firſt bow, *i. e.* from red to red being 42°, 11′, and the leaſt, *viz.* from violet to violet 40°, 16′; the breadth of the *faſcia* or *bow*, meaſured a-croſs from red to violet will be 1°, 45′, and the greateſt diameter of the ſecond bow being 54°, 9′, and the leaſt 50°, 58′ the breadth of the *faſcia* will be 3°, 10′. And hence the diſtance between the two will be found 8°, 15′.

In theſe meaſures the ſun is only eſteemed a point; wherefore as his diameter is really about 30 ſo much muſt be added to the breadth of each *faſcia* or *bow*, from red to violet, and ſo much be ſubſtracted from the diſtance between them.

This will leave the breadth of the *primary bow*, 2°, 15, that of the *ſecondary bow* 3°, 40′, and the interval between the bows 8°, 25′; which dimenſions deduced by calculation, Sir Iſaac Newton aſſures us from his own obſervations, agree very exactly with thoſe found by actual menſuration in the heavens.

Particular phænomena of the RAINBOW—from this theory of the *rainbow*, all the particular phænomena are eaſily deduced: hence we ſee why the Iris is always of the ſame breadth; by reaſon the intermediate degrees of refrangibility of the rays between red and violet, which are it's extreme colours, are always the ſame.

Secondly, Why it is more diſtinctly terminated on the ſide of the red, than on that of the violet; there being no efficacious rays in the ſpace adjoining to the red drops, *i. e.* to the ſpace between the bows; whence it terminates abruptly; whereas in the ſpace on the ſide of the violet ones there are ſome rays emitted to the eye, which though too feeble to affect it ſtrongly, yet have this effect, that they ſoften the violet edge inſenſibly, ſo that it is difficult to determine preciſely where it terminates.

Thirdly, why the *bow* ſhifts it's ſituation as the eye does; and, as the popular phraſe has it, *flies thoſe who follow it, and follows thoſe that fly it?* the coloured drops being diſpoſed under a certain angle about the line of aſpect, which is different in different places: whence, alſo, it follows that every different ſpectator ſees a different bow.

Fourthly, Why the bow is ſometimes a larger portion of a circle, ſometimes a leſs? it's magnitude depending on the greater, or leſs part of the ſurface of the cone, above the ſurface of the earth at the time of it's appearance; and that part being greater or leſs as the line of aſpect is more inclined or oblique to the ſurface of the earth; which inclination, or obliquity, is greater as the ſun is higher: whence, alſo, the higher the ſun, the leſs the *rainbow.*

Fifthly, Why the bow never appears when the ſun is above a certain altitude? the ſurface of the cone wherein it ſhould be ſeen, being loſt in the ground, at a little diſtance from the eye, when the ſun is above 42° high.

Sixthly, Why the bow never appears greater than a ſemicircle, on a plane? ſince be the ſun never ſo low, and even in the horizon; the centre of the bow is ſtill in the line of aſpect; which, in this caſe, runs along the earth, and is not all raiſed above the ſurface.

Indeed, if the ſpectator be placed on a very conſiderable eminence, and the ſun in the horizon; the line of aſpect, wherein the centre of the bow is, will be notably raiſed above the horizon, (conſidering the magnitude of the circle whereof the bow uſes to be a part.) Nay, if the eminence be very high, and the rain near, it is poſſible the bow may be an entire circle.

Seventhly, How the bow may chance to appear inverted, *i. e.* the concave ſide be turned upwards? to wit, a cloud happening to intercept the rays, and prevent their ſhining on the upper part of the arch: in which caſe only the lower part appearing, the bow will ſeem as if turned upſide down: which probably has been the caſe in ſeveral prodigies of this kind, related by authors.

Indeed the bow may appear inverted from another cauſe: for, if, when the ſun is 41°, 46′ high, his rays fall upon the ſmooth ſurface of ſome ſpacious lake, in the middle whereof a ſpectator is placed; and if at the ſame time there be rain falling to which the rays may be reflected from the lake: it will be the ſame as if the ſun ſhould ſhine below the horizon, and the line of view be extended upwards: thus the ſurface of the cone wherein the coloured drops are to be placed, will be wholly above the ſurface of the earth. But ſince the upper part will fall among the unbroken clouds, and only the lower part be found among the drops of rain, the arch will be inverted.

Eighthly, why the bow ſometimes appears inclined; the accurate roundneſs of the bow depending on it's great diſtance, which prevents us from judging of it exactly: if the rain which exhibits it, chance to be much nearer, we ſhall ſee it's irregularities; and if the wind in that caſe drive the rain ſo as the higher part be farther from the eye than the lower, the bow will appear inclined.

Ninthly, Why the legs of the *rainbow* ſometimes appear unequally diſtant? If the rain terminate on the ſide of the ſpectator, in a plane ſo inclined to the line of aſpect as to make an acute angle on the left hand, and an obtuſe angle on the right; the ſurface of the cone which determines what drops will appear, will fall upon them in ſuch manner as that thoſe on the left hand will appear farther from the eye than thoſe on the right. For the line of aſpect being perpendicular to the plane of the bow, if you ſuppoſe two rectangular triangles, a right and left, the cathetus of each to be the line of view, and the baſe of the ſemidiameter of the bow, inclined as above: it is evident, ſince thoſe angles of the triangles, next the eye, muſt always be the ſame, (*viz.* 43° in the inner bow) the baſis of the right-hand triangle will appear much longer than that of the left.

Lunar RAIN-BOW — The moon, ſometimes, alſo exhibits the phænomenon of an Iris, or bow; by the refraction of her rays in the drops of rain in the night-time. See MOON.

Ariſtotle ſays, he was the firſt that ever obſerved it; and adds that it never happens, *i. e.* is never viſible, but at the time of the full moon; her light at other times being too faint to affect the ſight after two refractions, and one reflection.

The lunar Iris has all the colours of the ſolar, very diſtinct and pleaſant; only faint, in compariſon of the other; both from the different intenſity of the rays, and the different diſpoſition of the medium.

In that mentioned *Philoſ. Tranſact.* N°. 331. Mr. Thoresby obſerves the largeneſs of the arch was not ſo much leſs than that of the ſun, as the different dimenſions of their bodies, and their diſtances from the earth ſhould ſeem to require: but, as to it's intireneſs and the beauty of it's colour, it was admirable. It continued about 10 minutes before the interpoſition of a cloud hindered it's obſervation.

Marine RAIN-BOW—The *marine* or *ſea bow*, is a phænomenon ſometimes obſerved in a much agitated ſea; when the wind ſweeping part of the tops of the waves, carries them aloft; ſo that the ſun's ray falling upon them, are refracted, *&c.* as in a common ſhower; and paint the colours of the bow.

F. Bourzes, in the *Philoſ. Tranſact.* obſerves, that the colours of the marine *rainbow* are leſs lively, diſtinct, and of leſs duration than thoſe of the common bow; that there are ſcarce above two colours diſtinguiſhable, a dark yellow on the ſide next the ſun, and a pale green on the oppoſite ſide.

But theſe bows exceed as to number, there being ſometimes 20 or 30 ſeen together: they appear at noon day, and in a poſition oppoſite to that of the common bow, *i. e.* the concave ſide is turned upwards, as, indeed, it is neceſſary it ſhould be, from what we have ſhewn in accounting for the phænomena of the ſolar bow.

To this claſs of bows may be referred a kind of *white colourleſs rainbows*, which Mentzelius, and others, affirm to have ſeen at noon day. M. Mariotte in his fourth *Eſſai de Phyſique*, ſays, theſe bows are formed in miſts, as the others are in ſhowers; and adds, that he has ſeen ſeveral, both after ſun riſing and in the night.

The want of colours he attributes to the ſmallneſs of the vapours which compoſe the miſt: we ſhould rather account for it from the exceeding tenuity of the little *veſiculæ* of the vapour; which being in effect only little watery pellicles bloated with air, the rays of light undergo but little refraction in paſſing out of air into them; too little to ſeparate the differently coloured rays, *&c.*

Hence the rays are reflected from them, compounded as they came, that is, white. See REFRACTION.

Rohault mentions coloured *rainbows* on the graſs; formed by the refractions of the ſun's rays in the morning dew. *Trait. de Phyſ.*

RAIN-*water*. See the article WATER.

RAISED-*airs*. } See the articles { AIR.
RAISED-*plan*. } { PLAN.

RAISER, in building, a board ſet on-edge under the fore ſide of a ſtep, a ſtair, *&c.* See STAIR, *&c.*

RAISING, in the manage, one of the three actions of a horſe's legs; the other two being the ſtay, and the tread. See AIR, *&c.*

The *raiſing* or lifting up of his leg in caprioles, curvets, *&c.* is eſteemed good, if he perform it hardily and with eaſe; not croſſing his legs, nor carrying his feet too much out or in; yet bending his knees as much as is needful.

RAISING-*pieces*, or REASON-*pieces*, in architecture, are pieces that lie under the beams, and over the poſts or puncheons.

RAISINS, grapes prepared by drying them in the ſun, or the air; to fit them for keeping, and for ſome medicinal purpoſes. See CURRANTS.

Of theſe there are various kinds: as, *raiſins* of Damaſcus, thus called from the capital city of Syria, in the neighbourhood whereof they are cultivated. They are much uſed in the compoſition of ptiſans, together with jujubes and dates; are broad, flat and ſeeded, of the ſize of the thumb; whence it is eaſy judging of the extraordinary bulk of the grape, when freſh. Travellers tell us of bunches weighing 25 pounds. Their taſte is faintiſh and diſagreeable.

Raiſins of the ſun, are a kind of *raiſins* brought from Spain, of a reddiſh or blueiſh colour, ſeeded, very agreeable to eat.

There are various other ſorts, denominated from the place where they grow, or the kind of grape, *&c.* as *raiſins* of Calabria, Muſcadine *raiſins*, &c.

RAITING, or RATING, the laying of hemp, flax, timber, *&c.* when green, in a pond or running water, to ſeaſon and diſpoſe it for future uſe.

RAKE, of a ſhip, is ſo much over her hull as over-hangs at both ends of her keel. See OVER RAKE.

That part of it which is before, is called the *rake forward on*: and that part which is at the ſetting on of the ſtern poſt, is called her *rake-aſt*, or *aſt-ward on.*

When a ſhip hath but a ſmall *rake* forward on, but is built with her ſtern too ſtrait up, ſhe is called *blouffe-beaded.*

RAKE of the rudder, is the hindermoſt part of it. See RUDDER.

RAKE, among hunters. See the article RAG.

RAKING, of a horſe, is the drawing his ordure with the hand out of the fundament, when he is coſtive and cannot dung. In order to this the hand muſt be anointed with ſallet-oil or butter.

A horſe is alſo ſaid to *rake*, when being ſhoulder-ſplaid, or having ſtrained his fore-quarters, he goes ſo lame as to drag one of his fore-legs in a circle.

RAKING-*table*, or RAKED *table*, among architects, a member hollowed in the ſquare of a pedeſtal, or elſewhere. See CAVETTO, SCOTIA, *&c.*

RALLYING, in war, the re-aſſembling, or calling together of troops broken, routed, and put to flight.

RAM, in aſtronomy. } See the article ARIES.
Battering RAM. }

RAMADAN, a ſort of lent obſerved by the Mahometans; during which they faſt the whole day, with ſuch extreme ſuperſtition, that they dare not waſh their mouth, nor even ſwallow their ſpittle. See LENT and FASTING.

The men indeed are allowed to bathe themſelves; but it is on condition they do not plunge the head under water, leſt ſome drops enter by the mouth or ears, *&c.*—But for the women they are ſtrictly forbid bathing, for fear of taking in water at the pudendum—To make amends, they feaſt all night; and uſually ſpend more this month than in ſix others.

RAMAGE, a term uſed for the boughs or branches of trees. See BRANCH, *&c.* Hence,

RAMAGE *hawk*, or *falcon*, one that is wild and coy, as having been long among the boughs, preying for itſelf.

All falcons retain this name till they have left the aery; being ſo called in May, June, July, and Auguſt—Theſe are very rarely reclaimed. See HAWK, and FALCON.

RAMAGE *velvet*. See the article VELVET.

RAMIFICATION, the production of boughs or branches; or of figures reſembling branches. See BRANCH.

RAMIFICATIONS, in anatomy, are the diviſions of the arteries, veins, and nerves, ariſing from ſome common trunk—See *Tab. Anat.* (*Angeiol.*) *fig.* 1. *n.* 18. 18. *fig.* 4. *fig.* 5. See alſo ARTERY, VEIN, and NERVE.

RAMMER, or BEETLE, an inſtrument for driving down ſtones or piles into the ground; or for beating the earth, and making it more ſolid for a foundation. See FOUNDATION.

RAMMER *of a gun*, the *gun-ſtick*; a rod or ſtaff uſed in charging a gun, to drive home the powder to the breech, as alſo the ſhot, and the wad, which keeps the ſhot from rolling out. See CHARGE.

The rammer of a great gun has a round piece of wood at one end; the other is uſually rolled in a piece of ſheep-skin, fitted to the bore of the piece, in order to clear her after ſhe has been diſcharged: which they call *ſpunging the piece.* See SPUNGE, and SPUNGING.

RAMPANT*, in heraldry, is applied to a lion, bear, leopard, or other beaſt, in a poſture of climbing, or ſtanding upright on his hind-legs, and rearing up his fore-feet; ſhewing only half his face, as one eye and one ear.

* The term is french, and ſignifies literally, *creeping.*

It is different from *ſaliant*, which denotes a poſture leſs erect, or ſomewhat ſtooping forwards, as if making a ſally.

This poſture is to be ſpecified in blazoning in all animals, except in the lion and griffon; it being their natural ſituation.

RAMPART*, or RAMPIER, in fortification, a maſſy bank, or elevation of earth raiſed about the body of a place, to cover it from the great ſhot; and formed into baſtions, curtins, *&c.*—See *Tab. Fort. fig.* 21. *lit. rr.* See alſo FORTREESS, WALL, BASTION, *&c.*

* The word is formed from the Spaniſh *Amparo*, defence, covering.

Upon the *rampart* the ſoldiers continually keep guard, and pieces of artillery are planted for the defence of the place—Hence, to ſhelter the guard from the enemies ſhot, the outſide of the *rampart* is built higher than the inſide, *i. e.* a parapet is raiſed upon it with a platform. See PARAPET, and PLATFORM—Hence, alſo, earth not being capable to be raiſed perpendicularly, like ſtone; the *rampart* is built with a talus or ſlope, both on the inner and outer-ſide. See TALUS.

The *rampart* is ſometimes lined, *i. e.* fortified with a ſtone wall within ſide, otherwiſe it has a berme. See BERME—It is incompaſſed with a moat or ditch, out of which the earth that forms the *rampart* is dug. See DITCH.

The height of the *rampart* ſhould not exceed three fathom; this being ſufficient to cover the houſes from the battery of the cannon: neither ought it's thickneſs to be above 10 or 12, unleſs more earth be taken out of the ditch, than can be otherways beſtowed.

The *ramparts* of half-moons are the better for being low; that the ſmall fire of the defendants may the better reach the bottom of the ditch: but yet they muſt be ſo high, as not to be commanded by the covert-way.

Rampart is alſo uſed in civil architecture, for the ſpace left void between the wall of a city and the next houſes.

This is what the Romans called *pomœrium*, wherein it was forbid to build; and where they planted rows of trees, for the people to walk and amuſe themſelves under.

RAMUS, in anatomy, *&c.* a branch of a greater veſſel. See VESSEL.

Ramus *anterior* is particularly uſed for a branch of the ſubcutaneous vein, paſſing under the muſcles of the ulna.

Ramus poſterior, denotes a branch of the ſame vein running near the elbow.

Rana. See the article RANULA.

RANCID*, **Rancidus**, denotes a fatty ſubſtance that is become mouldy, or muſty; or that has contracted an ill ſmell, by being kept cloſe. See MOULDINESS.

* The word is particularly underſtood of old ruſty bacon. It comes from the Latin *rancidus*, of *ranceo*, to be rank.

RANDOM-*ſhot*, a ſhot made when the muzzle of a gun is raiſed above the horizontal line, and is not deſigned to ſhoot directly, or point-blank. See GUNNERY.

The utmoſt *random* of any piece is about ten times as far as the bullet will go point-blank; and the bullet will go fartheſt when the piece is mounted to about 45 degrees above the level-range. See RANGE.

The ſpace or diſtance of the *random*, is reckoned from the platform to the place where the ball firſt grazes.

RANFORCE *ring*. See RE-IN-FORCED *ring*.

RANGE, in gunnery, the path of a bullet, or the line it deſcribes, from the mouth of the piece, to the point where it lodges. See GUN, BULLET, RANDOM, *&c.*

If the piece be laid in a line parallel to the horizon, it is called the *right* or *level range*. See HORIZONTAL.

If it be mounted to 45 degrees, the ball is ſaid to have the *utmoſt range*; and ſo proportionably; all others between 00 degrees and 45°, being called the *intermediate ranges*. See GUNNERY, PROJECTILE, RANDOM, *&c.*

Amplitude of the RANGE *of a projectile*. See AMPLITUDE.

RANGER, a ſworn officer of a foreſt, whoſe buſineſs it is to walk daily through his charge, to drive back the deer out of the purlieus or diſafforeſted places, into the foreſt lands; and to preſent all treſpaſſes done in his bailiwick, at the next court held for the foreſt. See FOREST and PURLIEU.

The *ranger* is made by the king's letters, and has a fee paid yearly out of the exchequer, and certain fee-deer.—In the charter de foreſta, mention is made of twelve kind of *rangers*.

RANGES, in a ſhip, are two pieces of timber, going a-croſs from ſide to ſide; one aloft, on the fore caſtle, a little abaft the fore-maſt; and the other in the beak-head before the wouldings of the bow-ſprit.

RANGING, in war, the diſpoſing of troops in a condition proper for engagement, or for marching. See ARMY.

The army was *ranged* in form of battle to receive the enemy; *ranged* in three columns, for a march, *&c.* See LINE, COLUMN, *&c.*

In building, the ſide of a work that runs ſtrait, without breaking into angles, is ſaid to *range*, or *run range*.

RANK, a due order; or a place allotted a thing ſuitably to it's nature, quality, or merit. See ORDER.

Kings are perſons of the firſt *rank* on earth: In cavalcades, proceſſions, *&c.* every perſon is to obſerve his *rank*, See PRECEDENCE.

Rank, in military diſcipline, denotes a ſeries or row of ſoldiers, placed ſide by ſide; a number of which *ranks* form the depth of the ſquadron or battalion, as a number of files does the width. See FILE.

To *cloſe the rank*, is to bring the men nearer: to *open*, to ſet them further a-part.—To *double the ranks*, is to throw two into the ſpace of one, by which the files are thinned.

Rear **Rank**. See the article REAR.

Rank, in reſpect of ſhips. See RATE.

RANSOM, a ſum of money, paid for the redemption of a perſon out of ſlavery; or for the liberty of a priſoner of war. See REDEMPTION.

In our law-books, *ranſom* is alſo uſed for a ſum paid for the pardoning of ſome notorious crime.

Horn makes this difference between *ranſom* and *amerciament*, that *ranſom* is the redemption of a corporal puniſhment due to any crime. See AMERCEMENT.

When one is to make a fine and *ranſom*, the *ranſom* ſhall be treble the fine. *Crompt. Juſt.*

RANT, in the drama, an extravagant flight of paſſion; overſhooting nature and probability. See PROBABILITY.

Lee's tragedies abound with *rants*: yet the rankeſt, it is obſerved, frequently meet with applauſe on the ſtage.

We find inſtances of *rants*, even in our ſevereſt poets. Such, *e. gr.* is that in the beginning of Ben Johnſon's *Catiline*, where the parricide ſpeaking to Rome, ſays, *I'd plough up rocks, ſteep as the Alps, in duſt; and lave the Tyrrhene waters into clouds; but I would reach thy head!*

RANULA, or **Rana**, in medicine, a tumour under the tongue, which like a ligament hinders a child from ſpeaking, or ſucking.

The Ranula ſub lingua, is ſometimes the ſame with what we popularly call being *tongue-tied*: a defect which is uſually cauſed by a ſhort frænum not permitting the tongue to perform it's proper motions.—Though at other times, there is a ſtrong concretion, or rather impoſthume under the tongue, which is the proper *ranula*, by the Greeks called Βατραχιον.

This impoſthume contains in a bag a matter that is ſometimes œdematous, at other times melicerous, ſcirrhous, black, or livid; in which caſes the operation of cutting is dangerous; and grows to the magnitude of a bean or cheſnut. *Shaw.*

RANULARES, or **Raninæ** *venæ*, in anatomy, two veins under the tongue, ariſing from the external jugular, and running on either ſide the linea mediana. See TONGUE.

Theſe veins are opened with good ſucceſs in quinzies.—They take their denomination from a reſemblance of their ſtate to that of little frogs, called in Latin, *ranulæ*, becauſe never out of water.

RAPACIOUS *animals*, in the general, are ſuch as live upon prey. See ANIMAL.

Naturaliſts divide birds into *rapacious*, *carnivorous*, and *frugivorous*. See BIRD.

The characteriſtic notes of *rapacious* birds are, that they have a great head, and a ſhort neck; hooked, ſtrong, and ſharp pointed beak and talons, fitted for tearing of fleſh; ſtrong and brawney thighs, for ſtriking down their prey; a broad thick fleſhy tongue like that of human creatures: 12 feathers in their train; and 24 flag feathers in each wing. The two appendices or blind guts, are always very ſhort. See EAGLE, FALCON, HAWK, *&c.*

Rapacious Birds have a membranous ſtomach; and not a muſculous one, or a gizzard, ſuch as birds have that live on grain. See STOMACH and DIGESTION.

They are very ſharp ſighted; and gather not in flocks, but generally ſpeaking, are ſolitary; though vultures will fly 50 or 60 in a company.

RAPE, **Raptus**, in law, a *raviſhing*; or the having carnal knowledge of a woman by force, and againſt her will.

If the woman conceive, the law eſteems it no *rape*; from an opinion that ſhe cannot conceive unleſs ſhe conſent. Coke *on Litt.* lib. 2. cap. 11.

This offence is felony in the principal and his aiders, by ſeveral ſtatutes; and the criminal is excluded from the benefit of his clergy. See FELONY.

By the civil law, *C. de raptu virginum*, raviſhing is decreed capital, even though the woman, being a maid, or widow, conſent to marry the raviſher. In France, the civil law conſtitution obtains, though it had been ſuſpended ſome time by the ordinances which allowed the man to marry the woman with her conſent. By an ordinance in 1639, the *rape* of a girl or a boy are put on the ſame footing. Fleta obſerves that by our laws the complaint muſt be made within forty days, elſe the woman may not be heard. *lib.* 3. *cap.* 5. All carnal knowledge of a maid before ten years of age, is deemed by the law a *rape*. *Stat. An.* 8. *Eliz. cap.* 6.

In Bracton's time, the *raptor*, or *raviſher*, was puniſhed with the loſs of his eyes and teſticles, *quia colorem ſtupri induxerunt.* 3 Inſt. fol. 60.

The civilians make another kind of *rape*, called *ſubornatio*, *rape of ſubornation*, or *ſeduction*; which is when a perſon ſeduces, or entices a maid to uncleanneſs, or even marriage, and that by gentle means; provided there be a conſiderable diſparity in age or condition between the parties. In this caſe, the father and mother intent their action reciprocally for the *crimen raptus*, or *ſubornationis*.

The French laws make no difference between the *rape* of violence, and that of ſolicitation, or ſubornation; they make both capital.—This kind of *rape* our laws call *raviſhment*. See RAVISHMENT.

Rape, of the foreſt, is a treſpaſs committed in the foreſt by violence. See FOREST.

This is mentioned in the laws of Henry. I. as one of the crimes cognizable alone by the King.

Rape, is alſo a name given the wood or ſtalks of the cluſters of grapes, when dried and freed from the fruit.

The *rape* is uſed in making vinegar; ſerving to heat, and ſour the wine: but it is firſt put into a place to ſour itſelf before it be caſt into the vinegar veſſel; to which end, preſently after the vintage, it is carefully put up in barrels, leſt it take air, otherwiſe it would heat itſelf, and be ſpoiled: There is no other way of keeping *rape*, hitherto diſcovered, but to fill the veſſel, wherein it is contained, with wine or vinegar. See VINEGAR, and WINE.

on the right. For the line of aſpect being perpendicular to the plane of the bow, if you ſuppoſe two rectangular triangles, a right and left, the cathetus of each to be the line of view, and the baſe of the ſemidiameter of the bow, inclined as above: it is evident, ſince thoſe angles of the triangles, next the eye, muſt always be the ſame, (*viz.* 43° in the inner bow) the baſis of the right-hand triangle will appear much longer than that of the left.

Lunar RAIN-BOW — The moon, ſometimes, alſo exhibits the phænomenon of an Iris, or bow; by the refraction of her rays in the drops of rain in the night-time. See MOON.

Ariſtotle ſays, he was the firſt that ever obſerved it; and adds that it never happens, *i. e.* is never viſible, but at the time of the full moon; her light at other times being too faint to affect the ſight after two refractions, and one reflection.

The lunar Iris has all the colours of the ſolar, very diſtinct and pleaſant; only faint, in compariſon of the other; both from the different intenſity of the rays, and the different diſpoſition of the medium.

In that mentioned *Philoſ. Tranſact.* N°. 331. Mr. Thoresby obſerves the largeneſs of the arch was not ſo much leſs than that of the ſun, as the different dimenſions of their bodies, and their diſtances from the earth ſhould ſeem to require: but, as to it's intireneſs and the beauty of it's colour, it was admirable. It continued about 10 minutes before the interpoſition of a cloud hindered it's obſervation.

Marine RAIN-BOW—The *marine* or *ſea bow*, is a phænomenon ſometimes obſerved in a much agitated ſea; when the wind ſweeping part of the tops of the waves, carries them aloft; ſo that the ſun's ray falling upon them, are refracted, &c. as in a common ſhower; and paint the colours of the bow.

F. Bourzes, in the *Philoſ. Tranſact.* obſerves, that the colours of the marine *rainbow* are leſs lively, diſtinct, and of leſs duration than thoſe of the common bow; that there are ſcarce above two colours diſtinguiſhable, a dark yellow on the ſide next the ſun, and a pale green on the oppoſite ſide.

But theſe bows exceed as to number, there being ſometimes 20 or 30 ſeen together: they appear at noon day, and in a poſition oppoſite to that of the common bow, *i. e.* the concave ſide is turned upwards, as, indeed, it is neceſſary it ſhould be, from what we have ſhewn in accounting for the phænomena of the ſolar bow.

To this claſs of bows may be referred a kind of *white colourleſs rainbows*, which Mentzelius, and others, affirm to have ſeen at noon day. M. Mariotte in his fourth *Eſſai de Phyſique*, ſays, theſe bows are formed in miſts, as the others are in ſhowers; and adds, that he has ſeen ſeveral, both after ſun riſing and in the night.

The want of colours he attributes to the ſmallneſs of the vapours which compoſe the miſt: we ſhould rather account for it from the exceeding tenuity of the little *veſiculæ* of the vapour; which being in effect only little watery pellicles bloated with air, the rays of light undergo but little refraction in paſſing out of air into them; too little to ſeparate the differently coloured rays, &c.

Hence the rays are reflected from them, compounded as they came, that is, white. See REFRACTION.

Rohault mentions coloured *rainbows* on the graſs; formed by the refractions of the ſun's rays in the morning dew. *Trait. de Phyſ.*

RAIN-*water*. See the article WATER.

RAISED-*airs*. RAISED-*plan*.	See the articles	AIR. PLAN.

RAISER, in building, a board ſet on-edge under the fore ſide of a ſtep, a ſtair, &c. See STAIR, &c.

RAISING, in the manage, one of the three actions of a horſe's legs; the other two being the ſtay, and the tread. See AIR, &c.

The *raiſing* or lifting up of his leg in caprioles, curvets, &c. is eſteemed good, if he perform it hardily and with eaſe; not croſſing his legs, nor carrying his feet too much out or in; yet bending his knees as much as is needful.

RAISING-*pieces*, or REASON-*pieces*, in architecture, are pieces that lie under the beams, and over the poſts or puncheons.

RAISINS, grapes prepared by drying them in the ſun, or the air; to fit them for keeping, and for ſome medicinal purpoſes. See CURRANTS.

Of theſe there are various kinds: as, *raiſins* of Damaſcus, thus called from the capital city of Syria, in the neighbourhood whereof they are cultivated. They are much uſed in the compoſition of ptiſans, together with jujubes and dates; are broad, flat and ſeeded, of the ſize of the thumb; whence it is eaſy judging of the extraordinary bulk of the grape, when freſh. Travellers tell us of bunches weighing 25 pounds. Their taſte is faintiſh and diſagreeable.

Raiſins of the ſun, are a kind of *raiſins* brought from Spain, of a reddiſh or blueiſh colour, ſeeded, very agreeable to eat.

There are various other ſorts, denominated from the place where they grow, or the kind of grape, &c. as *raiſins* of Calabria, Muſcadine *raiſins*, &c.

RAITING, or RATING, the laying of hemp, flax, timber, &c. when green, in a pond or running water, to ſeaſon and diſpoſe it for future uſe.

RAKE, of a ſhip, is ſo much over her hull as over-hangs at both ends of her keel. See OVER RAKE.

That part of it which is before, is called the *rake forward on*: and that part which is at the ſetting on of the ſtern poſt, is called her *rake-aſt*, or *aſt-ward on*.

When a ſhip hath but a ſmall *rake* forward on, but is built with her ſtern too ſtrait up, ſhe is called *blouffe-beaded*.

RAKE of the rudder, is the hindermoſt part of it. See RUDDER.

RAKE, among hunters. See the article RAG.

RAKING, of a horſe, is the drawing his ordure with the hand out of the fundament, when he is coſtive and cannot dung. In order to this the hand muſt be anointed with ſallet-oil or butter.

A horſe is alſo ſaid to *rake*, when being ſhoulder-ſplaid, or having ſtrained his fore-quarters, he goes ſo lame as to drag one of his fore-legs in a circle.

RAKING-*table*, or RAKED *table*, among architects, a member hollowed in the ſquare of a pedeſtal, or elſewhere. See CAVETTO, SCOTIA, &c.

RALLYING, in war, the re-aſſembling, or calling together of troops broken, routed, and put to flight.

RAM, in aſtronomy. *Battering* RAM.	See the article ARIES.

RAMADAN, a ſort of lent obſerved by the Mahometans; during which they faſt the whole day, with ſuch extreme ſuperſtition, that they dare not waſh their mouth, nor even ſwallow their ſpittle. See LENT and FASTING.

The men indeed are allowed to bathe themſelves; but it is on condition they do not plunge the head under water, leſt ſome drops enter by the mouth or ears, &c.—But for the women they are ſtrictly forbid bathing, for fear of taking in water at the pudendum—To make amends, they feaſt all night; and uſually ſpend more this month than in ſix others.

RAMAGE, a term uſed for the boughs or branches of trees. See BRANCH, &c. Hence,

RAMAGE *hawk*, or *falcon*, one that is wild and coy, as having been long among the boughs, preying for itſelf.

All falcons retain this name till they have left the aery; being ſo called in May, June, July, and Auguſt—Theſe are very rarely reclaimed. See HAWK, and FALCON.

RAMAGE *velvet*. See the article VELVET.

RAMIFICATION, the production of boughs or branches; or of figures reſembling branches. See BRANCH.

RAMIFICATIONS, in anatomy, are the diviſions of the arteries, veins, and nerves, ariſing from ſome common trunk—See *Tab. Anat.* (*Angeiol.*) *fig.* 1. *n.* 18. 18. *fig.* 4. *fig.* 5. See alſo ARTERY, VEIN, and NERVE.

RAMMER, or BEETLE, an inſtrument for driving down ſtones or piles into the ground; or for beating the earth, and making it more ſolid for a foundation. See FOUNDATION.

RAMMER *of a gun*, the *gun-ſtick*; a rod or ſtaff uſed in charging a gun, to drive home the powder to the breech, as alſo the ſhot, and the wad, which keeps the ſhot from rolling out. See CHARGE.

The rammer of a great gun has a round piece of wood at one end; the other is uſually rolled in a piece of ſheep-ſkin, fitted to the bore of the piece, in order to clear her after ſhe has been diſcharged: which they call *ſpunging the piece*. See SPUNGE, and SPUNGING.

RAMPANT*, in heraldry, is applied to a lion, bear, leopard, or other beaſt, in a poſture of climbing, or ſtanding upright on his hind-legs, and rearing up his fore-feet; ſhewing only half his face, as one eye and one ear.

* The term is french, and ſignifies literally, *creeping*.

It is different from *ſaliant*, which denotes a poſture leſs erect, or ſomewhat ſtooping forwards, as if making a ſally.

This poſture is to be ſpecified in blazoning in all animals, except in the lion and griffon; it being their natural ſituation.

RAMPART*, or RAMPIER, in fortification, a maſſy bank, or elevation of earth raiſed about the body of a place, to cover it from the great ſhot; and formed into baſtions, curtins, &c.—See *Tab. Fort. fig.* 21. *lit. rr.* See alſo FORTREESS, WALL, BASTION, &c.

* The word is formed from the Spaniſh *Amparo*, defence, covering.

Upon the *rampart* the ſoldiers continually keep guard, and pieces of artillery are planted for the defence of the place—Hence, to ſhelter the guard from the enemies ſhot, the outſide of the *rampart* is built higher than the inſide, *i. e.* a parapet is raiſed upon it with a platform. See PARAPET, and PLATFORM—Hence, alſo, earth not being capable to be raiſed perpendicularly, like ſtone; the *rampart* is built with a talus or ſlope, both on the inner and outer-ſide. See TALUS.

The *rampart* is ſometimes lined, *i. e.* fortified with a ſtone wall within ſide, otherwiſe it has a berme. See BERME—It is incompaſſed with a moat or ditch, out of which the earth that forms the *rampart* is dug. See DITCH.

The height of the *rampart* ſhould not exceed three fathom; this being ſufficient to cover the houſes from the battery of the cannon: neither ought it's thickneſs to be above 10 or 12, unleſs more earth be taken out of the ditch, than can be otherways beſtowed.

The *ramparts* of half-moons are the better for being low; that the ſmall fire of the defendants may the better reach the bottom of the ditch: but yet they muſt be ſo high, as not to be commanded by the covert-way.

RAMPART is alſo uſed in civil architecture, for the ſpace left void between the wall of a city and the next houſes.

This is what the Romans called *pomœrium*, wherein it was forbid to build; and where they planted rows of trees, for the people to walk and amuſe themſelves under.

RAMUS, in anatomy, &c. a branch of a greater veſſel. See VESSEL.

RAMUS *anterior* is particularly uſed for a branch of the ſubcutaneous vein, paſſing under the muſcles of the ulna.

Ramus poſterior, denotes a branch of the ſame vein running near the elbow.

RANA. See the article RANULA.

RANCID*, RANCIDUS, denotes a fatty ſubſtance that is become mouldy, or muſty; or that has contracted an ill ſmell, by being kept cloſe. See MOULDINESS.

* The word is particularly underſtood of old ruſty bacon. It comes from the Latin *rancidus*, of *ranceo*, to be rank.

RANDOM-*ſhot*, a ſhot made when the muzzle of a gun is raiſed above the horizontal line, and is not deſigned to ſhoot directly, or point-blank. See GUNNERY.

The utmoſt *random* of any piece is about ten times as far as the bullet will go point-blank; and the bullet will go fartheſt when the piece is mounted to about 45 degrees above the level-range. See RANGE.

The ſpace or diſtance of the *random*, is reckoned from the platform to the place where the ball firſt grazes.

RANFORCE *ring*. See RE-IN-FORCED *ring*.

RANGE, in gunnery, the path of a bullet, or the line it deſcribes, from the mouth of the piece, to the point where it lodges. See GUN, BULLET, RANDOM, &c.

If the piece be laid in a line parallel to the horizon, it is called the *right* or *level range*. See HORIZONTAL.

If it be mounted to 45 degrees, the ball is ſaid to have the *utmoſt range*; and ſo proportionably; all others between 00 degrees and 45°, being called the *intermediate ranges*. See GUNNERY, PROJECTILE, RANDOM, &c.

Amplitude of the RANGE *of a projectile*. See AMPLITUDE.

RANGER, a ſworn officer of a foreſt, whoſe buſineſs it is to walk daily through his charge, to drive back the deer out of the purlieus or diſaforeſted places, into the foreſt lands; and to preſent all treſpaſſes done in his bailiwick, at the next court held for the foreſt. See FOREST and PURLIEU.

The *ranger* is made by the king's letters, and has a fee paid yearly out of the exchequer, and certain fee-deer—In the charter de foreſta, mention is made of twelve kind of *rangers*.

RANGES, in a ſhip, are two pieces of timber, going a-croſs from ſide to ſide; one aloft, on the fore caſtle, a little abaft the fore-maſt; and the other in the beak-head before the wouldings of the bow-ſprit.

RANGING, in war, the diſpoſing of troops in a condition proper for engagement, or for marching. See ARMY.

The army was *ranged* in form of battle to receive the enemy; *ranged* in three columns, for a march, &c. See LINE, COLUMN, &c.

In building, the ſide of a work that runs ſtrait, without breaking into angles, is ſaid to *range*, or *run range*.

RANK, a due order; or a place allotted a thing ſuitably to it's nature, quality, or merit. See ORDER.

Kings are perſons of the firſt *rank* on earth: In cavalcades, proceſſions, &c. every perſon is to obſerve his *rank*, See PRECEDENCE.

RANK, in military diſcipline, denotes a ſeries or row of ſoldiers, placed ſide by ſide; a number of which *ranks* form the depth of the ſquadron or battalion, as a number of files does the width. See FILE.

To *cloſe the rank*, is to bring the men nearer: to *open*, to ſet them further a-part.—To *double the ranks*, is to throw two into the ſpace of one, by which the files are thinned.

Rear RANK. See the article REAR.

RANK, in reſpect of ſhips. See RATE.

RANSOM, a ſum of money, paid for the redemption of a perſon out of ſlavery; or for the liberty of a priſoner of war. See REDEMPTION.

In our law-books, *ranſom* is alſo uſed for a ſum paid for the pardoning of ſome notorious crime.

Horn makes this difference between *ranſom* and *amerciament*, that *ranſom* is the redemption of a corporal puniſhment due to any crime. See AMERCEMENT.

When one is to make a fine and *ranſom*, the *ranſom* ſhall be treble the fine. *Crompt. Juſt.*

RANT, in the drama, an extravagant flight of paſſion; overſhooting nature and probability. See PROBABILITY.

Lee's tragedies abound with *rants*: yet the rankeſt, it is obſerved, frequently meet with applauſe on the ſtage.

We find inſtances of *rants*, even in our ſevereſt poets. Such, *e. gr.* is that in the beginning of Ben Johnſon's *Catiline*, where the parricide ſpeaking to Rome, ſays, *I'd plough up rocks, ſteep as the Alps, in duſt; and lave the Tyrrhene waters into clouds; but I would reach thy head!*

RANULA, or RANA, in medicine, a tumour under the tongue, which like a ligament hinders a child from ſpeaking, or ſucking.

The Ranula ſub lingua, is ſometimes the ſame with what we popularly call being *tongue-tied*: a defect which is uſually cauſed by a ſhort frænum not permitting the tongue to perform it's proper motions.—Though at other times, there is a ſtrong concretion, or rather impoſthume under the tongue, which is the proper *ranula*, by the Greeks called Βατραχιον.

This impoſthume contains in a bag a matter that is ſometimes œdematous, at other times melicerous, ſcirrhous, black, or livid; in which caſes the operation of cutting is dangerous; and grows to the magnitude of a bean or cheſnut. *Shaw.*

RANULARES, or RANINÆ *venæ*, in anatomy, two veins under the tongue, ariſing from the external jugular, and running on either ſide the linea mediana. See TONGUE.

Theſe veins are opened with good ſucceſs in quinzies.—They take their denomination from a reſemblance of their ſtate to that of little frogs, called in Latin, *ranulæ*, becauſe never out of water.

RAPACIOUS *animals*, in the general, are ſuch as live upon prey. See ANIMAL.

Naturaliſts divide birds into *rapacious*, *carnivorous*, and *frugivorous*. See BIRD.

The characteriſtic notes of *rapacious* birds are, that they have a great head, and a ſhort neck; hooked, ſtrong, and ſharp pointed beak and talons, fitted for tearing of fleſh; ſtrong and brawney thighs, for ſtriking down their prey; a broad thick fleſhy tongue like that of human creatures: 12 feathers in their train; and 24 flag feathers in each wing. The two appendices or blind guts, are always very ſhort. See EAGLE. FALCON, HAWK, &c.

Rapacious Birds have a membranous ſtomach; and not a muſculous one, or a gizzard, ſuch as birds have that live on grain. See STOMACH and DIGESTION.

They are very ſharp ſighted; and gather not in flocks, but generally ſpeaking, are ſolitary; though vultures will fly 50 or 60 in a company.

RAPE, RAPTUS, in law, a *raviſhing*; or the having carnal knowledge of a woman by force, and againſt her will.

If the woman conceive, the law eſteems it no *rape*; from an opinion that ſhe cannot conceive unleſs ſhe conſent. Coke *on Litt.* lib. 2. cap. 11.

This offence is felony in the principal and his aiders, by ſeveral ſtatutes; and the criminal is excluded from the benefit of his clergy. See FELONY.

By the civil law, *C. de raptu virginum*, raviſhing is decreed capital, even though the woman, being a maid, or widow, conſent to marry the raviſher. In France, the civil law conſtitution obtains, though it had been ſuſpended ſome time by the ordinances which allowed the man to marry the woman with her conſent. By an ordinance in 1639, the *rape* of a girl or a boy are put on the ſame footing. Fleta obſerves that by our laws the complaint muſt be made within forty days, elſe the woman may not be heard. *lib.* 3. *cap.* 5. All carnal knowledge of a maid before ten years of age, is deemed by the law a *rape*. *Stat. An.* 8. *Eliz. cap.* 6.

In Bracton's time, the *raptor*, or *raviſher*, was puniſhed with the loſs of his eyes and teſticles, *quia colorem ſtupri induxerunt*. 3 Inſt. fol. 60.

The civilians make another kind of *rape*, called *ſubornatio*, *rape of ſubornation*, or *ſeduction*; which is when a perſon ſeduces, or entices a maid to uncleanneſs, or even marriage, and that by gentle means; provided there be a conſiderable diſparity in age or condition between the parties. In this caſe, the father and mother intent their action reciprocally for the *crimen raptus*, or *ſubornationis*.

The French laws make no difference between the *rape* of violence, and that of ſolicitation, or ſubornation; they make both capital.—This kind of *rape* our laws call *raviſhment*. See RAVISHMENT.

RAPE, of the foreſt, is a treſpaſs committed in the foreſt by violence. See FOREST.

This is mentioned in the laws of Henry. I. as one of the crimes cognizable alone by the King.

RAPE, is alſo a name given the wood or ſtalks of the cluſters of grapes, when dried and freed from the fruit.

The *rape* is uſed in making vinegar; ſerving to heat, and ſour the wine: but it is firſt put into a place to ſour itſelf before it be caſt into the vinegar veſſel; to which end, preſently after the vintage, it is carefully put up in barrels, leſt it take air, otherwiſe it would heat itſelf, and be ſpoiled: There is no other way of keeping *rape*, hitherto diſcovered, but to fill the veſſel, wherein it is contained, with wine or vinegar. See VINEGAR, and WINE.

RAPE, RAPA, is alſo uſed for a part, or diviſion of a county; ſignifying as much as a *hundred*. See HUNDRED.

Though, ſometimes *rape* is taken for a diviſion containing ſeveral hundreds—Thus Suſſex is divided into ſix *rapes*, *viz.* thoſe of Chicheſter, Arundel, Bramber, Lewes, Pevency, and Haſtings; every one of which, beſides it's hundreds, has a caſtle, river, and foreſt belonging to it.

The like parts in other counties are called *tithings*, *lathes*, or *wapentakes*. See TITHING, LATHE, WAPENTAKE.

RAPIER*, properly denotes a long, ordinary, old faſhioned cutting ſword, ſuch as thoſe wore by the common ſoldiers. See SWORD.

* The word is formed from the French *rapiere*, of the Greek ῥαπιζειν, *cedere*, to ſmite, ſtrike.

In this ſenſe do the French ſtill uſe the term: ſo that among them to *take the rapier*, is to enter in the army.

RAPIER, in a modern ſenſe among us, uſually denotes a ſmall ſword—as contradiſtinguiſhed from a back-ſword, or ſheering ſword. See SWORD.

RAPINE, RAPINA in law — To take a thing in private againſt the owner's will, is properly *theft*; but to take it openly, or by violence, is *rapine* or *robbery*, See ABACTOR, ROBBERY, &c.

RAPSODIST, } See { RHAPSODIST.
RAPSODY, } See { RHAPSODY.

RAPTU *hæredis*, an ancient writ which lies for the taking away an heir, holding in ſocage; of which there are two ſorts; one when the heir is married, the other when not. See RAVISHMENT.

RAPTURE, RAPTURA, an extaſy, or tranſport of mind. See EXTASY, ENTHUSIASM, RHAPSODY, &c.

RARE, in phyſics, denotes a body that is very porous, whoſe parts are at a great diſtance from one another, and which contains but little matter under a great deal of bulk. See RAREFACTION, BODY, PORE, &c.

In this ſenſe *rare* ſtands oppoſed to *denſe*. See DENSITY.

The corpuſcular philoſophers, *viz.* Epicureans, Gaſſendiſts, Newtonians, &c. aſſert that bodies are *rarer* ſome than others, in virtue of a greater quantity of vacuity included between their pores.— The Carteſians hold, that a greater *rarity* only conſiſts in a greater quantity of materia ſubtilis included in the pores — Laſtly, the Peripateticks contend, that *rarity* is a new quality ſuperinduced upon a body, without any dependance, either on vacuity, or ſubtile matter. See PLENUM. VACUUM, CARTESIAN, &c.

RAREFACTION, RAREFACTIO, in phyſics, the act whereby a body is rendered *rare*; that is, is brought to poſſeſs more room, or appear under a larger bulk, without any acceſſion of new matter. See RARE.

Rarefaction is oppoſed to *condenſation*. See CONDENSATION.

Our more accurate writers reſtrain *rarefaction* to that expanſion of a maſs into a larger bulk, which is effected by means of heat — All expanſion from other cauſes they call dilatation. See HEAT and DILATATION.

The Carteſians deny any ſuch thing as abſolute *rarefaction*: extenſion, with them, conſtituting the eſſence of matter, they are obliged to hold all extenſion equally full. See EXTENSION and PLENUM.

Hence, they make *rarefaction* to be no other than an acceſſion of freſh, ſubtile, and inſenſible matter, which entring the parts of a body, ſenſibly diſtends them. See this diſproved under VACUUM.

It is by *rarefaction* that gunpowder has it's effect: and to the ſame principle we owe our æolipiles, thermometers, &c. See GUNPOWDER, THERMOMETER, ÆOLIPILE, &c.

The degree to which the air is *rarefiable* exceeds all imagination: Merſennus, long ago, by means of an intenſe heat, found that air might be rarified, ſo as to poſſeſs more than 70 times it's former ſpace. See AIR.

Mr. Boyle afterwards found, that air, by it's own elaſticity, and without the help of any heat, would dilate itſelf ſo as to take up 9 times it's former ſpace; then 31 times; then 60; then 150: at length, by many degrees he found it would reach to 8000 times, then 10000, then 13679. See ELASTICITY.

Such is the rarefaction of common air, from it's own principle of elaſticity, and without any pervious condenſation; but if it be compreſſed, the ſame author found it's greateſt ſpace when moſt rarified, is to its leaſt when moſt condenſed, as 550000 to 1. See COMPRESSION.

Such an immenſe *rarefaction*, Sir Iſaac Newton ſhews, is inconceivable on any other principle than that of a repelling force inherent in the air, whereby its particles mutually fly from one another. See ATTRACTION, &c.

This repelling force, he obſerves, is much more conſiderable in air than in other bodies, as being generated from the moſt fixt bodies, and that with much difficulty, and ſcarce without fermentation; thoſe particles being always found to fly each other with the moſt force, which when in contact, cohere the moſt firmly. See REPELLING-*power*.

The members of the French royal academy have beſtowed a world of attention on the different *rarefractions*, or rather the different *rarities* of the air at different heights. M. Mariotte eſtabliſhed this as a principle, from experiments, that the different *rarefactions* or condenſations of the air follow the proportion of the weights wherewith it is preſſed.

Hence, ſuppoſing the mercury in the level of the ſea ſuſpended to 28 inches, which is the weight of the whole atmoſphere; and that 60 foot height of air are equivalent to a Line, or $\frac{1}{12}$ of an inch of mercury; ſo that the barometer at the height of 60 foot from the ſea, would fall a line; it is eaſy finding what height of air would be equal to a ſecond, or any other line of mercury: for as 28 inches of mercury $\frac{1}{12}$ are to 28 inches, ſo is the height of 60 foot of air, to a fourth term; which is the height of air correſponding to a ſecond line of mercury.

And after the ſame manner may the heights of air correſponding to each line be found; which will make a geometrical progreſſion, the ſum whereof will be the whole height of the atmoſphere. Of conſequence a certain part of that ſum will be the height of a mountain at whoſe top the barometer ſhall have ſunk a certain quantity. See MOUNTAIN.

Meſſ. Caſſini and Maraldi, upon meaſuring the heights of ſeveral mountains, found that this progreſſion of M. Mariotte, was defective; that it always gave the height of the mountains, and conſequently the *rarefactions*, leſs than they really were; and from ſome new experiments M. Amontons found that the principle will only hold in the mean *rarefactions*, not in the extremes. See AIR.

RAREFACTIVES, RAREFACIENTIA, in medicine, remedies which open and enlarge the pores of the ſkin, to give an eaſy vent to the matter of perſpiration. See ARÆOTIC, DIAPHORETIC, PERSPIRATION, &c.

Such are aniſe, mallows, pellitory, camomile flowers, linſeed, &c.

RASANT, or RAZANT, in fortification —RASANT *flank*, or *line*, is that part of the curtin, or flank, whence the ſhot exploded raze or glance along the face of the oppoſite baſtion. See LINE and FLANK.

The defence of the baſtion is *raſant*. See DEFENCE.

RASH in clockwork. See the article RATCH.

RASH, in medicine, an eruption or effloreſcence upon the ſkin, thrown out in fevers, or ſurfeits. See ERUPTION, EXANTHEMA, SURFEIT, &c.

RASP, a rank ſort of file. See FILE.

RASPATORY, a chirurgeon's inſtruments wherewith they ſcrape foul, carious, or fractured bones.

RASPHUYS, or RASP-*houſe*, a celebrated work-houſe, or houſe of correction, at Amſterdam. See WORK-*houſe*.

RATA *pro* RATA. See the article PRO *rata*.

Onerando pro RATA *portionis*. See ONERANDO.

RATAFIA, a fine ſpirituous liquor, prepared from the kernels, &c. of ſeveral kinds of fruits, particularly cherries, and apricocks.

Ratafia of cherries is prepared by bruiſing the cherries, and putting them into a veſſel wherein brandy has been kept; then adding to them the kernels of cherries, with ſtrawberries, ſugar, cinnamon, white pepper, nutmegs, cloves; and to 20 pound of cherries, 10 quarts of brandy.—The Veſſel is left open 10 or 12 days, then ſtopped cloſe, for two months before it be tapped.

Ratifia of apricocks is prepared two ways; *viz.* either by boiling the apricocks in white wine, adding to the liquor an equal quantity of brandy, with ſugar, cinnamon, mace, and the kernels of apricocks; infuſing the whole for 8 or 10 days; then ſtraining the liquor, and putting it up for uſe: or by infuſing the apricocks, cut in pieces, in brandy, for a day or two; paſſing it through a ſtraining bag, and putting in the uſual ingredients.

RATCH, or RASH, in clock-work, a ſort of wheel having twelve fangs, which ſerve to lift up the detents every hour, and to make the clock ſtrike. See CLOCK.

RATCHETS, in a watch, are the ſmall teeth at the bottom of the fuſy, or barrel; which ſtop it in winding up. See WATCH.

RATE, a ſtandard or proportion by which either the quantity or value of a thing is adjuſted. See STANDARD.

The *rates* of bread, &c. in London, are fixed by authority See ASSISE.

The *rate* of intereſt, as now eſtabliſhed by law in England, is 5 per cent. The *rate* of intereſt in Italy is 3 per cent. In Sweden 6. In France 5. In Spain 10. In Barbadoes 10. In Ireland 12. In Turky 20.—Low *rates* of intereſt advance the prices of land. See INTEREST.

The *rates* or *fares* of hackney-coachmen, chairmen, and watermen, are fixed by act of parliament, 14 Car. II. See *Hackney*-COACH, &c.

The *rates* of exchange, factorſhip, &c. are different. See EXCHANGE, FACTORAGE, &c.

RATE-*tithe*. When ſheep, or other cattle, are kept in a pariſh for leſs time than a year, the owner muſt pay tithe for them, *pro rata*, according to the cuſtom of the place. See TITHE.

RATE, of a ſhip of war, is it's order, degree, or diſtinction, as to magnitude, burthen, &c. See SHIP, &c.

The *rate* is uſually accounted by the length and breadth of the gun-deck, the number of tuns, and the number of men and guns the veſſel carries—There are ſix *rates:*

A firſt RATE man of war has its gun-deck from 159 to 174 feet in length, and from 44 to 50 foot broad; contains from 1313, to 1882 tuns; has from 706 to 800 men; and carries from 96 to 110 guns. See NAVY.

Second RATE *ſhips* have their gun-deck from 153 to 165 foot long; and from 41 to 46 broad; they contain from 1086 to 1482 tuns; and carry from 524 to 640 men; and from 84 to 90 guns.

Third RATES have their gun decks from 142 to 158 foot in length; from 37 to 42 foot broad; they contain from 871 to 1262 tuns; carry from 389 to 476 men; and from 64 to 80 guns.

Fourth RATES are in length on the gun-deck, from 118 to 146 foot; and from 29 to 38 broad; they contain from 448 to 915 tuns, carry from 226 to 346 men; and from 48 to 60 guns.

Fifth RATES have their gun-decks from 100 to 120 foot long: and from 24 to 31 broad; they contain from 259 to 542 tuns; carry from 145 to 190 men; and from 26 to 44 guns.

Sixth RATES have their gun-decks from 87 to 95 foot long: and from 22 to 25 foot broad; they contain from 152 to 256 tuns; carry from 50 to 110 men; and from 16 to 24 guns.

Note, The new-built ſhips are much larger, as well as better than the old ones of the ſame *rate*; whence the double numbers all along; the larger of which expreſs the proportions of the new-built ſhips, as the leſs thoſe of the old ones.—For the number of each *rate* in the Engliſh fleet. See NAVY.

RATEEN, or RATTEN, in commerce, a thick woollen ſtuff, quilled, wove on a loom with four treddles, like ſerges and other ſtuffs that have the whale or quilling.

There are ſome *rateens* dreſſed and prepared like cloths; others left ſimply in the hair; and others where the hair or nap is frized.

Rateens are chiefly manufactured in France, Holland, and Italy; and are moſtly uſed in linings.

The frize is a ſort of coarſe *rateen*; the drugget, a *rateen* half linen, half woollen.

RATIFICATION, RATIFICATIO, an act, approving of, and confirming ſomething done by another, in our name.

A treaty of peace is never ſecure till the princes have *ratified* it. See TREATY.

All procuration imports a promiſe of *ratifying* and approving what is done by the proxy or procurator. After treating with a procurator, agent, factor, &c. A *ratification* is frequently neceſſary on the part of his principal.

RATIFICATION, is particularly uſed in our laws, for the confirmation of a clerk in a benefice, prebend, &c. formerly given him by the biſhop, &c. where the right of patronage is doubted to be in the king.

RATIFICATION is alſo uſed for an act confirming ſomething we ourſelves have done in our own name.

An execution, by a major, of an act paſſed in his minority, is equivalent to a *ratification.*

RATING. See the article RAITING.

RATIO, REASON, in arithmetic and geometry, that relation of homogeneous things which determines the quantity of one from the quantity of another, without the intervention of any third. See RELATION.

The homogeneous things thus compared, we call *the terms of the ratio*; particularly, that referred to the other, we call the *antecedent*; and that to which the other is referred, the *conſequent*. See TERM, &c.

Thus, when we conſider one quantity, by comparing it with another, to ſee what magnitude it has in compariſon of that other; the magnitude this quantity is found to have in compariſon thereof is called the *ratio*, *reaſon*, of this quantity to that: which ſome think would be better expreſſed by the word *compariſon*. See COMPARISON.

Euclid defines *ratio* by *the habitude or relation of magnitudes of the ſame kind in reſpect of quantity*.—But this definition is found defective; there being other relations of magnitudes which are conſtant, yet are not included in the number of *ratio's*: ſuch as that of the right ſine, to the ſine of the complement in trigonometry.

Hobbs endeavoured to mend Euclid's definition of *ratio*, but unhappily; for in defining it, as he does, by *the relation of magnitude to magnitude*; his definition has not only the ſame defect with Euclid's in not determining the particular kind of relation; but has this farther, that it does not expreſs the kind of magnitudes, which may have a *ratio* to one another.

Ratio is frequently confounded with *proportion*; yet ought they by all means to be diſtinguiſhed, as very different things. Proportion, in effect, is an identity, or ſimilitude of two *ratio's*. See PROPORTION.

Thus, if the quantity A be triple the quantity B; the relation of A to B, *i. e.* of 3 to 1, is called the *ratio* of A to B. If two other quantities, C, D, have the ſame *ratio* to one another that A and B have, *i. e.* be triple one another; this ſameneſs of *ratio* conſtitutes *proportion:* and the four quantities A : B : : C : D, are in proportion, or proportional to one another.

So that *ratio* exiſts between two terms, proportion requires more.

There is a twofold compariſon of numbers: by the firſt, we find how much they differ, *i. e.* by how many units the antecedent exceeds, or comes ſhort of, the conſequent.

This difference is called, the *arithmetical ratio*, or exponent of the arithmetical relation or habitude of the two numbers. Thus if 5 and 7 be compared, their arithmetical *ratio* is 2.

By the ſecond compariſon, we find how oft the antecedent contains, or is contained in the conſequent; *i. e.* as before, what part of the greater is equal to the leſs.

This *ratio*, being common to all quantity, may be called *ratio* in the general, or by way of eminence. But it is uſually called *geometrical ratio*; becauſe expreſſed, in geometry, by a line, though it cannot be expreſſed by any number.

Wolfius better diſtinguiſhes *ratio*, with regard to quantity in the general, into *rational* and *irrational*.

Rational RATIO, is that which is as one rational number to another, *e. gr.* as 3 to 4. See NUMBER.

Irrational RATIO, is that which cannot be expreſſed by rational numbers.

Suppoſe, for an illuſtration, two quantities A and B; and let A be leſs than B. If A be ſubſtracted as often as it can be, from B, *e. gr.* five times, there will either be left nothing or ſomething. In the former caſe A will be to B as 1 to 5; that is, A is contained in B five times; or $A = \frac{1}{5}B$, The *ratio*, here, therefore, is *rational*.

In the latter caſe, either there is ſome parts, which being ſubſtracted certain times from A, *e. gr.* three times, and likewiſe from B, *e. gr.* 7 times leaves nothing; or there is no ſuch part: if the former, A will be to B, as 3 to 7, or $A = \frac{3}{7}B$, and therefore the *ratio*, *rational*. If the latter, the *ratio* of A to B, *i. e.* what part A is of B, cannot be expreſſed by rational numbers; nor any other way than either by lines, or by infinite approaching ſeries. See SERIES.

The *exponent of a geometrical ratio* is the quotient ariſing from the diviſion of the antecedent by the conſequent—Thus the exponent of the *ratio* of 3 to 2, is $1\frac{1}{2}$; that of the *ratio* of 2 to 3, is $\frac{2}{3}$; for when the leſs term is the antecedent, the *ratio*, or rather the *exponent*, is an improper fraction. Hence the fraction $\frac{3}{4} = 3 : 4$. If the conſequent be unity, the antecedent itſelf is the exponent of the *ratio:* thus the exponent of 4 to 1 is 4. See EXPONENT.

If two quantities be compared without the invention of a third; either the one is equal to the other, or unequal: Hence, the *ratio* is either of *equality* or *inequality.*

If the terms of the *ratio* be unequal, either the leſs is referred to the greater, or the greater to the leſs: That is, either the leſs to the greater, as a part to the whole; or the greater to the leſs as the whole to a part: The *ratio* therefore determines how often the leſs is contained in the greater, or how often the greater contains the leſs, *i. e.* to what part of the greater the leſs is equal.

The *ratio* which the greater term has to the leſs, *e. gr.* 6 to 3, is called the *ratio of the greater inequality.* The *ratio* which the leſs term has to the greater, *e. gr.* 3 to 6, is called the *ratio of the leſs inequality.*

This *ratio* correſponds to quantity in the general, or is admitted of by all kinds of quantities, diſcrete or continued, commenſurable, or incommenſurable. But diſcrete quantity, or number does likewiſe admit of another *ratio.*

If the leſs term of a *ratio* be an aliquot part of the greater, the *ratio* of the greater inequality is ſaid to be *multiplex*, multiple: and the *ratio* of the leſs inequality, *ſubmultiple*. See MULTIPLE, and SUBMULTIPLE.

Particularly, in the firſt caſe, if the exponent be 2, the *ratio* is called *duple*; if 3, *triple*, &c. In the ſecond caſe, if the exponent be $\frac{1}{2}$, the *ratio* is called *ſubduple*; if $\frac{1}{3}$, *ſubtriple*, &c. *E. gr.* 6 to 2 is in a triple *ratio*; becauſe 6 contains two thrice. On the contrary, 2 to 6 is in a ſubtriple *ratio*, becauſe 2 is the third part of 6. See DUPLE, SUBDUPLE, &c.

If the greater term contain the leſs once; and over and above, an aliquot part of the ſame; the *ratio* of the greater inequality is called *ſuperparticularis*; and the *ratio* of the leſs *ſubſuperparticularis.*

Particularly, in the firſt caſe, if the exponent be $1\frac{1}{2}$, it is called *ſeſquialterate*; if $3\frac{1}{3}$, *ſeſquitertia*, &c. In the other, if the exponent be $\frac{2}{3}$, the *ratio* is called *ſubſeſquialterate*; if $\frac{3}{4}$ *ſubſeſquitertia*, &c.

E. gr. 3 to 2 is in a *ſeſquialterate ratio*; 2 to 3 in a *ſubſeſquialterate.*

If the greater term contains the leſs once, and over and above ſeveral aliquot parts; the *ratio* of the greater inequality is called *ſuperpartiens*, that of the leſs inequality is *ſubſuperpartiens.*

Particularly in the former caſe, if the exponent be $1\frac{2}{3}$, the *ratio* is called *ſuperbipartiens tertias*; if the exponent be $1\frac{3}{4}$, *ſuper-*

ſupertripartiens quartas; if 1 $\frac{4}{7}$, *ſuperquadripartiens ſeptimas*, &c. in the latter caſe, if the exponent be $\frac{3}{5}$, the *ratio* is called *ſubſuperbipartiens tertias*; if $\frac{4}{7}$, *ſubſupertripartiens quartas*; if $\frac{7}{11}$, *ſubſuperquadripartiens ſeptimas.*

E. gr. the *ratio* of 5 to 3 is *ſuperbipartiens tertias*; that of 3 to 5, *ſubſuperbipartiens tertias.*

If the greater term contain the leſs ſeveral times, and, beſides, ſome quota part of the ſame; the *ratio* of the greater inequality is called *multiplex ſuperparticularis*; and the *ratio* of the leſs inequality, *ſubmultiplex ſubſuperparticularis.*

Particularly, in the former caſe, if the exponent be 2 $\frac{1}{2}$, the *ratio* is called, *dupla ſeſquialtera*; if 3 $\frac{1}{4}$, *tripla ſeſquiquarta*, &c. In the latter caſe, if the exponent be $\frac{2}{5}$, the *ratio* is called *ſubdupla ſubſeſquialtera*; if $\frac{4}{13}$, *ſubtripla ſubſeſquiquarta*, &c.

E. gr. the *ratio* of 16 to 5 is *tripla ſeſquiquinta*; that of 4 to 9 *ſubdupla ſubſeſquiquarta.*

Laſtly, if the greater term contain the leſs ſeveral times, and ſeveral aliquot parts thereof beſides; the *ratio* of the greater inequality is called *multiplex ſuperpartiens*; that of the leſs inequality, *ſubmultiplex ſubſuperpartiens.*

Particularly, in the former caſe, if the exponent be 2 $\frac{2}{3}$, the *ratio* is called *dupla ſuperbipartiens tertias*; if 3 $\frac{4}{7}$, *tripla ſuperbiquadripartiens ſeptimas*, &c. In the latter caſe, if the exponent be $\frac{3}{8}$, the *ratio* is called, *ſubdupla ſubſuperbipartiens tertias*; if $\frac{7}{25}$ *ſubtripla ſubſuperquadripartiens ſeptimas*, &c.

E. gr. the *ratio* of 25 to 7 is *tripla ſuperquadripartiens ſeptimas*; that of 3 to 8, *ſubdupla ſubſuperbipartiens tertias.*

Theſe are the various kinds of *rational ratio's*; the names whereof, though they occur but rarely among the modern writers, (for in lieu thereof they uſe the ſmalleſt terms of the *ratio's*, *e. gr.* for *duple* 2 : 1, for *ſeſquialterate*, 3 : 2) yet are they abſolutely neceſſary to ſuch as converſe with the ancient authors.

Clavius obſerves, that the exponents denominate the *ratio's* of the greater inequality, both in deed and name; but the *ratio's* of the leſs inequality, only in deed, not in name. But it is eaſy finding the name in theſe; if you divide the denominator of the exponent, by the numerator.

E. gr. if the exponent be $\frac{5}{8}$, then 5 : 8 = 1 $\frac{3}{5}$; whence it appears the *ratio* is called *ſubſupertripartiens quintas.*

As to the names of *irrational ratio's*, nobody ever attempted them.

Same, or *Identic ratio's* are thoſe whoſe antecedents have an equal reſpect to their conſequents, *i. e.* whoſe antecedents divided by their conſequents, give equal exponents—And hence may the identity of irrational *ratio's* be conceived.

Hence, *firſt*, as oft as the antecedent of one *ratio* contains it's conſequent, or whatever part it contains of it's conſequent, ſo oft, or ſuch part of the other conſequent does the antecedent of the other *ratio* contain: or, as oft as the antecedent of the one is contained in it's conſequent, ſo oft is the antecedent of the other contained in it's conſequent.

Secondly, If A be to B as C to D, then will A : B : : C : D; or A : B = C : D. The former of which is the uſual manner of repreſenting the identity of *ratio's*; the latter is that of the excellent Wolfius; which has the advantage of the former, in that the middle character =, which denotes the ſameneſs, is ſcientifical, *i. e.* expreſſes the relation of the thing repreſented, which the other : : does not. See Character.

Two *equal ratio's*, *e. gr.* B : C = D : E, we have already obſerved, to conſtitute a proportion: of two *unequal ratio's*, *e. gr.* A : B and C : D we call A : B the *greater*, if A : B > C : D; on the contrary we call C : D the *leſſer*, if C : D < A : B.

Hence, we expreſs a greater and leſs *ratio* thus. *E. gr.* 6 to 3 has a greater *ratio*, than 5 to 4; for, 6 : 3 (= 2) > 5 : 4 (= 1 $\frac{1}{4}$). But 3 to 6 has a leſs *ratio* than 4 to 5, for $\frac{3}{4}=\frac{1}{2}<\frac{4}{5}$.

Compound *ratio* is that made up of two or more other *ratio's*, which the factum of the antecedents of two or more *ratio's* has to the factum of their conſequents. Thus 6 to 72 is in a *ratio* compounded of 2 to 6, and 3 to 12.

Particularly, if it be compounded of two, it is called a *duplicate ratio*; if of three, a *triplicate*, if of four, *quadruplicate*; and in the general *multiplicate*, if it be compoſed of ſeveral ſimilar *ratio's*. Thus 48 : 3 is a *duplicate ratio* of 4 : 1 and 12 : 3. See Duplicate and Triplicate.

Alternate Ratio, is where the antecedent of one *ratio* is to it's conſequent, as the antecedent of another to it's conſequent; the very ſame *ratio*, in this caſe, holding alternately in reſpect of the antecedents to each other, and the conſequents to each other.—Thus if A : B : : C : D; then, alternately, A : C : : B : D.

Ordinate Ratio, is that, wherein the antecedent of the firſt *ratio* is to its conſequent, as the antecedent of the ſecond is to its conſequent.

Denominator of a Ratio. See Denominator.

Properties of Ratio's—*Firſt*, *ratio's* ſimilar to the ſame third are alſo ſimilar to one another; and thoſe ſimilar to ſimilar, are alſo ſimilar to one another.

Secondly, If A : B = C : D; then, inverſely, B : A = D : C.

Thirdly, Similar parts P and p have the ſame *ratio* to wholes T and t; and if the wholes have the ſame *ratio*, the parts are ſimilar.

Fourthly, If A : B = C : D; then alternately, A : C = B : D. And hence, if B = D : A = C; hence, alſo, if A : B = C : D; and A : F = C : G; we ſhall have B : F = D : G. Hence, again, if A : B = C : D; and F : A = G : C; we ſhall have F : B = G : D.

Fifthly, Thoſe things which have the ſame *ratio* to the ſame, or equal things, are equal: and *vice verſa.*

Sixthly, if you multiply any quantities, as A and B, by the ſame or equal quantities: their products D and E will be to each other as A and B.

Seventhly, if you divide any quantities as A and B, by the ſame or equal quantities, the quotients F and G will be to each other as A and B.

Eighthly, The exponent of a compound *ratio* is equal to the factum of the exponents of the ſimple *ratio's*. See Exponent.

Ninthly, If you divide either the antecedents, or the conſequents of ſimilar *ratio's*, A : B and C : D by the ſame E; in the former caſe, the quotients F and G will have the ſame *ratio* to the conſequents B and D; in the latter, the antecedents A and B will have the ſame *ratio* to the quotients H and K.

Tenthly, If there be ſeveral quantities in the ſame continued *ratio* A, B, C, D, E, *&c.* the firſt, A, is to the third C, in a *duplicate ratio*, to the fourth, D, in a *triplicate*, to the fifth, E, in a *quadruplicate*, &c. *ratio* of the *ratio* of the firſt, A, to the ſecond B.

Eleventhly, If there be any ſeries of quantities in the ſame *ratio*, A, B, C, D, E, F, *&c.* the *ratio* of the firſt, A, to the laſt, F, is compounded of the intermediate *ratio's*, A : B, B : C, C : D, D : E, E : F, *&c.*

Twelfthly, *ratio's* compounded of *ratio's*, whereof each is equal to each other, are equal among themſelves. Thus the *ratio's* 90 : 3 = 960 : 32 are compounded of 6 : 3 = 4 : 2, and 3 : 1 = 12 : 4; and 5 : 1 = 20 : 4.

For other properties of ſimilar or equal *ratio's*, ſee Proportion.

Ratio, in our law writers, is uſed for a judgment given in a cauſe. See Judgment.

Hence, *ponere* ad rationem, is to cite one to appear in judgment. Walſingh. 88.

Ratio-*ſtatus*, Ragione *di ſtato.* See Reason *of ſtate.*

Ratio *victus*. See the article Victus.

RATIOCINATION, the act of *reaſoning*. See Reasoning.

RATION*, or Ratian, in the army, a pittance, or proportion of amunition, bread, drink, or forage, diſtributed to each ſoldier for his daily ſubſiſtence. See Ammunition, *&c.*

> * Some write the word *racion*, and borrow it from the Spaniſh *racion*. But they both come from the Latin, *ratio*: in ſome parts of the ſea they call it *reaſon.*

The horſe have *rations* of hay and oats, when they cannot go out to forage.

The *rations* of bread are regulated by weight—The ordinary *ration* of a foot ſoldier is a pound and half of bread per day.

The officers have ſeveral *rations* according to their quality, and the number of attendants they are obliged to keep. When the *ration* is augmented on occaſions of rejoicing, it is called *double ration.*

The ſhip's crews have alſo their *rations* or allowances of biſket, pulſe, and water, proportioned according to their ſtock. The uſual *ration* at ſea, particularly among the Portugueſe, *&c.* is a pound and half of bisket, a pint of wine, and a quart of freſh water per day, and each month an arrobe or 31 pound of ſalt meat, with ſome dried fiſh and onions.

RATIONABILES *expenſæ*, *reaſonable expences.* The commons in parliament, as well as the proctors of the clergy in convocation, were anciently allowed *rationabiles expenſas*; that is, ſuch allowance as the king, conſidering the prices of all things, ſhall judge meet to impoſe on the people to pay for the ſubſiſtence of their repreſentatives. See Representative, De Expensis, *&c.*

This, in the 17th of Edward II, was ſettled at 10 groats per day for knights, and 5 for burgeſſes. Afterwards 4 ſhillings a day for knights, and 2 ſhillings for burgeſſes; which was then deemed an ample retribution both for expences, for labour, attendance, neglect of their own affairs, *&c.* See Parliament.

RATIONABILI *parte bonorum*, a writ which lies for the wife, againſt the executors of her husband denying her the third part of her husband's goods, after debts and funeral expences paid. See Goods.

Fitzherbert quotes Magna Charta and Glanville, to prove that by the common law of England, the goods of the deceaſed, his debts firſt paid, ſhould be divided into three parts; whereof his wife to have one, his children a ſecond, and the executors a third. Adding, that this writ lies as well for the children, *&c.* as the wife. — But it ſeems only to obtain where the cuſtom of the country makes for it.

Recto de Rationabili *parte*. See Recto.

RATIONABILIBUS *diviſis*, is a writ that lies where two lords have ſeigneuries joining together, for him that finds his waſte incroached upon, within the memory of man, againſt the encroacher; thereby to rectify the Bounds of the ſeigneuries: in which reſpect Fitzherbert ſays it is of the nature of a writ of right.

RATIONAL, *reaſonable*. See Reason.

Rational *fable*. See the article Fable.

Rational *fraction*, or *broken number*, is that equal to ſome aliquot part or parts of unity. See Fraction.

Rational, or *true horizon*, is that whoſe plane is conceived to paſs through the centre of the earth; and which therefore divides the globe into two equal portions, or hemiſpheres. See Horizon.

It is called the *rational horizon*, becauſe only conceived by the underſtanding; in oppoſition to the *ſenſible* or apparent horizon, which is viſible to the eye. See Sensible.

Rational *integer*, or *whole number*, is that whereof unity is an aliquot part. See Number and Aliquot *part*.

Rational *mixt number*, is that conſiſting of an integer and a fraction; or of unity, and a broken number. See Number and Mixt.

Commenſurable quantities are defined by being to one another, as one *rational* number to another. See Commensurable.

For unity is an aliquot part of a rational number; and a fraction has ſome aliquot part common with unity: in things, therefore, that are as a *rational* to a *rational* number, either the one is an aliquot part of the other, or there is ſome common aliquot part of both: therefore they are commenſurable.

Hence, if a *rational* number be divided by a *rational*, the quotent is a *rational*.

Rational *phyſicians*. See Physician.

Rational *quantity* or *number*, a quantity or number commenſurable to unity. See Number and Unity.

Suppoſing any quantity to be 1, there are infinite other quantities, ſome whereof are commenſurable to it, either ſimply, or in power: theſe Euclid calls *rational quantities*. See Quantity.

The reſt, that are incommenſurable to 1, he calls *irrational quantities*, or *ſurds*. See Surd.

Rational *ratio*, is a ratio whoſe terms are *rational* quantities; or a ratio which is as one *rational* number to another, *e. gr.* as 3 to 6. See Ratio.

The exponent of a *rational* ratio is a *rational* quantity. See Exponent.

Rational *ſoul*. See the article Soul.

RATIONALE, a ſolution, or account of the principles of ſome opinion, action, hypotheſis, phænomenon, or the like. See Principle, Phænomenon, *&c.* — Hence,

Rationale is alſo the title of ſeveral books — The moſt conſiderable is the *Rationale of divine offices*, by Guil. Durandus, a celebrated ſchool divine, biſhop of Mende; finiſhed in 1286, as he himſelf tells us.

Rationale alſo denotes an antient ſacerdotal veſtment, wore by the high-prieſt under the old law; and called by the Hebrews חשן *hhoſchen*; by the Greeks λογιον; by the Latins *rationale* and *pectorale*; and by the Engliſh tranſlators, *breaſtplate*. See Pectorale.

The *rationale* was a piece of embroidered ſtuff wore on the breaſt, about a ſpan-ſquare — Du Cange deſcribes it as a double ſquare, of four colours, interwove with gold, and ſet with twelve precious ſtones in four rows, whereon were engraven the names of the twelve tribes; and faſtened to the ſhoulder by two chains and two hooks of gold — The form of the *rationale* was preſcribed by God himſelf, Exod. 28.

A Rationale appears alſo to have been antiently wore by the biſhops under the new law — But authors are in doubt about it's form; ſome will have it reſemble that of the Jews; others take it to be only the pallium. See Pallium.

RATIONALIS, an officer mentioned in ſeveral antient inſcriptions. See Accountant.

Lampridius, in the life of Alex. Severus, uſes *rationalis* as ſynonymous with *procurator*. See Procurator.

The *rationales* were intendants, or ſurveyors under the emperors; and though Lampridius pretends they were firſt eſtabliſhed by Severus, it is evident there were ſome under Auguſtus.

Ens RATIONIS. See the article Ens.

Diſtinctio Rationis. See the article Distinctio.

Rationis *os*, in anatomy, the bone of the forehead, otherwiſe called *os frontis*. See Frontis.

RATLINES, or, as the ſeamen call them, Ratlings; thoſe lines which make the ladder ſteps, to get up the ſhrouds and puttocks: hence called the *ratlings of the ſhrouds*.

RATTEN. See the article Rateen.

RATTLE, among the antients, a muſical inſtrument, of the pulſatile kind: called by the Romans, *crepitaculum*. See Musick.

Mr. Malcolm takes the tintinnabulum, crotalum, and ſiſtrum, to have been only ſo many different kinds of *rattles*. See Bell, Crotalum, Sistrum, *&c.*

The Invention of the *rattle* is aſcribed to the famous mathematician Archytas; whence Ariſtotle calls it, Αϱχυτȣ ϖλαταγη, Archytas's *rattle* — Diogenianus adds the occaſion of the invention; *viz.* that Archytas having children, he contrived this inſtrument to prevent their tumbling other things about the houſe. So that how much ſoever ſome inſtruments have changed their uſes, the *rattle* we are ſure has preſerved it's.

RAVELIN, in fortification, was antiently a flat baſtion, placed in the middle of a curtin. See Bastion and Curtin.

Ravelin is now a detached work, compoſed only of two faces, which make a ſalient angle, without any flanks; and raiſed before the curtin on the counterſcarp of the place.

A *ravelin* is a triangular work reſembling the point of a baſtion, with the flanks cut off — See *Tab. Fortif. fig.* 21. *lit.* iii.

It's uſe before a curtin, is to cover the oppoſite flanks of the two next baſtions. It is uſed alſo to cover a bridge or a gate; and is always placed without the moat.

What the engineers call a *ravelin*, the ſoldiers generally call a *demi-lune*, or half-moon. See Demi-Lune, *&c.*

There are alſo *double ravelins*, which ſerve to defend each other — They are ſaid to be *double* when they are joined by a curtin.

RAVISHMENT, in law, denotes an unlawful taking either a Woman, or an heir in ward.

Sometimes it is alſo uſed in the ſame ſenſe as *rape*. See Rape.

Ravishment *de gard*, is a writ which antiently laid for the guardian againſt him who took from him the body of his ward. See Guardian, Ward, *&c.*

RAW *hide*. See the article Hide.

RAW *ſilk*. See the article Silk.

RAY, Radius, in optics, a beam or line of light, propagated from a radiant point, through an unreſiſting medium. See Light, Radiant, *&c.*

Sir Iſaac Newton defines *rays* to be the leaſt parts of light, whether ſucceſſive in the ſame line, or contemporary in ſeveral lines.

For, that light conſiſts of parts of both kinds, appears hence, that one may ſtop what comes this moment in any point, and let paſs that which comes the next; and again may ſtop what comes in this point, and let paſs that in the next — Now, the leaſt light, or part of light which may be thus ſtopped alone, he calls a *ray of light*.

If the parts of a *ray* of light do all lie ſtraight between the radiant and the eye, the *ray* is ſaid to be *direct*: the laws and properties whereof make the ſubject of optics. See Optics, and Direct.

If any of them be turned out of that direction, or bent in their paſſage, the *ray* is ſaid to be *refracted*. See Refraction.

If it ſtrike on the ſurface of any body, and be driven back, it is ſaid to be *reflected*. See Reflection.

In each caſe, the *ray*, as it falls either directly on the eye, or on the point of reflection, or of refraction, is ſaid to be *incident*. See Incidence.

Again, if ſeveral *rays* be propagated from the radiant equidiſtantly from one another, they are called *parallel rays*. See Parallel.

If they come inclining towards each other, they are called *converging rays*. See Converging.

And if they go continually receding from each other, they are called *diverging rays*. See Diverging.

It is from the circumſtances of *rays*, that the ſeveral kinds of bodies are diſtinguiſhed in optics. A body, *e. gr.* that diffuſes it's own light, or emits *rays* of it's own, is called a *lucid*, or *luminous* body.

If it only reflect *rays* which it receives from another, it is called an *illuminated body*.

If it only tranſmit *rays*, it is called a *tranſparent body*. See Transparency.

If it intercept the *rays*, or refuſe them paſſage, it is called an *opake body*. See Opacity.

Hence no body radiates, *i. e.* emits *rays*, unleſs it be either luminous, or illumined. See Radiation.

It is by means of *rays* reflected from the ſeveral points of illumined objects to the eye, that they become viſible, and that viſion is performed; whence ſuch *rays* are called *viſual rays*. See Visual.

In effect we find that any point of an object is ſeen in all places to which a right line may be drawn from that point: but it is allowed, nothing can be ſeen without light, therefore every point of an object diffuſſes innumerable *rays* every way. Again, from other experiments it appears that the images of all objects, whence right lines may be drawn to the eye, are painted in the eye, behind the cryſtallin, very ſmall, but very diſtinct.

And laſtly, from other experiments, that each *ray* carries with it the ſpecies, or image of the radiating point: and that the ſeveral rays emitted from the ſame point are again united in one point, by the cryſtallin, and thus thrown on the retina. See VISION.

It is the ſpiſſitude, or cloſeneſs of the *rays* emitted from a luminous body, that conſtitutes the intenſeneſs of the light. Yet the direction wherein the *rays* ſtrike the eye, has a good ſway. In effect, a perpendicular *ray*, ſtriking with more force than an oblique one, in the ratio of the whole ſine to the ſine of the angle of obliquity (as follows from the laws of percuſſion) a perpendicular *ray* will affect the eye more vividly than an oblique one in that ratio.

If then the ſpiſſitude of the *rays* be equal, the intenſity will be as the direction; if the direction be the ſame, the intenſeneſs will be as the ſpiſſitude. If both differ, the intenſeneſs will be in a ratio compounded of the direction and the ſpiſſitude.

Hence, *firſt*, If light be propagated in *parallel rays* through an unreſiſting medium, it's intenſity will not be varied by diſtance.

Secondly, If light be propagated in *diverging rays*, through an unreſiſting medium, it's intenſity will decreaſe in a duplicate ratio of the diſtances from the radiant point, reciprocally. See QUALITY.

Thirdly, If light be propagated in *converging rays*, through an unreſiſting medium, it's intenſity will increaſe in a duplicate ratio of the diſtances from the point of concourſe, reciprocally.

Fourthly, If the breadth of an illuminated plane be to the diſtance of the radiant point, as 1 to 2000000, it is the ſame thing as if the *rays* ſtruck upon it parallel: and hence, ſince the diameter of the pupil of the eye, when largeſt, ſcarce exceeds ^{1} of an inch; the *rays* will fall upon it parallel, as to ſenſe, at the diſtance of 3860 Engliſh feet, which is nearly 6 furlongs. See LIGHT.

The effect of concave lenſes, and convex mirrours, is to make parallel *rays* diverge; converging *rays*, become parallel; and diverging *rays* to become more divergent. See MIRROUR.

The effect of convex lenſes, and concave mirrours, is to make diverging *rays* become parallel; parallel *rays* become convergent, and converging *rays* to converge the more. See LENS.

The *rays* of light are not homogeneous, or ſimilar, but differ in all the properties we know of, *viz.* refrangibility, reflexibility, and colour. See REFRANGIBILITY, *&c.*

It is probably from the different refrangibility, that the other differences have their riſe; at leaſt it appears, that thoſe *rays* which agree or differ in this, do ſo in all the reſt.

Thus from the different ſenſations the differently diſpoſed *rays* excite in us, we call them, *red rays*, *yellow rays*, &c. See COLOUR.

The effect of the priſm is to ſeparate and ſort the different kinds of *rays*, which come blended promiſcuouſly from the ſun; and to throw each kind by itſelf, according to it's degree of refrangibility and colour, red to red, blue to blue, *&c.* See PRISM.

Beſides, refrangibility, and the other properties of the *rays* of light already aſcertained by obſervation and experiment, Sir Iſaac Newton ſuſpects they may have many more; particularly, a power of being inflicted, or bent, by the action of diſtant bodies; and thoſe *rays* which differ in refrangibility, he conceives likewiſe to differ in this flexibility.

In paſſing by the edges and ſides of bodies, he conceives that the *rays* may be bent ſeveral times backwards and forwards, with a motion like that of an eel; and that thoſe *rays* which appear to fall on bodies, are reflected or refracted before they arrive at the bodies. And adds, that they may be refracted, reflected, and inflected, all by the ſame principle acting in different circumſtances. See INFLECTION, *&c.*

Again, do not the *rays* falling on the bottom of the eye excite vibrations in the retina; which being propagated along the fibres of the optic nerve into the brain cauſe viſion? and do not ſeveral ſorts of *rays* make vibrations of ſeveral bigneſſes, which excite ſenſations of ſeveral colours, much after the manner as the vibrations of the air, according to their ſeveral bigneſſes, excite ſenſations of ſeveral ſounds? See SOUND.

Particularly, do not the moſt refrangible *rays* excite the ſhorteſt vibrations, to make a ſenſation of a deep violet; and the leaſt refrangible, the largeſt, to make a ſenſation of a deep red? and the ſeveral intermediate kinds of *rays*, vibrations of intermediate bigneſſes, to make ſenſations of the intermediate colours? See COLOUR.

And may not the harmony and diſcord of colours ariſe from the proportion of theſe vibrations; as thoſe of ſound depend on the vibrations of the air? for ſome colours, if viewed together, are agreeable, as gold and indico; others diſagreeable. See CONCORD and HARMONY.

Again, have not the *rays* of light ſeveral ſides endued with ſeveral original properties?— It is certain we find that every *ray* of light has two oppoſite ſides, originally endued with a property whereon the unuſual refraction of iſland cryſtal depends, and other two oppoſite ſides not endued with that property. See CRYSTAL.

Laſtly, Are not the *rays* of light very ſmall bodies emitted from ſhining ſubſtances?

Such bodies may have all the conditions of light: and there is that action and re-action between tranſparent bodies and light, which very much reſembles the attractive force between other bodies. Nothing more is required for the production of all the various colours, and all the degrees of refrangibility, but that the *rays* of light be bodies of different ſizes; the leaſt of which may make violet, the weakeſt and darkeſt of the colours, and be the moſt eaſily diverted by refracting ſurfaces from it's rectilinear courſe; and the reſt as they are bigger and bigger, may make the ſtronger and more lucid colours, blue, green, yellow, and red. See RAINBOW, RED, *&c.*

Nor is any thing more requiſite for the putting of the *rays* into fits of eaſy reflection, and eaſy tranſmiſſion, than that they be ſmall bodies, which by attraction, or ſome other force, excite vibrations in the bodies they act upon; which vibrations being ſwifter than the *rays*, overtake them ſucceſſively, and agitate them ſo as by degrees to increaſe and diminiſh their velocity, and thereby put them into thoſe fits. See TRANSMISSION.

Laſtly, the unuſual refraction of iſland cryſtal looks very much as if it were performed by ſome attractive virtue lodged in certain ſides both of the *rays* and the cryſtal.

Common RAY, in optics, is ſometimes uſed for a right line drawn from the point of concourſe of the two optical axes, through the middle of the right line which paſſes through the middle of the centres of the pupils of the two eyes. See AXIS.

Cone of RAYS.	See	CONE.
Deflection of RAYS.		DEFLECTION.

Optic RAYS.		OPTIC.

Reflexibility of the RAYS. See REFLEXIBILITY.

Principal RAY, in perſpective, is the perpendicular diſtance between the eye, and the vertical plane or table, as ſome call it. See PERSPECTIVE.

Pyramid of RAYS.	See	PYRAMID *of rays.*
Pencil of RAYS.		PENCIL *of rays.*

RAZANT.	See	RAZANT.
RAZANT *flank.*		FLANK.
Line of defence RAZANT.		LINE.

RE, in grammar, *&c.* an inſeparable particle, or prepoſition, added at the beginning of words, to vary, double, or otherwiſe modify their meaning.

The modificative *re* was firſt introduced by the Latins, from whom it is borrowed, into moſt of the modern tongues: Priſcian derives it from *retro*, backwards; others rather derive *retro* from *re*; others derive *re* from the Greek ῥεια, eaſy, or from ῥεω, I flow.

The effect of the *re* is various: uſually it ſignifies *again*, *rurſum*, ανα; as in *re*-joyn, *re*-ſign, *re*-ſume, *re*-courſe, *re*-bound, *re*-cite, *re*-hear, *re*-cognize, *re*-compare, *re*-double, *re*-linquiſh, *&c.*

Sometimes it ſtands for *contra*, αντι, *againſt*; as in *re*-luctance, *re*-cumbent, *re*-cline, *&c.*

Sometimes for ὑπερ, *ſuper*, over, as in *re*-dundant; ſometimes for ποῤῥω, *longe*, *far*, as in *re*-moving, *&c.*

RE, in muſic. See the article NOTE.

RE, in matters of monies. See the article REE.

REACH, in the ſea-language, the diſtance between any two points of land that lie in a right line from one another.

RE-ACTION, in phyſics, the action whereby a body acted upon, returns the action, by a reciprocal one, upon the agent. See ACTION.

The Peripatetics define *re-action* to be that which a paſſive body returns upon the agent, by means of ſome quality contrary to that received therefrom; in the ſame part wherewith the agent acted; and at the ſame time—as if water, while it is heating by the fire, does, at the ſame time, cool the fire.

It was known even in the ſchools, that there is no action in nature, without *re-action*; and it was a maxim among them, *omne agens, agendo repatitur*.

But the equality of the actions was not known; Sir Iſaac Newton eſtabliſhed it as one of the laws of nature, that *action and re-action are equal and contrary*; or that the mutual actions of two bodies ſtriking one againſt another, are exactly equal, but in contrary directions; or in other words, that by the action and *re-action* of bodies one on another, there are produced equal changes in each; and thoſe changes are impreſſed towards directly contrary parts or ways. See *Law of* NATURE.

Thus, whatever body preſſes or draws another, is equally preſſed or drawn by it again: if any one preſs a ſtone with his finger, his finger is as much preſſed by the ſtone. If a horſe by a rope, *&c.* draw a ſtone, the horſe will be equally drawn by the ſtone; for the rope being ſtretched both ways alike, endeavours to relax itſelf again, and by that means draws the horſe towards the ſtone, and hinders the progreſſion of the horſe, as much as it forwards that of the ſtone.

If any body ſtriking againſt another, doth by it's force any way change it's motion, itſelf will undergo the ſame change in it's own proper motion, but towards a contrary part; from the *re-action* of that body, and the equality of it's mutual preſſion.

By theſe actions are produced equal changes, not indeed of the velocities, but of the motions of bodies; (that is of ſuch bodies as have no impediment any other way) for the changes of their velocities being made towards contrary parts, (becauſe the motions are equally changed) are reciprocally proportional to the bodies themſelves. See MOTION.

Some of the ſchool philoſophers deny any ſuch thing as *re-action*, properly ſo called, at all; urging that action ariſes only from the ratio of the greater inequality; that is, we are only to account for action the exceſs of action, or what the agent does more than is returned by the patient. But the equality between action and *re-action*, ſets aſide the exception.

READINGS, in criticiſm—*Various* READINGS, *variæ lectiones*, are the different manners of reading the text of authors in antient manuſcripts; where a diverſity has ariſen from the corruption of time, or the ignorance of copiſts. See TEXT.

A great part of the buſineſs of the critics lies in ſettling the *readings*, by confronting the various *readings* of the ſeveral manuſcripts, and conſidering the agreement of the words, and ſenſe—The various *readings* in the bible and claſſic authors, are almoſt innumerable. See BIBLE.

READINGS are alſo uſed for a ſort of commentary or gloſs on a law, text, paſſage, or the like; to ſhew the ſenſe an author takes it in, and the application he conceives to be made of it. See COMMENTARY, ANNOTATION, GLOSS, *&c.*

RE-AFFORESTED, is where a foreſt having been diſafforeſted, is again made a foreſt—As the foreſt of Dean was, by an act of parliament in the 20th of King Charles II. See FOREST, AFFOREST, DISAFFOREST, *&c.*

RE-AGGRAVATION, in the romiſh eccleſiaſtical law, the laſt monitory, publiſhed after three admonitions, and before the laſt excommunication. See MONITORY.

Before they proceed to fulminate the laſt excommunication, they publiſh an aggravation, and a *re-aggravation*—Fevret obſerves, that in France the miniſter is not allowed to come to *re-aggravation*, without the permiſſion of the biſhop or official, as well as that of the lay judge. See EXCOMMUNICATION.

REAL, REALE, is applied to a being that actually exiſts; in which ſenſe it coincides with *actual*. See ACTUAL. See alſo REALITY.

REAL, in law, is oppoſed to *perſonal*. See PERSONAL.

REAL *action*, that whereby the plaintiff lays title to land, *&c.* See ACTION.

Cuſtoms are ſaid to be *real*; that is, they determine all inheritances within their extent; and none may diſpoſe of them, but according to the conditions allowed by the cuſtoms where they are ſituate. See CUSTOM.

REAL *altitude*. See the article ALTITUDE.

REAL, RIAL, or RYAL in commerce. See RIAL.

REALGAR, RISIGALIUM, a red friable mineral ſubſtance, popularly called *red arſenic*. See ARSENIC.

Realgar is prepared from orpiment, by fuſing it over the fire in a cloſe veſſel. See ORPIMENT.

It is of an acrimonious nature, and reputed poiſonous, though not in any great degree. See POISON.

Boerhaave takes it for the ſame with the *ſandaracha* of the antients. See SANDARACHA.

In the hiſtory of the French academy, we have an account of a cup brought to Paris by the embaſſadors of Siam, and preſented there, as a remedy uſed by that people againſt all diſeaſes. Upon an examination, which had like to have coſt M. Homberg dear, he found it to be a kind of *realgar*, or red arſenic, more cauſtic than ours.

It's uſe among the Siameſe, he takes to have been the ſame with that of *regulus* of antimony; *viz.* to give an emetic quality to the wine drank out of it.

As the doſe of medicines is much ſtronger in the torrid zone than among us, (the quantity of ipecacuanha, *e. gr.* ordinarily taken by the Indians, being twenty times as great as that among us) it is very poſſible a cup of *realgar*, though enough to poiſon an European, may prove a gentle medicine to a Siameſe.

REALISE, in commerce, a term little known in trade before the year 1710, when thoſe immenſe fortunes began to be made in France and England, by the buſineſs of actions or ſtock. See ACTION, BUBBLE, COMPANY, *&c.*

By *realiſing* is meant the precaution many of thoſe, who had gained moſt, took, to convert their paper into real effects; as lands, houſes, rich moveables, jewels, plate; but above all into current ſpecies. A precaution, capable of ruining the ſtate; but which the French regency had the wiſdom to fruſtrate, by taking proper meaſures to have the money, thus ready to be hoarded up, returned to the public.

REALISTS, REALISTÆ, a ſect of ſchool philoſophers, formed in oppoſition to the Nominaliſts. See NOMINALISTS.

Under the *Realiſts* are included the Scotiſts, Thomiſts, and all excepting the followers of Ocham. See SCOTIST, THOMIST, *&c.*

Their diſtinguiſhing tenet is, that univerſals are realities, and have an actual exiſtence, out of an idea and imagination; or, as they expreſs it in the ſchool language, *a parte rei*: whereas the Nominaliſts contend that they exiſt only in the mind; and are only ideas, or manners of conceiving things. See UNIVERSAL.

Doctor Odo, or Oudart, a native of Orleans, afterwards abbot of St Martin de Tournay, was the chief of the ſect of the *Realiſts*; he wrote three books of dialectics; where, on the principles of Boethius and the antients, he maintained that the object of that art is things, not words: whence the ſect took it's riſe, and name.

REALITY, REALITAS, in the ſchools, a diminutive of *res*, thing, firſt uſed by the Scotiſts to denote a thing which may exiſt of itſelf, or which has a full and abſolute being of itſelf, and is not conſidered as a part of any other. See ESSE, EXISTENCE, *&c.*

Yet a *reality* is conceived as ſomething leſs than *res*; and accordingly every *res* is ſuppoſed to contain a number of *realities*, which they otherwiſe call *formalities*.

Thus, *e. gr.* in a man, according to the doctrine of the Scotiſts, are a number of *realities*, *viz.* a ſubſtance, life, animal, and reaſon.

Some diſtinguiſh *reality* into ſubjective and objective. See SUBJECT, and OBJECT.

REALM *, REGNUM, *kingdom*, a country which gives it's head or governour the denomination of king. See KING, MONARCHY, GOVERNMENT, *&c.*

* The word is formed of the French, *Royaume*, which denotes the ſame.

REAR *, a term frequently uſed in compoſition, to denote ſomething behind or backwards in reſpect of another; in oppoſition to *van*, or *vaunt*, before. See VAN.

* It is formed by corruption of the French, *Arriere*, ſignifying the ſame.

REAR, in a military ſenſe, is uſed for the hind-part of an army, *&c.* in oppoſition to the *front*, or face thereof. See FRONT.

REAR-GUARD, is that part of an army which marches laſt; following the main body, to hinder or ſtop deſerters. See GUARD.

REAR-HALF-FILES, are the three hindmoſt ranks of a battalion, when it is drawn up ſix deep. See FILE.

REAR-LINE, of an army encamped, is the ſecond line; it lies about four or five hundred yards diſtant from the firſt line, or front. See LINE.

REAR-RANK, is the laſt rank of a battalion, or ſquadron, when drawn up. See RANK.

REAR-ADMIRAL, is the admiral of the third and laſt ſquadron of the royal fleet. See ADMIRAL, SQUADRON, and FLEET.

REASON, RATIO, a faculty, or power of the ſoul, whereby it diſtinguiſhes good from evil, truth from falſhood. See SOUL and FACULTY.

Or, *reaſon* is that principle, whereby, comparing ſeveral ideas together, we draw conſequences from the relations they are found to have. See IDEA and RELATION.

Some of the later ſchool philoſophers define *reaſon* the comprehenſion of many principles which the mind ſucceſſively can conceive, and from which concluſions may be drawn. See CONCLUSION.

Others conceive *reaſon* as no other than the underſtanding itſelf, conſidered as it diſcourſes. See UNDERSTANDING and DISCOURSE—Chauvin thinks it better defined, an innate notion or idea, farther diffuſed, and ariſing from a continued attention.

Reaſon, Mr Lock obſerves, comprehends two diſtinct faculties of the mind, *viz. ſagacity*, whereby it finds intermediate ideas; and *illation*, whereby it ſo orders and diſpoſes of them as to diſcover what connection there is in each link of the chain, whereby the extremes are held together, and thereby, as it were, draws into view the truth ſought for. Illation, or inference, conſiſts in nothing but the perception of the connection there is between the ideas in each ſtep of the deduction, whereby the mind comes to ſee either the certain agreement or diſagreement of any two ideas; as in demonſtration, in which it arrives at knowledge: or their probable connection, on which it gives or withholds it's aſſent; as in opinion. See KNOWLEDGE and OPINION.

Senſe and intuition reach but a little way: the greateſt part of our knowledge depends upon deductions and intermediate ideas. In thoſe caſes, where we muſt take propoſitions for true, without being certain of their being ſo, we have need to find out, examine, and compare the grounds of their probability: In both caſes, the faculty which finds out the means, and rightly applies them to diſcover certainty in the one, and probability in the other, is that which we call *reaſon.*

In *reaſon*, therefore, we may conſider four degrees: *firſt*, the diſcovering and finding out of proofs. See INVENTION.

Secondly, the regular and methodical diſpoſition of them, and laying them in ſuch order, as their connection may be plainly perceived. See METHOD.

Thirdly, The perceiving of their connection; and,

Fourthly, The making a right concluſion. See CONCLUSION.

Reaſon fails us in ſeveral inſtances: as, *firſt*, Where our ideas fail. See IDEA and IGNORANCE.

Secondly, It is often at a loſs becauſe of the obſcurity, confuſion, or imperfection of the ideas it is employed about—Thus, having no perfect idea of the leaſt extenſion of matter, nor of infinity, we are at a loſs about the diviſibility of matter. See OBSCURITY.

Thirdly, Our *reaſon* is often at a ſtand becauſe it perceives not thoſe ideas which would ſerve to ſhew the certain or probable agreement or diſagreement of any two other ideas.

Fourthly, Our *reaſon* is often engaged in abſurdities and difficulties, by proceeding upon falſe principles, which being followed, lead men into contradictions to themſelves, and inconſiſtency in their own thoughts. See AXIOM, MAXIM, PRINCIPLE, *&c.*

Fifthly, Dubious words, and uncertain ſigns, often puzzle men's *reaſon*, and bring them to a non-plus.

Though the deducing one propoſition from another, be a great part of the office of *reaſon*, and that about which it is uſually employed; yet the principal act of ratiocination is the finding the agreement or diſagreement of two ideas one with another, by the intervention of a third. As a man, by a yard, finds two houſes to be of the ſame length, which could not be brought together to meaſure their equality by juxta-poſition. Words have their conſequences as the ſigns of ſuch ideas and things agree, or diſagree, with what they really are; but we obſerve it only by our ideas. See REASONING.

Hence we may be able to form an idea of that ordinary diſtinction of things, into ſuch as are *according* to, thoſe that are *above*, and thoſe *contrary* to *reaſon.*

According to reaſon, are ſuch propoſitions, whoſe truth we can diſcover by examining and tracing thoſe ideas we have from ſenſation and reflection, and by natural deduction find to be true or probable.

Above *reaſon* are ſuch propoſitions, whoſe truth or probability we cannot by *reaſon* derive from thoſe principles.

Contrary to reaſon, are ſuch propoſitions as are inconſiſtent with, or irreconcileable to, our clear and diſtinct ideas.

Thus the exiſtence of one God, is according to *reaſon*: the exiſtence of more than one God, contrary to reaſon: the reſurrection of the body after death, above *reaſon.*

Above *reaſon* may be alſo taken in a double ſenſe; *viz.* above probability, or above certainty. See PROBABILITY and CERTITUDE.

They who diſpute moſt againſt the power and privileges of human *reaſon*, do it becauſe their own *reaſon* perſuades them to that belief; and ſo, whether the victory be on their or our ſide, are equally defeated.

They ſeek to terrify us with the example of many great wits, who by following this *ignis fatuus* (ſo they call the only pole ſtar God has given us to direct our courſe by) have fallen into wild and ridiculous opinions, and increaſed the catalogue of hereſies to ſo great a number: but theſe men either followed not their *reaſon*, but made it follow their will; or firſt hoodwinked it by intereſt and prejudice, and then bad it ſhew them the way; or were wanting in thoſe neceſſary diligences required for ſo doubtful a paſſage: or, if, without any of theſe, the weakneſs of their underſtanding had deceived them; the error is neither hurtful to themſelves, nor would be to others, if this doctrine of governing ourſelves by our own *reaſon*, and not by authority and example, were eſtabliſhed. *Diſc. concern. Hum. Reaſ.*

It is not the uſe of ſuch liberty, but the appropriating it to ourſelves, that is the cauſe of all the diſorders charged thereon: for thoſe who lay a reſtraint on other men's *reaſon*, have firſt made uſe of their own to ſettle them, and do make uſe of it in this very reſtraining of others. *Ibid.*

REASON, in matters of religion, is uſed in oppoſition to *faith*. See FAITH.

This uſe of the word, Mr Lock takes to be in itſelf very improper: for faith is nothing but a firm aſſent of the mind; which if it be regulated, as it is our duty, cannot be afforded to any thing but upon good *reaſon*, and ſo cannot be oppoſite to it.—See FAITH.

He that believes without having any *reaſon* for believing, may be in love with his own fancies, but neither ſeeks truth, as he ought, nor pays the obedience due to his maker, who would have him uſe thoſe diſcerning faculties he has given him, to keep him out of miſtake and error—But ſince *reaſon* and faith are by ſome men oppoſed, it may be neceſſary to conſider them together.

Reaſon, as contradiſtinguiſhed to faith, is the diſcovery of the certainty or probability of ſuch propoſitions, or truths, which it has got by the uſe of it's natural faculties, *viz.* by ſenſation or reflection.

Faith, on the other hand, is the aſſent to any propoſition upon the credit of the propoſer, as coming immediately from God; which we call revelation. See REVELATION, and ASSENT.

REASON, in logick and rhetorick, denotes a neceſſary or probable argument; or an anſwer to the queſtion, *cur eſt?* Why is it? See ARGUMENT.

As if it be enquired, why do the ſubject and predicate agree? And it is anſwered, becauſe they are ſpoke of the ſame thing: This laſt enunciation is a *reaſon.*

Hence, ſay the ſchoolmen, becauſe, *quia*, is the ſign or character of a reaſon, as *non*, no, of a negation, and *eſt*, is, of an affirmation.

They make three kinds of *reaſons*, *rationes*; *viz. ratio ut*, that; *ne*, leaſt; and *quia*, becauſe. For, anſwering to a queſtion, *cur*, why; we begin with becauſe, *quia*; as, why do you ſtudy? that I may become learned; which is the *ratio ut*. Again, why do you ſtudy? leaſt I ſhould be ignorant; which is the *ratio ne*. Laſtly, why is a body tangible? becauſe matter is impenetrable; which is the *ratio quia*.

The *reaſon ut*, properly denotes the end, or final cauſe; and *reaſon ne*, the beginning: accordingly the one is called the beginning, the other the end; ſo that the *reaſon quia*, is left the only *reaſon*, properly ſo called.

Among metaphyſicians, REASON is uſed in the ſame ſenſe with eſſence; or that whereby any thing is what it is. See ESSENCE.

This is ſometimes alſo called formal *reaſon*, as repreſenting the thing under that form or nature under which it is conceived. See FORM and FORMAL.

REASON, in mathematicks. See the article RATIO.

REASON *of ſtate* *, *Ratio ſtatus*, in matters of policy, denotes a rule or maxim, whether it be good or evil, which may be of ſervice to the ſtate. See GOVERNMENT.

* The phraſe is borrowed from the Italians, who firſt uſed *ragione di ſtato* in this ſenſe.

Reaſon of ſtate, is properly underſtood of ſomething that is neceſſary and expedient for the intereſt of the government, but contrary to moral honeſty, or juſtice.

Politicians have a long time diſputed about the *ratio ſtatus*: whether ſtates and governments are tied down to the ſame laws of morality with individual perſons; or whether things, otherwiſe immoral and unlawful, may not be practiſed on urgent occaſions, by way of *reaſon* of ſtate?

The queſtion is, whether any thing be unlawful, or prohibited a ſtate, that is neceſſary to the preſervation of that ſtate, or whether it be allowed to preſerve itſelf on any terms?

Challenge upon REASON. See CHALLENGE.

REASONABLE *aid*, a duty which the lord of the fee antiently claimed of his tenants holding in knight's ſervice, or on ſocage; towards the marrying his daughter, or the making his eldeſt ſon knight. See SERVICE, SOCAGE, *&c.*

This is taken away by *Stat.* 2. *Car.* II. See AID.

REASONING, RATIOCINATION, the exerciſe of that faculty of the mind called *reaſon*; or reaſon deduced into diſcourſe. See REASON and DISCOURSE.

The agreement or diſagreement of two ideas, does not appear from the bare conſideration of the ideas themſelves, unleſs ſome third be called in, and compared, either ſeparately or conjointly therewith: the act, then, whereby from ideas thus diſpoſed and compared, we judge this or that to be ſo or not ſo, is called *reaſoning.*

Rohault defines *reaſoning* to be a judgment depending on ſome antecedent judgment: thus; having judged that no even number can be compoſed of five uneven numbers; and that ten is an even number; to conclude that ten cannot be divided into five uneven parts, is a *ratiocination*, or *reaſoning*. This agrees with father Malebranche's doctrine, one of the great points whereof is, that *reaſoning*, on the part of the underſtanding, is only a meer *perceiving*. See PERCEPTION.

That ingenious author endeavours to ſhew, that as to the underſtanding, there is no difference between a ſimple *perception*, a *judgment*, and a *reaſoning*, except in this, that the underſtanding perceives a ſimple thing without any relation to any thing elſe, by a ſimple *perception*—That it perceives the relations between two or more things in a *judgment*—And laſtly, that it perceives the relations that are between the relations of things in a *reaſoning*. So that all the operations of the underſtanding are no more than meer perceptions. See JUDGMENT.

Thus, *e. gr.* when we conclude, that 4 being leſs than 6; twice 2 being equal to 4, are of conſequence leſs than 6; we do no more than perceive the relation of the inequality between the relation of twice two and four, and the relation of 4 and 6. See UNDERSTANDING.

The manner of proceeding juſtly in *reaſoning*, ſo as to arrive with the greater ſafety at the knowledge of truth, makes what we call *method*. See METHOD.

For the real benefit of logic to *reaſoning*. See LOGIC and SYLLOGISM.

RE-ATTACHMENT, in law, a ſecond attachment of him who was formerly attached, and diſmiſſed the court without day, by the not coming of the juſtices, or the like caſualty. See ATTACHMENT.

Brook makes *re-attachment* either *general* or *ſpecial*—*General* is where a man is *re-attached* for his appearance on all writs of aſſize lying againſt him—*Special*, for one or more certain writs.

RE-BAPTISANTS, a religious ſect who maintain that perſons irregularly baptized, are to be baptized a-freſh. See BAPTISM.

The anabaptiſts are *re-baptiſants*, inaſmuch as they baptize thoſe at maturity who had been before baptized in childhood. See ANABAPTIST.

St Cyprian, and pope Stephen, had mighty differences about the rebaptiſation of converted heretics. See HERETIC.

Donatus was condemned at Rome in a council, for having re-baptized ſome perſons who had fallen into idolatry after their firſt baptiſm. See DONATIST.

REBATE, REBATEMENT, in commerce, a term much uſed at Amſterdam, for a diſcount or abatement in the price of certain commodities, when the buyer advances the ſum in hand for which he might have taken time. See DISCOUNT.

Rebate (among us is uſually called *prompt payment*) is eſtimated by months; and is only allowed for certain kinds of merchandizes, which, according to the cuſtom of Amſterdam, are,

German wools,	which are ſold at	15	Months *rebate*.
Aſhes, and-pot-aſhes,		18	
Italian ſilks,		33	
Sugars of Braſil,		18	
Spaniſh wools,		21	

That is, theſe commodities are ſold for ready money; only deducting or *rebating* the intereſt of the money, which ought not to be paid till the end of 15, 18, &c. months.

This intereſt, called *rebate*, is uſually regulated on the footing of 8 *per cent. per annum.*

The reaſon of this expedient is, that the merchants having not always wherewithal to pay for their goods in hand, by means of the *rebatement*, ſuch as have, will find their account in it; and ſuch as have not, will be engaged to diſcharge themſelves as ſoon as poſſible, in hopes of the diſcount.

REBATEMENT, in heraldry, a diminution or abatement of the dignity of the figures or bearings in a coat of arms. See ABATEMENT.

REBELLION, originally ſignified a ſecond reſiſtance, or riſing of ſuch as had been formerly overcome in battle by the Romans, and had yielded themſelves to their ſubjection.

It is now generally uſed for a traiterous taking up of arms againſt the king, either by his own natural ſubjects, or by thoſe formerly ſubdued.

Rebel is ſometimes alſo uſed in our antient ſtatutes, for a perſon who wilfully breaks a law; and ſometimes for a villain diſobeying his lord.

Commiſſion of REBELLION. See COMMISSION.

REBELLIOUS *aſſembly*, a gathering of twelve perſons, or more, intending, going about, or practiſing, unlawfully, and of their own authority, to change any laws of the realm; or to deſtroy the encloſure of any park, or ground encloſed, banks of fiſh-ponds, pools, conduits, &c. to the intent the ſame ſhall remain void, or that they ſhall have way in any of the ſaid grounds; or to deſtroy the deer in any park, fiſh in ponds, coneys in any warren, dove-houſes, &c. or to burn ſtacks of corn, or to abate rents, or prices of victuals. See RIOT, &c.

REBOUND. See the article RECOIL.

REBUS, a name-device, as Cambden Engliſhes it; or an enigmatical repreſentation of ſome name, &c. by uſing a figure, or picture, inſtead of a word, or part of a word. See NAME and DEVICE.

Such is that of the gallant, mentioned by Cambden, who expreſſed his love to Roſe Hill, by painting in the border of his gown, a roſe, a hill, an eye, a loaf, and a well; which in the *rebus*-ſtile, reads, *roſe hill I love well.*

The Picards have the honour of the Invention of this notable kind of wit; whence the French, to this day, call it, *rebus de Picardie.* Cambden adds, that the Engliſh firſt learned it of them in the reign of our Henry III. by means of the garriſons we then had in Calais, Guienne, and other places bordering on Picardy.

It's origin is by Menage, &c. aſcribed to the prieſts of Picardy, who, it ſeems, antiently, in carnival-time, uſed every year to make certain libels entitled, *de rebus quæ geruntur*, being railleries on what intrigues and tranſactions had paſſed about the city; wherein they made great uſe of ſuch ſort of equivoques and alluſions, breaking and joining words, and ſupplying them with paintings.

Thus in the *rebus* of Picardy, ſays Marot, a curry-comb, *etrille*; a ſcythe, *faux*; and a calf, *veau*, make *etrille fauveau.* But the practice has been ſince prohibited, by reaſon of the ſcandal.

Cambden tells us, the *rebus* was in wonderful eſteem among our forefathers; and that he was nobody who could not hammer out of his name an invention by this wit-craft, and picture it accordingly.

The ſieur Des Accords, has made an ample collection of the moſt famous *rebus*'s de Picardy. And Mr Cambden has done ſomething of the ſame kind in his Remains—The abbot of Ramſey, he tells us, engraved in his ſeal a ram in the ſea, with this verſe, to ſhew he was a right ram, *cujus ſigna gero, dux gregis eſt ut ego*—Sir Thomas Caval (Caval ſignifying a horſe) engraved a galloping horſe in his ſeal, with this limping verſe, *Thomæ Creditis, cum cernitis ejus equum*—So John Eagleſhead bore in his ſeal an eagle's head, with this motto around it, *Hoc aquilæ caput eſt, ſignumq; figura Johannis.*

Bolton, prior of St Bartholomew's, ſignified his name by a bolt thruſt through a tun—Iſlip, abbot of Weſtminſter, a man highly in favour with Henry VII. had a quadruple *rebus* for his ſingle name; ſometimes he ſet up in his windows the figure of an eye with a ſlip of a tree; ſometimes the letter I with the ſaid ſlip; in other places one ſlipping boughs in a tree; and in others, one ſlipping from a tree; with the word, *I-ſlip.*

Thomas, earl of Arundel, ſignified his name by a capital A in a rundle. Morton, the great archbiſhop of Canterbury, was contented to uſe mor upon a tun; and ſometimes a mulberry called *morus*, out of a tun. So Luton, Thornton, Aſhton, &c. ſignified their names by a lute, a thorn, an aſh, upon a tun. So a hare on a bottle was the device of Harebottle; a mag-pye on a goat, of Pigot; a hare by a ſheaf of rye in the ſun, of Harriſon: Lionel Ducket uſed a lion with an L on it's head, whereas ſays Cambden, it ſhould have been on it's tail: had the lion been eating a duck, adds the ſame author, it had been a rare device, worth a ducat or a duck-egg. Garret Dews ſignified his name on his ſign by two men in a garret caſting dews at dice.

Abel Drugger's device in Ben. Johnſon's Alchymiſt, and Jack of Newberry in the ſpectator, are known to every body—But the *rebus* being once raiſed to ſign poſts, grew out of faſhion at court, and has been left to hang there ever ſince; indeed attempts have been lately made for it's reſcue by a reverend divine, in his *Tunbridge-Love-Letters*, &c.

Yet has the *rebus* antiquity on it's ſide, as having been in uſe in the pure auguſtan age: Cicero, in a dedication to the Gods, inſcribed Marcus Tullius, with a little pea, called by the Latins *cicer*, by us a *chich-pea.* And Julius Cæſar, in ſome of his coins, uſed an elephant, called *Cæſar* in the Mauritanian tongue. Add to theſe, that the two mint maſters in that age, L. Aquilius Florus, and Voconius Vitulus, uſed, the firſt a flower, the ſecond a calf, on the reverſe of their coins.

REBUTTER *, in law, the anſwer of the defendant in a cauſe to the plaintiff's ſurrejoinder. See SURREJOINDER.

* This is called a *rebutter*, from *re*, and the French, *bouter*, to repel, or bar.

The plaintiff's anſwer to the defendant's *rebutter*, is called a *ſur-rebutter*. See SURREBUTTER.

REBUTTER is alſo when a man warrants any land or hereditament to another; and the perſon making the warranty or his heir, ſues him to whom the warranty is made, or his heir or aſſignee, for the ſame thing: if he who is ſo ſued, plead the deed or fine with warranty, and pray judgment if the plaintiff ſhall be received to demand the thing which he ought to warrant to the party, againſt the warranty in the deed, &c. this is called a *rebutter Term de Ley*, 511.

Again, If I grant to the tenant to hold *ſine impetitione vaſti*, and afterwards implead him for waſte; he may debar me of the action, by ſhewing my grant: which is likewiſe a *rebutter*.

RECANTATION. See Palinody, and Retractation.

RECAPITULATION, in oratory, *&c.* a part of the peroration; called alſo, *anacephalæoſis*. See Peroration, *&c.*

Recapitulation is a ſummary of the preceding diſcourſe; or a conciſe, tranſient enumeration of the principal things inſiſted on at large therein; whereby the force of the whole is collected into one view.

An inſtance of this may be given in the peroration of Cicero's *Manilian: Quare cum bellum ita neceſſarium ſit ut negligi non poſſit: ita magnum ut accuratiſſimè ſit adminiſtrandum; & cum ei imperatorem præficere poſſitis, in quo ſit eximia belli ſcientia, ſingularis virtus, clariſſima auctoritas, egregia fortuna: dubitabitis, quirites, quin, &c.*

RECAPTION, Recaptio in law, the taking a ſecond diſtreſs of one formerly diſtrained for the ſame cauſe, and alſo during the plea grounded on the former diſtreſs. See Distress.

Recaption is alſo the name of a writ lying for the party thus diſtrained, to recover damages.

RECEIPT, or Receit, in commerce, an acquittance or diſcharge; or an act whereby it appears a thing has been paid off, or acquitted. See Acquittance.

Where the *receipt* is on the back of a bill, *&c.* it is uſually called an *indorſement*. See Endorsement.

Among tradeſmen, Receipt uſually makes the ſecond of the three articles of an account: the *receipt* contains the moneys received; the two others the expence, and the return or ballance. See Account, and Book-keeping.

Receipt, or Resceit, in law, denotes alſo an admiſſion, or receiving of any perſon to plead his right, in a cauſe formerly commenced between two other perſons. See Resceit.

Receipt *of homage*.	See	Resceit.
Receipt *of the exchequer*.		Exchequer.
Receipt, in medicine.		Recipe.

Auditor of Receipts. See the article Auditor.

RECEIVER, a veſſel uſed in chemiſtry, pneumatics, *&c.* See Recipient and Exhausted.

Receiver, Receptor, or Receptator, in law, is uſed commonly in the evil part, for ſuch as knowingly receive ſtollen goods from thieves, and conceal them—The crime is felony, and the puniſhment tranſportation.

Receiver, alſo denotes an officer; whereof there are various kinds, denominated from the particular matters they receive, the places where, or the perſons for whom, *&c.*

As, *receiver* of rents: *receiver* general of the cuſtoms. See Customs—*Receiver* of the fines, upon original writs in chancery, *&c.*

Receiver *general* of the dutchy of Lancaſter, is he who gathers all the revenues and fines of the lands of the ſaid dutchy, all forfeitures, aſſeſſments, *&c.* See Dutchy, *&c.*

RECENT *fruits*. See the article Fruit.

RECEPTACULUM *chyli*, Receptaculum *commune*, or *ciſterna chyli*, in anatomy, a reſervoir or cavity near the left kidney, into which the lacteal veſſels do all diſcharge their contents. See Lacteal.

This receiver, called alſo from it's inventor *ductus pecqueticus*, lies under the emulgent and great arteries, between the two origins of the diaphragma. Hither do the lacteal veſſels of the ſecond order bring the chyle after it's being diluted, and rendered thinner by the lympha in the glands of the meſentery. See Chyle and Mesentery.

In a preparation of this part, by filling it with mercury, Mr Cowper found it to conſiſt of three ſeveral large trunks; two of them more than a quarter of an inch in diameter.

This diviſion is only obſerved in human bodies, in whom Dr Drake thinks it's erect poſition makes it neceſſary, in order to take off the reſiſtance which would ariſe from the preſſure of the chyle and lympha, were it contained in a ſingle receiver. In quadrupeds, it's horizontal poſition may make one trunk ſufficient.

It's oſculum, or exit, is upwards in the thorax, and thence called the *thoracic duct*. See Thoracic *duct*.

RECEPTION, Receptio, in philoſophy, denotes the ſame with *paſſion*, conſidered as oppoſed to *action*. See Passion and Action.

The ſchoolmen, however, make ſome difference: The *receptive* paſſion, ſay they, does not tend to the deſtruction of the being, as paſſion does; but to the perfection thereof. It is conceived as the acquiſition of ſome new reality or modification, by means of the action of another.

Reception is alſo properly uſed for the manner of treating or entertaining a perſon; and the ſolemnities and ceremonies practiſed on that occaſion. See Entry.

The queen of Sweden's *reception* into Paris was one of the moſt magnificent theſe ages have ſeen. The *reception* of embaſſadors is uſually performed with a great deal of pomp.

Reception is ſometimes alſo uſed for the act of approving, accepting, and admitting a thing. See Acceptance.

The canon law only binds where it is *received*: The civil law is received in ſome countries, not in others. See Civil *law*. The French would never *receive* the council of Trent, the Spaniſh inquiſition, nor the dogmata of the ultramontane canoniſts.

Reception, in aſtrology, is a dignity befalling two planets when they exchange houſes: *e. gr.* when the ſun arrives in cancer, the houſe of the moon; and the moon, in her turn, arrives in the ſun's houſe.

The ſame term is alſo uſed, when two planets exchange exaltation.

RECEPTITIOUS *goods*. See the article Goods.

RECESSION *of the equinoxes*. See Precession.

RECESSUS *imperii*, Recess *of the empire*, a phraſe uſed in ſpeaking of the affairs of Germany; ſignifying a collection of the votes or determinations of a diet. See Diet and Imperial.

At the end of each diet, before it breaks up, they gather together all their reſolutions, and reduce them into writing; the act which contains them they call *receſſus imperii*, becauſe made when on the point of retiring. See Empire.

There being, now, no articles of ſuccours for the war againſt the Turks, which uſed to make the greateſt part of the *receſſus imperii*; they are at a loſs for matter to fill them withall, as well as for the manner of drawing them up. *Mozambano.*

The diſorders in the imperial chamber of Spires were ſo great, that in 1654, they made ſeveral regulations therein; inſerted in the *receſſus imperii. Id.* See Chamber.

RECHABITES, a kind of religious order among the antient Jews, inſtituted by Jonadab the ſon of Rechab; comprehending his family and poſterity.

Their founder preſcribed him three things; *firſt*, not to drink any wine. *Secondly*, not to build any houſes, but to dwell under tents. *Thirdly*, not to ſow any corn, or plant any vines. The *Rechabites* obſerved theſe rules with a great deal of ſtrictneſs, as appears from Jeremy xxxv. 6, *&c.*—Whence, St Jerom in his xiiith epiſtle to Paulinus, calls them *Monachi*, *Monks*. Jonadab, their founder, lived under Jehoaſh, king of Judah, cotemporary with Jehu king of Iſrael; his father Rechab, from whom his poſterity were denominated, deſcended from Raguel or Jethro, father-in-law to Moſes, who was a Kenite, or of the race of Ken; whence *Kenite* and *Rechabite*, are uſed as ſynonymous in ſcripture.

RECHACING, in hunting, the driving back of the deer, or other beaſts, into the foreſts, chaces, *&c.* which had ſtragled out into the copſes, or thickets, *&c.* See Forest, *&c.*

Antiently there were offices of *rechacers* of the deer, beſtowed by the king on gentlemen, or old hunters, with ſalaries for the keeping of running dogs, to *rechace* the deer into the foreſts, and then to beat the dogs off, without purſuing any farther. See Purlieu.

RECHANGE in commerce. See Re-exchange.

Rechange is alſo uſed at ſea for ſuch tackle as is kept in reſerve aboard the ſhip, to ſerve in caſe of failure of that already in uſe. See Tackle.

The Levantines uſe the word *reſpect* or *reſpit* in the ſame ſenſe.

RECHARGE, of a fire-arm, is a ſecond loading or charge. See Charge.

The *recharge* ſhould never be ſo deep as the firſt charge, leaſt the piece being over-heated ſhould burſt. See Cannon, *&c.*

RECHEAT, in hunting, a leſſon which the huntſman winds on the horn, when the hounds have loſt their game; to call them back from purſuing a counter-ſcent. See Horn, Hunting, *&c.*

RECIPE, in medicine, a preſcription, or formula of a remedy, appointed to be adminiſtred to a patient. See Prescription.

It is thus called, becauſe always beginning with the word *recipe*, take; ordinarily expreſſed by the abbreviator ℞.

RECIPIANGLE, or Recipient-angle, a mathematical inſtrument, ſerving to take the quantity of angles; uſed eſpecially in the drawing plans of fortifications.

The *recipiangle* is a popular inſtrument among the French, but little known among us: it is uſually very ſimple, in form of a ſquare, or rather a bevel; conſiſting of two arms or branches, riveted together, and yet moveable, like a ſector on the centre or rivet. See Bevel.

To take an angle with it, they lay the centre of a protractor to the joint, and the degrees cut by the edge ſhew the quantity of the angle: otherwiſe the angle made by the two rulers is drawn on paper, and then meaſured with a protractor. See Angle.

Sometimes there is a circle divided into degrees added over the centre or rivet, with an index to ſhew the degrees without a protractor—At other times the under branch is divided. To meaſure a ſaliant angle with any of the *recipiangles*, apply the inſides to the lines that form the angle; for a reentring angle, apply the outſides, *&c.*

RECIPIENDO *excommunicato*. See Excommunicato.

Recipiendo & *faciendo atturnato*. See Atturnato.

RECIPIENT, Receiver, in chemiſtry, an appendage of an alembic, retort, *&c.* being a veſſel luted to the beak thereof, to receive the liquor raiſed in diſtillation, &c. See Alembic, Retort, Distillation, &c.

Recipient is alſo part of the apparatus of an air-pump; being a glaſs veſſel placed a-top of the plate, for the air to be exhauſted from. See Air-pump.

To an air-pump belong various *recipients*, of various forms and ſizes, and ſerving for various purpoſes. See Vacuum.

RECIPROCAL, Reciprocus, ſomething that is mutual, or which is returned equally on both ſides, or affects both parties alike. See Mutual.

The end of human ſociety is to afford each other *reciprocal* aid: there are *reciprocal* duties between the prince and his ſubjects, the huſband and wife, &c. There is a *reciprocal* action between the agent and patient. See Reaction.

The *lex talionis* eſtabliſhes a kind of *reciprocation* of juſtice. See Talio.

If two ſimilar triangles be cut by parallel lines, the ſections of the ſides will be proportional; and *reciprocally*, if the ſides be cut proportionably, the triangles are ſimilar. See Triangle.

Reciprocal, in logic, is applied to terms which have the ſame ſignification, or are convertible — as, *reaſonable*, *animal*, and *man*. See Term, and Synonymous.

Schoolmen define *reciprocation*, a converſion of the ſeveral terms in an enunciation—And terms are ſaid to be converted in an enunciation, when the predicate is put in the place of the ſubject, and *reciprocally*, the ſubject in that of the predicate. See Converse and Conversion.

Thus rationality and riſibility are ſaid to *reciprocate*; for we ſay equally, *a rational is riſible*; and *a riſible is rational.*

Reciprocal, in grammar, is applied to certain verbs and pronouns in ſome of the modern languages; in regard of their turning or reflecting the noun, or perſon upon himſelf.

Thus the pronoun-relative *himſelf*, refers Cato to Cato's ſelf. See Pronoun.

The abbe de Dangeau defines *reciprocal verbs* to be thoſe whoſe nominative is plural, and denotes perſons acting mutually on one another: as, *Ces quatre hommes s' entrebattoient*; theſe four men fought together. *Pierre & toi vous vous louez*; Peter and you praiſe one another, &c.

Reciprocal verbs are a ſpecies of thoſe which that author calls *pronominals*, and which he diſtinguiſhes into *reciprocal* and *identical.* See Verb.

Reciprocal, in poetry, is applied to verſes which run the ſame both backwards and forwards; called alſo *recurrents.* See Recurrent.

Reciprocal *figures*, in geometry, are ſuch as have the antecedents and conſequents of the ſame ratio in both figures. See *Tab. Geom. fig.* 22. *n*°. 2. Here,

$$A : B :: C : D, \text{ or,}$$

$$12 : 4 :: 9 : 3$$

That is, as much longer as the ſide A, in the firſt rectangle, is than B; ſo much deeper is the ſide C in the ſecond rectangle, than the ſide D in the firſt: and conſequently, the length of one is compenſated by the depth of the other.

Alſo, as the ſide A is $\frac{1}{4}$ longer than the ſide C, ſo the ſide B is $\frac{1}{4}$ longer than D: wherefore the rectangles muſt needs be equal. See Rectangle.

This is the foundation of that catholic theorem; that the rectangle of the extremes muſt always be equal to that of the means: and conſequently, the reaſon of the rule of three, or golden rule. See Rule.

For, ſuppoſe there was given any three numbers, or quantities, geometrically proportional, as A, B, and C; and that it were required to find a fourth, D, proportional to them: ſince $A : B :: C : D$, therefore $A B = B C$, and conſequently, $D = \frac{BC}{A}$ that is, the fourth term is equal to the quotient of the ſecond, multiplied by the third term, divided by the firſt.

Or thus in numbers: ſuppoſe given 12, 4, and 9; required a fourth proportional. Now as $12 : 4 :: 9 : Q$. But $12\,Q = 4 \times 9 = 36$. Therefore $Q = \frac{4 \times 9}{12}$ (: 3. by dividing both ſides by 12.

And hence it follows, that if any two triangles, parallelograms, priſms, parallelepipeds, pyramids, cones, or cylinders, have their baſes and altitudes *reciprocally* proportional, thoſe two figures or ſolids are equal to one another; and *vice verſa*, if they are equal, their baſes and altitudes are *reciprocally* proportionable. See Triangle, Parallelepiped, Prism, Cone, Cylinder, &c.

Reciprocal *proportion*, is when in four numbers, the fourth is leſſer than the ſecond, by ſo much as the third is greater than the firſt; and *vice verſa.* See Proportion.

This is the foundation of the inverſe, or indirect rule of three. Thus; 4 : 10 : 8 : 6. See Rule.

Great uſe is made of this *reciprocal proportion*, by Sir Iſaac Newton, and others, in demonſtrating the laws of motion. See Motion.

Reciprocal *theorem.* See the article Theorem.

RECITATION, the act of *reciting*, or delivering a diſcourſe, either in the way of narration, rehearſal, declamation, or reading. See Declamation, &c.

RECITATIVO, or Recitative *muſick*, a kind of ſinging, which differs but little from ordinary pronunciation: ſuch as that wherein ſeveral parts of the liturgy are rehearſed in cathedrals, or that wherein the actors ordinarily deliver themſelves on the theatre, at the opera, &c. See Singing and Opera.

The Italians value themſelves on their performance in the *recitative* way. The *recitative's*, or *recitativo's*, in our operas, uſually tire the audience, by reaſon they do not underſtand the language; the ſongs make them amends. See Song.

Recitative *ſtyle*, is the way of writing accommodated to this ſort of muſick. See Style.

RECKONING, in navigation, the act of eſtimating the quantity of a ſhip's way; or of the diſtance run between one place and another. See Sailing and Distance.

This is uſually performed by means of the log-line; the manner of applying which ſee under it's proper article, Log-line.

Yet is this liable to great irregularities — Vitruvius adviſes an axis to be paſſed through the ſides of the ſhip, with two large heads propending out of the ſhip, wherein are to be included wheels touching the water, by whoſe revolution the ſpace paſſed over in any given time, may be meaſured. The ſame has been lately recommended by Snellius: but there are few who have wrote of navigation, but have ſhewn the inſufficiency of this method.

Dead Reckoning. See Dead *reckoning.*

RECLAIMING, or Reclaiming, in our antient cuſtoms, the action of a lord purſuing, proſecuting, and recalling his vaſſal, who had gone to live in another place, without his permiſſion. See Lord and Vassal.

Reclaiming is alſo uſed in a ſimilar ſenſe, for the demanding of a perſon or thing to be delivered up, or ſurrendered, to the prince or ſtate it properly belongs to; when, by any irregular means it has come into the poſſeſſion of another. See Claim.

An officer was ſent to reclaim the veſſel ſeized by the Algerines, contrary to the terms of the treaty of peace. The government *reclaimed* the late caſhier of the South-ſea company, who had refuged himſelf in Flanders, but in vain.

Reclaiming, in falconry, is the calling of a hawk, or bird of prey, back to the fiſt. See Hawk, and Falcon.

The ſpar-hawk, gos-hawk, &c. are *reclaimed* with the voice: the falcon only by ſhaking the lure—So that luring with regard to the falcon, is more proper than *reclaiming.* See Lure.

The partridge is alſo ſaid to reclaim her young ones, when ſhe calls them together upon their ſcattering too much.

RECLINATION, of a plane, in dialling, the number of degrees which a dial-plane, leans backwards, from an exactly upright or vertical plane, *i. e.* from the zenith. See Plane.

The *reclination* is eaſily found, by means of a ruler and a quadrant; for having drawn an horizontal line on the plane by a level or quadrant, and to it another line at right angles; apply a ruler, ſo that one end of it may hang over, or reach beyond the plane: then will a quadrant, applied to the under edge of the ruler, ſhew the degrees and minutes of the plane's *reclination*; accounting from that ſide of the quadrant that is contiguous to the edge of the ruler. See Dial, Quadrant, &c.

RECLINER, or Reclining *dial*, is a dial whoſe plane *reclines* from the perpendicular; *i. e.* leans from you when you ſtand before it. See Reclination.

When this reclination is equal to the height of the pole, the dial is ſaid to be equinoctial. See Dial.

Declining Recliner, or *declining* Reclining *dial*, is a dial which neither ſtands perpendicularly, nor oppoſite to one of the cardinal points. See Decliner.

RECLUSE, among religious, a perſon cloſe ſhut up in a very narrow cell of a hermitage, or other religious houſe; and cut off, not only from all converſation with the world, but even with the houſe. See Hermit, &c.

The word is chiefly uſed for ſuch as thus impriſon themſelves out of devotion, to do penance — It is ſometimes alſo applied to incontinent wives, whom their huſbands procure to be thus kept in a perpetual priſon in ſome convent. See Adultery, &c.

Recluſes were antiently very numerous: they were then a kind of ſolitaries who ſhut themſelves up in ſome little cell, with a vow never to ſtir out of it. See Monk, Anachoret, &c. None were admitted to this oath until they had given ſufficient proofs of their abſtinence, and had leave from the biſhop, or the abbot of the monaſtery where they were ſhut up: for the cells of the *recluſes* were always to join to ſome monaſtery.

The prelate's permiſſion being obtained, they were tried for a year in the monaſtery; out of which, during that time, they never ſtirred. See Probation.

They were then admitted to their vow of ſtability in the church before the biſhop; which being done, and the *recluſe* entered his little cell, the biſhop ſet his ſeal on the door.

The cell was to be very ſmall, and very exactly cloſed. See CELL—The *recluſe* was to have every thing within it neceſſary to life; and, even, if he were a prieſt, an oratory conſecrated by the biſhop, with a window which looked into the church, through which he might make his offerings at the maſs, hear the ſinging, ſing himſelf with the community, and anſwer thoſe who talked to him. But this window was to have curtains before it, both within-ſide and without; ſo that the *recluſe* might neither ſee nor be ſeen.

Indeed he was allowed a little garden in his *recluſion*, to plant a few herbs and take freſh air: adjoining to his cell was that of his diſciples, which he was very rarely without; with a window, through which they ſerved him with neceſſaries, and received his inſtructions.

When it was judged proper to have two or three *recluſes* together, their cells were made contiguous to each other, with windows of communication: if any woman would conſult them, or confeſs to them, it was to be in the church, and in the face of all the world.

Where there were two or three *recluſes* together, they were never to hold any conference, but on ſpiritual matters; and to confeſs to each other: where there was but one, he was to confeſs and examine himſelf.

If the *recluſe* fell ſick, his door was opened for people to come in and aſſiſt him; but he was not allowed to ſtir out on any pretence whatever.

Theſe articles are extracted from the rule, compiled for the *recluſes*, by Grimlaic, a prieſt in the IXth century.

There were alſo women *recluſes*, who led the ſame life, in proportion. St Viborade lived a *recluſe* at St Gall, and was there martyred by the Hungarians in 825. See RECLUSION.

RECLUSION, the ſtate of a recluſe; or the cell and other appurtenances thereof. See RECLUSE.

F. Helyot gives a particular account of the ceremonies practiſed in the *recluſion* of a woman, in that of mother de Cambray, inſtitutrix of the order of the preſentation of Notre Dame. A cell being built for her in 1625, adjoining to the church of St Andrew in Tournay: the biſhop waited for her early in the morning at the church door. Upon her arrival, proſtrating herſelf at the feet of that prelate, he gave her his benediction, conducted her to the grand altar; and there bleſſing a mantle, veil, and ſcapular, put them on her, and gave her a new name.

Having here made her vow, and the biſhop having harangued the people in praiſe of the new *recluſe*, he conducted her proceſſionally to her *recluſion*; the clergy all the way ſinging *Veni ſponſa Chriſti*, &c.

Here the biſhop bleſſing her a-freſh, conſecrated the *recluſion*, and ſhut her up in perpetual confinement.

RECOGNISANCE. See the article RECOGNIZANCE.

RECOGNITION, RECOGNITIO, denotes an acknowledgment—The word is particularly uſed in our law-books, for the title of the firſt chapter of the Stat. 1 Jac. I, whereby the parliament acknowledged the crown of England, after the death of queen Elizabeth, to have rightfully deſcended to king James.

RECOGNITION, in the drama. See DISCOVERY.

RECOGNITIONE *adnullanda per vim & duritiem facta*, is a writ to the juſtices of the common-bench, for ſending a record touching a recognizance, which the recognizor ſuggeſts to have been acknowledged by force and hard dealing: that if it ſo appear it may be diſannulled. See RECOGNIZANCE.

Tranſcriptio RECOGNITIONIS *factæ coram juſticiariis itinerantibus*. See TRANSCRIPTIO.

RECOGNIZANCE, or RECOGNISANCE, in law, a bond, or obligation of record acknowledged to the king; teſtifying the *recognizor* to owe to the *recognizee*, a certain ſum of money.

It is thus called, becauſe *recognized*, or acknowledged in ſome court of record, or before ſome judge, maſter in chancery, or juſtice of the peace.

Meer *recognizances* are not ſealed, but enrolled; and execution, by force thereof, is of all the recognizor's goods or chattels (except draught beaſts, or implements of huſbandry) and the moyety of his land.

There are alſo *recognizances* for bail, others for appearing at the ſeſſions to proſecute a felon, others for good behaviour, *&c.*

RECOGNIZANCE is alſo uſed in our antient ſtatutes, for the verdict of the twelve jurors impanelled upon an aſſize; hence called *recognitors*. See JURY and VERDICT.

RECOGNIZEE, is he to whom one is bound in a recognizance—He that is ſo bound is called RECOGNIZOR.

RECOIL, or REBOUND, the reſilition of a body, chiefly a fire-arm; or the motion whereby, upon exploſion, it ſtarts or flies backwards. See GUN, MORTAR, *&c.*

The greater the charge, *cæteris paribus*, the greater the rebound—By an experiment made before the royal ſociety, and related in the *Philoſ. Tranſact.* it was found that cannons charged to a certain degree, throw the ball from right to left of their own direction; but that the cannons themſelves *recoil* from left to right.

Some of the gentlemen of the French academy, doubting the juſtneſs of the obſervation, Mr Caſſini, the younger, undertook to repeat the experiment; which he did by means of a machine, as like that uſed in England as he could; and that tried over, and over again.

The reſult was, that the ball, when the gun had liberty to *recoil*, was always thrown to the right of the point to which it was thrown when the gun was fixed without a poſſibility of rebounding; but then the *recoil* was always made the ſame way, *viz.* to the right; and he never found that contrariety of directions between the ball and the rebound, obſerved in the Engliſh experiment. See *Hiſt. Acad. R. Scienc. A.* 1703. *p.* 120, *&c.*

The cauſe of the Phænomena ſeems very difficult to aſſign: for ſuppoſing the guns of a common make, with the touch-hole on the top, we cannot ſo much as gueſs what cauſe ſhould conſtantly determine the ball from right to left—Unleſs ſome very material circumſtances be omitted in the recital they have given us of the experiment.

RECOLLECTION, a mode of thinking, whereby thoſe ideas ſought after by the mind, are with pain and endeavour found, and brought again to view. See MEMORY, REMINISCENCE, MODE, THINKING, *&c.*

RECOLLECTS, a congregation of reformed Franciſcans, called alſo *Friars minor of St Francis, of the ſtrict obſervance.* See FRANCISCAN.

They were eſtabliſhed about the year 1530; when ſome religious of the order of St Francis, willing to keep his rule to the letter; Clement VII. gave them houſes, particularly Tulles in the Limoſin, and Murat in Auvergne, whither they might retire, and receive ſuch as were diſpoſed to follow them—. The ſame year he approved the reform; and in 1584 it was carried into Italy.

RECOMMENDATI. See AFFIDATUS.

RECONCILIARI, in our law-books, *&c.*—A church is ſaid *reconciliari*, to be *reconciled*, when it is conſecrated afreſh, after having been polluted or profaned; as by the poſſeſſion of pagans, heretics, *&c.* See CHURCH, CONSECRATION, PROFANATION.

RECONNOITRE *, in war, to go view and examine the ſtate of things, in order to make a report thereof.

* The word is pure French, ſignifying litterally, to *know*, *recollect*.

We ſay, to *reconnoitre* the coaſts, to *reconnoitre* a port, *&c.*—A body of horſe was ſent to *reconnoitre* their camp, the ground, the condition of the roads, rivers, *&c.*

A general is to go *reconnoitre* in perſon, the place to be beſieged, in order to learn it's ſituation, avenues, it's ſtrengths and weakneſſes.

RECONNOITRE is alſo uſed at ſea—To *reconnoitre* a veſſel, a fleet, *&c.* is to approach near enough to examine the rate and burthen of a veſſel, *&c.* the force it may have a-board, what nation it is of, *&c.*

To *reconnoitre* a land, or ſhore, is to obſerve it's ſituation, in order to find what land it is.

RECORD, RECORDUM, in law, an authentic teſtimony of any thing in writing, contained in rolls of parchment, and preſerved in a court of *record*. See COURT, ROLL, *&c.*

Records are ſaid to be *vetuſtatis, & veritatis, veſtigia*—An act committed to writing in any of the king's courts, during the term wherein it is written, is alterable; being no *record*: but that term once ended, and the act enrolled, it is a *record*, and of ſuch credit, as admits no alteration, or proof to the contrary.

Lawyers reckon three ſorts of *records: viz.* a *judicial record*, as attainder, *&c.*—a *miniſterial record* upon oath, as an office of inquiſition found—and a *record* made by *conveyance* and conſent, as a fine, or deed enrolled, and the like.

Matter of RECORD.	See	MATTER.
Muſter of RECORD.		MUSTER.
Oyer de RECORD.		OYER.
Priſoner upon matter of RECORD.		PRISONER.

RECORD, among fowlers: a bird is ſaid to *record*, when it begins to tune, or ſing within itſelf; to form it's notes, and diſpoſe it's organs for ſinging.

The cock thruſh is diſtinguiſhed from the hen in *recording*; the firſt being more loud and frequent than the ſecond.

RECORDARE *facias*, a writ directed to the ſheriff to remove a cauſe depending in an inferiour court, as hundred-court, county-court, court of antient demeſne, *&c.* to the king's-bench, or common-pleas.

It is thus called, becauſe it commands the ſheriff to *make a record* of the proceedings either by himſelf, or others; and then to ſend up the cauſe.

RECORDER, RECORDATOR, a perſon whom the mayor, or other chief magiſtrate of any city or town corporate having juriſdiction and a court of *record* within their precincts, does aſſociate with him, for his better direction in matters of juſtice, and proceedings according to law. See MAYOR, *&c.*

He is uſually a man verſed and experienced in the common law—In ſome towns which have their particular aſſizes within themſelves, and no mayor, the *recorder* is the judge.

RECORDO & *proceſſo mittendis*, is a writ to call a *record*, together with the whole proceedings in the cauſe, out of an inferior court, into the king's court.

RECOVERY, in a legal ſenſe, an obtaining of any thing by judgment, or trial at law: anſwering to *evictio* among the civilians. See JUDGMENT and TRIAL.

There is a *true* and a *feigned recovery*.

True RECOVERY is an actual or real *recovery* of any thing, or the value thereof, by judgment—as if a Man ſue for any land, or other thing, and have a verdict, and judgment for him.

Feigned, or *common* RECOVERY, is a ſort of *fictio juris*; being a certain form or courſe preſcribed by law to be obſerved for the better aſſuring of lands and tenements to us; the end and effect whereof is to diſcontinue and deſtroy eſtates tail, remainders, and reverſions, and to bar the intails thereof. See TAIL, REMAINDER, REVERSION, *&c.*

This *recovery* is either with a *ſingle*, or a *double voucher*.

In RECOVERY *with a ſingle voucher*, there are three parties required, the *demandant*, the *tenant*, and the *vouchee*.

The demandant is he who brings the writ of entry, and may be termed the *recoverer*—The tenant is he againſt whom the writ is brought, and may be called the *recoveree*—The vouchee is he whom the tenant voucheth, or calls to warrant for the land in demand. See VOUCHEE.

RECOVERY *with double voucher*, is where the tenant voucheth one, who voucheth another, or the common vouchee.

The point is a little quaint, and perplexed: to explain it, ſuppoſe a Man deſirous to cut off an eſtate tail in lands or tenements, to the end that he may ſell, give, or bequeath them; the firſt thing he does, is to cauſe a feigned writ of entry, *ſur deſſeiſin in le poſt*, to be brought, of the lands of which he intends to dock the entail; and in a feigned declaration thereupon made, pretends he was diſſeiſed by him, who by a feigned fine, or deed of bargain and ſale, is named and ſuppoſed to be tenant of the lands.

This feigned tenant, if it be a ſingle *recovery*, is made to appear, and vouch a poor fellow, the bag-bearer of writs of the cuſtos brevium of the common-pleas; (where alone theſe common *recoveries* are allowed) who makes default: upon which a judgment is by this fiction entered, that the demandant ſhall recover, and have a writ of ſeiſin for the poſſeſſion of the lands in queſtion; and that the tenant ſhall recover the value of the lands againſt the lands of the vouchee bag-bearer, (who has not a foot of land) which is an imaginary ſatisfaction for the heir in tail, though he is to be never the better for it. See ENTAIL.

By this means one Edward Howes, a bag-bearer, and common vouchee, in the ſpace of 20 years, paſſed, or ſuffered to be *recovered* againſt him, a great part of the lands of England; obliging his own lands to anſwer the value of thoſe recovered againſt the tenants or remainders in tail.

Clerk of enrollments of RECOVERIES *and fines*. See CLERK.

RECOUPE[*], in law, to rebate or diſcount. See REBATE and DISCOUNT.

[*] The word is pure French, formed of *re* and *couper*, to cut again.

Thus, if a man have ten pounds iſſuing out of certain lands, and he diſſeiſes the tenant of the land; in an aſſize brought by the diſſeiſee the diſſeiſor ſhall *recoupe* the rent in the damages.

RECOUPE, alſo denotes a quick ſharp reply to a peremptory demand. See REPARTEE.

RECREANT, in our old law-books, implies cowardly, faint-hearted. See CHAMPION, COMBAT and DUEL.

Hence, *recreantiſe*. See the article CRAVEN.

Recreant was ſo reproachful a word, that Glanville would not deſcribe it—*Recreantes equi* is uſed by Fleta, lib. 2. cap. 2. for dull, jaded horſes.

RECREMENT, RECREMENTUM, in medicine, ſome ſuperfluous matter mixed with other that is uſeful. See FÆCES.

In which ſenſe it amounts to much the ſame with *fæces*, or *excrement*. See FÆCES and EXCREMENT.

RECREMENT is ſometimes alſo uſed to denote ſuch ſecreted juices in the body, as are afterwards of uſe to the œconomy: as the lympha, gall, *&c.* — which are thus called in contradiſtinction to *excrements*, which are expelled out of the body, as of no farther uſe. See EXCREMENT.

RECRIMINATION, a poſterior accuſation brought by the accuſed againſt his accuſer, upon the ſame fact. See ACCUSATION.

When two parties have made their mutual complaint at the ſame time; the buſineſs is firſt, to determine who ſhall be the accuſer, and who the accuſed; *i. e.* on whom ſhall fall the *recrimination*.

By the French laws, *recrimination* is of no force till the criminal have been purged legally.

RECRUDESCENCE, RECRUDESCENTIA, in medicine, is, when a diſeaſe that was gone off returns again. See RELAPSE.

RECTANGLE, in geometry, called alſo *oblong*, and *long ſquare*, a quadrilateral rectangular figure, (MLIK, *Tab. Geometry*, *fig.* 60) whoſe oppoſite ſides (OP and NQ, as alſo ON and PQ) are equal. See QUADRILATERAL.

Or, a *rectangle* is a parallelogram, whoſe ſides are unequal, but angles right. See PARALLELOGRAM.

To find the area of a rectangle; meaſure the length of the ſides ML and MI; and multiply them by one another: the product is the area of the *rectangle*.

Thus ML being=345 foot, and MI=123 foot; the area will be found 42435 ſquare feet.

Hence, 1°, *rectangles* are in a ratio compounded of that of their ſides ML and IK; and therefore *rectangles* which have the ſame height, are to each other as their baſes; and thoſe which have the ſame baſe are to each other as their heights.

2°, If therefore there be three lines in continual proportion; the ſquare of the middle one is equal to the *rectangle* of the two extremes. See PROPORTION.

3°, If there be four right lines in continual proportion; the *rectangle* under the extremes is equal to the *rectangle* under the middle terms.

4°, If from the ſame point A *fig.* 61. be drawn two lines; one whereof, AD. is a tangent to a circle, the other a ſecant AB: the ſquare of the tangent AD, will be equal to the *rectangle* under the ſecant AB; and that part of it without the circle, AC.

5°, If two or more ſecants A*a*, AB; *&c.* be drawn from the ſame point A; the *rectangles* under their wholes and their parts without the circle, will be equal. See SECANT.

6°, If two chords interſect each other, the *rectangles* under their ſegments will be equal. See CHORD.

Similar RECTANGLES. See the article SIMILAR.

RECTANGLE, in arithmetic, is the ſame with *product* or *factum*. See PRODUCT and MULTIPLICATION.

RECTANGLED, RIGHT-ANGLED, *triangle*, is a triangle, one of whoſe angles is right, or equal to 90°.

There can be but one right angle in a plain triangle; therefore a *rectangled* triangle, cannot be equilateral. See TRIANGLE.

RECTANGULAR, in geometry, is applied to figures, and ſolids which have one or more angles right. See ANGLE, *&c.*

Such are ſquares, *rectangles*, and rectangled triangles among plain figures; cubes, parallelepipeds, *&c.* among ſolids. See FIGURES, SOLID, *&c.*

Solids are alſo ſaid to be *rectangular* with reſpect to their ſituation: thus, if a cone, cylinder, *&c.* be perpendicular to the plane of the horizon, it is called a *rectangular* or *right* cone, cylinder, *&c.* See CONE and CYLINDER.

The antients uſed the phraſe *rectangular ſection of a cone*, to denote a parabola; that conic ſection, before Apollonius, being only conſidered in a cone whoſe ſection by the axis would be a triangle, right-angled at the vertex.

Hence it was that Archimedes entitled his book of the quadrature of the parabola, by the name of *rectanguli coni ſectio*.

RECTANGULAR *barometer*. } See { BAROMETER.
RECTANGULAR *windmills*. } { WINDMILLS.

RECTIFICATION[*], the act of *rectifying*, i. e. of correcting, remedying, or redreſſing ſome defect or error, in reſpect either of nature, art, or morality. See RIGHT, RECTITUDE, *&c.*

[*] The word is compounded of *rectus*, right, direct, and *fio*, I become.

RECTIFICATION, in chemiſtry, is the repeating of a diſtillation or ſublimation ſeveral times; in order to render the ſubſtance purer, finer, and free from aqueous, or earthy parts. See DISTILLATION.

Rectification is a reiterated depuration of a diſtilled matter, *e. gr.* brandy, ſpirits, or oils; by paſſing them again over their fæces, or marc, to render them more ſubtile, and exalt their virtues. See SPIRIT, *&c.*

Fixed ſalts are *rectified* by calcination, diſſolution, or filtration. See SALT, DISSOLUTION, *&c.*

Metals are *rectified*, i. e. *refined*, by the *coppel*; regulus's, by repeated fuſions, *&c.* See METAL, REFINING, *&c.*

RECTIFICATION, in geometry, is the finding of a right line equal to a curve. See CURVE.

All we need to find the quadrature of the circle, is the *rectification* of it's circumference; it being demonſtrated, that the area of a circle is equal to a rectangled triangle, whoſe two ſides comprehending the right angle, are the radius, and a right line equal to the circumference. See CIRCLE and CIRCUMFERENCE.

To *rectify* the circle, therefore, is to *ſquare* it: or rather both the one and the other are impoſſible—For the various attempts to rectify the circle in order to the quadrature, *&c.* See QUADRATURE *of the circle.*

The *rectification of curves* is a branch of the higher geometry; wherein the uſe of the new-invented integral calculus, or inverſe method of fluxions, is very conſpicuous—For, ſince a curve line may be conceived to conſiſt of innumerable right lines, infinitely ſmall; if the quantity of one of them be found, by the differential calculus; their ſum, found by the integral calculus, gives the length of the curve.

Thus, if M R (*Tab. Analyſ. fig.* 18.) $= dx$, and m R $= dy$; Mm, or the element of the curve will be $\surd\, dx^2 + dy^2$. See ELEMENT.

If then, from the differential equation, to the particular curve, we ſubſtitute the value either of dx^2, or of dy^2, we ſhall have the particular element, which being integrated, gives the length of the curve. See CALCULUS *Integralis* and FLUXIONS.

Indeed the element of the curve is ſometimes more commodiouſly determined from ſome particular circumſtances; inſtances whereof we ſhall give in the *rectification of the parabola* and *cycloid.*

To RECTIFY *the parabola*—For this we have

$$adx = 2ydy$$

$$a^2\, dx^2 = 4y^2\, dy^2$$

$$dx^2 = 4y^2\, dy^2 : a^2$$

$$\surd\,(dx^2 + dy^2) = \surd\,(dy^2 + 4y^2\, dy^2 : a^2) = dy\,\surd\,(aa + 4\,yy : a.$$

To render this element of the curve integrable; let it be reſolved into an infinite ſeries; (ſee SERIES.) Then in the general theorem.

$$n = 2\;\; m = 1\;\; P = a^2\;\; Q = 4y^2 : a^2\;\; P^{n:n} = a = A$$

$$\frac{m}{n}\,AQ = \tfrac{1}{2}\,a.\,4y^2 : a^2 = -\,2y^2 : a = B$$

$$\frac{m-n}{2n}\,BQ = -\tfrac{1}{4}.\frac{2y^2}{a}.\frac{4y^2}{a^2} = -\frac{2y^4}{a^3} = C$$

$$\frac{m-2n}{3n}\,CQ = -\tfrac{3}{6}.-\frac{2y^4}{a^3}.\frac{4y^2}{a^2} = \frac{4y^6}{a^5} = D$$

$$\frac{m-3n}{4n}\,DQ = -\tfrac{5}{8}\,\frac{4y^6}{a^5}.\frac{4y^2}{a^2} = -\frac{10y^8}{a^7},\ \&c.\ \text{in infinitum.}$$

Wherefore, $dy\,\surd\,(aa + 4yy) : a = dy + \frac{2y^2\,dy}{a^2} - \frac{2y^4\,dy}{a^4} + \frac{4y^6\,dy}{a^6} - \frac{10y^8\,dy}{a^8}$, *&c.* Whoſe integral $y + \frac{2y^3}{3a^2} - \frac{2y^5}{5a^4} + \frac{4y^7}{7a^6} - \frac{10y^9}{9a^8}$, *&c.* In infinitum expreſſes the parabolic arch A M.

Hence, *firſt*, let A C, and D C (*Tab. Analyſis, fig.* 19.) be the conjugate ſemi-axes of an equilateral hyperbola; then will A C $=$ D C $= a$. Suppoſe M P $= 2y$, Q M $= x$; then will A P $= x - a$; conſequently, by reaſon of P B. A P $=$ P M^2 $xx - aa = 4yy$, and hence $xx = 4yy + aa$; conſequently, $x = \surd\,(4yy + aa.)$ If then qm be ſuppoſed infinitely near QM, we ſhall have Q$q = dy$; and therefore the element of the area CQMA$= dy\,\surd\,(aa + 4yy.)$ The *rectification* of the parabola therefore depends on the quadrature of the hyperbolic ſpace CQMA.

It is to be here noted that all integrations or ſummations are reduced to the quadratures of curves; in what caſes ſoever they be uſed: ſo that to have them perfect, the rule laid down under *quadrature of the logiſtic curve*, muſt be obſerved throughout.

To RECTIFY *the cycloid*—Let AQ$= x$, AB$= 1$, (*fig.* 27.) then will Qq=MS$= dx$, PQ$= \surd\,(x - xx.)$ And hence AP$= \surd\, x = x^{1:2}$; conſequently by reaſon of the ſimilitude of the triangles APQ and MmS,

$$AQ : AP :: MS : Mm$$

$$x : x^{1:2} :: dx : x^{-1:2}dx.$$

Therefore Mm is the differential of the cycloidal arch A M $= x^{-1:2}dx$. Wherefore $\int x - 1 : 2dx = 2x^{1:2} = 2$ A P is the arch A M.

The *rectification* of curves Mr de Moivre ſhews may be obtained by conſidering the fluxion of the curve as an hypotenuſe of a rectangular triangle, whoſe ſides are the fluxions of the ordinate and abſciſſa: care being taken in the expreſſion of this hypotenuſe, that only one of the fluxions be remaining, as alſo only one of the intermediate quantities, *viz.* that whoſe fluxion is retained: an example will render this clear.

The right ſine CB (*fig.* 20.) *being given, to find the arch* AC.—Let AB$= x$, CB$= y$, OA$= r$. CE the fluxion of the abſciſſe, ED the fluxion of the ordinate, CD the fluxion of the arch CA. From the property of the circle $2rx - xx = yy$, whence $2r\dot{x} - 2x\dot{x} = 2y\dot{y}$, and therefore $\dot{x} = y\dot{y}$. But

$$CD\,q = \dot{y}\dot{y} + \dot{x}\dot{x} = \dot{y}\dot{y} + \overline{r - x}\,\frac{y^2\,\dot{y}\dot{y} = \dot{y}\dot{y}}{rr - 2rx + xx} + \frac{y^2\,\dot{y}\dot{y}}{rr - yy} = \frac{rr\,\dot{y}\dot{y}}{rr - yy};$$

therefore

$$CD = \frac{r\dot{y}}{\sqrt{rr - yy}} = \frac{1}{\sqrt{rr - yy}} + r\dot{y} = r\dot{y}\;\overline{+\,rr - yy}^{\,-\frac{1}{2}}.$$

And conſequently, if $rr - yy$ be thrown into an infinite ſeries, and the ſeveral members of it be multiplied into $r\dot{y}$, and then the flowing quantity of each be taken, we ſhall have the length of the arch A C.

RECTIFIED *ſpirits*, &c. are ſuch as have undergone the operation of *rectification*, or have been diſtilled over and over, to ſeparate from them any heterogeneous matter, which might have ariſen with them in the former diſtillations. See RECTIFICATION.

Hence we ſay, ſpirit of wine twice *rectified*, thrice *rectified*, &c. See SPIRIT.

It is the rectification that makes the difference between brandy and *rectified* ſpirits of wine. See BRANDY.

RECTIFIER, in navigation, is an inſtrument uſed for determining the variation of the compaſs, in order to *rectify* the ſhip's courſe, *&c.* See VARIATION and COURSE.

It conſiſts of two circles, either laid upon, or let into one another, and ſo faſtened together in their centres that they repreſent two compaſſes, the one fixed, the other moveable; each divided into 32 points of the compaſs, and 360 degrees, and numbered both ways, from the north and the ſouth, ending at the eaſt and weſt in 90 degrees.

The fixed compaſs repreſents the horizon, in which the north, and all the other points are liable to variation.

In the centre of the moveable compaſs is faſtened a ſilk thread, long enough to reach the outſide of the fixed compaſs. But if the inſtrument be made of wood, an index is uſed inſtead of the thread. See COMPASS.

RECTIFYING *of curves.* See RECTIFICATION.

RECTIFYING *of the globe*, or *ſphere*, is a previous adjuſting of the globe or ſphere, to prepare it for the ſolution of problems. See GLOBE and SPHERE.

It is done by bringing the ſun's place in the ecliptic on the globe, to the graduated ſide of the braſs meridian; elevating the pole above the horizon, as much as is the latitude of the place: fitting the hour index exactly to twelve at noon; and ſcrewing the quadrant of altitude (if there be occaſion) to the zenith.

All this is comprehended under the term, *rectifying the globe.* When this is done, the celeſtial globe repreſents the true poſture of the heavens, for the noon of that day it is rectified for.

RECTILINEAR, RIGHT-LINED, in geometry, is applied to figures whoſe perimeter conſiſts of right lines. See FIGURE, PERIMETER, LINE, *&c.*

RECTILINEAR *angle.* } See { ANGLE.
RECTILINEAR *maps.* } See { MAPS.
RECTILINEAR *ſuperficies.* } See { SUPERFICIES.

RECTITUDE, RECTITUDO, RECTUM, in matters of philoſophy, refers either to the act of judging, or of willing; and therefore whatever comes under the denomination of *rectitude*, is either what is true, or what is good: theſe being the only objects about which the mind exerciſes it's two faculties of judging and willing. See TRUTH and GOOD.

Rectitude of the mind, conſidered as it *judges*, *i. e.* of the faculty of judgment, conſiſts in it's agreement and conformity to the nature and reaſon of things; in it's determining and deciding about them according to what their conſtitutions, properties, uſes, *&c.* really are. See JUDGMENT. See alſo LOGIC, *&c.*

Rectitude of the mind, conſidered as it *wills*, called alſo *moral rectitude*, or *uprightneſs*, conſiſts in the chooſing and purſuing of thoſe things which the mind, upon due inquiry and attention, clearly perceives to be good; and avoiding thoſe that are evil. See WILL.

RECTITUDINES, in law, rights, or legal dues, belonging either to God or Man. See RIGHT.

RECTO, in law, a writ uſually called a *writ of right*; of ſo high a nature, that whereas other writs in real action are only to recover the poſſeſſion of the lands, *&c.* in queſtion, loſt by the plaintiff or his anceſtor; this aims to recover both the ſeiſin thus loſt, and the property of the thing: ſo that both rights are here pleaded together; that of *property*, and that of *poſſeſſion.* See PROPERTY and POSSESSION.

If a man loſe his cauſe upon this writ, he is without all remedy. See RIGHT.

There are two kinds of this writ: *breve magnum de recto*, or *breve de recto patens*, a writ of right patent; and *recto clauſum*, a writ of right cloſe.

The firſt is ſo called, becauſe ſent open—It lies only for him that hath fee-ſimple in the lands ſued for, againſt the tenant of the freehold at leaſt.

Indeed, the writ of right patent is extended in practice beyond it's original intention: for a writ of right of dower, which lies for the tenant in dower, is patent; and ſo in ſeveral other caſes. *Fitzherb.*

The writ of right cloſe, called alſo *breve parvum de recto*, is directed to the lord of antient demeſn, or the bailiff of the king's manors, and lies for thoſe who hold lands and tenements by charter, in fee-ſimple, or in fee-tail, or for term of life, or in dower, if they be ejected out of ſuch lands or diſſeiſed, In ſuch a caſe a man or his heirs may ſue out the writ of right cloſe, directed to the lord of antient demeſn, commanding him to do him right in his court.

RECTO *de advocatione eccleſiæ*, a writ of right, lying where a man has right of advowſon in fee to him and his heirs, and the incumbent dying, a ſtranger preſents his clerk to the church: and he not having brought his action of *quare impedit* nor *darrien preſentment* within ſix months, has ſuffered the ſtranger to uſurp upon him.

RECTO *de cuſtodia terræ & hæredis*, a writ which lies for him whoſe tenant dying in his nonage, a ſtranger enters and takes the body of the heir.

This writ as to lands holden in *capite*, or by knight's ſervice, is become uſeleſs by the Stat. 12. *Car.* II. But not where there is a guardian in ſocage, or appointed by the laſt will of the anceſtor.

RECTO *de dote*, a writ of right of dower, which lies for a woman that has received part of her dower, and proceeds to demand the remnant in the ſame town againſt the heir or his guardian. See DOWER.

RECTO *de dote unde nihil habet*, is a writ of right which lies in caſe where the huſband having divers lands and tenements, has aſſured no dower to his wife; and ſhe is thereby driven to ſue for her thirds againſt the heir, or his guardian.

RECTO *de rationabili parte*, a writ that lies between privies of blood, as brothers in gavel-kind, or ſiſters, or other coparteners, as nephews and neices; and for land in fee-ſimple.

If a man leaſe his land for life, and afterwards die, leaving iſſue two daughters, and after, the tenant for life likewiſe dies; the one ſiſter entering on all the land, and ſo deforcing the other, the ſiſter ſo deforced ſhall have this writ to recover her part.

RECTO *quando dominus remiſit*, a writ of right, which lies in caſe where lands or tenements in the ſeigniory of any lord, are in demand by a writ of right.

If the lord hold no court; or at the prayer of the demandant or tenant, ſend his writ to the king's court, to put the cauſe thither for that time; this writ iſſues for the other party, and has it's name from the words compriſed, which is the true occaſion thereof.

RECTO *ſur diſclaimer*, a writ which lies where the lord, in the court of common pleas does avow upon his tenant, and the tenant diſclaims to hold of him; upon which diſclaimer the lord ſhall have this writ.

RECTO *folio*. See the article FOLIO.

RECTOR, of a pariſh, the *parſon*; or he who has the charge or cure of a pariſh church. See PARSON.

If the predial tythes of the pariſh be impropriated, or appropriated, *i. e.* either in lay hands, or in thoſe of ſome eccleſiaſtical community, inſtead of *rector*, the parſon is called *vicar*. See VICAR and IMPROPRIATION—In England are reckoned 3845 rectories. See PARISH.

The name *rector* denotes him governor, or ruler, *quia tantum jus in eccleſia parochiali habet, quantum prælatus in eccleſia collegiata*. See PARSONAGE.

RECTOR, alſo denotes the chief elective officer in ſeveral foreign univerſities; particularly that of Paris. See UNIVERSITY.

The *rector* is choſen afreſh every three months: antiently he was choſen every ſix weeks. The alteration was made by the legate of pope Nicholas III. in 1278.

The *rector* is choſen out of the faculty of arts—While that faculty, and the faculty of theology were united, one officer had the inſpection of both, under the title of *chancellor*: upon their diviſion, a *rector* was created.

The *rector* makes a ſolemn proceſſion four times a year, attended by the doctors, batchelors, &c. in their formalities.

RECTOR is alſo uſed in ſeveral convents for the ſuperior, or officer who governs the houſe. See SUPERIOR.

The Jeſuits uſe it for the ſuperiors in ſuch of their houſes, as are either ſeminaries or colleges. See JESUIT, COLLEGE, SEMINARY, &c.

RECTORY, or RECTORATE, RECTORIA, a pariſh-church, parſonage, or ſpiritual living, with all it's rights, glebes, and tythes. See CHURCH, PARISH, PARSON, RECTOR, &c.

RECTUM, in law. See RECTO, RIGHT and RECTITUDE.

RECTUM, in our old law-writers, is alſo uſed for a trial or accuſation. See TRIAL, &c.

Commune **RECTUM**, denotes a trial at law, or in the common courſe of law—*Stare ad rectum*, denotes to ſtand a trial—*Rectum rogare*, to petition the judge to do right.

RECTUM, in anatomy, denotes the third and laſt of the large inteſtines—See *Tab. Anat. (Splanch) fig.* 9. *lit. f.* See alſo INTESTINE.

It is thus called, becauſe it paſſes ſtraight from the os ſacrum to the anus; without making any turns or circumvolutions, as all the other guts do.

It's length is uſually about a hands-breath; and it's capacity, the thickneſs of three fingers—It's upper part is tied faſt to the oſſa ſacrum and coccygis, by means of the peritonæum; and in men to the neck of the bladder, in women to the vagina uteri: it's lower end, the anus, is furniſhed with three muſcles. See ANUS.

The firſt, is the ſphincter ani ſerving to ſhut it, and prevent the excrements from paſſing out involuntarily. See SPHINCTER, &c.

The other two, are the levatores ani, which ſerve to raiſe or pull back the *rectum* after the expulſion of the excrements; which, eſpecially after hard ſtools, is apt to be too far protruded. See LEVATOR ANI.

RECTUS, in anatomy, a name common to ſeveral muſcles; on account of the ſtraightneſs of the courſe of their fibres, from their origin to their inſertion; having particular denominations from the parts to which they miniſter, as the *Rectus abdominis*, *rectus femoris*, *rectus capitis lateralis*, *major externus*, *minor externus*, *major internus*, *minor internus*, and *rectus palpebræ*.

RECTUS *abdominis*, is a muſcle of the lower belly, which ariſes from the ſternum, and the extremity of the laſt two ribs; and goes ſtraight down to the fore-part of the abdomen, to be inſerted in the os pubis.—See *Tab. Anat. (Myol.) fig.* 1. *n.* 47. *fig.* 2. *n.* 28. See alſo ABDOMEN.

It hath three or four innervations, or rather tendinous coarctations of its fleſhy fibres, which divide the belly of it, as it were, into ſo many diſtinct muſcles.

It has veins and arteries, which creep on it's inſide from the mammillary and epigaſtric veſſels, which communicate together, that the blood may return by the mammillary veins, when the paſſage is ſtopped by the epigaſtric which are compreſſed in women with child.

RECTUS *femoris*, is a muſcle of the leg, which ariſing from the lower part of the ſpine of the ilium, and deſcending between the two vaſti, is inſerted into the patella.—See *Tab. Anat. (Myol.) fig.* 1. *n.* 53. See alſo FEMUR.

RECTUS *palpebræ*, is a muſcle which lifts up the eyelid. It ariſes from the bottom of the orbit of the eye, where the optic nerves pierce the cranium, and paſſing above the ſuperbus, is inſerted by a large tendon into the border of the eyelid. See PALPEBRÆ.

RECTUS *capitis lateralis*, a pair of ſhort thick fleſhy muſcles, riſing from the ſuperior part of the tranſverſe proceſſes of the firſt vertebra of the neck, whence it aſcends, and is inſerted into the os occipitis. See HEAD.

It's uſe is to move the head laterally towards either ſhoulder: when they act together, being antagoniſts, they keep it ſteady.

RECTUS *externus capitis major*, the third pair of muſcles of the head, ariſing fleſhy and tendinous from the upper part of the double ſpine of the ſecond vertebra of the neck, and ſpreading in it's aſcent, is inſerted into the poſterior part of the os occipitis.—It ſerves to draw the head directly back upon the firſt vertebra.

RECTUS *externus minor*, a pair of muſcles ariſing from the hind-part of the firſt vertebra of the neck; and inſerted into the middle of the os occipitis.

It ſerves likewiſe to draw the head directly backwards.

Theſe two muſcles are otherwiſe called *renuentes*.

RECTUS *internus capitis major*, a pair of muſcles ariſing from the fore-part of the five interior tranſverſe proceſſes of the firſt vertebra in the back, near it's great hole.

RECTUS *internus minor*, ariſes from the fore-part of the firſt vertebra of the neck; and is inſerted into the anterior appendix of the os occipitis, immediately under the former.

Theſe ſerve to nod the head forwards, being antagoniſts to the *rectus externus*, or renuens, on the back of the head; and are hence alſo called *annuentes*.

RECTUS *in curia*, in law, one who ſtands at the bar, and no man objects any thing againſt him.

When a man hath reverſed the outlawry, and can participate of the benefit of the law, he is ſaid to be *rectus in curia*. See OUTLAWRY.

RECURRENT, RECURRENS in anatomy, a nerve ariſing from the par vagum, and diſtributing ſeveral branches to the larynx, to aſſiſt in the formation and modulation of the voice; whence it is alſo called the *vocal nerve*. See NERVE, VOICE, &c.

It has it's name *recurrent*, from it's reaſcending or running back again from the thorax to the larynx.

There are really two *recurrents*, right and left: the left ariſes from the trunk of the vagum; the right from a plexus thereof, immediately under the clavicle—They both run up along the trachea, to which they impart ſome twigs, and end at laſt in the muſcles of the larynx.

Their office appears partly hence, that a dog is not able to bark after they are cut. See LARYNX.

RECUSANTS, perſons who refuſe to acknowledge the king's ſupremacy. See SUPEMACY, and CONVICT.

Such are the Roman catholics, who hold the pope to be over him; hence called popiſh *recuſants*. See POPE and KING.

The Romaniſts are not charged with double taxes, *&c.* meerly as romaniſts, but as *recuſants*.

RECUSATION, RECUSATO, an act whereby a judge is deſired to refrain from judging ſome certain cauſe, on account of his relation to one of the parties; or ſome capital enmity, or the like.

By the French laws kinſhip within the fourth degree, is deemed a legal cauſe of *recuſation*; as alſo the judge's being godfather, *&c.* of one of the parties.

RED, in phyſics, one of the ſimple or primary colours of natural bodies, or rather of the rays of light. See BODY, RAY and COLOUR.

The *red* rays are thoſe of all others the leaſt refrangible: hence, as Sir Iſaac Newton ſuppoſes the different degrees of refrangibility to ariſe from the different magnitudes of the luminous particles whereof the rays conſiſt; the *red* rays, or *red* light, is concluded to be that which conſiſts of the largeſt particles. See REFRANGIBILITY.

Authors diſtinguiſh three general kinds of *red*; one bordering on the blue, as colombine, or dove colour, purple, and crimſon. See PURPLE, *&c.* Another bordering on yellow, as flame-colour and orange. See ORANGE, *&c.* Between theſe extremes is a medium partaking neither of the one nor the other; which is what we properly call *red*.

Acids turn black, blue, and violet into *red*; and *red* into yellow; and yellow into a very pale yellow—Alcali's change *red* into violet, or purple, and yellow into feuillemort, or dead leaf colour. See ACID and ALCALI.

Terreſtrial and ſulphurous matters become *red* by extreme heat; and ſome, at length, black; as we ſee in brick, red bole, red chalk, ſlate, punice, *&c.* which when vitrified by a burning glaſs, become black.

Lobſters become *red* by a moderate fire; and by a violent one black. Mercury and ſulphur mixed and heated over a moderate fire, make a beautiful *red*, called *artificial cinnabar*. See CINNABAR.

An acid ſpirit, as lemon juice, being poured on a blue ſolution of turnſole, turns it into a beautiful *red*—Alcali reſtores it to it's original blue. Filtrating of the reddiſh wine takes from it all it's *red* colour.

M. de la Hire obſerves, that a very luminous body viewed through a black one, always appears *red:* as when the ſun is ſeen ſhining through a black cloud. He adds, that many people who ſee all the other colours perfectly well, yet have no idea of *red*, and only ſee it as black. See BLUE.

RED, in dying, is one of the five ſimple, or mother colours of the dyers. See COLOUR and DYING.

Some reckon ſeven kinds, or caſts of *red: viz.* ſcarlet *red*, crimſon *red*, madder *red*, half-grain *red*, lively orange *red*, and ſcarlet of cochineel. But they may be all reduced to three; according to the three principal drugs which give the colours; which are vermillion, cochineel and madder.

The fine ſcarlet, called *ſcarlet of the gobelins*, is given with agaric, bran-water, woad and ſcarlet grain, or kermes. Some dyers add cochineel, and others fennigreek; brightening it with bran-water, agaric, tartar, and turmeric. See SCARLET.

Crimſon red is dyed with bran-water, tartar, and cochineel meſtique. See CRIMSON.

Madder red is dyed with madder; to which ſome add realgal, or arſenic; others common ſalt, or other ſalts, with wheat flower; or agaric with ſpirit of wine, with galls or turmeric. See MADDER.

The *half-grain* is made with agaric and bran-water, half ſcarlet-grain, half madder, and ſometimes turmeric.

The *half crimſon* is made of half madder, half cochineel.

As to the *lively orange red*, the ſtuff muſt be firſt put in yellow, then in a liquor made of goat's hair (which has been boiled ſeveral times with madder, and now) diſſolved over the fire with certain acids, as urine, tartar, *&c.*

The ſcarlet of cochineel, or dutch *ſcarlet*, as the French call it, is made with ſtarch, tartar and cochineel; after firſt boiling it with alum, tartar, ſal-gemma and aqua-fortis, wherein pewter has been diſſolved. See COCHINEEL.

Beſides theſe ſeven *reds*, which are good and allowed colours, there is alſo a braſil *red*; which is diſcouraged, as fading eaſily. See BRAZIL.

Of the ſeven good *reds*, only four have particular caſts or ſhades: the madder *red*, crimſon *red*, lively orange *red*, and *ſcarlet* of cochineel.

The caſts or ſhades of crimſon, are fleſh-colour, peach-colour, carnation-roſe-colour, and apple-tree-flower-colour—Thoſe of madder, are fleſh-colour, onion-peel-colour, and flame-colour—Thoſe of orange are the ſame with thoſe of crimſon. Scarlet, beſides the ſhades of all the reſt, has ſome peculiar to itſelf, as cherry-colour, fire-colour, *&c.*

RED, in painting—For painting in oil colours they uſe a *red* called *cinnabar* or vermillion; and another called *lacca*. See each in it's place, CINNABAR, VERMILLION and LACCA.

In limning, and freſco, for a violet *red*, inſtead of lacca they uſe a natural earth found in England; for a brown *red* they uſe *oker*. See REDDLE, OKER, *&c.*

RED, in heraldry. See the article GULES.

RED, in coſmetics, a fucus or paint wherewith the ladies enliven their cheeks and lips.

There are two kinds of *reds*; the one in leaves, called Spaniſh *red*; the other a liquor, which is an extract of ſcarlet dye.

RED *arſenic*. See the article ARSENIC.

RED *chalk*	See the articles	CHALK.
RED *deer*		HUNTING.
RED *fiſh*		FISH.
RED *lead*		LEAD.
RED *ſtar*		STAR.
RED *ſtorax*		STORAX.
RED *tartar*		TARTAR.

REDENS or REDANT. See REDENS.

REDDAT—*Precipe quod* REDDAT. See PRECIPE.

REDDANDIS *chartis*. See the article CHARTIS.

REDDENDUM, in law, a clauſe in a leaſe, *&c.* whereby a rent is reſerved to the leſſor. See RENT and LEASE.

REDDITARIUM, an ancient law term, for a terrier, roll or rental, in which the rents and ſervices of a manor are ſet down. See ROLL, RENT, TERRIER, *&c.*

REDDITION, REDDITIO, a ſurrendering or reſtoring. In law it denotes a judicial acknowledgment that a thing in queſtion belongs to the demandant.

REDDLE, RUDDLE, or *Red chalk*, a red foſſile ſtone, which has it's particular mine or quarry; and is uſed by painters, *&c.* to make red pencils, or craions for deſigning.

The beſt is the produce of England, is moderately hard, eaſy to cut or ſaw into long ſlips. The goldſmiths and gilders alſo uſe it to burn the gold leaf they uſe—Some call *reddle*, *lapis hæmatites*, ſuppoſing it to have a particular faculty of ſtopping blood: but others will have the real hæmatites to be another ſtone. See HÆMATITES.

REDEEMABLES, are lands, funds, *&c.* ſold with a reſervation of the equity of redemption. See REDEMPTION.

Crown lands are *redeemable* for ever; others only for a certain time.

REDEMPTION, REDEMPTIO in law, a faculty or right of re-entering upon lands, *&c.* that have been ſold, and aſſigned; upon re-imburſing the purchaſe-money, with legal coſts.

Bargains wherein the *faculty*, or, as ſome call it, the *equity of redemption* is reſerved; are only a kind of pignorative contracts. A certain time is limited, within which the faculty of *redemption*, ſhall be exerciſed; and beyond which it ſhall not extend.

REDEMPTIONS, REDEMPTIONES, in our old law-writers, denote grievous mulcts impoſed by way of commutation for the head or life of the delinquent. See RANSOM and MISERICORDIA.

REDENS, REDANS or REDANT, in fortification, a kind of work indented in form of the teeth of a ſaw, with ſaliant and re-entering angles; to the end that one part may flank or defend another. See WORK, DEFENCE, *&c.*

It is alſo called *ſaw work*, and *indented work*. The faces flank one another.

Redens are frequently uſed in the fortifying of walls, where it is not neceſſary to be at the expence of building baſtions; as when they ſtand on the ſide of a river, a marſh, the ſea, *&c.* The parapet of the corridor is frequently *redented*, or carried on in the way of *redans*. See PARAPET and COUNTERSCARP.

REDHIBITION, REDHIBITIO, in the civil law, an action allowed a buyer, whereby to annul the ſale of ſome moveable, and oblige the ſeller to take it back again, upon the buyer's finding it damaged, or that there was ſome perſonal cheat, *&c.*

The *redhibition*, or *redhibitory action*, has place in ſeveral caſes, in the body of the civil law—If a horſe was ſold that had the glanders, were broken-winded, or foundered, it was a *redhibitory caſe*; and the ſeller might be obliged to take him again within nine days.

REDINTEGRATED *medals*. See the article MEDAL.

REDINTEGRATION, REDINTEGRATIO, in the civil law, the act of reſtoring a perſon to the enjoyment of a thing whereof he had been illegally diſpoſſeſſed.

In France, where a perſon is diſpoiled of his property, he claims it again by a *redintegrand*, or action of reſtitution—The *redintegrand* muſt be demanded within a year and a day, otherwiſe it is precluded.

REDINTEGRATION, in chemiſtry, the reſtoring of any mixt body, or matter, whoſe form has been deſtroyed by calcination, corroſion, ſublimation, or the like; to it's former nature and conſtitution.

The *redintegration* of mercury is properly called *revivification*. See REVIVIFICATION—Mr Boyle has an expreſs treatiſe on the *redintegration* of ſalt-petre; where he ſhews that after reducing it by fluxion into fixed nitre, which is next of kin to ſalt of tartar in all it's properties; he could preſently *redintegrate* it by pouring a ſufficient quantity of ſpirit of nitre to it; *i. e.* he could re-produce true chryſtals of the uſual form and virtue of ſalt-petre. See SALT-PETRE.

It is a ſtrong objection againſt the chemical principles, that we cannot *redintegrate* the body they were procured from, by re-mixing them. See PRINCIPLE and ELEMENT.

This ſeems to argue that the body did not properly conſiſt of ſuch elements; or that they were not originally contained in it, but were rather produced by the Fire. See FIRE, &c.

REDIRE *ad pacem.* See the article AD *pacem.*

REDISSEISIN, in law, a diſſeiſin made by him who once before was found and adjudged to have diſſeiſſed the ſame man of his lands or tenements; for which there lies a ſpecial writ, called a *writ of rediſſeiſin.*

RED-MANS, or RADMANS, in domeſday and other antient books, are probably the ſame rod, or rad-nights, *viz.* men who by the tenure or cuſtom of their lands were to ride with or for the lord of the manor about his buſineſs.

REDOUBT*, or REDOUTE, REDUCTUS, in fortification, a ſmall ſquare fort, without any defence but in front; uſed in trenches, lines of circumvallation, contravallation, and approach; as alſo for the lodging of corps de garde, and to defend paſſages. See FORT.

* The word is French, formed from the Latin, *reductus.*

In marſhy grounds, *redoubts* are often made of ſtone work, for the ſecurity of the neighbourhood: their face conſiſts of from ten to fifteen fathom; the ditch round them from eight to nine foot broad and deep; and their parapets have the ſame thickneſs. See SCONCE.

REDRESSING, the rectifying, or ſetting, any thing ſtraight again. See RECTIFICATION.

Trees and other plants have a natural faculty of *redreſſing* themſelves, when by any external cauſe they are forced out of the perpendicular. See PERPENDICULARITY.

In the moral ſenſe, to *redreſs* grievances, is to reform or remove them.

To *redreſs* a ſtag, among hunters, is to put him off his changes.

REDSEAR. See the article IRON.

REDUBBORS, thoſe who buy ſtolen cloaths, &c. and to the end they may not be known, turn them into ſome other colour, or faſhion, &c. See FRIPPERY, and REGRATOR.

REDUCE in chemiſtry. See the article REDUCT.

REDUCTED *chart.* See the article CHART.

REDUCING *ſcale*, is a thin broad piece of box, with ſeveral lines and ſcales of equal parts, thereon; for turning chains and links into acres and rods, by inſpection. See REDUCTION, &c.

It is uſed by ſurveyors to reduce maps or draughts from one dimenſion into another: it is ſometimes alſo called the *ſurveying ſcale.* See SCALE.

REDUCT, or REDUIT, a military term, ſignifying an advantageous piece of ground, entrenched and ſeparated from the reſt of the place, camp, &c. for an army, garriſon, &c. to retire to in caſe of ſurprize. See CASTLE, and DONJON.

REDUCT, in building, a quirk, or little place, taken out of a larger, to make it more uniform and regular; or for ſome other convenience, as for a little cabinet aſide of a chimney, alcoves, &c. See QUIRK.

REDUCT, or REDUX, among chemiſts, is a powder by which calcined metals and minerals are reduced again to their regulus, or pure ſubſtance. See REGULUS, CALX, &c.

REDUCTION, REDUCTIO, in the ſchools, a manner of bringing a term or propoſition, which before was oppoſite to ſome other, to be equivalent to it. See PROPOSITION, &c.

Reduction is effected by the addition or retrenchment of a negative particle—Thus, to reduce this propoſition: *no man is an animal*, to be equivalent to it's oppoſite, *every man is an animal*; I drop the negative, and ſay, *man is an animal*—After the like manner might the term, *every man*, be reduced, by adding the negative, and ſaying *there is no man.*

REDUCTION *of propoſitions*, is uſed in a more general ſenſe, for any expreſſion of one prpooſition, by another propoſition equivalent thereto. See PROPOSITION.

To a *reduction*, therefore, there are two propoſitions required; the *reduced* and *reducing*; which are conſidered as the extremes thereof; and to be connected in the *reduction*, by means of the particle *that is*, which here has the effect of a copula.

As here, *only animals think*; *that is*, *animals think*, *and nothing beſide animals think*—Where the propoſition preceeding the particle, is *reduced*, and the ſubject of the *reduction*; that following the particle *reduces*, and has the effect of the predicate of the *reduction*: and the particle *that is*, acts as a copula, importing, not barely that the propoſition is expreſſed by another, but by another equivalent one, or as it were the ſame.

REDUCTION *of ſyllogiſms*, is a regular changing or tranſforming of an imperfect ſyllogiſm into a perfect one—Or, it is a change of a ſyllogiſm in reſpect of form, whereby the neceſſity of the illation or inference is made more evident. See SYLLOGISM.

Reduction obtains in ſyllogiſms of the ſecond and third figure; as alſo in the indirect mode of the firſt—By it, theſe are all brought to the firſt. See MOOD and FIGURE.

There are two kinds of this *reduction*, the one *direct* or *oſtenſive*, performed merely by a converſion of one or both the premiſes, or by a tranſpoſition thereof; as when CAMESTRES is reduced to CELARENT.

The other *indirect*, called *per impoſſibile*, or *ad abſurdum*, whereby the perſon who denies the goodneſs and legitimacy of an imperfect ſyllogiſm, is reduced to aſſert or grant ſomething abſurd and impoſſible; or contradictory to ſome other thing maintained by him.

Suppoſe *e. gr.* a perſon granting the premiſes of the following ſyllogiſm denies the concluſion—*All fraud is prohibited*, *but ſome trading is not prohibited*, *therefore ſome trading is not fraud*—We thus proceed againſt him: if the ſyllogiſm be not good, the antecedent is juſt, but the conſequent falſe; and therefore the contrary of the concluſion muſt be true: now, I take the contrary of the concluſion which you thus give, *viz.* all trading is fraud; and of that with the other premiſe of the former ſyllogiſm, *viz.* the major, which you likewiſe grant, make a new ſyllogiſm; thus, *all fraud is prohibited*; *all trading is fraud*; *therefore all trading is prohibited.* But this propoſition, *all trading is prohibited*, and the other, *ſome trading is prohibited*, which you granted me in the firſt ſyllogiſm, are contradictories.

REDUCTION, in arithmetick, is the converting of monies, weights, or meaſures, into the ſame value in other denominations; *e. gr.* pounds into ſhillings and pence; or ſhillings and pence into pounds.

The *reductions* of the principal monies, coins, weights, and meaſures, antient and modern, foreign and domeſtic, are found under the reſpective articles, MONEY, COIN, WEIGHT, MEASURE, POUND, FOOT, &c.

Reduction is of two kinds: 1°. *deſcending*: when a quantity is to be brought from a higher denomination to a lower.

This is done by conſidering how many of the next leſs denomination are contained in the next greater before, and by that number multiplying the greater. See MULTIPLICATION.

Thus pounds are reduced into ſhillings by multiplying by 20; ſhillings into pence by multiplying by 12; and pence into farthings, by multiplying by 4. See POUND, &c.

Troy pounds are reduced into grains, by multiplying by 12, 20, and 24. And *averdupois* hundreds into ounces, by 4, 28, and 16. See OUNCE, &c.

The 2°. *aſcending*; when a lower denomination is to be reduced to an higher.

In order to this, divide the leaſt by ſo many of it's denomination as are contained in the next greater: thus 24720 pence, divided by 12, and the quotient by 20, give 103 pounds. See DIVISION.

If there remain any thing in each diviſion, it is reſpectively either odd pence or ſhillings: thus 6713 pence reduced, give 27*l.* 19*s.* 5*d.* cut off the laſt, the reſt is the pounds required.

To expedite the practice, ſeveral compendious ways of *reduction* have been invented. See PRACTICE.

Thus yards are turned into ells, by ſubſtracting a fifth; and into ells Flemiſh by adding a fifth—Ells Flemiſh are reduced into yards, by ſubſtracting a quarter—Ells Flemiſh reduced to ells Engliſh by multiplying by 6, and cutting off the right hand figure. See ELL, &c.

Great pounds of ſilk of 24 ounces, are reduced to pounds of 16 ounces, by adding one half. Pounds of 16 ounces into pounds of 24, by ſubſtracting one third.

REDUCTION *of fractions.* See the article FRACTION.

REDUCTION *of equations*, in algebra, is the clearing them from all ſuperfluous quantities, bringing down the quantities to their loweſt terms, and ſeparating the known quantities from the unknown; 'till, at length, only the unknown quantity is found on one ſide, and known ones on the other. See EQUATION.

The *reduction* of an equation is the laſt part of the reſolution of the problem. See RESOLUTION, and PROBLEM.

The end of all algebraical operations, is to have the unknown letter alone in one member of the equation; and in the other, all the known letters, without any mixture of unknown; for, in this caſe, it is evident that the value of the unknown quantity is found.

This *reduction* is effected by adding the quantities ſubſtracted, ſubſtracting thoſe added; multiplying thoſe divided, and dividing thoſe multiplied; extracting the roots out of powers, and raiſing roots to powers; ſo as ſtill to preſerve an equality. See EQUALITY — This ſuffices for the *reduction* of ſimple equations; but for higher equations, the proceſs is leſs obvious.

From the manner wherein powers are formed, it is evident, that as the unknown letter is raiſed to a higher power, it will be found in it's lower powers, mixed and combined ſo many more times with known quantities, and of conſequence will be ſo much the more difficult to be diſengaged therefrom

from. And the difficulty is the ſame, where there are ſeveral unknown letters multiplied ſingly one into another, and again multiplied by known letters. See PROBLEM.

The *reduction* of the equation being made; from the laſt quantity thus gained, the geometrical conſtruction is to be deduced. See CONSTRUCTION.

REDUCTION *of curves*. See the article CURVE.

REDUCTION *of a figure, deſign*, or *draught*, is the making a copy thereof either larger or ſmaller than the original; ſtill preſerving the form and proportion. See FIGURE.

The great uſe of the proportional compaſſes is in the *reduction* of figures, *&c.* whence they are alſo called *compaſſes of reduction*. See COMPASS.

There are various methods of reducing figures, *&c.* the moſt eaſy is by means of the pentagraph or parallelogram; but this has it's defects. See PENTAGRAPH—The beſt and moſt uſual methods of *reduction*, are as follow:

To REDUCE *a figure*: As ABCDE (*Tab. Geometry, fig.* 64.) into a leſs compaſs: about the middle of the figure, as z, pitch on a point: and from this point draw lines to it's ſeveral angles, A, B, C, *&c.* then drawing the line *a b*, parallel to AB, *b c* parallel to BC, *&c.* you will have the figure *a b c d e* ſimilar to ABCDE.

If the figure *a b c d e* had been required to be enlarged, there needed nothing but to produce the lines from the point beyond the angles, as z D, z C, *&c.* and to draw lines, *viz.* DC, DB, *&c.* parallel to the ſides *d c*, *d b*, &c.

To REDUCE *a figure by the angle of proportion*—Suppoſe the figure ABCDE (*Fig.* 65.) required to be diminiſhed in the proportion of the line AB, to *ab*. (*Fig.* 66.) Draw the indefinite line GH (*Fig.* 67.) and from G to H ſet off the Line AB: on G deſcribe the arch HI. Set off the Line *a b* as a chord on HI, and draw GI. Then with the angle IGH you have all the meaſures of the figure to be drawn. Thus to lay down the point *c*, take the interval BC, and upon the point G deſcribe the arch KL; alſo, on the point G deſcribe MN; and upon A with the diſtance MN deſcribe an arch cutting the preceeding one in *c*, which will determine the ſide *b c*. And after the ſame manner are all the other ſides and angles to be deſcribed—The ſame proceſs will alſo ſerve to enlarge the figure.

To REDUCE *a figure by a ſcale*—Meaſure all the ſides of the figure, *e. gr.* ABCDE, by a ſcale, and lay down the ſame meaſures, reſpectively, from a ſmaller ſcale in the proportion required. See SCALE.

To REDUCE *a map, deſign, or figure, by ſquares*—Divide the original into little ſquares, and divide a freſh paper of the dimenſions required, into the ſame number of ſquares; which will be larger or leſs than the former, as the map is to be inlarged or diminiſhed.

This done, in every ſquare of the ſecond figure, draw what you find in it's correſpondent one in the firſt. See MAP, *&c.*

REDUCTION *to the ecliptic*, in aſtronomy, is the difference between the argument of latitude, as NP (*Tab. Aſtron. fig.* 26.) and an arch of the ecliptic NR, intercepted between the plane of a planet, and the node N. See ECLIPTIC.

To find the reduction: the angle of inclination PNR, and the argument of latitude NP being given; find, by the doctrine of ſpherics, the arch NR: ſubſtract NR and NP from each other, the remainder is the *reduction*.

REDUCTION *into firſt matter*, is a term which alchymiſts uſe when they find their ſubſtances putrify, and grow black.

REDUCTION is more particularly uſed for the converting of a dry matter into a liquid, particularly water; which by the alchymiſts is held the principal of all things. See WATER, PRINCIPLE, *&c.*

The *reduction* of metals into their firſt matter or principles, according to theſe philoſophers, can only be effected by mercury; nothing elſe being able to looſen the fixt ſulphur of metallic bodies, which binds them together. See METAL and MERCURY.

REDUCTION, in chirurgery, denotes an operation whereby a diſlocated, luxated, or fractured bone, is reſtored to it's former place. See BONE, LUXATION, DISLOCATION, FRACTURE—*Reduction* or *repoſition*, is always performed before any remedy be applied.

REDUIT, in military affairs. See the article REDUCT.

REDUNDANCE, or REDUNDANCY, a fault in diſcourſe, conſiſting in the uſe of a ſuperfluity of words. See PLEONASM.

Words perfectly ſynonymous, are *redundant*, and ought to be retrenched—*Redundancy* makes the ſtyle weak and languid.

REDUNDANT *hyperbola*, is a curve of the higher kind, thus called, becauſe it exceeds the conic ſection of that name in the number of it's hyperbolical legs; being a triple hyperbola, with ſix hyperbolical legs. See CURVE and HYPERBOLA.

REDUPLICATION, in rhetoric, a figure whereby a verſe begins with the ſame word as the preceeding one ends. See ANADIPLOSIS.

REDUPLICATION, in logic, is a kind of condition expreſſed in a propoſition, indicating or aſſigning the manner wherein the predicate is attributed to the ſubject. See REPLICATION.

The uſual *reduplicating* words are *quatenus, as, ſo far as, conſidered as, inaſmuch as, &c.* Hence,

REDUPLICATIVE *proportions*, are ſuch wherein the ſubject is repeated, with ſome circumſtance or condition—Thus, *men, as men, are rational: kings, as kings, are ſubject to none but God.*

REDUX, in chemiſtry. See the article REDUCT.

REE, RE, REIS, or RES, a little Portugueze copper coin, nearly equal to the late French denier tournois, or to a third part of the Engliſh farthing. See COIN.

The *ree* is both a current and imaginary money; the Portugueze uſually reckoning by *rees*, as the Spaniards by maravedis. See MARAVEDIS.

Strangers in treating with them, are frequently ſurprized with demands of ſeveral thouſand *rees*, when the matter betwixt them is only of a few pieces of eight; the *millree* or thouſand *rees*, only making 6*s.* 3*d. ſterl.*—750 of them are equal to the piece of eight. See MILLREE.

REED, an antient Jewiſh meaſure. See MEASURE.

Anſwerable to this is the *canna* or *cane* of ſome modern nations. See CANE.

Ezechiel's REED. See EZECHIEL'S REED.

REEF, a term in navigation—When there is a great gale of wind, they commonly roll up part of the ſail below, that by this means it may become the narrower, and not draw ſo much wind; which contracting or taking up of the ſail, they call a *reef*, or *reefing the ſail.*

So alſo when a top-maſt is ſprung, as they call it, that is, cracked, or almoſt broken in the cap; they cut off the lower piece that was near broken off, and ſetting the other part, now much ſhorter, in the ſtep again, call it a *reefed top-maſt.*

REEL, in the manufactures, a machine ſerving for the office of *reeling*. See REELING.

There are various kinds of *reels*; ſome very ſimple, others very complex; of the former kind, thoſe moſt in uſe are,

1°. A little *reel*, held in the hand, conſiſting of three pieces of wood; the biggeſt and longeſt whereof (which does not exceed a foot and a half in length, and ¼ of an inch in diameter) is traverſed by two other pieces diſpoſed different ways.

2°. The *common reel*, or *windlaſs*, which turns upon a pivot and has four flights, traverſed by long pins or ſticks whereon the ſkain to be *reeled* is put, and which are drawn cloſer, or opened wider, according to the ſkain.

Other *reels* uſed in particular arts, are explained under their particular articles; as the *reel* uſed in the milling of ſilk, under the article MILLING: and that in the *reeling* or winding of ſilks, under the article of SILK, *&c.*

REELING, in the manufacturies, the winding of thread, ſilk, cotton, or the like, into a ſkain, or upon a bottom; to prevent it's intangling. See SILK, *&c.*

It is alſo uſed for the charging or diſcharging of bobins or quills, to uſe them in the manufacture of different ſtuffs, as thread, ſilk, cotton, *&c.*—*Reeling* is performed different ways, and by different engines. See REEL.

RE-ENTRING *angle*, in fortification. See ANGLE.

RE-ENTRY, in law, the reſuming or retaking that poſſeſſion which we had lately fore-gone. See ENTRY.

As, if I make a leaſe of land, or tenement, I do thereby forego the poſſeſſion: and if I condition with the leſſee, That for non-payment of the rent at the day, it ſhall be lawful for me to *re-enter*; this is as much as if I conditioned to take again the lands, *&c.* into my own hands, and to recover the poſſeſſion by my own act, without the aſſiſtance of judge, or other proceſs.

REER *county*. See the article RIER.

REEVE *of a church*, is the guardian of it; or the church-warden. See CHURCH-WARDEN.

So, *ſhire-reeve* is the ſheriff, or guardian of a county. See SHERIFF—And *port-reeve*, the warden of a port or haven. See PORTGREVE.

REEVING, in the ſea language, is the putting a rope thro' a block—Hence to pull a rope out of a block, is called *unreeving*.

RE-EXCHANGE, in commerce, a ſecond payment of the price of exchange; or rather the price of a new exchange, due upon a bill of exchange that comes to be proteſted; and to be refunded the bearer, by the drawer or endorſer. See EXCHANGE.

The occaſion of *re-exchange* is, when the bearer of a bill of exchange, after proteſting it for want either of acceptance, or of payment, borrows money on his own promiſe, bond, or the like; or draws a bill of exchange in the place where the payment was to be made, on the perſon who furniſhed the firſt; for which he pays a ſecond exchange, which being added to the firſt already paid, the drawer of the firſt bill is anſwerable for two exchanges, properly called *exchange* and *re-exchange*. See BILL and PROTEST.

The bearer of a proteſted bill has a right to recover both the one and the other on the drawer. Yet the ſimple proteſtation which the bearer makes in the act of proteſt, that he will take up a like ſum at *re-exchange*, for want of his bill being accepted or paid, is not ſufficient to entitle him to demand the re-imburſement of his *re-exchange*; unleſs he make it appear he has actually taken up money in the place whereon the bill was drawn.

Otherwiſe the *re-exchange* will only amount to the reſtitution of the firſt exchange, with intereſt, the expences of proteſting, and of the journey, if there have been any.

If a bill of exchange, payable to the bearer or order, come to be proteſted, the *re-exchange* is only due upon the drawer for the place where the remittance was made; not for thoſe places where it may have been negotiated: at leaſt, the drawer has a right to be refunded his *re-exchange* for thoſe places, by the endorſer.

Indeed the *re-exchange* is due from the drawer upon all places where a power of negotiation is given by the bill, and upon all others, if the power of negotiating be indefinite.

Laſtly, the intereſt of the *re-exchange*, of the expences of the proteſt, and the journey, are only due from the day of the demand.

It is ſuppoſed to be the Gibelins driven out of Italy by the faction of the Guelphs, and ſheltered at Amſterdam, who firſt eſtabliſhed the cuſtom of *re-exchange*; on pretence of the intereſts, damages, and expences they underwent, when the bills given them for the effects they had been obliged to abandon, were not accepted, but came to be proteſted. See BILL *of exchange*.

RE-EXTENT, in law, a ſecond extent made upon lands or tenements, on complaint, that the former extent was partially made. See EXTENT.

REFECTION, REFECTIO, among monks and eccleſiaſtics, a ſpare meal or repaſt, juſt ſufficing for the ſupport of life. See REPAST, PITTANCE, *&c.*

REFECTION is alſo uſed in antient authors for a duty, or ſervice incumbent on any perſon to provide meals, for eccleſiaſtics or even princes. See PROCURATION.

REFECTORY, or REFECTUARY, REFECTORIUM, a ſpacious hall in convents, and other communities, where the monks, nuns, *&c.* take their refections or meals in common.

The *refectory* of the Benedictines of St. George at Venice, deſigned by Palladio, is one of the fineſt in the world. *Daviler.*

REFERENCE, in writing, *&c.* a mark relative to another ſimilar one in the margin, or at the bottom of the page; where ſomething omitted in the text, is added; and which is to be inſerted either in reading or copying. See CHARACTER.

A copiſt muſt be very expert at taking *references*.

References are alſo uſed in books, where things being but imperfectly handled, the reader is directed to ſome other part or place where they are more amply explained.

Dictionaries are full of *references* denoted by *ſee*, or *vide*—By means of theſe *references*, the Dictionary writer ſettles a correſpondence between the ſeveral parts of his work; and may give his dictionary moſt of the advantages of a continued treatiſe. See DICTIONARY.

Indices or tables are only *references* to the ſeveral parts of the work where the ſeveral matters are handled.

REFERENDARY, REFERENDARIUS, in antient cuſtoms, an officer who exhibited the petitions of the people to the king; and acquainted the judges with his commands.

An officer of this kind, Spelman obſerves, we had in England, in the time of the Saxons—The like office was afterwards diſcharged by others called maſters of requeſts. See REQUEST.

REFINING, the art or act of purifying a thing; or of rendering it finer, cleaner, and purer. See PURIFICATION, and CLARIFYING.

Refining is chiefly uſed in ſpeaking of metals; ſugar and ſalt. See METAL, *&c.*

The REFINING of gold is performed three ways: either with antimony, with ſublimate, or with aqua-fortis; which laſt method, much the moſt uſual, and leaſt dangerous of the three, is called *departing* or *parting*; the proceſs whereof ſee under the articles GOLD and DEPARTING.

REFINING *of gold with antimony*—They here uſe a wind-furnace; (a deſcription whereof may be ſeen under the article FURNACE) with an ordinary crucible, of a ſize anſwerable to the quantity of gold to be refined; obſerving that the gold and antimony together do not above half fill it.

The gold being melted in the crucible, the antimony is thrown in, in powder—The proportion of the mineral to the metals, is about a pound to eight ounces, if the gold be between 22 and 16 carats fine: if it be beneath 16 carats, they uſe about five quarters of a pound to eight ounces: the coarſer the gold, ſtill the more antimony is required.

As ſoon as the antimony is in the crucible, it is covered up; and after charging the furnace with charcoal, they put on it's head or cover; which ſtands till ſuch time as the crucible be left quite bare; then the head being taken off, and the crucible left to cool in the furnace itſelf, till ſuch time as it may be taken out by the hand, they break it, to get out the bottom or culot, which is a maſs of fine gold remaining at the bottom, with the fæces of the antimony, the ſilver and copper alloy, and ſometimes little particles of gold itſelf, over it.

Though the gold thus prepared be very pure, yet the antimony gives it ſuch a harſh brittle quality, that it ceaſes to be ductile; and muſt be ſoftened by fuſion with ſalt-petre and borax, to bring it to itſelf.

For this operation they prepare what they call a *dry coppel*; that is, a coppel made of crucible earth, which does not imbibe like the coppels made of aſhes. See COPPEL.

The coppel being ſufficiently heated in the *refining* furnace, they put the gold in it, and cover it up with charcoal.

As ſoon as the gold is diſſolved, which is very ſoon, by reaſon of the remains of the antimony, they blow it with the bellows to drive the mineral entirely away, which now goes off in ſmoak; adding to it, as ſoon as the fumes ceaſe, a little ſalt-petre and borax, in powder; which collect the impurities remaining upon the diſſolution, and fix the gold in the coppel, in form of a plate.

The gold being taken out of the coppel, and melted a-freſh in a crucible, with an addition of two ounces of ſalt-petre and as much borax in powder, to each eight ounces of gold, as ſoon as it ceaſes to fume, they caſt it into an ingot; which upon trial is found 23 carats, 26 thirty-ſeconds fine.

As to the particles of gold which may have been left behind with the alloy in the fæces of the antimony, they get them out by a dry coppel, with the ſame meltings and ingredients as are uſed in ſoftening the former—And when they are aſſured, by the eſſay, of the ſhare of gold that matter contains, they refine it, to ſeparate the copper; and afterwards make the depart.

As to the gold which may be left ſticking to the dry coppels, they get it out by breaking, and pulverizing the crucibles, and by repeated lotions of the powder thereof in ſeveral waters; after the manner deſcribed under the article *waſhing*. See WASHING.

REFINING *of gold by means of ſublimate*—The proceſs is begun like that with antimony; *i. e.* in the ſame furnace, with the ſame coal, the ſame fire, and the ſame crucibles.

The gold being melted in the crucible, they caſt in the ſublimate, not pulverized, but only broke in pieces—As to the proportion; to 8 ounces of gold to be refined, they put an ounce, or ounce and a half, or even two ounces, if the gold be of 22 carats; three ounces, if 20 carats; and 4 or 6 ounces, if it only be from 18 to 20 carats. In which laſt caſe they part the ſublimate into two; putting half at a time, with the gold, into a new crucible; which when the operation is over, leaves the gold from 18 to 23 carats, according to it's fineneſs before—After this, they raiſe it farther by the fire, as follows:

The broken ſublimate being put into the crucible with the melted gold, the crucible is immediately covered up, to ſmother the mineral: which done, the furnace is filled with charcoal, and the head put on—A quarter of an hour afterwards they take off the head, lay the crucible bare, and give the gold air, *i. e.* blow off all the aſhes, and other impurities that may be floating on the liquid gold, with a pair of bellows, the nozzle whereof is crooked.

This they repeat again and again, till all the impurities of the gold being carried off, by virtue of the ſublimate, it be found of a bright glittering colour: after which it is taken out of the crucible, and the gold caſt into an ingot.

The method of *refining* by ſublimate is both more complete and cheaper than that by antimony; but they are both exceedingly dangerous, by reaſon of their ſulphurous and arſenical exhalations: the only difference in their malignity conſiſting in this, that the poiſon of the antimony is ſlower than that of the ſublimate. See SUBLIMATE, *&c.*

Gold may alſo be *refined* with lead and aſhes; but this is a method ſeldom uſed, excepting in eſſays. See ESSAY.

REFINING *of ſilver*—There are two ways of *refining* ſilver: the one with lead; the other with ſalt-petre. The beſt and cheapeſt is that with lead; though that with ſalt-petre ſtill obtains in many places, for want of workmen who underſtand the proceſs of the latter.

We ſhall here only give that with ſalt-petre; referring for the other to the article SILVER.

REFINING *with ſalt-petre* is performed in a wind furnace—The ſilver to be *refined* having been reduced into grains, of the ſize of little peas, by pouring it, when melted, into a tub of common water; it is heated over again in a boiler.

After this they put it in a crucible, and along with it, to every eight ounces of metal, two of ſalt-petre.

The crucible is now covered up with an earthen lid, in form of a dome, exactly luted; which lid, however, is to have a little aperture in the middle.

The crucible being put in the furnace, and covered with charcoal, which is only to be lighted by degrees, at length they give it the full force of the fire to put the metal into a perfect fuſion. This they repeat three times ſucceſſively, at an interval of a quarter of an hour.

After the third fire they uncover the furnace, and let the crucible cool; and at length break it, to get out the ſilver, which is found in a button or culot; the bottom whereof is very fine ſilver; and the top mixed with the fæces of the ſalt-petre, and the alloy of the ſilver, and even ſome particles of the fine ſilver.

The culot being ſeparated from the impurities, is melted in a new crucible, and into the diſſolution is thrown charcoal duſt, and the whole briſkly worked together. Then the crucible being covered up again, and the furnace charged with coal, a ſecond fire is given it.

This done, the aſhes and other impurities are blown from the top of the metal, till it appear as clear as a looking-glaſs; and then an ounce of borax broke in pieces is thrown in.

Laſtly, the crucible being cover'd up again, they give it the laſt fire; after which it is caſt into ingots; which are found eleven penny-weights, and ſixteen grains fine.

To recover the ſilver that may be left in the fæces, or ſcoria, they pound them, and give them repeated lotions in freſh waters. See WASHING.

REFINING *of copper*, is only performed by giving the mineral matter ſeveral lotions before the melting it; and then giving it ſeveral repeated fuſions. See COPPER.

REFINING *of tin* is performed much after the ſame manner as that of copper. See TIN.

Though we may diſtinguiſh two kinds of fineneſs of this metal: the one ariſing from it's fuſion; that tin taken firſt out of the furnace wherein it is melted, being always purer than that towards the bottom.

The other kind of fineneſs is that given the tin by adding ſome other metal or mineral to it, to render it more ſonorous, as well as brighter: ſuch is tin of antimony, pewter, *&c.* See PEWTER, *&c.*

REFINING *of iron*, begins likewiſe by the melting it. See IRON.

The greater degree of fuſion the mineral has, the more the metal is purified: but this firſt fuſion is not ſufficient—To render the iron malleable, and fit it to endure the file, it muſt be melted a ſecond time; then forged or beaten a long time with huge heavy hammers, wrought by water; then heated in the fire, and at laſt reduced on the anvil, into bars of ſeveral thickneſſes. See FORGING.

The more the iron is heated in the fire; and the more it is beaten, whether hot or cold, the finer it becomes. See IRON.

Steel is only iron *refined* to a great degree by heating it, with ſome other ingredients which cloſe up the pores, and ſoften the grain thereof. See STEEL.

REFINING of *lead*, is performed like that of moſt other imperfect metals, by frequent meltings, ſtill ſcumming it before it be cold, and caſting in tallow, and other kinds of fat.

They alſo make eſſays of lead; not to refine it, but to ſee if it be pure, and without mixture of any other metal. See LEAD.

REFINING *of ſugar*—The operation is begun by ſeveral ſtrong lixiviums or lyes of lime-water, and eggs, ſhells and all, mixed and beaten together.

This firſt *refining* is performed in the Caribees and other places where the ſugar-canes are cultivated; and only ſerves for the brown or coarſe ſugar.

When theſe are imported into Europe, the ſugar-bakers take them up, and refine them farther, by a ſecond operation, or rather a repetition of the firſt.

To render the ſugar very fine, fit for confections, they uſually give it a third *refining*; wherein they only uſe the whites of eggs, and their ſhells beaten together, and thrown into the melted ſugar; which is called *clarifying the ſugar*. See SUGAR.

REFINING *of ſalt-petre*—The ſalt being put in an earthen or iron veſſel, as much ſpring-water is poured on it as ſuffices to diſſolve it. The veſſel is then put over a gentle fire; and as ſoon as the water begins to boil, alum-powder is thrown into it: the proportion is, one pound of alum to 128 pound of ſalt-petre; and a little vinegar is added. As it boils, the ſcum is to be taken off; and thus is it *refined*. See SALT-PETRE.

For the REFINING *of other matters*, as *camphor*, *cinnabar*, *ſulphur*, *lapis*, *ſalt*, *borax*, &c. See CAMPHOR, CINNABAR, SULPHUR, SALT, *&c.*

REFLECTED *viſion*. See the article VISION.

REFLECTING, or REFLEXIVE *dial*, is a ſort of dial, which ſhews the hour by means of a thin piece of looking-glaſs plate, duly placed to caſt the ſun-rays to the top of a cieling, on which the hour-lines are drawn. See DIAL.

REFLECTING *microſcope*.	See	MICROSCOPE.
REFLECTING *level*.		LEVEL.
REFLECTING *teleſcope*.		TELESCOPE.

REFLECTION, or REFLEXION, in mechanics, the return, or regreſſive motion of a moveable, occaſioned by the reſiſtance of a body, which hindred it's purſuing it's former direction. See MOTION, RESISTANCE, *&c.*

It is controverted, whether there be any moment's reſt or interval between the incidence and the *reflection*? for the affirmative, ſtand the Peripatetics, and all who conceive the *reflected* motion to be different from the incident one of the ſame body—The motion of incidence, according to theſe authors, is wholly loſt, and deſtroyed by the reſiſtance of the obſtacle ſtruck againſt; and the moveable is thus rendered abſolutely quieſcent in the point of contact; till a new motion of *reflection* is produced therein, from a contrary cauſe.

The Carteſians aſſert the negative; abſolutely denying any reſt at all between the incidence and *reflection*: urging that if the motion were once deſtroyed, though but for a moment, there would be nothing to excite it again; but the body would perſevere in that new ſtate, as much as if it had been at reſt a thouſand years. See REST and *law of* NATURE.

Accordingly Rohault, and others, define *reflection* to be no other than a change of determination; or a continuation of the former motion in a new direction. See DETERMINATION, *&c.*

As, ſay they, a pendulum, when arrived at it's greateſt ſweep, does not ſtop; ſo a hard body, ſtriking on another hard one, does not reſt, but purſues it's motion the contrary way, according to the eſtabliſhed law of nature; and this from the immediate influence or impulſe of the cauſe that firſt moved it—But this doctrine is now generally ſet aſide.

Reflection is conceived by the lateſt and beſt authors, as a motion peculiar to elaſtic bodies, whereby after ſtriking, on others which they cannot remove, they recede, or turn back, by their elaſtic power. See ELASTIC *body*.

On this principle it is aſſerted, that there may be, and is a period of reſt between the incidence and *reflection*; ſince the *reflected* motion is not a continuation of the other, but a new motion, ariſing from a new cauſe or principle, *viz.* the power of elaſticity. See ELASTICITY.

It is one of the great laws of *reflection*, that the angle a *reflected* body makes with the plain of a *reflecting* obſtacle, is equal to that wherein it ſtruck on that obſtacle. See ANGLE and INCIDENCE — *For the ſeveral laws of motion obſerved in the* REFLECTIONS *of bodies*, ſee the article PERCUSSION.

REFLECTION *of the rays of light*, in optics, is a motion of the rays, whereby, after impinging on the ſolid parts of bodies, or rather, after a very near approach thereto, they recede or are driven therefrom. See REFLEXIBILITY.

The *reflection* of the rays of light from the ſurfaces of bodies, is the means whereby bodies become viſible. See VISION. And the diſpoſition of bodies to reflect this or that kind of rays moſt copiouſly is the cauſe of their being of this or that colour. See COLOUR.

The *reflection* of light from the ſurfaces of mirrors, makes the ſubject of catoptrics. See CATOPTRICS.

The *reflection* of light, Sir Iſaac Newton has ſhewn, is not effected by the rays ſtriking on the very parts of the bodies; but by ſome power of the body equally diffuſed throughout it's whole ſurface, whereby it acts upon the ray, attracting or repelling it without any immediate contact. See RAY.

This power he ſhews to be the ſame whereby, in other circumſtances, the rays are refracted; and whereby they are at firſt emitted from the lucid body. See LIGHT.

The arguments he produces to prove this are as follow—

1°. Becauſe the ſurfaces of poliſhed glaſſes, which to the eye appear ſmooth, are yet in reality very rugged and uneven; (poliſhing being nothing but the grating, ſcratching and breaking off the coarſer protuberances, by means of ſand, glaſs putty or tripoly.) If the rays of light, therefore, were reflected by ſtriking on the ſolid parts of the glaſs, the *reflections* would never be ſo accurate as we find they are; but the rays would even be as much ſcattered by the moſt poliſhed glaſs, as by the rougheſt — It remains, therefore, a problem how glaſs poliſhed by fretting ſubſtances can reflect light ſo regularly as it does, which problem is ſcarce otherways to be ſolved than by ſaying, that the *reflection* of a ray is effected, not by a ſingle point of the *reflecting* body, but by ſome power of the whole body, evenly diffuſed all over it's ſurface, and by which it acts on a ray without immediate contact: for that the parts of bodies do act upon light at a diſtance, is already ſhewn under the article INFLECTION.

2°. If the colours ſeparated by a priſm placed at the entrance of a beam of light into a darkned room, be ſucceſſively caſt on a ſecond priſm placed at a greater diſtance from the former, in ſuch manner as that they all fall alike, or with an equal obliquity upon it; the ſecond priſm may be ſo inclined to the incident rays, that thoſe which are of a blue colour ſhall be all *reflected* by it; and yet thoſe of a red colour pretty copiouſly tranſmitted—Now, if the *reflection* were cauſed by the parts of the air or glaſs, we would aſk, why, at the ſame obliquity of incidence, the blue ſhould wholly impinge on thoſe parts ſo as to be all *reflected*, and yet the red find pores enough to be in a great meaſure tranſmitted?

3°. Where two glaſſes touch one another, there is no ſenſible *reflection*, and yet we ſee no reaſon why the rays ſhould not impinge on the parts of the glaſs, as much when contiguous to other glaſs, as when contiguous to air.

4°. When the top of a water-bubble, by the continual ſubſiding and exhaling of the water, grows very thin, there is ſuch a little, and almoſt inſenſible quantity of light *reflected* from it, that it appears intenſely black; whereas round about that black ſpot, where the water is thicker, the *reflection* is ſo ſtrong as to make the water ſeem very white — Nor is it only at the leaſt thickneſs of thin plates or bubbles, that there is no manifeſt *reflection*, but at many other thickneſſes, gradually greater and greater. For in one of our author's obſervations the rays of the ſame colour were by turns tranſmitted at one thickneſs, and *reflected* at another thickneſs for an indeterminate number of ſucceſſions: and yet in the ſuperficies of the thinned body, where it is of one thickneſs, there are as many other parts for rays to impinge on, as where it is of any other thickneſs.

5°. If red and blue rays, ſeparated by a priſm, fall ſucceſſively on a thin plate of any pellucid matter, whoſe thickneſs increaſes in continual proportion (ſuch as a plate of air between two glaſſes, the one plane and the other a little convex) the ſame plate will, in the ſame part *reflect* all the rays of one colour, and tranſmit all thoſe of the other; but in different parts, will *reflect* the rays of one and the ſame colour, at one thickneſs, and tranſmit them at another; and thus alternately, and *in infinitum*—Now it can never be imagined that at one place the rays which for inſtance, exhibit a blue colour, ſhould have the fortune to ſtrike on the ſolid parts, and thoſe which exhibit a red to hit on the void parts of the body; and at another place, where the body is either a little thicker, or a little thinner, that on the contrary the blue ſhould hit on the pores, and the red upon the ſolid parts.

6°. In the paſſage of light out of glaſs into air, there is a *reflection* as ſtrong as in it's paſſage out of air into glaſs, or rather a little ſtronger, and by many degrees ſtronger than in it's paſſage out of glaſs into water.

Now it ſeems improbable that air ſhould have more *reflecting* parts than water or glaſs: but if that ſhould be ſuppoſed, yet it will avail nothing; for the *reflection* is as ſtrong or ſtronger when the air is drawn from the glaſs by the air-pump, as when it is adjacent to it—If any ſhould here object, on Des Cartes's hypotheſis, that though the air be drawn, there is a ſubtle matter remaining to ſupply it's place, which being of a denſer kind, is better fitted for the *reflection* of light than any other body: beſide that we have elſewhere ſhewn ſuch ſubtle matter to be fictitious; and that ſuppoſing it's exiſtence, and it's *reflecting* power, no light could ever have been propagated, but muſt have been all *reflected* back to the lucid body, immediately after it was firſt emitted; the following experiment does evidently convict it of falſity.

7°. If light in it's paſſage out of glaſs into air ſtrike more obliquely than at an angle of 40 or 41 degrees, it is wholly *reflected*, if leſs obliquely it is in great meaſure tranſmitted—Now it is not to be imagined, that light at one degree of obliquity ſhould meet with pores enough in the air to tranſmit the greater part of it, and at another degree ſhould meet with nothing but parts to *reflect* it wholly; eſpecially conſidering that in it's paſſage out of air into glaſs, how oblique ſoever be it's incidence, it finds pores enough in the glaſs to tranſmit a great part of it — If any ſuppoſe that it is not *reflected* by the air, but by the outmoſt ſuperficial parts of the glaſs, there is ſtill the ſame difficulty: beſides, that ſuch a ſuppoſition is unintelligible, and will alſo appear to be falſe by applying water behind ſome part of the glaſs inſtead of air: for ſo, in a convenient obliquity of the rays, ſuppoſe of 45 or 46 degrees, at which they are all *reflected* where the air is adjacent to the glaſs, they ſhall be in great meaſure tranſmitted where the water is adjacent to it: which argues, that their *reflection* or tranſmiſſion depends on the conſtitution of the air and water behind the glaſs, and not on the ſtriking of the rays upon the parts of the glaſs; the rays not being *reflected* untill they have reached the laſt part of the ſurface, and are begun to go out. For if in going out they fall upon a ſurface of oil and water, they proceed; the attraction of the glaſs being ballanced by an equal force the contrary way, and prevented from having it's effect by the attraction of the liquor adhering to it: but if the rays in paſſing out of this laſt ſurface fall into a vacuum which has no attraction, or into air which has but little, not enough to counter-balance the effect of the glaſs; in this caſe the attraction of the glaſs draws them back, and *reflects* them.

This will appear ſtill more evident, by laying two glaſs priſms, or the object glaſſes of two teleſcopes, the one plane and the other a little convex, upon each other, ſo as they may neither touch nor yet be too far a-part. For that light which falls on the hind ſurface of the firſt glaſs, where the glaſſes are not above $\frac{1}{1000000}$ part of an inch a-part, will be tranſmitted through the ſurface, and through the air or vacuum between the glaſſes, and paſs into the ſecond glaſs: but if the ſecond glaſs be taken away, then the light paſſing out of the ſecond ſurface of the firſt glaſs into the air or vacuum, will not proceed but return into the firſt glaſs, and be *reflected*.

Whence it follows, that the rays are drawn back again by ſome force in the firſt glaſs; there being nothing elſe to occaſion their return — And hence too, it follows, that the *reflection* is not effected by means of any ſubtle matter, contiguous to the hind ſurface, according to the principles of Des Cartes; ſince that matter ought to *reflect* them when the glaſſes were nearly contiguous, as well as when the ſecond glaſs is quite removed.

Laſtly, If it be aſked how ſome of the rays come to be *reflected*, and others tranſmitted: and why they are not all alike *reflected*, ſuppoſing the *reflection* owing to the action of the whole ſurface? the ſame great author ſhews, that there are both in the rays of light, and in the bodies themſelves, certain vibrations (or ſome ſuch property) impreſſed on the rays, by the action either of the luminary that emits them, or of the bodies that *reflect* them; by means whereof it happens, that thoſe rays in that part of their vibration which conſpires with the motion of the parts of the body, enter the body, are refracted and tranſmitted; but thoſe in a contrary part of their vibration reflected. See VIBRATION and MEDIUM. See alſo REFRACTION and TRANSMISSION.

Add, that every ray of light, in it's paſſage through any refracting ſurface, is put into a certain tranſient conſtitution or ſtate, which in the progreſs of the ray returns at equal intervals, and diſpoſes the ray at each return to be eaſily tranſmitted through the next *refracting* ſurface; and between each return to be eaſily *reflected* by it.

Theſe alternate diſpoſitions, which Sir Iſaac Newton calls *fits of eaſy reflection*, and of eaſy *tranſmiſſion*, he accounts for by ſuppoſing that the rays of light, in impinging on bodies, excite vibrations therein, which happening to move faſter than the rays, when a ray is in that part of the vibration which conſpires with it's motion, it paſſes through; but when in the contrary part of the vibration, is beat back again: whence every ray is ſucceſſively diſpoſed to be eaſily *reflected*, or eaſily tranſmitted, by every vibration which overtakes it. See TRANSMISSION.

REFLECTION, in catoptrics, is the return of a ray of light from the poliſhed ſurface of a ſpeculum or mirrour, driven thence by ſome power reſiding therein. See MIRROUR and CATOPTRICS.

The ray thus returned is called a *reflex*, or *reflected ray*, or *ray of reflection*; and the point of the ſpeculum whence the return commences, the *point of reflection*.

Thus the ray A B (*Tab. Optics*, *fig.* 26.) proceeding from the radiant A, and ſtriking on the point of the ſpeculum B; being returned thence to C; B C repreſents the *reflected ray*, and B the *point of reflection*: in reſpect whereof A B repreſents the *incident ray*, or *ray of incidence*, and B the point of *incidence*. See POINT and RAY.

Again, a line C G drawn from any point as C of the *reflected* ray B C, perpendicular to the ſpeculum, is called the *cathetus of reflection*, or *cathetus of the eye*: as a line A F, drawn from the radiant perpendicular to the ſpeculum, is called the *cathetus of incidence*. See CATHETUS.

Of the two angles which the *reflected ray* B C makes with the mirrour, the ſmalleſt, C B E, is called the *angle of reflection*: as, of the two angles the incident ray makes with the ſpeculum, the ſmalleſt A B D is called the *angle of incidence*. See ANGLE.

If the mirrour be either concave, or convex, the ſmalleſt angles the ray makes with a tangent to the point of *reflection* and incidence, are the *angles of reflection* and incidence.

The angle C B H which the *reflected* ray makes with a perpendicular to the point of *reflection*, is called the *inclination of the reflected rays*; as the angle A B H is called the *inclination of the incident ray*. See INCLINATION.

General laws of REFLECTION—I. *If a ray of light be reflected from a ſpeculum of any form*; *the angle of incidence is ever equal to the angle of reflection* — This law obtains in percuſſions of all kinds of bodies, and conſequently muſt do ſo in thoſe of light. See *laws* of PERCUSSION, ſee alſo ANGLE.

It might therefore be here aſſumed as an axiom: but it is of that importance, and it's demonſtration ſo beautiful, that we cannot omit it — Suppoſe, then, D C (*fig.* 54.) an incident ray, propagated from the radiant D: here, though the motion of the ray be ſimple, yet it's determination in the line D C being oblique with reſpect to the obſtacle, is really compounded of two determinations; the one along D E, the other along D G. See COMPOUND *motion*.

The force along D C, therefore is equal to the two forces along D G and D H. But the obſtacle G F only oppoſes one of the determinations, *viz.* that along D G (for it cannot oppoſe a determination parallel to itſelf, as D E;) therefore only the force along D G will be loſt by the ſtroke; that along D H or G C remaining entire — But a body perfectly elaſtic (ſuch as we ſuppoſe the ray of light) will recover by it's elaſticity, the force it loſt by the ſhock. See ELASTICITY.

The ray, therefore, will recover the force D G or C H. Thus, retaining both it's forces, and both it's former determination H C and C F, after percuſſion, it will be impelled along C F and C H, by the ſame forces as before along D H and D G. By it's compound motion, therefore, it will deſcribe the right line C E, and that in the ſame time as

DC; and HE and DH will be equal, as being deſcribed by the ſame force. Now, the two triangles DCH and CHE are equal, and conſequently their ſimilar angles equal. Since then, HCA=HCF; DCA the angle of incidence, is equal to ECF the angle of *reflection*. *Q. E. D.*

This law is confirmed in light by an eaſy experiment. For a ray of the ſun falling on a mirrour, in a dark room, through a little hole; you will have the pleaſure to ſee it rebound, ſo as to make the angle of *reflection* equal to that of incidence. See CAMERA *obſcura*.

The ſame may be ſhewn various other ways: thus, *e. gr.* placing a ſemicircle F *i* G (*Tab. Optics*, *fig.* 26.) on a mirrour DE, it's centre on B, and it's limb perpendicular to the ſpeculum; and aſſuming equal arches, F*a* and G*e*; place an object in A, and the eye in C: then will the object be ſeen by a ray *reflected* from the point B, and if B be covered, the object will ceaſe to be ſeen.

Hence, 1°. If a ray of light, as HB, fall perpendicularly on the ſurface of a ſpeculum DE, it will be *reflected* back upon itſelf.

2°. From the ſame point of a ſpeculum, ſeveral rays cannot be *reflected* to the ſame point; for in that caſe all the ſeveral angles of *reflection* would be equal to the ſame angle of incidence; which is abſurd.

3°. One ray as AB cannot be *reflected* to two or more points; for in that caſe all it's angles of *reflection* would be equal to the ſame angle of incidence; which is as abſurd as before. See RADIANT.

II. *Each point of a ſpeculum reflects rays falling on it, from each part of an object*—Hence, ſince ſeveral rays coming from ſeveral parts of a radiant object, cannot be *reflected* from the ſame point of a ſpeculum to the ſame point; the rays that flow from different points of the object, are ſeparated after *reflection:* and hence each ray ſhews the point whence it proceeded. See VISION.

On this principle it is that the rays *reflected* from mirrours or looking-glaſſes, exhibit the appearances of objects placed before them. See LOOKING-GLASS.

And hence we eaſily conceive why rough bodies exhibit no images; in regard they reflect the light in ſuch manner as to confound rays which proceed from different points, by means of their eminences and cavities, their alternate riſings and fallings—But for this, all hard bodies would be mirrours.

III. *If the eye* C, *and the radiant point* A *change places*; *the point will continue to radiate upon the eye, in the ſame courſe or path as before.*

For if the object be removed from A to C, it will ſtill radiate on it's former point of *reflection* B; but there can be but one right line drawn between the two points G and D; and the rays are right lines. Therefore that which was before the ray of *reflection*, will now be the ray of incidence; and ſince it will be *reflected* under the ſame angle as that under which it fell, that which was before the ray of incidence, will now be the ray of *reflection*. So that the object removed to C, will radiate on the eye placed in A, by the right lines CB and BA. *Q. E. D.*

Hence, an object is ſeen by the *reflected* ray AB, with the eye placed in A, the ſame, as if the eye were in AC, and the object in A.

The truth of this theorem is ſo eaſily confirmed by experiment, that ſome, with Euclid, aſſume it as a principle; and demonſtrate the great law of *reflection* therefrom — Thus; ſuppoſe the angle of incidence a little greater than the angle of *reflection*; then will the angle ABF be greater than that CBE. Wherefore, changing the places of the eye and the object, the angle CBE will become the angle of incidence; and therefore CBE greater than ABF, by the ſuppoſition. So that the ſame angle ABF will be both greater and ſmaller than the other CBE; which being abſurd, ABE cannot be greater than CBE—The ſame abſurdity will follow, if you ſuppoſe the angle of incidence leſs than the angle of *reflection* —Since then the angle of incidence can neither be greater nor leſs then that of *reflection*, it muſt be equal to it.

IV. *The plane of reflection*, that is, the plane wherein the incident and reflected rays are found, *is perpendicular to the ſurface of the ſpeculum*; *and in ſpherical ſpecula paſſes through the centre.* See PLANE.

Hence the cathetus both of incidence and *reflection* is in the plane of *reflection*. See CATHETUS.

That the *plane of reflection is perpendicular to the ſpeculum*, is aſſumed by Euclid, Alhazen, and others, as a principle, without any demonſtration; as being evident from all obſervation and experiment.

V. *The image of an object ſeen in a mirrour, is in the cathetus of incidence* — This the antients aſſumed as a principle: and, hence, ſince the image is certainly in the *reflected* ray, they inferred it muſt appear in the point of concourſe of the *reflected* ray with the cathetus of incidence; which indeed holds univerſally in plane and ſpherical mirrours, and uſually in concave ones; a few caſes only excepted, as is ſhewn by Kepler.

For the particular laws of REFLECTION, *ariſing from the circumſtances of the ſeveral kinds of ſpecula, or mirrours, plane, concave, convex,* &c. *ſee them laid down under the article* MIRROUR.

Point of REFLECTION. See the article POINT.

REFLECTION *of the moon*, is a term uſed by ſome authors, for what we otherwiſe call her *variation*; being the third inequality in her motion, whereby her true place out of the quadratures, differs from her place twice equated. See MOON.

REFLECTION is alſo uſed in the Copernican ſyſtem, for the diſtance of the pole from the horizon of the diſk; which is the ſame thing as the ſun's declination in the Ptolemaic ſyſtem. See DECLINATION.

REFLECTION is alſo uſed figuratively for an operation of the mind, whereby, turning as it were back upon itſelf, it makes itſelf and it's own operation it's object; and conſiders or contemplates the manner, order, and laws which it obſerves in perceiving, reaſoning, willing, judging, doubting, believing, *&c.* and frames itſelf new ideas of the relations diſcovered therein. See SOUL, FACULTY, PERCEPTION, IDEA, *&c.*

REFLEX, REFLECT, in painting, is underſtood of thoſe places in a picture which are ſuppoſed to be illuminated by a light *reflected* from ſome other body repreſented in the ſame piece. See LIGHT.

Or, *reflexes* may be defined thoſe places which beſide the general light that illumines the whole piece, receive ſome particular light, from their ſituation with reſpect to ſome more illumined poliſhed body that reflects part of the rays it receives upon them. See COLOUR.

Reflexes are ſcarce ſenſible except in the ſhadowed parts—The management of the *reflexes* requires a world of accuracy and ſkill —All reflected light is ſuppoſed to carry with it part of the colour of the body which reflects it; ſo that thoſe places which receive this light, muſt have their colour mixed or tinged with that colour, but the ſame place may receive *reflexes* from different objects, differently coloured, and thoſe again receive *reflexes*, from others — The painter therefore muſt have a view to every circumſtance of the colour, light and poſition of each figure; muſt conſider what effect each has on others, and purſue nature through all the variety of mixtures. See CLAIR-*obſcure*.

REFLEX *viſion*, or REFLECTED *viſion*, is that performed by means of rays reflected from the poliſhed ſurfaces of objects to the eye. See VISION and REFLECTION.

Reflex viſion is the ſubject of catoptrics. See CATOPTRICS —Under *reflex viſion* come all the phænomena of ſpecula or mirrours of all kinds. See MIRROUR.

REFLEXIBILITY *of the rays of light*, is that properperty whereby they are diſpoſed to be *reflected*. See REFLECTION.

Or, it is their diſpoſition to be turned back into the ſame medium, from any other medium on whoſe ſurface they fall —Hence thoſe rays are ſaid to be *more* or *leſs reflexible*, which are returned back more or leſs eaſily under the ſame incidence. See RAY.

Thus if light paſs out of glaſs into air, and by being inclined more and more to the common ſurface of the glaſs and air, begins at length to be totally reflected by that ſurface; thoſe ſorts of rays which at like incidences are reflected moſt copiouſly; or the rays which by being inclined begin ſooneſt to be totally reflected, are moſt *reflexible*.

That rays of light are of different colours endued with different degrees of *reflexibility*, was firſt diſcovered by Sir Iſaac Newton; and is ſhewn by the following experiment—Applying a priſm DFE (*Tab. Optics*, *fig.* 55.) whoſe angles are each 45°, to the aperture C of a darkned room, in ſuch manner as that the light is reflected from the baſe in G: the violet rays are ſeen firſt reflected in HG; the other rays continuing ſtill refracted in IK — After the violet, the blue are all refracted, then the green, *&c.* See PRISM.

Hence it appears, that the differently coloured rays, differ in degree of *reflexibility*. See COLOUR.

From other experiments it appears, that thoſe rays which are more *reflexible*, are alſo moſt *refrangible*. See REFRANGIBILITY.

REFLEXION. See the article REFLECTION.

REFLUX *of the ſea*, the ebbing of the water; or it's return from the ſhore. It is thus called, as being the oppoſite motion to the flood, or flux. See FLUX and TIDE.

REFORM, a re-eſtabliſhment, or revival of former neglected diſcipline; or a correction of the reigning abuſes therein. See REFORMATION.

The term is much uſed in a monaſtic ſenſe, for the reducing an order or congregation of religious to the antient ſeverity of the rule, from which it had gradually ſwerved; or even for the improving on the antient rule and inſtitution itſelf, and voluntarily making it more ſevere. See ORDER and RELIGIOUS.

In this ſenſe the order of St Barnard is ſaid to be only a *reform* of that of St Benedict. See BERNARDIN and BENEDICTIN.

To REFORM in a military ſenſe, is to reduce a company, regiment, or other body of men, either by diſbanding the whole, or only breaking a part, and retaining the reſt; or ſometimes by incorporating them in other regiments—Hence,

REFORMADO, or **REFORMED** *officer*, one whoſe troop, or company is ſuppreſſed in a *reform*, and he continued either in whole or half pay, doing duty in the regiment.

A *reformed* captain on foot follows the company, and aſſiſts the ſtanding officer as a ſecond; but ſtill maintains his degree and precedence. See CAPTAIN.

REFORMATION, REFORMATIO, the act of *reforming*, or correcting an error, or abuſe in religion, diſcipline, or the like. See REFORM.

The *reformation* of the Roman calendar by Pope Gregory, was effected in the year 1582, chiefly by the advice of Aloyſius Lilius, and Clavius. See CALENDAR.

The *reformation of religion*, called by way of eminence, *the reformation*, was begun by the elector of Saxony, at the ſollicitation of Luther, about the middle of the ſixteenth century. See LUTHERANISM.

King Henry VIII. of England, happening to have then a pique againſt pope Clement VII. by reaſon of his perſiſting in not allowing of his divorce from queen Catherine of Auſtria, fell in with the torrent, aboliſhed the pope's ſupremacy, ſeized the monaſteries, and other religious houſes, and divided their lands among the nobility and gentry.

In every thing elſe he perſevered a papiſt—So that the *Reformation* went on but lamely in his time—Under his ſon Edward VI. it went much farther; but was all undone again by his ſucceſſor queen Mary, who re-eſtabliſhed the antient ſuperſtitions.

But the executions of above 500 people, who were burnt for the proteſtant faith in the five years of her reign, ſo alienated the people from popery, that queen Elizabeth, her ſiſter, found it no hard matter to carry the *reformation* to its full length, and to ſettle it on the foot whereon it now ſtands among us.

Right of REFORMATION, *jus* REFORMATIONIS, is a right which the princes of Germany claim to *reform* the church in their reſpective territories; as being inveſted with the ſpiritual as well as the temporal power.

The *jus reformationis* is annexed to the ſovereignty; by this they have the power of conſcience, the diſpoſition of eccleſiaſtical revenues, &c. as they enjoyed the ſame at the treaty of Munſter in 1624.

REFORMED *calendar*	See the articles	CALENDAR.
REFORMED *church*		CHURCH.
REFORMED *officer*		REFORMADO.

REFRACTED *dials*, are ſuch as ſhew the hour by means of ſome *refracting* tranſparent fluid. See DIAL.

If a pin or ſtick be ſet up, or any point be aſſigned in a concave bowl or diſh, for the centre of the dial; and a horizontal dial be applied over the ſame; aſſigning the meridian line on the edges of the bowl; and marking out the reſt of the hour lines alſo on the edges of the bowl: then taking away the horizontal dial, and elevating a ſtring or thread from the end of the ſaid pin over the meridian line, as much as is the latitude or elevation of the pole of the place.—Then, by bringing the thread to caſt a ſhadow or any hour-point formerly marked out on the edges of the bowl, by a candle or the like; that ſhade in the bowl is the true hour-line: and if the bowl be full of water, &c. when this is done; it will never ſhew the true hour by the ſhadow of the top of the pin, but when filled again with the ſame liquor.

REFRACTED *ray*, or *ray of* REFRACTION. See RAY and REFRACTION.

REFRACTED *viſion*. See the article VISION.

REFRACTION, REFRACTIO, in mechanics, the deviation of a moving body from its direct courſe, by reaſon of the different denſity of the medium it moves in; or a flexion and change of determination, occaſioned by a body's falling obliquely out of one medium into another of a different denſity. See MEDIUM.

Thus a ball A, (*Tab. Mechanics*, *fig.* 52.) moving in the air in the line A B, and falling obliquely on the ſurface of the water C D, does not proceed ſtraight to E, but deviates or is inflected to F—Again, if the ball moving in water in the ſame line A B ſhould fall obliquely on a ſurface of air C D; it will not proceed ſtraight to E, nor yet deflect to F, but to G. Now the deflection in each caſe is called the *refraction*; and the two caſes are diſtinguiſhed by means of the perpendicular MI; that B G being called *refraction towards the perpendicular*, or to the *axis of refraction*; and the other B F, *refraction from the perpendicular*, or *from the axis of refraction*.

Theſe *refractions* are ſuppoſed to ariſe hence, that the ball arriving at B, in the firſt caſe, finds more reſiſtance or oppoſition on the ſide O, *i. e.* from the ſide of the water, than from the ſide P, or that of the air; and in the latter more reſiſtance from the ſide P, which is now the ſide of the water, than the ſide O, which is that of the air.

The *great law of refraction*, then, which holds in all bodies, and all mediums, is, that a body paſſing obliquely out of a medium which reſiſts it more into another, which reſiſts it leſs, is refracted towards the perpendicular; and in paſſing out of a medium which oppoſes it leſs into another which oppoſes it more, is refracted from the perpendicular.

Hence the rays of light falling out of air into water are refracted towards the perpendicular; whereas a ball thrown into the water is refracted from it; by reaſon water, which reſiſts the motion of light leſs than air, reſiſts that of the ball more: or, to ſpeak more juſtly, by reaſon water, by it's greater attraction, accelerates the motion of the rays of light more than air does; for that this is the true cauſe of *refraction*, at leaſt in light, ſhall be ſhewn under REFRACTION of light.

To have a body *refracted*, it is neceſſary it fall obliquely on the ſecond medium—In perpendicular incidences there is no *refraction*.

Voſſius, indeed, and Snellius imagined they had obſerved a perpendicular ray of light undergo a *refraction*; a perpendicular object appearing in the water nearer than in reality it was: but this was to attribute that to a *refraction* of the perpendicular rays, which was owing to the divergency of the oblique rays after *refraction*, from a nearer point.

Yet is there a manifeſt *refraction* even of perpendicular rays found in *iſland cryſtal*. See *Iſland* CRYSTAL.

Rohault adds, that though an oblique incidence be neceſſary in all other mediums we know of; yet the obliquity muſt not exceed a certain degree—If it do, the body will not penetrate the medium, but be *reflected* inſtead of *refracted*—Thus cannon balls in ſea engagements, falling very obliquely on the ſurface of the water, are obſerved to mount a-loft again, and frequently to ſweep the men from off the oppoſite decks: and the like happens to the little ſtones wherewith children make their ducks and drakes.

The antients confounded *refraction* with *reflection*; and it was Sir Iſaac Newton, who firſt taught us the juſt difference between them—He ſhews withall, that there is a good deal of analogy between them; and particularly in the caſe of light. See REFLECTION and REFRACTION *of light*.

The laws of *refraction* of the rays of light in mediums differently terminated, *i. e.* whoſe ſurfaces are plain, concave, convex, &c. make the ſubject of dioptrics. See DIOPTRICS.

By *refraction* it is, that convex glaſſes, or lenſes collect the rays, magnify objects, burn, &c. See LENS, CONVEX, and CONCAVE.

Hence the foundation of microſcopes, teleſcopes, &c. See MICROSCOPE and TELESCOPE, &c.

By *refraction* it is, that all remote objects are ſeen out of their their real places; particularly, that the heavenly bodies are apparently higher than they are in reality, &c. See APPARENT and PLACE. See alſo REFRACTION *aſtronomical*.

REFRACTION *of light*, in optics, is an inflexion or deviation of the rays from their rectilinear courſe upon falling obliquely out of one medium into another, of a different denſity. See RAY.

The *refraction* of light Sir Iſaac Newton ſhews is not performed by the rays falling on the very ſurface of bodies; but without any contact, by the action of ſome power in bodies equally diffuſed throughout their ſurfaces; by which ſame power acting in other circumſtances, they are alſo emitted and reflected. See LIGHT.

The ſame arguments whereby we have proved that *reflection* is performed without immediate contact, go a great way towards demonſtrating the ſame of *refraction*: to which may be added the following ones.

1°. Becauſe if when light falls out of glaſs into air, with the utmoſt obliquity it will be tranſmitted at, it be then made to fall a little more obliquely, it becomes wholly reflected—For, the power of the glaſs after it has refracted light emerging as obliquely as poſſible, ſuppoſing the rays to fall ſtill more obliquely, will be too ſtrong to let any of the rays paſs; conſequently, inſtead of being *refracted* they will be all reflected.

2°. Becauſe in thin lamellæ, or plates of glaſs, light is reflected and *refracted* ſeveral times alternately, as the thickneſs of the lamellæ increaſes in arithmetical progreſſion—For here it depends on the thickneſs of the lamina which of the two it ſhall do; whether reflect it, or let it be tranſmitted.

3°. Becauſe whereas the power of other bodies both to reflect and refract light are very nearly proportional to their denſities; yet unctuous and ſulphurous bodies are found to reflect more ſtrongly than according to their denſities—For as the rays act more ſtrongly on thoſe bodies to kindle them, than on others; ſo do they, again, by their mutual attraction, act more ſtrongly on the rays to *refract* them.

Laſtly, Becauſe not only thoſe rays tranſmitted through glaſs are found to be *refracted*, but alſo thoſe paſſing in the air, or in a vacuum near it's extremities, or even near the extremes of many opake bodies, *e. gr.* the edge of a knife, undergo a ſimilar inflection, from the attraction of the body. See INFLECTION.

The manner wherein *refraction* is performed by meer attraction,

traction, without contact, may be thus accounted for—Suppoſe H I (*Tab. Optics*, *fig.* 56.) the boundary of two mediums, N and O; the firſt the rarer, *e. gr.* air; the ſecond the denſer, *e. gr.* glaſs; the attraction of the medium here will be as their denſities—Suppoſe P S to be the diſtance to which the attracting force of the denſer medium exerts itſelf within the rarer.

Let now a ray of light A *a* fall obliquely on the ſurface which ſeparates the mediums; or rather, on the ſurface P S, where the action of the ſecond and more reſiſting medium commences. All attraction being performed in lines perpendicular to the attractive body, as the ray arrives at *a*, it will begin to be turned out of its rectilinear courſe, by a ſuperior force wherewith it is attracted by the medium O, more than by the medium N, *i. e.* by a force wherewith it is driven towards it in a direction perpendicular to it's ſurface—Hence the ray is bent out of it's right line, in every point of it's paſſage between P S and R T, within which the attraction acts. Between thoſe lines, therefore it deſcribes a curve *a* B *b*. But beyond R T, being out of the ſphere of attraction of the medium N, it will proceed uniformly in a right line, according to the direction of the curve in the point *b*.

Again, ſuppoſe N the denſer and more reſiſting medium, O the rarer; and H I the boundary, as before; and let R T be the diſtance to which the denſer medium exerts it's attractive force within the rarer: even when the ray has paſſed the point B, it will be within the ſphere of ſuperior attraction of the denſer medium; but that attraction acting in lines perpendicular to it's ſurface, the ray will be continually drawn from it's ſtraight courſe B M perpendicularly towards H I; thus having two forces or directions, it will have a compound motion, whereby inſtead of B M it will deſcribe B*m*; which B*m*, will in ſtrictneſs be a curve.

Laſtly, After it has arrived in *m*, being out of the influence of the medium N, it will perſiſt uniformly in a right line, in the direction wherein the extreme of the curve leaves it.

Thus we ſee how *refraction* is performed, both *towards the perpendicular*, and *from it*.

But note, the attraction of the denſer medium, *e. gr.* N. is continually diminiſhing as the ray proceeds from B, towards the limit of attraction R T; in regard fewer and fewer parts ſtill come to act: at I H, *e. gr.* all the parts between that and P S attract, but at R T, none but thoſe in the line H I—Note alſo, that the diſtance between P S and R T being ſmall, when we conſider *refractions*, no notice is taken of the curve part of the ray; but we conſider it as conſiſting of two ſtraight lines, C B, A B, or *m*B, A B.

Refraction, in dioptrics, is the inflection or bending of the rays of light, in paſſing the ſurfaces of glaſſes, lenſes, and other tranſparent bodies of different denſities.

Thus a ray, as A B, (*Tab. Optics*, *fig.* 56.) falling obliquely from the radiant A, upon a point B, in a diaphanous ſurface, H I rarer or denſer than the medium along which it was propagated from the radiant; it has its direction there altered by the action of the new medium, and inſtead of proceeding to M deviates, *e. gr.* to C.

This deviation is called the *refraction of the ray:* B C the *refracted ray*, or *line of refraction*; and B the *point of refraction*. See Ray, Line, and Point.

The line A B is called the *line of incidence*, or *ray of incidence*; and in reſpect hereof B is alſo called the *point of incidence*. See Incidence.

The plane wherein both the incident and *refracted* rays are found, is called the *plane of refraction*; a right line B E drawn in the *refracting* medium perpendicular to the *refracting* ſurface in the point of *refraction* B, is called the *axis of refraction*—And a right line D B drawn perpendicular to the *refracting* ſurface, in the point of incidence B, along the medium through which the ray fell, is called the *axis of incidence*. See Plane, Axis, *&c.*

The Angle A B I included between the incident ray, and the *refracting* ſurface, is called the *angle of incidence*; and the angle A B D included between the incident ray, and the axis of incidence, is called *the angle of inclination*—The angle M B C which the *refracted* ray makes with the incident, is called the *angle of refraction*; and the angle C B E which the *refracted* ray makes with the axis of *refraction*, is called the *refracted angle*. See Angle.

General laws of Refraction—1°. *A ray of light in it's paſſage out of a rarer, into a denſer medium*, e. gr. *out of air into glaſs, is refracted towards the perpendicular*, i. e. *towards the axis of refraction.*

Hence, the *refracted* angle is leſs than the angle of inclination: and the angle of *refraction* leſs than that of incidence; as they would be equal, were the ray to proceed ſtraight from A to M. Hence, alſo a ray perpendicular to the *refracting* ſurface, will paſs through without being *refracted*; as it cannot be *refracted* to the perpendicular. The phyſical cauſe thereof is, that the attraction of the denſer medium, which in incidences oblique to it's ſurface acting perpendicular to that ſurface, draws the ray out of it's courſe: this attraction, we ſay, in a perpendicular incidence, acts in the direction of the ray.

2°. *The ratio of the ſine of the angle of inclination, to the ſine of the refracted angle, is fixed and conſtant*; viz, if the *refraction* be out of air into glaſs, it is found greater than as 114 to 76; but leſs than 115 to 76; that is, nearly as 3 to 2.

This ratio, aſſigned by Huygens, agrees with another of Sir Iſaac Newton, who makes the ſine of the angle of inclination to the ſine of the *refracted* angle, as 31 to 20; which is, likewiſe, nearly as 3 to 2—Indeed there is ſome difference in the quantity of *refraction*, in different kinds of glaſs; but in phyſical matters preciſeneſs is not neceſſary—In rain water, Des Cartes found, the ratio of the ſine of the angle of inclination, to the ſine of the *refracted* angle, as 250 to 187, that is, nearly as 4 to 3; which agrees with Sir Iſaac Newton's obſervation, who makes it as 529 to 396—In ſpirit of wine the ſame great author makes the ratio as 100 to 73; which is not far from the ſeſquitertian ratio—In air he makes it as 3851 to 3850.

Whence the different *refractive* power in different fluids ariſes, is not determined—Clear water, of all others, *refracts* the leaſt; and if impregnated with ſalts, it's *refraction* is increaſed in proportion to the quantity of ſalt. Sir Iſaac Newton ſhews, that in many bodies, *e. gr.* glaſs, chryſtal, a ſelenites, pſeudo-topaz, *&c.* the *refractive* power is proportionable to their denſities; only in ſulphurous bodies, as camphire, oil, olive, amber, ſpirit of turpentine, *&c.* the power is two or three times greater than in other bodies of equal denſity; yet they have the *refractive* power with reſpect to each other, nearly as their denſities—As to air, he ſhews that a ray of light in traverſing quite through the atmoſphere, is *refracted* the ſame it would be were it to paſs with the ſame obliquity out of a vacuum into air of equal denſity with that in the loweſt part of the atmoſphere. See Air.

From the law juſt laid down, it follows that one angle of inclination, and it's correſponding *refracted* angle being found by obſervation; the *refracted* angles correſponding to the ſeveral other angles of inclination, are eaſily computed—Now, Zahnius and Kircher have found, that if the angle of inclination be 70°, the *refracted* angle will be 38°, 50′; on which principle Zahnius has conſtructed a table of *refractions* out of air into glaſs, for the ſeveral degrees of the angle of inclination; a ſpecimen whereof follows:

Ang. of Inclin.	Refracted Angle.	Angle of Refraction.	Ang. of Inclin.	Refracted Angle.	Angle of Refraction.
1°	0° 40′ 5″	0° 19 55″	10°	6° 39′ 16″	3° 20′ 44″
2	1 20 6	0 39 54	20	13 11 35	6 48 25
3	2 0 3	0 59 56	30	19 29 29	10 30 31
4	2 40 5	1 19 55	45	28 9 19	16 50 41
5	3 20 3	1 39 57	90	41 51 40	48 8 20

Hence it appears that if the angle of inclination be leſs than 20°, the angle of *refraction* out of air into glaſs, is almoſt $\frac{1}{3}$ of the angle of inclination; and therefore a ray is *refracted* to the axis of *refraction*, by almoſt a third part of the quantity of it's angle of inclination—And on this principle it is that Kepler and moſt other dioptrical writers, demonſtrate the *refractions* in glaſſes.

The conſtant *ratio* of the ſines of the angles of inclination, and the *refracted* angles was firſt diſcovered by Willeb. Snellius—It is vulgarly attributed to Des Cartes; who having ſeen it in Snellius's MS, firſt publiſhed it in his dioptrics, without naming Snellius; as we are informed by Huygens.

Indeed, as the rays of light are not all of the ſame degree of *refrangibility*; this conſtant ratio muſt be different in different kinds—The ratio therefore obſerved by authors is to be underſtood of rays of the mean *refrangibility*, *i. e.* of green rays. The difference of *refraction* between the leaſt and moſt *refrangible* rays, that is between violet and red rays, Sir Iſaac Newton ſhews is about $\frac{1}{23}$ part of the whole *refraction* of the mean *refrangible*; which difference he owns is ſo ſmall that there ſeldom needs to be any regard had to it. See Refrangibility.

3°. *When a ray paſſes out of a denſer into a rarer medium*, e. gr. *out of glaſs into air, it is refracted from the perpendicular, or from the axis of refraction.*—And hence the angle of *refraction* is greater than the angle of inclination.

Hence, alſo, if the angle of inclination be leſs than 30°; M B C is nearly equal to $\frac{1}{3}$ of M B E—Therefore M B C is one half of C B E: conſequently if the *refraction* be out of glaſs into air; and the angle of inclination leſs than 30°; the ray is *refracted* from the axis of *refraction* by almoſt one half part of the angle of inclination—And this is the other dioptrical principle uſed by moſt authors after Kepler, to demonſtrate the *refractions* of glaſſes.

If the *refraction* be out of air into glaſs, the ratio of the ſine of inclination to the ſine of the *refracted* angle is as 2 to 3; if out of air into water, as 4 to 3: therefore, if the *refraction* be the contrary way, *viz.* out of glaſs or water into air; the ratio of the ſines in the former caſe, will be as 2 to 3, in the latter as 4 to 3.

4°. *A ray falling on a curve ſurface, whether concave or convex, is refracted after the ſame manner as if it fell on a plane which is a tangent to the curve in the point of incidence.*

For the curve and plane ſurface touching it, have an infinitely ſmall part common to them both (each being originally generated by the flux of a point.) But a ray is *refracted* in ſuch a little part; therefore it is the ſame as if it were *refracted* in ſuch a plane.

5°. *If a right line* E F (*fig.* 57.) *cut a refracting ſurface* G H *at right angles; and if from any point in the denſer medium as* D *be drawn* D C *parallel to the incident ray* A B: *this will meet the refracted ray in* C; *and will be to it as the ſine of the refracted angle to the ſine of the angle of inclination.*

Hence, if B C paſs out of glaſs into air, it is in a ſubſeſquialterate ratio to C D; if out of air into glaſs, in a ſeſquialterate ratio to C D.

Hence, alſo, if light paſs out of water into air; C B is in a ſubſeſquitertian ratio to C D; if out of air into water in a ſeſquitertian. See *fig.* 57. and 58.

Laws of REFRACTION *in plane ſurfaces* — 1°. If parallel rays be *refracted* out of one tranſparent medium into another of different denſity, they will continue parallel after *refraction.*

The phyſical reaſon is, that being parallel, their obliquity, or angle of incidence is the ſame: but at equal obliquities we have ſhewn the *refraction* is equal; conſequently the parallelism which they had before the *refraction*, will be retained after it.

But this may be alſo demonſtrated geometrically, thus: if the rays be perpendicular to the *refracting* ſurface, they will paſs without any *refraction*; conſequently being parallel before their paſſage, they will be ſo after it. If they fall obliquely, as A B and D C, the angles of incidence *o* and *u*, and conſequently alſo the angles of inclination *x* and *y*, will be equal. But the ſines of the angles of inclination *x* and *y*, have the ſame ratio to the ſines of the *refracted* angles *m* and *n*; therefore the *refracted* angles *m* and *n* are alſo equal; conſequently the *refracted* rays are parallel.

Hence a glaſs, plain on both ſides, being turned directly to the ſun; the light paſſing through it will be propagated after the ſame manner as if the glaſs were away: for the rays being perpendicular will paſs without *refraction* — If the glaſs be turned obliquely to the ſun, the light after *refraction* will be of the ſame intenſity as before; the intenſity depending on the ſpiſſitude or cloſeneſs of the rays, and on the angle wherein they ſtrike the object, or the eye, both which are here unvaried. See RAY.

2. If two rays C D and C P (*fig.* 59.) proceeding from the ſame radiant C, and falling on a plane ſurface of a different denſity, ſo as the points of *refraction* D and P are equally diſtant from the cathetus of incidence G K; the *refracted* rays D F and P Q have the ſame virtual focus, or point of diſperſion G. See VIRTUAL.

Hence, 1°. Since in rays very near each other, the diſtance from the cathetus is the ſame as to ſenſe; very near rays will diverge from the ſame point G, *i. e.* have the ſame virtual focus G — And hence, 2°. When *refracted* rays falling on the eye placed out of the cathetus of incidence, are either equally diſtant from the cathetus, or very near each other; they will flow upon the eye, as if they came to it from the point G; conſequently the point C will be ſeen by the *refracted* rays as in G.

3. If a ray C D fall obliquely out of a thinner into a denſer medium, having a plane ſurface; the diſtance of the radiant point C K will have a leſs ratio to the point of diſperſion, or virtual focus K G, than the ſine of the *refracted* angle to the ſine of the angle of inclination — But if the diſtance of the point of *refraction* from the cathetus of incidence K D be leſs than the eleventh or nineteenth part of the diſtance of the radiant point C K; and if in the former caſe the tenth, in the latter the hundreth part thereof be ſo ſmall that it cannot be aſſigned or need not be minded then will C K be to K G, as to ſenſe, in the ratio of the ſine of the refracted angle, to the ſine of the angle of inclination.

Hence, 1°. If the *refraction* be out of air into glaſs, the diſtance of the point of diſperſion of rays near the cathetus, is ſeſquialterate, of the radiant point; of more remote rays, greater than ſeſquialterate.

Hence, 2°. If the eye be placed in a denſe medium, objects in a rarer will appear more remote than they are; and the place of the image in any given caſe, may be determined from the ratio of the *refraction* — *Thus to fiſhes ſwimming under water, objects out of the water muſt appear farther diſtant than in reality they are.*

4. If a ray D G fall obliquely out of a denſer, into a rarer medium A B, the diſtance of a radiant point G K, has a greater ratio to the diſtance of the point of diſperſion K C, than the ſine of the *refracted* angle has to the ſine of the angle of inclination — In the other caſe of the preceding theorem, K G will be to K C, as to ſenſe, in the ratio of the ſine of *refracted* angle, to the ſine of the angle of inclination.

Hence, 1°. If the *refraction* be out glaſs into air, the diſtance of the point of diſperſion of rays near the cathetus of incidence, is ſubſeſquialterate of the diſtance of the radiant point. That of the more remote rays is leſs than ſubſeſquialterate.

But, 2°. If the *refraction* be out of water into air, the diſtance of the point of diſperſion of rays near the cathetus, is ſubſeſquitertian; of thoſe more remote, leſs then ſubſeſquitertian.

And, 3°. The eye therefore being in a rarer medium, objects placed in a denſer appear nearer than they are; and the place of the image may be determined in any given caſe by the ratio of *refraction* — Hence the bottom of a veſſel full of water; is raiſed by *refraction*, to a third part of it's height, with reſpect to an eye perpendicularly over the *refracting* ſurface; and hence *fiſhes and other bodies under water, appear nearer than they really are.*

5. If the eye be placed in a rarer medium, an object ſeen in a denſer medium, by a ray *refracted* in a plain ſurface, will appear larger than it really is — If the object be in a rarer, and the eye in a denſer medium, the object will appear leſs than it is — And in each caſe the apparent magnitude is to the real one in a ratio compounded of the diſtance of the point to which the rays tend before *refraction*, from the *refracting* ſurface F L (*fig.* 60.) to the diſtance of the eye G L, from the ſame, and of the diſtance of the object from the eye G M, to it's diſtance from a point to which the rays F M tend before *refraction.*

Hence, 1°. If the object A B be very remote; F M will be phyſically equal to G M; and therefore the real magnitude M B to it's apparent one M H, as G L to F L, or the diſtance of the eye G from the *refracting* plane to the diſtance of the point of convergence F from the ſame plane.

Hence, 2°. *Objects under water, to an eye in the air, appear larger than they are; and to fiſhes under water, objects in the air appear leſs than they are.*

Laws of REFRACTION *in ſpherical ſurfaces, both concave and convex* — 1. A ray of light D E (*fig.* 61.) parallel to the axis of a denſer ſphere, after a ſingle *refraction* in E, falls in with the axis in the point F, beyond the centre C.

For the ſemidiameter C E drawn to the point of *refraction* E, is perpendicular to the ſurface K L, and is therefore the axis of *refraction*; but a ray out of a rarer into a denſer medium, we have ſhewn, is *refracted* towards the perpendicular, or the axis of *refraction*; therefore the ray D E will converge to the axis of the ſphere A F; and will, therefore at length concur with it; and that beyond the center C, in F, becauſe the angle of *refraction* F E H is leſs than the angle of inclination C E H.

2. If a ray D E fall on a ſpherically convex ſurface of a denſer medium, parallel to it's axis A F; the ſemidiameter C E will be to the *refracted* ray E F in the ratio of the ſine of the *refracted* angle, to the ſine of the angle of inclination: but the diſtance of the focus or point of concurrence from the centre C F, is to the *refracted* ray F E in the ratio of the ſine of the *refracted* angle to the ſine of the angle of inclination.

3. If a ray D E fall on a denſer ſpherical convex ſurface K L, parallel to the axis A F; the diſtance of the focus from the *refracting* ſurface F B, is to it's diſtance from the centre F C; in a ratio greater than that of the ſine of the angle of inclination to the ſine of the *refracted* angle — But if the rays be very near the axis, and the angle of inclination B C E only of a few degrees; the diſtances of the focus from the ſurface, and the centre F B and F C, will be, nearly, in the ratio of the ſine of the angle of inclination, to the ſine of the *refracted* angle.

Hence, 1°. If the *refraction* be out of air into glaſs; in the caſe of rays near the axis, $BF : FC :: 3 : 2$. And in the caſe of the rays remote from the axis, $BF : FC \urcorner 3 : 2$. Conſequently in the former caſe, $BC : BF :: 1 : 3$; and in the latter $BC : CF \angle 1 : 3$.

And 2°. If the *refraction* be out of air into water; in the former caſe, $BF : FC :: 4 : 3$; and in the latter, $BF : FC \urcorner 4 : 3$. Conſequently in the former $BC : BF :: 1 : 4$, and in the latter $BC : BF \angle 1 : 4$.

Hence, 3°. Since the ſun's rays are parallel as to ſenſe; if they fall on the ſurface of a ſolid glaſs ſphere, or of a ſphere full of water, they will not concur with the axis within the ſphere. So that Vitellio was miſtaken when he imagined that the ſun's rays falling on the ſurface of a chryſtallin ſphere, *refracted* to the centre. See FOCUS.

4. If a ray D E (*fig.* 62.) parallel to the axis F A, fall out of a denſer into a rarer ſpherical medium; after *refraction* it will diverge from the axis; and the diſtance of the point of diſperſion, or the virtual focus from the centre of the ſphere, F C, will be to it's ſemidiameter C E in the ratio of the ſine of the *refracted* angle to the angle of *refraction*; but to the portion of the *refracted* ray drawn back, F E, in the ratio of the ſine of the *refracted* angle to the ſine of the angle of inclination.

5. If a ray E D fall parallel to the axis A F on the ſpherically convex ſurface K L, of a rarer medium, out of a denſer; the diſtance of the point of diſperſion from the centre, F C, is to it's diſtance from the ſurface F B, in a ratio greater than that of the ſine of the *refracted* angle to the ſine of the

angle of inclination — But if the rays D E be very near the axis F A, the ratio will be very nearly the ſame with that of the *refracted* angle to the ſine of the angle of inclination.

Hence, 1°. If the *refraction* be out of glaſs into air; in the caſe of rays near the axis, FC : FB : : 3 : 2. Conſequently BC : FB : : 1 : 2. Therefore in the caſe of rays more remote from the axis, BC : FB ∠ 1 : 2.

2°. if the *refraction* be out of water into air; in the former caſe FC : FB : : 4 : 3. Conſequently BC : FB : : 1 : 3; in the latter caſe, therefore, BC : FB 1 ∠ 1 : 3.

3°. Since then the point of diſperſion F is more remote from the *refracting* ſurface KL, if the rays proceed out of water, than out of glaſs into air; parallel rays are leſs diſperſed in the former caſe than in the latter.

6. If a ray HE (*fig.* 61.) fall parallel to the axis FA, out of a rarer, on the ſurface of a ſpherically concave denſer medium; the *refracted* ray EN will be driven from the point of the axis F; ſo as FE will be to FC, in the ratio of the ſine of the angle of inclination, to the ſine of the *refracted* angle.

7. If a ray EH fall parallel to the axis FB on the concave ſurface KL of a ſpherical denſer medium, from a rarer; the diſtance of the point of diſperſion from the *refracting* ſurface FB; is to it's diſtance from the centre, FC, in a ratio greater than that of the ſine of the angle of inclination, to the ſine of the *refracted* angle. But if the rays be very near the axis, and the angle BCE very ſmall; BF will be to CF very nearly in the ratio of the ſine of the angle of inclination, to the ſine of the *refracted* angle.

Hence, 1°. If the *refraction* be out of air into glaſs; in the caſe of rays near the axis, FB : FC : : 3 : 2; in the caſe of rays more remote from the axis FB : FC ⅂ 3 : 2 conſequently in the former, BC : FC : : 1 : 2 : And hence, in the latter. BC : FC ∠ 1 : 2.

Hence alſo 2°. If the *refraction* be out of air into water; in caſe of the rays near the axis; FB : FC : : 4 : 3. In the caſe of rays more remote from the axis FB : FC ⅂ 4 : 3. Conſequently in the firſt caſe, BC : FC : : 1 : 3. And hence, in the latter, BC : FC ⅂ 1 : 3.

And hence, 3°. Since the point of diſperſion F, is farther from the centre C, if the *refraction* be in water than in air; the rays will be leſs diſperſed in the latter caſe than in the former.

8. If the ray HE (*fig.* 62.) fall parallel to the axis AF, from a denſer, upon the ſurface of a ſpherically concave rarer medium; the *refracted* ray will concur with the axis AF, in the point F; ſo as the diſtance of the point of concourſe from the centre CF, may be to the *refracted* ray FE in the ratio of the ſine of the *refracted* angle, to the ſine of the angle of inclination.

REFRACTION *in a glaſs priſm* — If a ray of light DE (*fig.* 62. n°. 2.) fall obliquely out of air on a priſm ABC; being *refracted* towards the perpendicular, inſtead of proceeding to F it will decline to G, *i. e.* towards a line HI, drawn perpendicular to the ſurface AB in the point of *refraction* E — Again, ſince the ray EG paſſing out of the glaſs into air falls obliquely on CB; it will be *refracted* to M: ſo as to recede from the perpendicular NGO. *And hence the various phænomena of the priſm.* See PRISM.

REFRACTION *in a convex lens*—If parallel rays AB, CD, and EF (*fig.* 63.) fall on the ſurface of a lens 2 B 3 K; the perpendicular ray AB will paſs unrefracted to K, where emerging into air perpendicular, as before, it will proceed ſtraight to G. But the rays CD and EF falling obliquely out of air into glaſs, in D and F, will be *refracted* towards the axis of *refraction* (*i. e.* towards lines HI and LM drawn perpendicular to the *refracting* ſurface in the points of *refraction* F and D) and decline to P and Q — Again, emerging obliquely out of the glaſs into the ſurface of the air, they will be refracted from the perpendicular; and therefore DQ will not proceed to X but to G; and FP, not to V but to G: thus likewiſe might all the other rays falling on the ſurface of the glaſs, be ſhewn to be *refracted* ſo as to meet the reſt about the point G. See FOCUS.

Hence the great property of convex glaſſes; *viz. that they collect parallel rays, or make them converge into a point.* See CONVEXITY.

REFRACTION *in a concave lens* — Parallel rays AB, CD, and EF (*fig.* 64.) falling on a concave lens GBHIMK; the ray AB falling perpendicular on the glaſs at B, will paſs *unrefracted* to M; where being ſtill perpendicular, it will paſs into the air, without *refraction*, to L. But the ray CD falling obliquely on the ſurface of the glaſs, will be *refracted* towards the perpendicular NDO, and proceed to Q; and the ray DQ, again, falling obliquely out of the glaſs upon the ſurface of air, will be *refracted* from the perpendicular RQS, and proceed to V. After the ſame manner might the ray EF be ſhewn to be *refracted* to Y, and thence to Z.

Hence the great property of concave glaſſes, *viz. That they diſperſe parallel rays, or make them diverge.* See CONCAVITY.

REFRACTION *in a plane glaſs* — If parallel rays EF, GH, IL (*fig.* 65.) fall obliquely on a plain glaſs ABCD; the obliquity being the ſame in all, by reaſon of their paralleliſm, they will be all equally *refracted* towards the perpendicular; and accordingly being ſtill parallel at M, O, and Q, will paſs out into the air equally *refracted*, again, from the perpendicular, and ſtill parallel. See PARALLEL, and LOOKING-*glaſs*.

Thus will the rays EF, GH, and IL, at their entering the glaſs, be inflected towards the right; and in their going out as much inflected to the left; ſo that the firſt *refraction* is here undone by the ſecond; though not ſo as that the object is ſeen in it's true place — For the ray BQ being produced back again, will not coincide with the ray LI; but will fall to the right thereof; and this the more as the glaſs is thicker: however as to matter of colour, the ſecond *refraction* does really undo the firſt. See COLOUR.

REFRACTION *in iſland cryſtal* — The laws of *refraction* in iſland cryſtal differ very much from thoſe laid down in other ſubſtances; for here is a double *refraction*, contrary ways, whereby not only oblique rays are ſplit or divided into two, and *refracted* to oppoſite parts, but even perpendicular rays are alſo ſplit, and one half of them refracted—For the theory hereof. See *iſland* CRYSTAL.

The particular laws of REFRACTION *in the ſeveral kinds of lenſes*, ſee under LENS.

REFRACTION in aſtronomy, or REFRACTION *of the ſtars*, is an inflection of the rays of thoſe luminaries, in paſſing through our atmoſphere; whereby the apparent altitudes of the heavenly bodies are increaſed. See STAR and ALTITUDE, *&c.*

This *refraction* ariſes hence, that the atmoſphere is unequally denſe in different ſtages or regions; rareſt of all a-top, and denſeſt at bottom; which inequality in the ſame medium, makes it equivalent to ſeveral unequal mediums. See AIR and ATMOSPHERE.

Sir Iſaac Newton has ſhewn that a ray of light in paſſing from the higheſt and rareſt part of the atmoſphere, down to the loweſt and denſeſt, undergoes the ſame *refraction* it would do in paſſing immediately, at the ſame obliquity, out of a vacuum into air of equal denſity with that in the loweſt part of the atmoſphere.

The effect of this *refraction* may be thus conceived. Suppoſe ZV (*Tab. Aſtronomy*, *fig.* 57. n°. 2.) a quadrant of a vertical circle, deſcribed from the centre of the earth T, under which is AB a quadrant of a circle on the ſurface of the earth, and GH a quadrant of the ſurface of the atmoſphere: and ſuppoſe SE a ray of light emitted by a ſtar at S, and falling on the atmoſphere at E — This ray coming out of the ætherial medium, which is much rarer than our air, or perhaps out of a perfect vacuum, and falling on the ſurface of the atmoſphere, will be refracted towards the perpendicular: and ſince the upper air, again, is rarer than that near the earth, and grows ſtill denſer as it approaches us: the ray, in it's progreſs will be continually *refracted*, ſo as to arrive at the eye in the curve line EA.

Suppoſing, then the right line AF to be a tangent to the arch in A, the ray will enter the eye A, according to the direction of AF — and ſince objects are always ſeen in that line, according to the direction whereof the rays enter the eye, the ſtar will appear in AF; that is, in the heavens at Q, which is nearer the zenith than the ſtar really is.

Hence ariſe the phænomena of the crepuſculum, or twylight, See CREPUSCULUM.

And hence alſo it is that the moon is ſometimes ſeen eclipſed, when ſhe is below the horizon, and the ſun above it. See ECLIPSE.

That there is a real *refraction* of the ſtars, *&c.* is deduced not only from phyſical conſiderations, and from arguments a priori, and a ſimilitudine; but alſo from preciſe aſtronomical obſervations; thus,

The diſtance of the two ſtars, Spica Virginis, and the Lion's Tail, when near the meridian, or even near the weſt, is conſtantly found 35°, 2′. But when the Lion's Tail is riſen in the eaſt 34°, 0′, high, Spica Virginis is obſerved to be in almoſt the ſame verticle circle — Add to this, an obſervation of the Dutch, who wintered at Nova Zembla in 1597, from whom the ſun totally diſappeared on the 14th of November; and again began to appear on the 24th of January, which was ſix days ſooner then he ſhould have returned, according to aſtronomical calculations; as is obſerved in the Acta Eruditorum, A. 1697—Nor muſt it be omitted that Charles XI, king of Sweden, being in 1694, at Tornou, in Weſt-Bothnia, in the latitude of 65°, 33′, obſerved, that the ſun never ſet between the 14th and 15th day of June, but was viſible in the middle of the night: the following year he appointed two mathematicians, Bilembergius, and Spolius, to obſerve the ſame more accurately; who accordingly found that at Tornou in the middle of the night, between the 10th and 11th of June the ſun was $\frac{3}{4}$ of his diameter above the horizon: and on the 14th of June at Kangis, in the latitude of 66°, 15′, they found the ſun at midnight, two diameters above the horizon.

Hence it is argued, that as light is propagated in right lines, no rays could reach the eye from a luminary below the horizon, unleſs they were deflected out of their courſe at their enterance into the atmoſphere; it is evident, therefore, the rays are *refracted* in paſſing through the atmoſphere. Hence the ſtars appear higher by *refraction* than they really are; ſo that to bring the obſerved or apparent altitudes to the true ones, the quantity of *refraction* muſt be ſubſtracted. See ALTITUDE.

And hence, as the antients were unacquainted with the *refraction*; reckoning upon too great altitudes, it is no wonder they ſometimes committed conſiderable errors.

From the doctrine of *refractions* it appears that we never ſee the real ſun riſing or ſetting, but only a phantom, or image thereof; the ſun himſelf being at that time hid below the horizon.

And from the obſervations juſt mentioned, it follows, that the *refractions* are greater near the pole, than at leſſer latitudes; doubtleſs from the greater denſity of the atmoſphere, and the greater obliquity of the incidence.

M. de la Hire aſſures us, he could never find any difference in the meridian altitudes of the ſtars; ſo that the *refractions* remain always the ſame—Though he owns near the horizon the different conſtitution of the air, &c. may occaſion ſome variations in the *refractions*.

Stars in the zenith are not ſubject to any *refraction* — Thoſe in the horizon have the greateſt — From the horizon the *refraction* continually decreaſes to the zenith: all which follows hence, that in the firſt caſe the rays are perpendicular; in the ſecond their obliquity is the greateſt; in the third, it is continually increaſing.

At the ſame altitudes, the ſun and ſtars all undergo the ſame *refraction*; for at equal altitudes, the incident rays have the ſame inclinations: but the ſines of the *refracted* angles as are the ſines of the angles of inclination, &c.

Indeed Tycho Brahe, who firſt deduced the *refractions* of the ſun, moon, and fixt ſtars from obſervation; makes the ſolar *refractions* greater than thoſe of the fixt ſtars; and the lunar *refractions* ſometimes greater than thoſe of the ſtars, ſometimes leſs — But the theory of *refractions* (which we have obſerved is owing to Snellius) was not fully underſtood in his age—De la Hire and Caſſini, find the *refraction* the ſame in all.

M. de la Hire gives us a table of the *refractions* of the ſtars, in their ſeveral degrees of altitude; deduced from the ſureſt and moſt accurate obſervations; as follows:

Table of the REFRACTIONS *of the heavenly bodies, at the ſeveral degrees of altitude.*

Alt.	Refract.	Alt.	Refract.	Alt.	Refract.	Alt.	Refract.	Alt.	Refract.	Alt.	Refract.
0	32′ 0″	16	3′ 26″	30	1′ 51″	46	1′ 9″	61	0′ 40″	77	0′ 17″
1	26 35	17	3 23	31	1 47	47	1 7	62	39	78	15
2	20 43	18	3 12	32	1 43	48	1 6	63	37	79	14
3	15 44	19	3 1	33	1 40	49	1 4	64	35	80	12
4	12 26	20	2 51	34	1 36	50	1 2	65	33	81	11
5	10 26	21	2 44	35	1 33	51	1 0	66	32	82	10
6	9 8	22	2 38	36	1 30	52	0 58	67	31	83	8
7	8 2	23	2 31	37	1 27	53	56	68	30	84	7
8	7 1	24	2 24	38	1 24	54	54	69	28	85	6
9	6 17	25	2 18	39	1 22	55	52	70	26	86	4
10	5 41	26	2 12	40	1 19	56	50	71	25	87	3
11	5 11	27	2 7	41	1 17	57	48	72	24	88	2
12	4 46	28	2 3	42	1 15	58	46	73	23	89	1
13	4 25	29	1 59	43	1 13	59	44	74	21	90	0
14	4 7	30	1 55	44	1 11	60	42	75	20		
15	3 51			45				76	18		

Tycho Brahe will have the *refractions of* the ſun to vaniſh at the altitude of 46°; thoſe of the moon at 45°, and thoſe of the fixt ſtars at 20°: but Caſſini has found that they reach even to the zenith — Indeed Tycho repreſented all the *refractions* leſs than they are; except the horizontal one, which he made too big: for he makes the horizontal *refraction* in the ſun 34′; in the moon 33′; in the fixt ſtars 30′. De la Hire and Caſſini make it 32′ in all the heavenly bodies. Tycho, again makes the *refraction* of the ſun at 33° altitude, to be 55″; but Caſſini 1′, 43″.

Fa. Laval in 1710, 22° Jan. obſerved the meridian altitude of the ſun to be 70°, 25′, 50″; and on the 23d of June, obſerved the ſame to be 70°, 26′, 0″, which is 10″ more, that ſhould be leſs—Having met with ſome like obſervations before, he takes occaſion to ſuſpect the *refraction* to be varied according to the different winds which blow from the different quarters — When the north-weſt wind blows, he thinks the *refraction* is the greateſt; and adds, from obſervations made at St Baume, and St Pilon, that the *refraction* at 24 fathoms above the ſurface of the ſea, is double that at 600 fathoms. See HORIZON —Huygens long ago obſerved the *refraction* to be changed every hour; though his experiments were made at very little altitudes, and in terreſtrial objects.

The *refraction* diminiſhes the right and oblique aſcenſions of a ſtar, and increaſes the deſcenſions: it increaſes the northern declination, diminiſhes the ſouthern. See ASCENSION, DESCENSION, &c.

Refraction, in the eaſtern part of the heavens, diminiſhes the longitude of a ſtar, but increaſes the ſame in the weſtern part of the heavens: it diminiſhes the ſouthern latitude, and increaſes the northern. See LONGITUDE and LATITUDE.

The *refraction* therefore, is by no means to be overlooked in aſtronomy — It is abſolutely neceſſary to the determining of the phænomena of the heavenly motions, to a degree of accuracy; ſo that the antient aſtronomy, where no regard was had to it, muſt of neceſſity have been exceedingly defective on this very account. See ASTRONOMY.

To obſerve the REFRACTION *of a ſtar*, &c.—1°. Obſerve the meridian altitude of a ſtar near the zenith; whence the latitude of the place being known, the true declination of the ſtar is eaſily had, the ſtar being now void of any ſenſible *refraction*. See DECLINATION.

2°. Obſerve the altitude of the ſame ſtar in any other degree, and note the time by a pendulum. 3°. For the given time of obſervation, from the declination of the ſtar compute it's true altitude. See ALTITUDE.

This being thus found leſs than the altitude obſerved; ſubſtract the one from the other; the remainder is the *refraction* for that moment, in that degree.

REFRACTION *of altitude*, is an arch of a vertical circle, as S *ſ* (*Tab. Aſtronomy*, *Fig.* 28.) whereby the altitude of a ſtar S E, is increaſed by the *refraction*. See ALTITUDE.

REFRACTION *of declination*, is an arch of a circle of declination, as *ſ* I, whereby the declination of a ſtar D S is increaſed or diminiſhed by the *refraction*. See DECLINATION.

REFRACTION *of aſcenſion and deſcenſion*, is an arch of the equator, D *d*, whereby the aſcenſion and deſcenſion of a ſtar, whether right or oblique, is encreaſed or diminiſhed, by means of the *refraction*. See ASCENSION, &c.

REFRACTION *of longitude*, is an arch of the ecliptic, T *t*, *fig.* 29. whereby the longitude of a ſtar is encreaſed or diminiſhed by means of the *refraction*. See LONGITUDE, &c.

REFRACTION *of latitude*, is an arch of a circle of latitude *ſ* I, whereby the latitude of a ſtar, T S, is increaſed or diminiſhed by means of *refraction*. See LATITUDE.

REFRACTION, in commerce, is a term ſometimes uſed by merchants, where there has been an overſight in an account, to the prejudice of a perſon, who thereupon demands reſtitution of ſo much, added or omitted by miſtake.

You muſt make me a *refraction* of five pound forgot in your account — I will deduct or make you a *refraction* of 30 *s.* charged inadvertently in my bill.

REFRANGIBILITY *of light*, the diſpoſition of the rays to be refracted. See REFRACTION.

A *greater* or *leſs refrangibility* is a diſpoſition to be *more* or *leſs* refracted, in paſſing at equal angles of incidence, into the ſame medium. See LIGHT, MEDIUM, &c.

That the rays of light are differently *refrangible*, is the foundation of Sir Iſaac Newton's whole theory of light and colours—The truth of the principle will appear from the following experiments.

1°. A ray of light being received through a little round hole into a dark room, upon a glaſs priſm, A B C (*Tab. Optics. fig.* 65. n°. 2.) in ſuch manner as to paſs through it near the angle C; the various colours of the rainbow will be ſeen painted in all their ſplendor on a white paper, E F; *viz.* the red in E, then the yellow, then green, blue, and at laſt purple, or violet; and on whatever body you receive the light, ſtill the colours will be the ſame.

Yet this coloured light is ſtill propagated, like other light, in right lines; it is reflected, too, like other light, from a mirrour, and refracted through a lens; yet retains it's colours both after refraction and reflection — When collected into a focus, the rays degenerate into a very bright white; but upon diverging again from the focus, reſume their former colours.

Hence, 1°. Since nothing here happens to the rays in paſſing the priſm, but that they are refracted, both in entering, and in quitting it: (See PRISM.) Light is converted into thoſe colours by meer refraction.

2°. Since the coloured rays are ſtill propagated in right lines, both when reflected from mirrours, and refracted in lenſes; they ſtill retain all the properties of light, and therefore are ſtill light.

3°. Since the ſeveral coloured rays decuſſated and mixed together in the focus, appear white; but after ſeparation, beyond the focus, recover their former colours; therefore red, yellow, green, blue, and purple rays mixed together in a convenient proportion, conſtitute a reſplendent white. See WHITE.

Note, The experiment will ſucceed if the room be not dark, only the colours will be leſs vivid.

2. A priſm D E F (*fig.* 66.) being ſo diſpoſed as that the refractions of the rays both at their entrance and exit, are equal (which is obtained, by turning it ſlowly round it's axis till the coloured light, which now riſes, and now falls, appear ſtationary between the two.) In the middle ſpace between the priſm and the coloured light, painted on the wall, place another priſm G H to receive the coloured light L M. After a ſecond refraction in this ſecond priſm the coloured light painted on the wall, I K, will be inclined to a like light N O, ſeen there, even when the priſm G H is removed; ſo as the blue extremities N and I will be further a-part than the red ones K and O.

Hence, 1°. The blue rays muſt of neceſſity be more refracted than the red ones; and there is, likewiſe, an unequal refraction in the intermediate rays.

Hence, therefore, the ſun's rays are not all of the ſame *refrangibility*; conſequently, not of the ſame nature. See RAY.

3. Thoſe rays are moſt *refrangible*, which are moſt reflexible. See this proved under REFLEXIBILITY.

The difference between *refrangibility* and reflexibility was firſt diſcovered and publiſhed by Sir Iſaac Newton in 1675, in the *Phil. Tranſact.* and from that time vindicated by him, from the objections of ſeveral authors; particularly F. Pardies, M. Mariotte, Fr. Linus, or Lin, and other gentlemen of the Engliſh college at Liege: at length it was more fully laid down, illuſtrated, and confirmed by great variety of experiments in his immortal optics.

But, further, as not only thoſe colours of light produced by refraction in a priſm, but alſo thoſe reflected from opake bodies, have their different degrees of refrangibility and reflexibility; and as a white light ariſes from a mixture of the ſeveral coloured rays; the ſame great author concluded all homogeneous light to have it's proper colour, correſponding to it's degree of refrangibility, and not capable of being changed by any reflexions, or any refractions; that the ſun's light is compoſed of all the primary colours; that all compound colours ariſe from a mixture of the primary ones, &c. See COLOUR.

The different degrees of *refrangibility*, he conjectures to ariſe from the different magnitude of the particles whereof the different rays conſiſt — Thus the moſt refrangible rays, *i. e.* the red ones, he ſuppoſes to conſiſt of the largeſt particles; the leaſt refrangible, *i. e.* the violet rays, of the ſmalleſt particles; and the intermediate rays, yellow, green, and blue, of particles, of intermediate ſizes. See RED, GREEN, RAY, &c.

REFRESHMENT, *quarters of.* See QUARTERS.

REFRET, in muſic. See the article RITORNELIO.

REFRIGERATIVE, in medicine, a remedy, or diet which refreſhes the inner parts by cooling them—Such, uſually, are ptiſans, clyſters, potions, &c. See PTISAN, &c.

REFRIGERATORY, REFRIGERATORIUM, in chymiſtry, a veſſel, filled with cold water, placed about the head of an alembic, to cool and condenſe the vapours raiſed thither by the fire, and to convert them into a liquor, to be diſcharged thence through the beak. See DISTILLATION, ALEMBIC, SPIRIT, WATER, &c.

The water in the *refrigeratory* is to be changed from time to time, as it begins to grow warm.

Sometimes they content themſelves with wrapping a wet cloth about the head of the alembic, inſtead of a *refrigeratory*: but the more uſual method now uſed to ſupply the place of the *refrigeratory*, is by a worm or ſpiral pipe running through a tub of cold water. See SERPENTINE.

Diſtillation chiefly conſiſts in evaporation and *refrigeration.* See EVAPORATION, &c.

REFUGE, REFUGIUM, in our old cuſtoms, a ſanctuary or aſylum. See SANCTUARY and ASYLUM.

At Paris is an hoſpital called the *refuge*, wherein diſſolute women art ſhut up. See PENITENT and MAGDALEN.

REFUGEES, French-proteſtants, who by the revocation of the edict of Nants, in 1685, have been conſtrained to quit their country, and retire for *refuge* into Holland, Germany, England, &c. to ſave themſelves from the neceſſity of abandoning their religion. See EDICT, HUGUENOT, &c.

REGAL, REGIUS or REGALIS, ſomething belonging to a king. See KING.

Regal is of the ſame import with *royal*; the former being formed of the Latin *rex*; the other of the French, *roy*, king. See ROYAL.

REGAL *fiſhes.* See the article ROYAL *fiſhes.*

REGAL *ſuit.* See the article SUIT.

REGALE, in the French juriſprudence, is a right belonging to the king over all benefices in that kingdom. See BENEFICE.

The *regale* conſiſts in enjoying the revenues of biſhoprics during the vacancy of their ſees, and of preſenting to the benefices dependent thereon, which become vacant during that time, and till a ſucceſſor have taken the oath of fidelity, and have procured letters patents, to ſecure him from the *regale.*

The enjoyment of the fruits of the ſee is called the *temporal regale*; that of preſenting the benefices, the *ſpiritual regale.* Some refer the origin of the *regale* to the time of Clovis, and ſay the clergy granted this privilege to the king, upon his defeating the Viſigoths; others alledge, that pope Adrian I. gratified Charlemaign with it, in a council held at Rome—It is obſerved by others, that the regale was originally no more than a ward, or adminiſtration; and that the kings were only depoſitaries of the fruits of the vacant biſhoprics, and appointed œconomi to look to them during the vacancy. See OECONOMUS.

It is added, that the kings of the firſt and ſecond race never enjoyed any ſuch privilege, and that it was only introduced in the twelfth century, in favour of inveſtitures. See INVESTITURE.

REGALE, REGALIO, a magnificent treat or entertainment, given embaſſadors, or other perſons of diſtinction, to divert or do them honour.

In Italy, it is uſual at the arrival of any traveller of eminence, to ſend him a *regale*; that is, a preſent of fruits, ſweet-meats, &c. by way of refreſhment.

REGALIA, in law, the royal rights, or prerogatives of a king. See KING, PREROGATIVE, &c.

Theſe are reckoned by civilians to be ſix; 1°. power of judicature. 2°. power of life and death. 3°. power of war and peace. 4°. maſterleſs goods. 5°. aſſeſſments. 6°. minting of money. See ROYALTIES.

REGALIA is alſo uſed for the ſeveral parts of the apparatus of a coronation; as the ſceptre with the croſs; ſceptre with the dove; St Edward's ſtaff; four ſeveral ſwords; the globe; the orb with the croſs, &c. uſed at the coronation of our kings.

REGALIA, *of the church*, are thoſe rights and privileges which cathedrals, &c. enjoy by grants, and other conceſſions of kings. See CHURCH, CATHEDRAL, &c.

Regalia is ſometimes alſo uſed, for the patrimony of a church: as, *regalia ſancti petri*—And more particularly, for ſuch lands and hereditaments as have been given by kings to the church. *Cepimus in manum noſtram baroniam &* regalia *quæ archiepiſcopus Eborum de nobis tenet.* Pryn. lib. Ang.

Theſe *regalia*, while in poſſeſſion of the church, were ſubject to the ſame ſervices as all other temporal inheritances; and after the death of the biſhop reverted to the king, 'till he inveſted another with them; which in the reigns of William the conqueror, and ſome of his immediate ſucceſſors, was frequently delayed, and as oft did the biſhops make complaint thereof as appears from Malmeſbury, Neubrigenſis, &c. See BISHOP.

This laſt author ſays, that great complaint was made againſt Henry II. *Quod epiſcopatus vacantes, & provenientia perciperet commoda, diu vacare voluit, & eccleſiaſticis potius uſibus applicanda in fiſcum redegit.* See TEMPORALITY, BENEFICE, &c.

REGALIA *facere*, is uſed for a biſhop's doing homage or fealty to the king, when he is inveſted with the *regalia.* See HOMAGE and BISHOP.

Thus Malmeſbury, in Anſelm. Regalia *pro more iſtius temporis faciens principi 7 kalend. octobris, Cantuariæ aſſedit.*

REGALITIES. See the article ROYALTIES.

REGARD, of the foreſt, the over-ſight, or inſpection thereof; or the office, and province of the *regarder*; which is to go through the whole foreſt, and every bailiwick thereof, before the holding of the ſeſſions of the foreſt, or juſtice ſeat; to ſee and enquire of the treſpaſſes therein. * See FOREST.

* *Ad videndum, ad inquirendum, ad certificandum,* &c. See REGARDER.

REGARD is alſo uſed for the extent of the *regarder*'s charge, *i. e.* for the whole foreſt, or all the ground that is parcel thereof. See PURLIEU.

REGARDANT, in heraldry, is underſtood of a lion, or other beaſt of prey, borne in a poſture of looking behind him, with his face towards his tail.

Others apply it to a beaſt which only ſhews the head, and ſome part of the neck, as moving from out of ſome diviſion of the coat into another—He bears azure, three bends or, in a chief argent, charged with a lion *regardant* gules.

Villain **Regardant**, or **Regardant** *to the manour*, denotes an antient ſervant, or retainer to the lord; thus called, becauſe charged to do baſe ſervices within the manour, to ſee the ſame freed of all filthy and loathſome things that might annoy it. *Coke on Littleton*, *fol.* 120.

REGARDER *of a foreſt*, **Regardator** *foreſtæ*, an antient officer of the king's foreſt, whoſe buſineſs was every year upon oath, to make a *regard*, *i. e.* take a view of the foreſt limits; alſo to enquire of all offences and defaults committed by the forreſters within the foreſt, and of all the concealments of them, and whether all the other officers did execute their reſpective duties or not. See Forest.

Manwood refers this inſtitution to king Henry II. but Spelman thinks the name, at leaſt, was given ſince; and that they were the ſame with thoſe officers called *cuſtodes venationis*. See Regard.

REGE, *querela coram*. See Querela.

REGEL, or **Rigel**, a fixed ſtar of the firſt magnitude, in Orion's left foot—It's longitude, latitude, *&c.* ſee among the reſt of the conſtellation Orion.

REGENERATION, in theology, the act of being born again by a ſpiritual birth, or becoming a child of God. See Conversion.

Regeneration is performed by the waſhing of the Holy Spirit, whereof babtiſm is the ſign. When an infidel is converted, babtiſm is adminiſtred as a ſign of *regeneration*. See Baptism.

REGENT, **Regens**, a perſon who governs a kingdom during the minority, or the abſence of a king. See Vice-Roy.

In France, the queen mother has the regency of the kingdom, under the title of *queen regent*, while the king is a minor—Some have urged that women being incapable of ſucceeding to that crown, were incapable of the *regency*; but cuſtom has declared in their favour. See Salic.

Regent is alſo uſed for a profeſſor of arts or ſciences, who holds a claſs, or ſet of pupils, in a college. See University, College, *&c.*

The foreign univerſities are generally compoſed of doctors, profeſſors and *regents*.—*Regent* and ſcholar are relative terms. See Tutor.

Regent is generally reſtrained to the lower claſſes, as *regent* of rhetoric, *regent* of logic, *&c.* thoſe of philoſophy are rather called *profeſſors*. See Professor.

REGIA *aqua*.	See the articles	Aqua.
Via **Regia**.		Via.
Villa **Regia**.		Villa.

REGICIDE, **Regicida**, a *king-killer*—The term is alſo uſed for the act itſelf of murdering a king; of *rex*, king, and *cædo*, I ſlay.

Regicide is chiefly uſed in ſpeaking of the perſons concerned in the trial, condemnation, and execution of king Charles the firſt.

REGIFUGE, **Regifugium**, a feaſt held in ancient Rome on the ſixth of the calends of March, *i. e.* on our 24th of February, in memory of the expulſion of their kings, particularly of Tarquin's flying out of Rome on that day. See Feast.

Some will have the feaſt to bear this name from the *rex ſacrorum*, king of the ſacrifices, flying out of the comitia, or place of aſſembly, as ſoon as the ſacrifice was over, in imitation of the flight of Tarquin the proud.

Some critics and antiquaries will have *regifugium*, the ſame with *fugalia*; others hold them to be different. See Fugalia.

REGIMEN*, in medicine, a rule or courſe of living, with regard to eating, drinking, cloathing, and the like; accommodated to ſome diſeaſe, and to the particular courſe of medicine the patient is under. See Diet.

* The word is pure latin, and ſignifies government or rule.

It is doubted whether the hot or cold *regimen* be moſt convenient in fevers?—The hot *regimen*; which antiently obtained in the ſmall-pox, begins to be diſuſed—The *regimen* is very different in different countries: Bartholin ſays, a ſlice of bacon in Denmark, is an uſual diſh for a perſon in a high fever.

Regimen, in chymiſtry and alchymy, is the method of ordering and conducting any thing, that it may anſwer it's intention.

Thus, *regimen of fire*, is the manner of making and ordering fire, and the degrees thereof. See Fire and Degree.

Regimen *of the work*, that is, of the philoſopher's ſtone, called *the work of patience*, is the rule and conduct to be obſerved to attain projection. See Philosophers *ſtone*, and Projection.

There are three things to be chiefly regarded in the *regimen of the work*—The firſt to adminiſter a gentle, eaſy heat, at the beginning of the coction.

The ſecond to continue this external heat according to the ſeaſon of the work; always obſerving four ſeaſons, as in the common and aſtronomical year: the beginning being the winter, the progreſs the ſpring, then ſummer, and laſtly autumn, which is the time of maturity and perfection of the ſtone: in all which the heat is to be augmented in proportion to the augmentation obſerved in nature.

It is to be added, that the work may not be begun in any ſeaſon, but regard is to be had to the ſeaſons of nature; leſt the winter of the work be found in the ſummer of the year, *&c.* Which, however, is to be underſtood of the day wherein the mercury is put in the ovum philoſophicum; not of that when it is begun to be ſet at liberty from the priſons nature had incloſed it in.

The third is that in augmenting the fire, the augmentation be not of a whole degree at once; the ſpirits being unable to bear ſuch violence; but a degree is to be divided into four parts, and one part to be taken at a time. See Degree.

All the operations of the firſt *regimen*, are occult and inviſible: in the ſecond *regimen* comes putrefaction, which is the firſt ſenſible change; ſhewing itſelf by it's black colour. See Putrefaction, *&c.*

Regimen, or *government*, in grammar, is that part of ſyntax or conſtruction which regulates the dependency of words; and the alterations which one occaſions in another. See Syntax and Construction.

Thus we ſay, the *regimen* of a verb active, is an accuſative, *i. e.* a verb active governs an accuſative; or requires that the noun which receives it's action be in the accuſative caſe. See Verb, Accusative, *&c.*

Prepoſitions have a *regimen*, *i. e.* they require certain caſes in the nouns they are prefixed to; by which they are diſtinguiſhed from *adverbs* which have none. See Preposition and Adverb.

The *regimen*, or conſtruction of government, is entirely arbitrary; and differs in all languages; one language forming it's *regimen* by caſes, as the Latins and Greeks; others by particles in lieu thereof; as the Engliſh, by *of*, *to*, &c. the French, Spaniards, and Italians, by *de*, *a*, *da*, &c. See Case.

There are, however, ſome general maxims which hold in all languages as 1°. That there is no nominative caſe in any ſentence but has a reference to ſome verb either expreſſed or underſtood. See Nominative.

2°. That there is no verb but has it's nominative caſe, either expreſſed or underſtood—Indeed in languages which have proper accuſatives, as the Latin, before infinitives there is an accuſative, not a nominative caſe: as *ſcio Petrum eſſe doctum*.

3°. There is no adjective but has a relation to ſome ſubſtantive. See Adjective, *&c.*

4°. That there is no genitive caſe but is governed by ſome other noun; inaſmuch as that caſe always expreſſes the poſſeſſor, which muſt be governed by the poſſeſſed—This rule does not hold ſo apparently in the modern as the antient languages; in regard the particles *of*, *de*, &c. which are the proper ſigns of the genitive caſe, are frequently uſed as prepoſitions. See Genitive.

5°. That the *regimen* of verbs is frequently laid on different kinds of relations according to cuſtom or uſage; which yet does not change the ſpecific relation of each caſe, but only ſhews that cuſtom has made choice of this or that, according to fancy—Thus the Latins ſay, *juvare aliquem*, & *opitulari alicui*, to help one—So the French ſay, *ſervir quelqu' un* & *ſervir a quelqu'un*, to ſerve one—Thus the Engliſh ſay, *fight one*, or *fight with one*—And thus in Spaniſh moſt of the verbs active govern indifferently either a dative or an accuſative. Sometimes, alſo, the verb admits of ſeveral *regimens*; as *præſtare aliquem*, or *alicui*, *eripere morti aliquem*, or *aliquem a morte*.

Indeed the different *regimen* ſometimes makes an alteration in the ſenſe; in which, particular regard is to be had to the uſage of the language—Thus the Latin *cavere alicui*, ſignifies to watch, or to be careful of the preſervation of any one: *cavere aliquem*, to beware of him.

There is one very common fault in *regimen*, which our accurate writers ſhould be careful to avoid; *viz.* the uſing of two verbs that require different caſes, together, as only governing one caſe: as in this example; after *embracing and giving his bleſſing to his ſon*; where *embracing* requiring an accuſative, and *giving* a dative caſe, the *regimen*, or conſtruction of the firſt verb with the noun is irregular: *embrace to a ſon*.

The ſame may be obſerved in nouns; as *I conjured him by the memory and the friendſhip he bore my father*; where *memory* does not agree with the verb *he bore*.

REGIMENT, in war, a body conſiſting of ſeveral troops of horſe, or companies of foot, commanded by a colonel. See Colonel and Major.

The number of men in a *regiment*, is as undetermined as that of the men in a troop, or company. See TROOP and COMPANY.

There are *regiments* of horſe, that are not above 300 men; and there are ſome in Germany of 2000; and the *regiment* of Picardy in France conſiſts of 120 companies, or 6000 men.

The French *regiments* of horſe are not commanded by a colonel, as the foot are, but by a meſtre de camp. See COLONEL.

Some obſerve, that there were no *regiments* of horſe before the year 1637. Till then the troops were looſe, and independent of each other, not incorporated into a body or *regiment*. See GUARD.

REGIO *aſſenſu*, is a writ whereby the king gives his royal aſſent to the election of a biſhop. See BISHOP.

REGION, REGIO, in geography, a *country*, or particular diviſion of the earth; or a tract of land inhabited by people of the ſame nation. See EARTH, NATION, &c.

The modern aſtronomers divide the moon into ſeveral *regions* or provinces, to each whereof they give it's proper name. See MOON.

REGION in phyſiology—Authors divide the atmoſphere into three ſtages, called the *upper*, *middle*, and *lower regions*. See ATMOSPHERE.

The *loweſt* REGION is that wherein we breathe; and is bounded by the reflection of the ſun's rays; that is, by the height to which they rebound from the earth. See RAY.

The *middle* REGION, is that wherein the clouds reſide, meteors are formed, &c. extending from the extremity of the *loweſt*, to the tops of the higheſt mountains. See METEOR, CLOUD, MOUNTAIN, &c.

The *upper* REGION, commences from the tops of the mountains, and reaches to the utmoſt limits of the atmoſphere—In this reigns a perpetual, equable calmneſs, clearneſs, and ſerenity. See AIR.

Some authors uſe the term *elementary* REGIONS for the ſpace of the whole atmoſphere, from the earth to the ſphere or heaven of the moon; becauſe within this are contained the four elements, and all elementary bodies. See ELEMENT and ELEMENTARY.

Ætherial REGION is uſed for the whole extent of the univerſe, including the orb of the fixed ſtars, &c. See UNIVERSE.

REGION, in anatomy, denotes alſo a diviſion of the human body. See BODY—Anatomiſts divide the body into three *regions*, or *venters*. See VENTER.

The *upper region* is that of the head; reaching as low as the firſt vertebra; and comprehending the animal organs, the brain, &c. See HEAD, &c.

The *middle region* is that of the thorax or breaſt, which Hippocrates calls the upper venter, and which reaches from the clavicles to the diaphragm; wherein are contained the vital parts, as the heart, lungs, &c. See HEART, LUNGS, &c.

The third or *lower region* is the abdomen or belly, &c. containing the natural parts, deſtined for digeſtion, purgation, and generation. See ABDOMEN.

Epicolic REGION.	See the articles	EPICOLIC.
Epigaſtric REGION.		EPIGASTRIC.
Umbilical REGION.		UMBILICAL.

REGIONARY, REGIONARIUS, in eccleſiaſtical hiſtory, a title given from the fifth century, to perſons who had the charge and adminiſtration of the church affairs within a certain diſtrict or *region*.

At Rome there were antiently ſeven *regionary deacons*, who preſided over a kind of hoſpitals, and looked to the diſtribution of alms. See DEACON.

There were alſo *regionary ſubdeacons*, and *regionary notaries*, *regionary biſhops*, &c. See NOTARY.

A regionary BISHOP was properly a miſſionary inveſted with an epiſcopal character, but without being attached to any particular ſee; that he might be at liberty to go preach, and perform other functions of his miniſtry, whitherſoever the Spirit of God, and the wants of the people ſhould call him. See BISHOP, MISSIONARY.

REGIS *pondus*.	See	PONDUS.
REGIS *villa*.		VILLA.

REGISTER*, REGISTRUM, a public book ſerving to enter and record memoirs, acts, and minutes, to be had recourſe to, occaſionally, for the juſtifying of matters of fact, &c. See RECORD, ARCHIVES, &c.

> * Menage derives the word by corruption, from *regeſtum*, a book containing extracts of ſeveral books, &c. collected together: *Dicitur regeſtum quaſi iterum geſtum*—Others derive it from the old French, *giſter*, to lie down in a bed, &c.

The law of Scotland is rendered very eaſy and regular, by means of the great number of *regiſters*, for recording the conveyances of lands, &c. of private perſons—Of theſe there are two kinds: the one general, fixed at Edinburgh, under the direction of the *lord regiſter*, who before the union was the fifth officer of ſtate, and beſides the *regiſtry*, was clerk of the parliament, treaſury, exchequer, and ſeſſion.

The other is particularly kept in the ſeveral ſhires, ſtewarties, and regalities—The clerks hereof are obliged to tranſmit the *regiſters* of their reſpective courts to the general *regiſter*; and the notaries their protocols: and here they are ſo diſpoſed, that on demand the lieges can have a view of any writs which the law requires to be *regiſtered*, or which parties for their ſecurity have thought fit to record.

The *regiſters* were firſt ſet on foot by act of parliament under king James VI. to the unſpeakable advantage of the ſubject. No man can have a right to any eſtate, but it muſt be *regiſtered* within forty days of his becoming ſeiſed of it, otherwiſe it is null: by this means all ſecret conveyances are cut off.

REGISTER, REGISTARIUS, is alſo uſed for the clerk or keeper of a *regiſter*, or *regiſtry*. See CLERK.

Of theſe we have ſeveral, denominated from the *regiſters* they keep—as *regiſter of the high court of delegates*; *regiſter of the arches court of Canterbury*; *regiſter of the court of admiralty*; *regiſter of the prerogative court*; *regiſter of the garter*, who is always dean of Windſor. See DELEGATE, ARCHES, ADMIRALTY, PREROGATIVE, GARTER, &c.

REGISTER *of a pariſh church*, is a book wherein the yearly babtiſms, marriages, and burials of each pariſh, are orderly regiſtered. See PARISH, &c.

This practice was laudably inſtituted by that great but unfortunate perſon, Thomas Cromwell, earl of Eſſex, anno 1538. while he was vicar-general to king Henry VIII. See BILL *of mortality*.

REGISTER is alſo the title of a book, containing the forms of moſt of the writs uſed in the common law; called the *regiſter of writs*. See WRIT.

This *regiſter*, Coke on Littleton obſerves, is one of the moſt antient books of the common law.

REGISTER *ſhips*, or *ſhips of* REGISTER, in commerce, are veſſels to which the king of Spain, or the council of the Indies, grant permiſſions to go and traffic in the ports of the Spaniſh Weſt-Indies. See COMMERCE.

They are thus called becauſe the ſhips are to be *regiſtered* before they ſet ſail from Cadiz, which is the place where they uſually load for Buenos Ayres.

Theſe veſſels, by the tenor of the cedula or permit, are not to exceed three hundred tuns: but there is that good underſtanding between the merchants and the council of the Indies, that ſhips of five or ſix hundred tun frequently paſs un-noted. The permiſſions coſt thirty thouſand pieces of eight each: but were they to coſt an hundred thouſand the merchants would be gainers, and the king of Spain a loſer—For though the quantity and quality of the merchandizes on board be always expreſſed; yet, by force of preſents, the officers here and in the Indies, allow them to load and unload vaſtly more than the permiſſion expreſſes—Veſſels whoſe certificate only mentions twelve thouſand ſkins, and an hundred thouſand pieces of eight, have been known to have on board above four millions in gold and ſilver; twenty ſix thouſand ſkins, &c. So that the king of Spain's fifth, and his other dues, were almoſt nothing to what they ſhould be.

Add to this, that in years 1702, 1703, &c. theſe *regiſter* veſſels, countenancing and backing each other, ſold their commodities for above three hundred per cent. profit—A hat was ſold for 18 pieces of eight; an ell of ordinary cloth for 12 pieces of eight, &c.

Among the *regiſter* veſſels may be reckoned a ſhip of five hundred tuns, which the king of Spain allows the Engliſh South Sea Company to ſend each year to the fairs held at Porto Bello, Carthagena, and Vera Cruz, &c. See ASSIENTO.

REGISTER, among letter-founders, is one of the inner parts of the mould wherein the printing-types are caſt. See LETTER.

It's uſe is to direct the joining them juſtly together again, after opening them to take out the new-caſt letter. See *Letter*-FOUNDERY.

REGISTERS, in chymiſtry, are holes, or chinks, with ſtopples to them, contrived in the ſides of furnaces, to regulate the fire, *i. e.* to make the heat immediately more intenſe, or remiſs, by opening them to let in the air, or keeping them cloſe, to exclude it. See FURNACE, FIRE, HEAT, DEGREE, &c.

REGISTER, in printing, the diſpoſing the forms of the preſs ſo as that the lines and pages printed on one ſide of the ſheet, meet exactly againſt thoſe on the other; which is done by means of two points in the greater or outward tympan. See PRINTING.

REGISTRY, REGISTRUM, comprehends the office, books, and rolls, wherein the proceedings of chancery, or any ſpiritual court, are *regiſtered*, or recorded. See REGISTER, RECORD, ROLL, &c.

REGIUS-*profeſſors*—King Henry VIII. founded five lectures in each of our univerſities, *viz.* of Divinity, Hebrew, Greek, Law, and Phyſic; the readers of which lectures are in the univerſity ſtatutes, called *regii profeſſores*, See PROFESSOR.

REGIUS *morbus*. See the article JAUNDICE.

REGLET*, or Riglet, in architecture, a little flat narrow moulding, uſed chiefly in compartiments, and pannels, to ſeparate the parts or members from one another, and to form knots, frets, and other ornaments — See *Tab. Archit. fig.* 1. *fig.* 26. *lit. y. fig.* 28. *lit. l. m. fig.* 32. *lit. m. fig.* 24. *lit. N.* z. See alſo Moulding, Fret, *&c.*

* The word is a diminutive of the French, *regle*, rule.

The *reglet* according to Daviler, differs from the *fillet* and *liſtel*, in that it projects equally, like a ruler. See Fillet and List.

Reglets, or Riglets, in printing, are thin rulers, or ſlips of wood of different dimenſions, placed in the chaſe, between the pages, and at the extremes thereof, to keep them aſunder and hold them tight. See Printing.

The *reglets* make the chief part of what they call *the furniture of the chaſe.* See Chase.

They are particularly denominated from the place they hold in reſpect of the pages, *head-ſticks*, *foot-ſticks*, *gutter-ſticks*, &c.

The term Reglet is alſo uſed abroad for a ruler of metal, $\frac{3}{4}$ of an inch long, but which may be lengthened out by joyning ſeveral together; uſed to ſeparate the columns, in books that have ſeveral in the ſame page; as alſo for lines to place the notes on it printing of muſic.

Reglet, is alſo uſed for a little thin ſlip of wood uſed by ſome compoſitors to take off the lines from the compoſing-ſtick, and place them on the galley, as faſt as compoſed. See Compositor, Galley, *&c.*

REGNANT *queen.* See the article Queen.

REGRATER, Regratarius, a law word, formerly uſed for one that bought wholeſale, or by the great, and ſold again by retail. See Engrosser, *&c.*

The term is now chiefly uſed to denote one that buys any wares or victuals, and ſells them again in the ſame market or fair, or within five miles of it. See Forestalling.

Regrater is alſo uſed for a perſon who furbiſhes up old moveables, to make them paſs for new. See Frippery, and Redubbor.

Among maſons, *&c*, to Regrate, is to take off the outer ſurface of an old hewn ſtone, with the hammer and ripe, in order to whiten, and make it look freſh again. See Stone and Masonry.

REGRESSION, or *retrogradation* of curves, *&c.* See Retrogradation, *&c.*

REGULA. See the article Rule.

Regula, in architecture. See the articles Reglet, List, Orle, *&c.*

REGULAR, Regularis, denotes the relation of any thing that is agreeable or conformable to the rules of art. See Rule and Irregular.

In which ſenſe the word ſtands oppoſed to *irregular*, or anomalous. See Irregular, Anomalous, *&c.*

Thus we ſay, a *regular* proceeding, *regular* building, *regular* poem, *regular* verb, *&c.* See Verb, Poem, *&c.*

Regular *figure*, in geometry, is a figure which is both equilateral, and equiangular; *i. e.* whoſe ſides, and conſequently angles, are all equal. See Figure.

The equilateral triangle and ſquare are *regular figures.* See Square and Triangle — All other *regular* figures conſiſting of more than four ſides, are called *regular polygons.* See Polygon,

Every *regular* figure may be inſcribed in a circle. See Circle — *For the dimenſions, properties, &c. of* Regular *figures*, ſee Polygon.

Regular *body*, called alſo *platonic body*, is a ſolid terminated on all ſides by regular and equal planes, and whoſe ſolid angles are all equal. See Body, Plane and Solid.

The *regular* bodies are five in number; *viz.* — The *cube*, which conſiſts of ſix equal ſquares; the *tetrahedron* of four equal triangles; the *octahedron* of eight; the *dodecahedron* of twelve; and the *icoſihedron* of twenty; ſee each under it's proper article. Cube, Tetraedron, Octaedron, *&c.* — Beſide theſe five there can be no other *regular* bodies in nature.

To meaſure the ſurface and ſolidity of the five Regular *bodies* — The ſolidity, *&c.* of the cube is ſhewn under the article Cube—The tetrahedron being a pyramid, and the octahedron a double pyramid; and the icoſihedron conſiſting of twenty triangular pyramids; and the dodecahedron of twelve quinquangular ones, whoſe baſes are in the ſurface of the icoſihedron and dodecahedron, and their vertices meeting in a centre: the ſolidities of theſe bodies are all found from what we have ſhewn under the article Pyramid.

Their ſurface is had by finding the area of one of the planes, from the lines that bound it (ſee Triangle) and multiplying the area thus found by the number from which the body is denominated; *e. gr.* for the tetrahedron, by 4; for the hexahedron or cube, by 6; for the octahedron, by 8; for the dodecahedron, by 12; and for the icoſihedron, by 20—The product is the ſuperficial area. See Area and Superficies.

Proportions of the ſphere, and of the five Regular *bodies inſcribed therein: the diameter of the ſphere being* 2.

The circumference of a great circle is	6.	28318
Surface of a great circle,	3.	14159
Surface of the ſphere,	12.	56637
Solidity of the ſphere,	4.	18859
Side of the tetrahedron,	1.	62299
Surface of a tetrahedron,	4.	6188
Solidity of a tetrahedron,	0.	15132
Side of a cube or hexahedron,	1.	1547
Surface of the hexahedron,	8.	
Solidity of the hexahedron,	1.	5396
Side of an octahedron,	1.	41421
Surface of the octahedron,	6.	9282
Solidity of the octahedron,	1.	33333
Side of the dodecahedron,	0.	71364
Surface of the dodecahedron,	10.	51462
Solidity of the dodecahedron,	2.	78516
Side of the icoſihedron,	1.	05146
Surface of the icoſihedron,	9.	57454
Solidity of the icoſihedron,	2.	53615

If one of theſe bodies be required to be cut out of the ſphere of any other diameter; ſay, as the diameter of the ſphere 2, is to the ſide of any one ſolid inſcribed in the ſame (ſuppoſe the cube 1. 1547.) ſo is the diameter of any other ſphere (ſuppoſe 8.) to 9. 2376, the ſide of the cube inſcribed in this latter ſphere.

Let *dr*, then (*Tab. Geometry, fig.* 81.) by the diameter of any ſphere, and *da* $\frac{1}{3}$ of it, $= ab = br$. Erect the perpendiculars *ae*, *cf*, and *bg*; and draw *de*, *df*, *er*, *fr*, and *gr*; then will (1) *re* be the ſide of the tetrahedron: (2) *df*, the ſide of the hexahedron: (3) *de* the ſide of the octahedron. (4) And cutting *de* in extreme and mean proportion in *h*, *dh* will be the ſide of the dodecahedron. (5) Setting the diameter *dr* up perpendicularly at *r*; from the centre *c*, to it's top, draw the line *cg*, cutting the circle in *g*—Let fall the perpendicular *gb*; ſo is *br* the ſide of the icoſihedron.

Regular *curves*, are ſuch whoſe curvity proceeds continually in the ſame uniform geometrical manner—Such are the perimeters of the conic ſections. See Curve, Conic *ſection*, *&c.*

Such as have a point of inflection, or regreſſion, and which being continued to a certain point, turn themſelves a contrary way are called *irregular curves* — Such are the conchoid, and the ſolid parabola, which has a ſquare for it's parameter. See Flexion and Retrogression.

Regular *architecture*, *fortification*, &c. See Architecture and Fortification.

Regular *Baſtion.* See the article Bastion.

Regular *Place.* See the article Place.

Regular, in the monaſtic ſenſe, denotes a perſon who has made the vows in ſome religious houſe. See Religious and Vow.

Under *regulars* are comprehended the whole body of monks, fryars, and mendicants, *&c.* See Monk, Mendicant, *&c.*

The denomination of *regulars*, in this caſe ariſes hence, that they are bound to obſerve the rule of the order they are entered into. See Rule and Order—Hence,

Regular *prieſt* is uſed for a prieſt who is in ſome religious order; in oppoſition to a *ſecular* prieſt, who lives in the world, or at large. See Secular.

A cardinal is reputed both *regular* and ſecular and is entitled to the privileges of both ſtates. See Cardinal.

Regulars may be promoted to biſhoprics and archbiſhoprics, as well as ſeculars; but their promotion ſecularizes them; the epiſcopal dignity diſpenſing them from the obſervation of the rule whereof they have made profeſſion. See Secularisation.

Regular *abbots.* See the article Abbot.

Regular *benefices*, are ſuch as can only be held by monks or religious; or at leaſt, *per cupientem profiteri*, by a perſon deſirous to embrace the monaſtic life. See Benefice.

It is a maxim in the Romiſh canon law — *Regularia regularibus*, i. e. *regular* benefices are to be conferred on *regular* prieſts — The abbies that are chiefs of their reſpective orders are all *regular*, and can only be ſerved by monks and cardinals. See Abby — All benefices are preſumed ſecular, unleſs they be proved *regular*.

Antiently, the *regular* benefices were almoſt all conferred by way of adminiſtration or curacy; the religious incumbents being always *ad manum* of their ſuperiors, who diſplaced them at pleaſure—Hence the common maxim among the canoniſts, *omne beneficium regulare manuale.*

The benefices appropriated to *regulars* are abbies, conventual priories, ſimple priories, and clauſtral offices — They may be conferred on ſeculars in commendam. See Commendam.

Regular *canons.* See the article Canon.

Regular *places*, are thoſe within the boundary or incloſure of the convent; as the cloiſter, dormitory, chapter, and refectory—In oppoſition to thoſe deſtined for gueſts, and for the neceſſaries of the houſe, which are reputed without the incloſure. See ABBY, MONASTERY, CLOISTER, &c.

REGULAR *corporation*. See the article CORPORATION.

REGULAR *ſmall pox*. See the article POX.

REGULATION, a rule or order preſcribed by a ſuperior, for the uniform and orderly management of ſome branch of policy, juſtice, or the like. See LAW, STATUTE, ORDINANCE, &c.

REGULATOR *of a watch*, is a ſmall ſpring belonging to the balance; ſerving to adjuſt the going, and make it either proceed faſter or ſlower. See WATCH, &c.

REGULO, a title given to the ſons of the emperors of China — The emperor's eldeſt ſon, whom we call the *firſt regulo*, was the only one of all his children in favour; till, of a ſudden, matters took a new face. From ſome new intelligences, the emperor learnt the innocence of the hereditary prince whom he had depoſed, and the artifices that had been uſed to ruin him: particularly, that the *regulo*, to ſucceed therein, had had recourſe to magic, and at the inſtigation of certain lamæ, or Tartar prieſts had procured a ſtatue to be buried in Tartary; accompanying the ceremony with ſeveral magical operations. Upon this, orders were inſtantly ſent to ſeize the lamæ, and to dig up the ſtatue: the *regulo* had his palace aſſigned him for a priſon. *Let. Edif. & Cur.*

REGULUS, *petty king*, in our antient cuſtoms, is a term frequently uſed in the Saxon councils, for *comes* or count. See COUNT and EARL.

Hence *ſub-regulus*, was alſo uſed for a vice-comes or vicount —Though in many places the two ſeem uſed indifferently for the ſame dignitary —Thus in the archives of the cathedral of Worceſter, Uthredus ſometimes ſtiles himſelf *regulus*, and ſometimes *ſub-regulus* of the city of Worceſter.

But in other places we find a diſtinction—Offa *rex merciorum*; Uthredus, *regulus*; Aldredus, *ſub-regulus*, &c.

REGULUS, in chymiſtry, denotes the fineſt and pureſt part of a metal or mineral, which ſinks or precipitates to the bottom of the crucible or furnace, in melting the mineral or ore. See METAL, MINERAL, FUSION, &c.

To procure the *regulus*, that is, the mercurial parts of metals, &c. flux powders are commonly uſed; as nitre, tartar, &c. which purge the ſulphurous part adhering to the metal, by attracting and abſorbing it to themſelves. See FLUX *powder*.

Regulus is principally uſed for that of antimony, which is a ponderous metallic powder, that upon fuſing ſome of the mineral in it's crude ſtate, ſinks to the bottom, leaving the ſcoria or impurities a-top. See ANTIMONY.

The alchymiſts will have this matter called *regulus*, *i. e.* little king, as being the firſt born of the royal metallic blood; which is really a ſon, but not a perfect man, *i. e.* not yet a perfect metal for want of time and proper nouriſhment.

Antimony purify'd by ſimple fuſion, is called *regulus of antimony*; or *regulus antimonii philoſophorum* — But the more common way of reducing it into a *regulus*, is with the addition of flux powders, as tartar and nitre. See FLUX *powder*.

The ſcoria found at the top of this *regulus* is violently emetic, as well as the *regulus* itſelf, whereof if cups or drinking veſſels be caſt, the wine put into them will become vomitive.

Of this *regulus* caſt in moulds are made thoſe commonly called the *antimonial pills*, weighing about eight or ten grains each, one of which being ſwallowed, will operate conſiderably both by vomit and ſtool.

Theſe pills having thus performed their office, and been diſcharged the body, will ſerve the ſame purpoſe again and again; whence they have obtained the name of perpetual *pills* — The virtue of this *regulus* is not however inexhauſtable, as has been imagined; for by repeated infuſions in wine, though the liquor be made violently emetic at firſt, yet by degrees it loſes it's force, and at length ceaſes to be vomitive.

Martial REGULUS *of antimony*, is a mixture of little bitts of iron, as the nails of horſe's ſhoes, melted with the *regulus*.

In this operation the iron diſſolving and abſorbing the ſulphurous parts of the antimony, more ſtrongly than the fluxes in the former caſe; and turning it into a crocus; the antimony is hereby brought to a greater degree of purity, and rendered more efficacious than in the common *regulus*. See IRON, SULPHUR, &c.

This *regulus* is ſometimes farther purify'd by repeated fuſions and detonations, with the addition of freſh antimony, and more nitre, alternately: in which caſe it becomes *regulus antimonii ſtellatus* or *ſtarry regulus of antimony*.

REGULUS *of arſenic*. See the article ARSENIC.

REGULUS, in aſtronomy, is a ſtar of the firſt magnitude, in the conſtellation *leo*; called alſo from it's ſituation, *cor leonis*; or the lion's heart; by the Arabs, *alhabor*: and by the Chaldeans, *kalbeleced* or *kalbelceeid*, from an opinion of it's influencing the affairs of the heavens; as is obſerved by Theon. See STAR.

The longitude of *regulus*, as fixed by Mr Flamſteed, is 25°, 31′, 20″; and it's latitude 0°, 26′, 38″, North. See LEO.

REHABILITATION, REHABILITATIO, in the civil and canon law, an action whereby a prince or pope, by diſpenſations or letters patents, reſtores a delinquent to the condition he was in before his delinquency. See DEGRADATION, &c.

The king alone can *rehabilitate* an officer noted, condemned and degraded; or a gentleman who has derogated from his rank. See NOBILITY.

The pope alone pretends to *rehabilitate*, *i. e.* to render capable of benefices and orders, ſuch as had fallen into hereſy, or other irregularities.

In Romiſh countries, an eccleſiaſtic who aſſiſts at the execution of a ſentence of death, is to be *rehabilitated*, by an abſolution, called a *ſævis*. See ABSOLUTION.

REHEARSAL, in muſic and the drama, an eſſay or experiment of ſome compoſition, made in private, previous to the repreſentation or performance thereof in public; to habituate the actors or performers, and make them more ready and perfect in their parts—There is a new tragedy in *rehearſal* — the *rehearſal* of the anthem, &c.

REI *domeſticæ domeſticus*. See DOMESTICUS.

REIMBURSEMENT, in commerce, the act of repaying, or returning what monies a perſon had received, by way of advance, &c. or what another has diſburſed or paid for us.

A perſon who gives a bill of exchange in payment, is to *reimburſe* it, if it come to be proteſted, for want of being accepted or paid. See BILL, PROTEST, &c.

REIMBURSING is alſo uſed for paying the price a commodity coſts it's owner —Thus, he has ſurrendred to me the lot of merchandize adjudged to him at the ſale at London, by the directors of the Eaſt-India company on condition of *reimburſeing* the price of the purchaſe, with the expences of carriage, and a profit of 5 per cent.

REINFORCED, or RENFORCED, *ring*, of a canon, is that next after the trunnions, betwixt them and the touchhole. See ORDNANCE, CANNON, &c.

REINFORCEMENT, in war, a ſupply, or new proviſion of men, arms, ammunition, &c.

REINTEGRATION. See the article REDINTEGRATION.

REINS *, in anatomy, the kidneys; or that part of an animal whereby the urine is ſeparated from the blood. See KIDNEYS. See alſo URINE.

> * The word according to Varro, is formed from the Greek, ῥειν, *quaſi rivi obſceni humoris ab iis oriantur* — The Greeks call the *rein*, νεφρος, from the verb, νεφειν, to rain, ſnow, &c. See NEPHRITIC.

In the manage they ſay, a horſe ſhould have *double reins*; which is when he has them a little more elevated on each ſide of the back-bone, than upon it; ſo that paſſing your hand along it, you find it large, well furniſhed and double, by the hollow that goes all along the back-bone —The back ſhould be firm, and not hollow, or bending from the withers to the croup, but ſtraight. See HORSE.

REINS, of a bridle, alſo denote two ſtraps of leather meeting in the bridle-hand of the horſeman, in order to make the bit bear, and keep the horſe under ſubjection. See BRIDLE.

Falſe **REINS** is a lath of leather, paſſed ſometimes through the arch of the banquet, to bend the horſe's neck.

REINS of a *vault*. See the article VAULT.

REINSTATING, the reſtoring of a perſon or thing to it's former ſtate or condition, from whence it had been diſturbed or diſplaced. See REHABILITATION, &c.

REJOINTING, or REJOYNTING, in architecture, the filling up the joints of the ſtones in old buildings, &c. when worn hollow by courſe of time, or weather.

Rejointing is performed by the beſt mortar; as that of lime, and cement; ſometimes, alſo with plaiſter, as in the joints of vaults, &c. See MORTAR, &c.

REJOYNDER, in law, the defendant's anſwer to the plaintiff's replication. See REPLICATION, and SURREJOYNDER.

The order in the court of chancery is thus—Firſt the defendant puts in an anſwer to the plaintiff's bill, which is ſometimes alſo called an *exception*: the plaintiff's anſwer to this is called a *replication*; and the defendant's anſwer to that, a *rejoynder*; anſwering to what the civilians call *duplicatio*. See CHANCERY, &c.

REIS, RE, or RES. See the article REE.

REITERATED *grafting*. See ENGRAFTING.

REITERATING, in printing. See PRINTING.

REITERATION, the act of repeating a thing, or doing it a ſecond time. See REPETITION.

The church does not allow of the *reiteration* of baptiſm. See BAPTISM — St Gregory obſerves, that it is no *reiteration* when there are wanting proofs of the thing's being regularly done before. See REBAPTISANTS.

In pleuriſies, the phyſicians order the bleeding to be *reiterated* ſix or ſeven times. See PLEURISY.

REITTERS, an antient title given the German cavalry—The word is originally high Dutch, and ſignifies a horſeman, cavalier, or even knight.

RELAPSE, a return or back-ſliding into a danger, or evil; out of which a perſon had eſcaped.

Fevers, dropſies, *&c.* are diſeaſes into which *relapſes* are very frequent and dangerous—Such a perſon is relapſed into a hereſy he had abjured.

RELATION *, RELATIO, in philoſophy, the mutual reſpect of two things; or what each is, with regard to the other.

* The word is formed *a referendo*; *relation* conſiſting in this, that one thing is *referred* to another: whence it is alſo called *reſpect*, *habitude*, *compariſon*, &c. See COMPARISON and HABITUDE.

The idea of *relation* we acquire, when the mind ſo conſiders any thing, that it doth, as it were, bring it to, and ſet it by, another; and carry it's view from the one to the other—Hence the denominations given to things intimating this reſpect are called *relatives*; and the things ſo brought together, are ſaid to be *related*. See IDEA.

Thus when I call Caius, *huſband*; or this wall *whiter*; I intimate ſome other perſon or thing in both caſes, with which I compare *him* or *it*—Hence the wall is called by the ſchoolmen, the *ſubject*; the thing it exceeds in whiteneſs the *term*; and the whiteneſs the *foundation* of the *relation*.

Relation may be conſidered two ways; either on the part of the mind referring one thing to another; in which ſenſe *relation* is only a mode or affection of the mind, whereby we make ſuch compariſon: or on the part of the things referred, which being no other than ideas, *relation*, in this ſenſe, is only a new idea reſulting or ariſing in the mind, upon conſidering of two other ideas—So that *relation*, take it as you will, is only the mind; and has nothing to do with the things themſelves.

Any of our ideas, Mr Lock obſerves, may be the foundation of *relation*—Though where languages have failed to give correlative names, the *relation* is not eaſily taken notice of: as in concubine, which is a *relative* name, as well as wife.

There is, in effect, no idea but is capable of an infinite number of *relations*: thus one ſingle man may at once ſuſtain the *relations* of father, brother, ſon, huſband, friend, ſubject, general, European, Engliſhman, iſlander, maſter, ſervant, bigger, leſs, *&c.* to an almoſt infinite number; he being capable of as many *relations*, as there can be occaſions of comparing him to other things, in any manner of agreement or diſagreement, or any reſpect whatſoever.

The ideas of *relations* are much clearer and more diſtinct, than of the things *related*: becauſe the knowledge of one ſimple idea is oftentimes ſufficient to give the notion of a *relation*: but to the knowing of any ſubſtantial being, an accurate collection of ſundry ideas is neceſſary. See SUBSTANCE.

The perception we have of the *relations* between various ideas wherein the mind acquieſces, makes what we call *judgment*—Thus when I judge 2 times 2 make 4, or does not make 5; I only perceive the equality between 2 times 2 and 4; and the inequality between 2 times 2 and 5. See JUDGMENT.

The perception we have of the *relations* between the *relations* of various things, conſtitutes what we call *reaſoning*—Thus when from this, that 4 is a ſmaller number than 6; and that twice 2 is equal to 4; I gather that twice 2 is a leſs number than 6; I only perceive the *relation* of the numbers twice 2 and 4, and the *relation* of 4 and 6. See REASONING.

The ideas of cauſe and effect we get from our obſervation of the viciſſitude of things, while we perceive ſome qualities or ſubſtances begin to exiſt, and that they receive their exiſtence from the due application and operation of other beings—That which produceth, is the cauſe; that which is produced, the effect. See CAUSE and EFFECT.

Thus fluidity in wax is the effect of a certain degree of heat, which we obſerve to be conſtantly produced by the application of ſuch heat.

The denominations of things taken from time, are for the moſt part only *relations*—Thus when it is ſaid, that queen Elizabeth lived ſixty-nine, and reigned forty-five years, no more is meant, than that the duration of her exiſtence was equal to ſixty-nine, and of her government to forty-five annual revolutions of the ſun: and ſo are all words anſwering to how long.

Young and old, and other words of time, that are thought to ſtand for poſitive ideas, are indeed *relative*; and intimate a *relation* to a certain length of duration, whereof we have the idea in our minds—Thus we call a man young or old, that hath lived little or much of that time, which men uſually attain to: and thus a man is called young at twenty, but an horſe old, *&c.*

There are other ideas, that are truly *relative*, which we ſignify by names that are thought poſitive and abſolute; ſuch as great and little, ſtrong and weak—The things thus denominated, are referred to ſome ſtandards with which we compare them: thus we call an apple *great*, which is bigger than the ordinary ſort of thoſe we have been uſed to; and a man *weak*, that has not ſo much ſtrength or power to move, as men uſually have, or thoſe of his own ſize.

Authors give various diviſions of *relations*—The ſchool philoſophers commonly divide them into thoſe of *origination*, under which are comprehended the *relations* of cauſe and effect: thoſe of *negation*, which are between oppoſite things: and thoſe of *affirmation*, which are *relations* of agreement between whole and part, the ſign and thing ſignified, the adjunct and ſubject—This diviſion is founded upon this, that the mind can only compare things three ways, *viz.* by inferring, denying, and affirming.

Others divide *relations* into thoſe of *origination*; thoſe of *agreement*, e. gr. ſimilitude, parity, *&c.* thoſe of *diverſity*; and thoſe of *order*, as priority, poſteriority, *&c.*

Others divide them into *predicamental*, and *tranſcendental*.—Under the firſt come thoſe *relations* between things that belong to the ſame predicament; *e. gr.* between father and ſon. To the latter belong thoſe which are more general than the predicaments, or are of different predicaments; as the *relations* of ſubſtance and accident; of cauſe and effect; of creator, and creature. See TRANSCENDENTAL, *&c.*

Mr Lock gives us a diſtribution of *relations* on a different bottom—All ſimple ideas, he obſerves, wherein are parts or degrees, afford an occaſion of comparing the ſubjects wherein they are, to one another, in reſpect of thoſe ſimple ideas: as, whiter, ſweeter, more, leſs, *&c.*—Theſe, depending on the equality and exceſs of the ſame ſimple idea, in ſeveral ſubjects, may be called *proportional relations*.

Another occaſion of comparing things being taken from the circumſtances of their origin, as father, ſon, brother, *&c.* Theſe may be called *natural relations*.

Sometimes the foundation of conſidering things, is ſome act whereby any one comes by a moral right, power, or obligation to do ſomething: ſuch are general, captain, burgher; theſe are *inſtituted* and *voluntary relations*, and may be diſtinguiſhed from the natural, in that they are alterable and ſeparable from the perſons to whom they ſometimes belonged, though neither of the ſubſtances ſo related be deſtroyed. But *natural* relations are not alterable, but are as laſting as their ſubjects.

Another *relation* is the conformity or diſagreement of men's voluntary actions to a rule, to which they are referred, and by which they are judged of: theſe may be called *moral relations*.

It is this conformity or diſagreement of our actions to ſome law (whereby good or evil is drawn on us from the will and power of the law-maker, and is what we call *reward* or *puniſhment)* that renders our actions morally good or evil. See GOOD and EVIL.

Of theſe moral rules or laws, there ſeem to be three ſorts, with their different enforcements. Firſt, the divine law: ſecondly, civil law: thirdly, the law of opinion or reputation. By their *relation* to the firſt, our actions are either ſins or duties. To the ſecond, criminal or innocent; to the third, virtues or vices. See SIN, VIRTUE, VICE, *&c.*

RELATION, in logic, is an accident of ſubſtance; accounted one of the ten categories or predicaments. See PREDICAMENT and CATEGORY.

Each ſubſtance admits of an infinity of *relations*—Thus the ſame Peter, conſider'd with regard to Henry, is in the *relation* of a maſter; with regard to John, in that of a tenant; with regard to Mary, in that of a huſband, *&c.* Again, with regard to one perſon, he is rich, with regard to another poor; with regard to another, he is far, near, tall, ſhort, a neighbour, ſtranger, learned, unlearned, good, bad, equal, *&c.*

It is diſputed among the ſchool philoſophers, whether or no the *relation* be a thing formally and really diſtinct from the foundation of the ſubſtance? See SUBSTANCE.

RELATION, is alſo uſed in the ſchool theology, to denote certain of the divine perfections, called *perſonal* ones; in regard by theſe one divine perſon is referred to another, and diſtinguiſhed from it. See PERSON.

Hence they teach, that in God there is one nature, two proceſſions, three perſons, and four *relations*. See TRINITY.

Theſe *relations* are paternity, filiation, active ſpiration, and paſſive ſpiration. See PATERNITY, *&c.* See alſo FATHER, SON, SPIRIT, *&c.*

RELATION, in geometry, arithmetic, *&c.* is the habitude, or reſpect of two quantities to one another, with regard to their magnitude—This we more uſually call *ratio*, *reaſon*. See RATIO.

The equality or ſameneſs of two ſuch *relations*, we call *proportion*. See PROPORTION.

RELATION, in grammar, is the correſpondence which words have to one another in conſtruction. See CONSTRUCTION.

Faulty and irregular *relations* are the things chiefly to be guarded againſt, in writing correctly; they make the ſenſe obſcure, frequently equivocal—Thus: the orator was attended to with a coldneſs, which was the more remarkable, as the audience were under ſome emotion before he began. —Here coldneſs being put indeterminately, the relative *which* can have no juſt and regular *relation* thereto. See RELATIVE.

RELATION is alſo frequently uſed for analogy, or what ſeveral things have in common. See ANALOGY.

In painting, architecture, *&c.* a certain *relation* of the ſeveral parts and members of the building or picture, conſtitutes what we call *ſymmetry*. See SYMMETRY.

RELATION *inharmonical*, in muſical compoſition, is that whoſe extremes form a falſe, or unnatural interval, incapable of being ſung.

This is otherwiſe called a *falſe relation*, and ſtands oppoſed to a *juſt* or *true relation*.

RELATION, in law, is where two things, as times, *&c.* are conſidered, as if they were one; the thing ſubſequent being conſidered as taking effect, by *relation*, at the time preceding.

As if *A* deliver a writing to *B*, to be delivered to *C*, as the deed of *A*; the writing ſhall be deemed to be delivered to *C*, at the time when it was given to *B*, by *relation*.

So bills in parliament to which the king aſſents on the laſt day of parliament, ſhall *relate*, and be of force from the firſt day thereof. Coke calls it *fictio juris*. See DAY, TIME, *&c.*

RELATIVE *propoſitions*, are ſuch as include ſome relation and compariſon. See PROPOSITION.

Thus, where the treaſure is, there will the heart be—As much as thou haſt, ſo much thou art worth, *&c.* are *relative propoſitions*.

RELATIVE *gravity*. See GRAVITY.

RELATIVE *levity*. See LEVITY.

RELATIVE *motion*. See MOTION.

RELATIVE *neceſſity*. See NECESSITY.

RELATIVE *place*. See PLACE.

RELATIVE *ſpace*. See SPACE.

RELATIVE *time*. See TIME.

RELATIVE *velocity*. See VELOCITY.

RELATIVE *terms*, in logic, are words which imply a relation, or a thing conſidered as compared to another. See RELATION and CORRELATIVE.

Relative terms include a kind of oppoſition between them; yet ſo, as that the one cannot be without the other.

Such are *father* and *ſon*, *huſband* and *wife*, *king* and *ſubjects*, *&c.*

RELATIVE in grammar, is a word or term which in the conſtruction anſwers to ſome word foregoing, called the *antecedent*. See ANTECEDENT,

Pronoun RELATIVE, which Buffier chuſes rather to call *modificative* or *determinative*, is a particle added after a noun, or perſonal pronoun, with which it has an affinity, ſo that without them it ſignifies nothing; it's only uſe being to expreſs in what view they are conſidered. See PRONOUN.

Of this kind, in the Latin, are *qui*, *quæ*, *quod*, &c. in the Engliſh, *who*, *which*, *whom*, &c. As in the book *which* you are reading; the man *whom* you ſeek; he *who* told it, *&c.* —Where *which*, *whom* and *who* only follow the noun, or pronoun, to refer or determine them to ſome particular thing; as to ſeeking, reading, *&c.*

Frequently, the noun or pronoun, wherewith the *relative* is joined, is underſtood: as *I know who* did that. Where it is evident I mean, I know the perſon who did, *&c.*

RELAXATION, RELAXATIO, in medicine, *&c.* the act of looſening or ſlackening the tone or tenſion of the fibres, nerves, muſcles, *&c.* See TENSION, TONE, *&c.* See alſo FIBRE.

The *relaxation* of a muſcle is ſuppoſed to be effected, either by the perſpiration of the nervous ſpirits, or the regreſs of the ſpirits, blood, *&c.* which inflated it's fibres; or by the contraction of the air, in the globules of blood before expanded by the ſudden influx and admixture of the ſpirits, *&c.* See MUSCLE and MUSCULAR *motion*.

RELAXATION, in chirurgery, is a preternatural extenſion, or ſtraining of a nerve, tendon, muſcle, or the like; either through violence or weakneſs.

Hernias are deſcents or *relaxations* of the inteſtines, *&c.* See HERNIA—From the ſame cauſe ariſe deſcents or prolapſions of the anus, *&c.* See PROCIDENTIA.

RELAXATION, in law, is uſed for a *releaſing*. See RELEASE.

In this ſenſe we ſay the *relaxation* of an attachment in the court of admiralty.

The tenor of indulgences is a *relaxation*, or diminution of the pains of purgatory. See INDULGENCE.

RELAY, a freſh equipage, horſe, *&c.* ſent before, or appointed to be ready, for a traveller to change; to make the greater expedition: as in riding poſt.

The term is borrowed from the French, *relais*, which ſignifies the ſame thing—In France, the general of the poſts, entitles himſelf ſuperintendant of the *relays*.

RELAYS, in hunting, are freſh ſets of dogs, or horſes, or both, diſpoſed here and there, for readineſs, in caſe the game come that way; to be caſt off, or to mount the hunters; in lieu of the former, which are ſuppoſed to want reſpite. See HUNTING.

RELAY, in tapiſtry, is an opening left in a piece of tapiſtry, where the colours or figures are to be changed; becauſe on thoſe occaſions the workmen are changed; or elſe, the places are left to be filled up till the reſt of the work is done. See TAPITRY.

RELEASE, RELAXATIO, in law, denotes an inſtrument, whereby eſtates, rights, titles, entries, actions, and other things are ſometimes extinguiſhed and annulled, ſometimes transferred, ſometimes abridged, and even ſometimes enlarged. A *Releaſe* is either in fact or in law—A *releaſe in fact* is that which the very words do expreſly declare.

A *releaſe in law*, is that which acquits by way of conſequence, or intendment of law. See INTENDMENT.

RELEGATION, RELEGATIO, a kind of exile or baniſhment, wherein the obnoxious perſon is commanded to retire to a certain place preſcribed, and to continue there till he be recalled. See EXILE.

Lord Coke calls *relegation* a baniſhment for a time only: Courtin more adequately defines *relegation* a baniſhment to a certain place for a certain term.

In Rome, *relegation* was a leſs ſevere puniſhment than deportation, in that the *relegated* perſon did not thereby loſe the rights of a Roman citizen, nor thoſe of his family, as the authority of a father over his children, *&c.* See BANISHMENT.

RELICS, RELIQUIÆ, in the Romiſh church, certain remains of the bodies or clothes of ſome ſaint or martyr, devoutly preſerved in honour to his memory, carried at proceſſions, kiſſed, revered, *&c.* See SAINT, MARTYR, PROCESSION, *&c.*

The abuſes in point of *relics* are moſt flagrant: F. Mabillon, a Benedictin, complains of the great number of ſuſpected *relics* expoſed on altars: he owns that were there to be a ſtrict inquiſition into the *relics*, vaſt numbers of ſpurious ones would be found offered every where to the piety and devotion of the faithful; and adds, that bones are frequently conſecrated, ſo far from belonging to ſaints, that in all probability they do not belong to chriſtians.

The catacombs are an inexhauſtible fund of *relics*; yet it is ſtill diſputed who were the perſons interred therein? See CATACOMB.

In the eleventh century, a method was introduced of trying ſuppoſed *relics* by fire—Thoſe which did not conſume in the fire were reputed genuine; the reſt not. See PURGATION, ORDEAL, JUDICIUM *Dei*.

It is an antient cuſtom, which ſtill obtains, to preſerve the *relics* in the altars whereon maſs is celebrated—To this purpoſe, a ſquare hole is made in the middle of the altar, big enough to receive the hand; and herein is the *relic* depoſited, wrapped in red ſilk, and incloſed in a leaden box. See ALTAR.

The Romaniſts alledge a good deal of antiquity in behalf of their *relics*.—The Manichees, it ſeems, out of hatred to the fleſh, which they held an evil principle, are recorded as refuſing to honour the *relics* of ſaints; which is eſteemed a kind of proof that the Catholics did it in the firſt ages. See MANICHEE.

Indeed folly and ſuperſtition got into religion but too early. —Even the touching of linen cloaths on *relics*, from an opinion of ſome extraordinary virtue derived therefrom, appears to be as antient as the firſt ages; there being a hole made in the coffins of the forty martyrs at Conſtantinople, expreſly for this purpoſe.

RELICT, RELICTA, in law. See the article WIDOW.

RELICTA *verificatione*, in law, is when a defendant relinquiſhes his proof or plea; and thereupon judgment is entered for the plaintiff.

RELIEF, RELEVIUM, *levamen*, in law, a fine paid to the chief lord, by a perſon at his coming to the inheritance of land held in capite, or by military ſervice. See FINE, LORD, TENURE, *&c.*

This was ſaid *relevare hæreditatem caducam*, and the money thus paid was called *relevamen*, *relevium*, or *relief*—*Relief* is uſually to the value of a year's rent or revenue.

The origin of the cuſtom is thus—A feudatory or beneficiary eſtate in lands, being at firſt only granted for life; after the death of the vaſſal it returned to the chief lord, and was hence called *feudum caducum*, q. d. fallen to the lord by the death of the tenant. See FEE.

In courſe of time theſe feudatory eſtates being converted into inheritances by the connivance and conſent of the lord; when the poſſeſſor of ſuch eſtate died it was called *hæreditas caduca*, q. d. an inheritance fallen to the lord; from whom it was to be recovered, by the heirs paying a certain ſum of money.

This *relief* was eſtabliſhed after the conqueſt — For till that time *bariots* were paid the lord, at the death of his tenant; conſiſting of horſes, arms, *&c.* See Hariot.

But upon the conqueſt, the poor people being deprived of all ſuch things by the Normans, a ſum of money was ſubſtituted in lieu thereof, which was called a *relief*; and continues in ſome places to this day—However, it is true, *relief* and *hariot* are frequently confounded in antient writers.

Relief *reaſonable*, called alſo *lawful*, and *antient relief*, is that enjoined by ſome law, or fixed by ancient cuſtom; and which does not depend on the will of the lord.

Thus in a charter of king John, mentioned by Matt. Paris—*Si quis comitum vel baronum noſtrorum ſive aliorum tenentium de nobis in capite per ſervitum militare, mortuus fuerit & cum deceſſerit, hæres ſuus plenæ ætatis fuerit &* relevium *debeat, habeat hæreditatem ſuam per* antiquum relevium.

What this was may be ſeen in the laws of William the Conqueror *&c.* — Bracton ſays, this fine was called a *relief quia hæreditas quæ jacens fuit per anteceſſoris deceſſum* relevatur *in manus hæredum*, &c.

A *relief* is alſo paid in ſoccage tenure, or petit ſerjeanty; where a rent or other thing is paid by rendering as much as the rent or payment reſerved.

By the cuſtom of Normandy, *relief* is due for lands held in villenage, as well as in fee—By the cuſtom of Paris, *relief* is not due upon inheritances in the direct line.

The quantity of the *relief* is very different: there are *ſingle reliefs*, *double reliefs*, &c. The quality, too, is diverſe: there are *reliefs of property*, paid by the heir: *reliefs of bail*, or *tutorage*, paid by a guardian for his minor, or by the huſband for the fiefs of his wife, *&c.* *Relief of horſe and arms*, &c.

By the laws of king Canutus, the *relief* of an earl, paid to the king, was eight war-horſes with their bridles and ſaddles, four cuiraſſes, four helmets, four ſwords, four hunting-horſes and a palfrey — The *relief* of a baron or thane was four horſes, *&c.*

Relief, in chancery, denotes an order ſued out for the diſſolving of contracts and other acts, on account of their being unreaſonable, prejudicial, grievous, or from ſome other nullity either *de jure*, or *de facto*. See Chancery and Equity.

Minors obtained *relief* againſt acts paſſed in their minority — Majors have *relief* in caſes of enormous damage, deceit, violence, over-reaching, extravagant bargains, *&c.*

Among the Romaniſts, it is a rule, that the church obtains *relief* any time, and againſt all acts paſſed in it's prejudice; no preſcription prevailing againſt it. See Preſcription.

Aid de Relief. See the article Aid.

Relief of a hare, among hunters, is the place were ſhe goes to feed in the evening. See Hunting.

Relief, in ſculpture. See the article Relievo.

RELIEVE, in the military ſenſe — To *relieve* is to take the poſt of another body—Hence, to *relieve* the guard, to *relieve* the trenches, *&c.* is to bring freſh men upon the guard, or the trenches, and to ſend thoſe to reſt who have been upon duty before. See Guard, Trench, *&c.*—They alſo ſay, *relieve* a ſentinel, *relieve* the ſteers-man, *&c.*

RELIEVO, or Relief *imboſſment*, is applied to a figure which projects, or ſtands out, prominent, from the ground, or plain whereon it is formed; whether that figure be cut with the chiſſel, moulded, or caſt. See Sculpture, *&c.*

There are three kinds of *relievo*; viz. *alto*, *baſſo*, and *demi-relievo*.

Alto-Relievo, *haut relief*, or *high relievo*, is when the figure is formed after nature, and projects as much as the life.

Baſſo Relievo, *bas-relief*, or *low relievo*, is when the work is but raiſed a little from it's ground; as we ſee in medals, and in the frontiſpieces of buildings, particularly the hiſtories, feſtoons, foliages, and other ornaments in friezes.

Demy-Relievo, is when one half of the figure riſes from plane, *i. e.* when the body of a figure ſeems cut in two, and one half is clapped on a ground — When in a *baſſo relievo* there are ſome parts that ſtand clear out, detached from the reſt, the work is called a *demi-boſſe*.

Relievo, in architecture, denotes the ſally or projecture of any ornament. See Projecture.

This, Daviler obſerves, is always to be proportioned to the magnitude of the building it adorns; and the diſtance at which it is to be viewed.

If the work be inſulate and terminated on all ſides, it is call'd a *figure in relievo*, or a *round imboſſment*. Such are ſtatues, acroters, *&c.*

Relievo, in painting, denotes the degree of force or boldneſs whereby a figure ſeems, at a due diſtance, to ſtand out from the ground of the painting, as if really imboſſed.

The *relievo* depends much on the depth of the ſhadow and the ſtrength of the light; or on the height of the different colours bordering on one another; particularly on the difference of the colour of the figure from that of the ground. See Shadow, Colouring, *&c.*

When the light is well choſen, to make the neareſt parts or figures advance; and well diffuſed on the maſſes, ſtill diminiſhing inſenſibly, and terminating in a large ſpecious ſhadow, brought off inſenſibly; the *relievo* is ſaid to be *bold*, and the *clair-obſcure*, *well underſtood*. See Clair-Obscure.

RELIGION, Religio, that worſhip or homage due to God, conſidered as creator, preſerver, and redeemer of the world. See God, Theology, *&c.*

The foundation of all *religion* is, that there is a God, and that he requires ſome ſervice at the hands of his creatures — From the different manners wherein we arrive at the knowledge of this ſervice; *religion* is divided into *natural* and *revealed*.

Natural Religion, is whatever we deſcry to be due and meet by the meer dictates of natural reaſon; as, to love, and honour God, not to abuſe his creatures, *&c.* See Natural, Reason, Deist, *&c.*

Revealed Religion is what we learn to be due by ſome ſupernatural means; as by an expreſs declaration of God himſelf, by the mouths of prophets, *&c.* See Revelation, Prophecy.

The firſt flows immediately from the relation between the creature and the creator: the latter does not follow from ſuch a relation, but is ſuper-added from the meer will and pleaſure of the creator.

The firſt we ordinarily call *morality*, or *ethics*; becauſe immediately converſant about the manners and duties of men towards one another; and towards themſelves, conſidered as creatures of that being. See Morality, Ethics, *&c.*

The latter we call by way of eminence *religion*, as being the rule of our duty immediately to God himſelf. See Revelation.

The firſt ſuppoſes a God, a providence, a future ſtate, rewards and puniſhments: the latter likewiſe ſuppoſes an immediate miſſion from God himſelf, atteſted by miracles, *&c.* See Miracle.

Religion is more particularly uſed for that ſpecial ſyſtem of faith, and worſhip, which obtains in this, or that country; in this, or that ſect; this, or that age, *&c.*

In this ſenſe we ſay the Romiſh *religion*, the Reformed *religion*, the *religion* of the Greeks, the Mahometan *religion*, Jewiſh *religion*, &c. See Judaism, Mahometanism, *&c.* under their proper heads.

The Siameſe hold the diverſity of *religions*, i. e. the different manners of honouring God, to be pleaſing to him; inaſmuch as they have all the ſame object, all tend to the ſame end, though by different means. *Claude.*

The ſentiment of theſe idolaters is doubtleſs more juſt than that of our zealots, who hold all but thoſe of their own religion odious to God—Theſe ſeveral ſects in *religion* ſee under their proper articles: ſee alſo Sect.

The *religion* of the ruling part of the world — You may find a lively deſcription of it in a chorus in Seneca's Troas, at the end of the 2d act; beginning thus: *Verum eſt, an timidos fabula decipit? Umbras corporibus vivere conditis*, &c. This according to Patin is the religion of princes, and great men, of magiſtrates, monaſtic ſuperiors, and even ſome phyſicians and philoſophers. M. du Maine, head of the leaguers in France uſed to ſay that princes have no religion till after they are turned of 40 — *Cum numine nobis mors inſtans majore facit.* Patin. Lett. Chois. 106.

Religion, again, is applied to a military order, conſiſting of knights who live under ſome certain rule, *&c.* See Knight, Military, Order, *&c.*

In this ſenſe we ſay the *religion of Malta*, *&c.* See Malta.

Religion, is ſometimes alſo uſed for a convent — Thus we ſay, there are *religions* of men, *i. e.* monks; *religions* of women, *i. e.* nuns—There are new *religions* eſtabliſhed every day, *i. e.* new monaſteries built. See Monk, Monastery, *&c.*

The Religion uſed abſolutely denotes the reformed in France. —Thus they ſay, d'Ablancourt and Dacier, were of *the religion*. See Huguenot.

RELIGIOUS, in a general ſenſe, ſomething that relates to *religion*. See Religion.

We ſay, a *religious* life, *religious* ſociety, *&c.* See Society — Churches, and church-yards are *religious* places—A *religious* war is alſo called a *croiſade*. See War and Croisade.

Religious, is more particularly uſed for a perſon engaged by ſolemn vows to the monaſtic life; or a perſon ſhut up in a monaſtery to lead a life of devotion and auſterity, under ſome rule or inſtitution. See Vow and Order.

The male *religious* we popularly call *monks* and *friars*; the females, *nuns* and *canoneſſes*. See Nun, Monk, Canon, *&c.*

M. Nicole obſerves, that ſome domeſtic chagrins, and a certain pride, which leads people to abſcond when they cannot make a figure to their mind, makes as many *religious* as real piety—He adds, that a girl muſt be made a *religious* for no other reaſon, but becauſe ſhe cannot be married anſwerable to her condition.

A *religious* cannot make any will—By the council of Trent, a *religious* may reclaim his vows within five years. See RECLAIM.

Antiently the *religious* were all laymen, and it was even prohibited them to take up orders—In 1557 the parliament of Paris made a difficulty of receiving a biſhop of Laon to the oath of a duke and peer, by reaſon of his being a *religious:* yet a *religious* being promoted to a biſhopric, is thenceforth ſecularized or diſpenſed from the obſervation of his rule. See REGULAR.

In antient deeds and conveyances of lands, we often find the ſeller reſtrained from giving or alienating it, *viris religioſis vel Judæis*, to *religious* or to Jews; to the end the land might not fall into mortmain. See JUDAISM and MORTMAIN.

In a memorial directed by king John to his viſcounts, they are ordered to proclaim through their reſpective counties, that no body as they love their bodies and cattle, injure the *religious* or clerks, either in word or deed; on penalty of being hanged up on the next oak—*Nulli ſicunt diligunt corpora & catalla ſua malum faciant vel dicant* viris religioſis vel clericis—*Si quem inde attingere poſſimus ad proximam quercum eum ſuſpendi faciemus.*

RELIGIOUS *order*. See the article ORDER.

Moſt military orders pretend, likewiſe to be *religious*; as thoſe of Malta, who make vows, *&c.* See MALTA.

RELIQUA, the remainder or debet, which a perſon finds himſelf debtor in, upon the balancing and liquidating an account.

Hence, *reliquitary*, the debtor of a *reliqua*; as alſo a perſon who only pays piece-meal—The term *reliqua* is pure Latin.

RELIQUARY, a ſhrine or caſket, in which the relics of a dead ſaint are kept. See SHRINE, RELICS, *&c.*

RELIQUIÆ, RELICS, in antiquity, the aſhes and bones of the dead, which remained after burning their bodies; and which they very religiouſly gathered and put in urns, and afterwards depoſited in tombs. See ASHES, FUNERAL, *&c.*

REMAINDER, REMANENTIA, in law, an eſtate limited in lands, tenements, or rents, given to a perſon at ſecond hand, to be enjoyed after the deceaſe of another, to whom the ſame is given immediately, or at firſt hand.

A man grants lands to one for term of life, the *remainder* to another for the term of his life; which *remainder* may be either for a certain time, or in fee ſimple, or fee tail.

Spelman makes the difference between a *remainder* and *reverſion* to conſiſt in this; that by a reverſion, after the appointed term, the eſtate returns to the donor, or his heirs, as the proper fountain; whereas by *remainder* it goes to ſome third perſon, or ſtranger. See REVERSION.

Glanville obſerves, that biſhops and abbots, in regard their baronies are the king's alms, cannot give any part thereof by way of *remainder*. See BISHOP.

REMAINDER, in mathematics, is the difference; or that which is left after the taking a leſſer number, or quantity, from a greater. See SUBSTRACTION.

RE-MARRYING, the repeating of a marriage; or the going through the ſolemnities of a ſecond marriage. See MARRIAGE.

Clandeſtine and uncanonical marriages are deemed null; and the parties are to be *re-married* in form; at leaſt to avoid diſputes.

It was antiently expreſly forbid to *re-marry* in the firſt year of viduity—M. Bayle obſerves, that a perſon who does not *re-marry*, is anſwerable to the public for all the time loſt in his viduity, or widowerhood. See WIDOW.

REMEDY, REMEDIUM, in phyſic, a medicine, or preparation applied either internally or externally, for the cure of a diſeaſe. See MEDICINE.

Emplaſters, unguents, cataplaſms, *&c.* are *topical remedies.* See TOPICAL—Mercury and the bark are *ſpecific remedies.* See SPECIFIC—Mineral waters, and aſs's milk, and country-air, are uſually the *laſt remedies*—Salivation is ſometimes called by way of eminence, *the remedy.* See SALIVATION..

When *remedies* are ſtuffed with too many ingredients, they load the ſtomach with a ſlimy mucilage, which ſwells, obſtructs, and does more hurt than good. See PHARMACY.

REMEDIES *appended.* See the article APPENDED.

REMEMBRANCE, is when the idea of ſomething formerly known, recurs again to the mind, without the operation of a like object, on the external ſenſory. See MEMORY and REMINISCENCE, RECOLLECTION, *&c.*

REMEMBRANCERS, *of the exchequer*, are three officers, or clerks therein, formerly called *clerks of the remembrance.* See EXCHEQUER.

They are now diſtinguiſhed by the appellations of the *king's remembrancer*; the *lord treaſurer's remembrancer*; and the *remembrancer* of the *firſt fruits*—Their buſineſs is to put the lord treaſurer and juſtices of the court in *remembrance* of ſuch things as are to be called upon, and dealt in for the king's benefit.

The *king's* REMEMBRANCER enters into his office all recognizances taken before the barons, for any of the king's debts, for appearance, or for obſerving orders; and makes out proceſs againſt the collectors of cuſtoms, ſubſidies, and fifteenths, for their accounts—All informations upon penal ſtatutes are entered in this office, and there all matters upon Engliſh bills in the exchequer-chamber remain—He makes the bills of compoſition upon penal laws, takes the ſtatement of debts; has delivered into his office all manner of indentures, fines, and other evidences whatſoever that concern the aſſuring of any lands to the crown: he every year *in craſtino animarum*, reads, in open court, the ſtatute for election of ſheriffs, and gives them their oath, and reads the oath of all the officers of the exchequer, when they are admitted.

The *lord treaſurer's* REMEMBRANCER, is charged to make proceſs againſt all ſheriffs, eſcheators, receivers, and bailiffs, for their account: proceſs of fieri facias, &c. extent for any debts due to the king, either in the pipe, or with the auditors, and proceſs for all ſuch revenues as are due to the king, by reaſon of his tenures—He alſo makes record, whereby it appears whether ſheriffs, or other accomptants, pay their proffers due at Eaſter and Michaelmas—He makes another record, whether ſheriffs or other accomptants keep their days of prefixion: all eſtreats or fines, iſſues, and amerciaments, ſet in any of the courts of Weſtminſter, or at the aſſizes or ſeſſions, are certified into his office, and are by him delivered to the clerk of the eſtreats to write proceſs upon them, *&c.*

The REMEMBRANCER *of the firſt fruits*, takes all compoſitions and bonds for firſt-fruits and tenths; and makes proceſs againſt ſuch as do not pay the ſame. See FIRST-FRUITS.

REMINISCENCE, REMINISCENTIA, is that power of the human mind, whereby it recollects itſelf, or calls again to it's remembrance ſuch ideas or notions as it had really forgot: in which it differs from *memory*, which is a treaſuring up of things in the mind, and keeping them there, without forgetting them. See REMEMBRANCE.

Hence memory may be conſidered as a continual *remembrance*; and *remembrance*, as an interrupted memory. See MEMORY.

How near a-kin ſoever the two faculties may ſeem, yet they are generally found ſeparated; ſo that they who excell in the one, are defective in the other. See RECOLLECTION, RETENTION, *&c.*

The antient Platoniſts were of opinion, that all learning and knowledge conſiſted in the *reminiſcence* or recollection of notices which had been in the ſoul, before it's union with the body. See PLATONISM.

REMINISCERE, the ſecond ſunday in Lent; antiently thus called from the firſt word of the introit of the maſs ſaid for that day, *reminiſcere miſerationum tuarum.*

REMISIT—*Recto quando dominus* REMISIT. See RECTO.

REMISSION, REMISSIO, in phyſics, the abatement of the power or efficacy of any quality—In oppoſition to the increaſe of the ſame, which is called it's *intenſion.*

In all qualities capable of intenſion and *remiſſion*, the intenſion decreaſes reciprocally as the ſquares of the diſtance from the centre of the radiating quality increaſe. See QUALITY.

REMISSION, in medicine, is when a diſtemper abates, but does not go quite off, before it returns again; as is common in fevers which do not quite intermit. See FEVER.

REMISSION, in law, *&c.* denotes the pardon of a crime, or the giving up the puniſhment due thereto. See PARDON.

REMIT, in commerce—To *remit* a ſum of money, bill, or the like, is to ſend a ſum of money, *&c.* See REMITTANCE.

To *remit* is alſo uſed among bankers for what is accuſtomed to be given a banker, or as it were, diſcounted with him, for his giving a bill of exchange. See EXCHANGE.

To *remit* is alſo to give up part of one's due to a debtor; as, I would *remit* you a fourth of what you owe on condition of paying me the reſt in hand.

REMITTANCE, in commerce, the trafic or return of money from one place to another, by bills of exchange, orders, or the like. See COMMERCE, EXCHANGE, *&c.*

A *remittance* is properly a bill of exchange, or the like, ſent to a correſpondent, and the contents thereof to be received by him of ſome other perſon on whom it is drawn.

Such a merchant has *remitted*, or made a *remittance* of five thouſand pounds in banks notes, to his correſpondent at London—I will *remit* you, or make you a *remittance* of five hundred crowns in three bills of exchange, drawn on *N.* banker in your city, and payable at ſight.

By means of theſe *remittances*, large ſums of mony are returned from one city to another, without danger, without carriage, *&c.*

In London it is eaſy getting *remittances* upon any city in the world: in the country it is more difficult. *Remittances* are not eaſily had upon Copenhagen. See BILL *of exchange.*

Book of REMITTANCES. See the article BOOK.

REMITTANCE is alſo uſed in ſpeaking of the payment of a bill of exchange—Thus, I have received an hundred piſtoles on your *remittance*—Mr *N.* banker in your city, ſhould have paid you two hundred crowns on my *remittance.*

Remittance, alſo denotes the due or fee allowed the banker, both of his wages, and the different value of the ſpecies, in the place where you pay the money, and where he *remits* it.

The *remittance* at London is very high—This *remittance* is more uſually called *change* and *rechange*. See Rechange.

REMITTER, in law—Where a man has two titles to land, and is ſeiſed by the latter; and that proving defective, he is *remitted* or reſtored to the former more antient title: this is called a *remitter*, from the Latin, *remittere*, to ſend back.

If land deſcend to him that had right to it before, he ſhall be *remitted* to his better title if he pleaſe. *Doctor* and *ſtudent.*

REMITTING *fever*. See the article Fever.

REMONSTRANCE, an expoſtulation or humble ſupplication addreſſed to king, or other ſuperior; to beſeech him to reflect on the inconveniences, or ill conſequences of ſome order, edict, or the like.

The parliament of Paris went in a body to make humble *remonſtrances* to the king, on the ſubject of ſuch a declaration.

Remonstrance, is alſo uſed for an expoſtulatory council or advice; or a gentle, handſome reproof, made either in general or particular, to apprize or to correct ſome fault—A mother makes *remonſtrances* to her daughter, *&c.*

REMONSTRANTS, Remonstrantes, a title given to the Arminians, by reaſon of the *remonſtrance* they made in 1610, againſt the ſynod of Dort, wherein they were condemned. See Arminian.

Epiſcopius and Grotius were at the head of the *remonſtrants*. See Contra-remonstrants.

REMORA, in natural hiſtory, the *ſucking fiſh*; a little fiſh, reſembling a herring, with creſt and fins; called by the Greeks, *echeneis*: famous for ſticking to the ſides of ſhips.

It is much talked of by the antients; who, as we find from *Pliny, lib.* 32. *c.* 1. unanimouſly believed it had the force to ſtop a veſſel in full ſail, or a whale in ſwimming: and hence called *remora*, a *remorando*—But Mr Cateſby obſerves that even ſeveral of thoſe fiſhes together can do no more than ſhells or corals and other foulneſſes of the ſame bulk, which make a ſhip ſomewhat the ſlower—And in the ſame manner they may be ſome ſmall hindrance to a whale. The author laſt mentioned aſſures us he has taken five of them off the body of a ſhark. Vid. Phil. Tranſ. N° 438. p. 113.

Remora, among ſurgeons, is alſo an inſtrument to ſet broken bones withal. See Fracture.

REMOUNT, in war—To Remount *the cavalry*, is to furniſh troopers, or dragoons with freſh horſes, in lieu of ſuch as have been killed or diſabled in the ſervice.

REMPLY, in heraldry, ſomething *filled up*—The term is chiefly uſed to denote that the chief is quite filled up with a ſquare piece of another colour, leaving only a bordure of the proper colour of the chief about the ſaid piece.

RENAL, Renalis, ſomething belonging to the reins, or kidneys. See Kidney.

Renal *glands*, *glandulæ* Renales, in anatomy, are glands thus called, becauſe ſituate near the reins or kidneys; firſt diſcovered by Bar. Euſtachio, native of San Severino in Italy. See Gland.

They are alſo called *capſulæ atrabilares*, in regard their cavity is always found full of a blackiſh liquor; and by others *renes ſuccenturiati*, becauſe reſembling kidneys in form. See Renes *ſuccenturiati*.

RENCOUNTER*, in the military art, the encounter of two little bodies or parties of forces.

* The word is formed from the French, *rencountre*, meeting.

In which ſenſe *rencounter* is uſed in oppoſition to a pitched battle—It was no battle; it was only a *rencounter*.

Rencounter, in ſingle combats, is uſed by way of contradiſtinction to duel.

When two perſons fall out, and fight on the ſpot, without having premeditated the combat, it it is called a *recounter*—It is no duel, it is a *rencounter*. See Duel.

Rencountre, or Rencontre, in heraldry, is applied to animals when they ſhew the head in front, with both eyes, *&c.* or when the face ſtands right forward, as if they came to meet the perſon before them.

Indeed in deer, this is called *maſſacré*, and in the leopard it is the natural ſituation—He bears ſable, in *rencounter*, a golden fleece.

RENDER, in law, a term uſed in levying a fine—A fine with *render*, is that whereby ſomething is *rendered back* again, by the cogniſee to the cogniſor. See Fine.

The lawyers alſo ſay, there are certain things in a manour which lie in *prender*, i. e. may be taken by the lord or his officers when they pleaſe, without the tenant's leave: and others which lie in *render*, that is, muſt be *rendered* or anſwered by the tenant, as rents, reliefs, heriots, and other ſervices. See Prender—Some ſervice conſiſts in ſeiſance; ſome in *render*. *Perkins*.

RENDERING, in building. See Pargetting.

RENDEZ-VOUS, or Rendevous, a place appointed to meet in at a certain day and hour.

The word is French; and is found ſo commodious, that moſt nations uſe it in it's purity, for want of a word of equal import in their reſpective languages—The virtue of a woman is already ſhaken when ſhe grants a *rendezvous*. St. Evremont.

A general *rendezvous* of the army—The regiments have their particular *rendezvous*, called *quarters of aſſembly*. See Quarter.

RENEGATE, Renegado, a perſon who has apoſtatized or renounced the chriſtian faith, to embrace ſome other religion; particularly Mahometaniſm. See Apostate.

It is the *renegado*'s who prove the moſt barbarous to the chriſtians when they fall into their hands—The *renegate* is thus called, *quaſi re-negat-Chriſtum*—Hoveden mentions it in the year 1192, under the name of *reneer*, from the French, *renier*, to deny again.

RENES *ſuccenturiati*, in anatomy, are glands thus called as reſembling the figure of the kidneys; and hence accounted a kind of *ſecondary reins*; *ſuccenturiatus* ſignifying ſomething in the place of another.

They are alſo called *capſulæ renales*, and *glandulæ renales*. See Renal *glands*.

RENEWING of leaſes and lives. See Reversion, Annuity, Political *arithmetic*, *&c.*

RENITENCY, Renitentia, or Renisus, among philoſophers, that force in ſolid bodies, whereby they reſiſt the impulſe of other bodies; or react as much as they are acted on. See Reaction. See alſo Resistance.

RENNET. See the article Runnet.

RENT*, Redditius, in law, a ſum of money, or other conſideration iſſuing yearly out of lands or tenements, alienated on that condition. See Revenue.

* It is thus called from the corrupt Latin, *rendita*, for *reddita* of *redditus*; becauſe, as Fleta tells us, *retroit & quotannis redit*.

The *rents*, of all the lands of England and Wales appear by the computations of Dr Davenant and Mr King, from the late land-tax, to be nearly ten millions per annum; thoſe of the houſes not let with the lands, two millions more; and thoſe of all other hereditaments, two millions more: in all fourteen millions.

The lawyers ordinarily reckon three ſorts of *rent*; viz. *rent-ſervice*, *rent-charge*, and *rent-ſeck*.

Rent-*ſervice*, is where a man holds lands of his lord by fealty, and certain rent; or by fealty-ſervice, and certain rent; or that which a man making a leaſe of lands to another for term of years, reſerveth to be yearly paid for them. See Service, Fealty, Reserve, *&c.*

Rent-*charge*, is where a man makes over his eſtate to another by deed indented, either in fee, or fee-tail, or for term of life; yet reſerves to himſelf, by the ſame indenture, a ſum of money yearly to be paid to him, with a cauſe of diſtreſs for non-payment.

Rent-*ſeck*, or *Dry*-Rent, is that which a man making over his eſtate by a deed indented, reſerveth yearly to be paid to him, without any cauſe of diſtreſs mentioned in the indenture.

Rents *of aſſize*, are the certain rents of freeholders, and antient copyholders: thus called becauſe aſſized and certain: in oppoſition to *redditus mobiles*.

Rents *reſolute*, are reckoned among the fee-farm *rents* to be ſold by the *Stat.* 22. *Car.* II. being ſuch *rents* or tenths as were antiently payable to the crown from the lands of abbies and other religious houſes: which lands, upon the diſſolution of abbies, being demiſed to others, the ſaid *rents* were ſtill reſerved and made payable to the crown.

Aſſart Rents.	See the articles	Assart.
Chauntry Rents.		Chauntry.
Gild Rents.		Gild.
Paſchal Rents.		Paschal.
Quit Rents.		Quit.
White Rents.		White.

RENTER-*warden*, an officer in moſt of the companies of London; whoſe buſineſs is to receive the rents or profits belonging to the company. See Treasurer, Receiver, Cashier, *&c.*

RENTERING*, and Fine-drawing, in the manufactories, the ſewing of two pieces of cloth, edge to edge, without doubling them; ſo as that the ſeam ſcarce appears at all: hence alſo called *fine-drawing*. See Fine-drawing.

* The word is formed from the French, *rentraire*, which ſignifies the ſame thing; and which Menage after Salmaſius derives from the Latin *retrahere* of *re*, in, and *trahere*, by reaſon the ſeam is drawn out of ſight and covered.

Serges, *&c.* are to be ſewed; cloths *fine-drawn.*—The author of one of the *Lett. Edif. & Cur.* ſpeaking of the great dexterity of the *fine-drawers* in the Eaſt-Indies, aſſures us, that if you tear a piece of fine muſlin, and give it one of them to mend, it ſhall be impoſſible for you to diſcover the place where it is rejoined, even though you had made a mark to know it by.

The dexterity of our own *fine-drawers* though inferior to that above mentioned is neverthelefs ſuch, as puts them in a condition to defraud the king, by ſowing a head or ſlip of Engliſh cloth on a piece of Dutch, Spaniſh, or other foreign cloth; or a ſlip of foreign cloth on a piece of Engliſh, ſo as to paſs the whole as of a piece; and by that means avoid the duties, penalties, *&c.*—The trick was firſt diſcovered in France, by M. Savary, author of the *Diction. de Commerce.*

To *renter* in tapiſtry, is to work new warp into a piece of tapiſtry damaged, eaten by the rats, *&c.* and on this warp to reſtore the antient pattern or deſign—The warp is to be of woollen, not linnen—Among the titles of the French tapiſtry-makers, is included that of *renterers.*

FINE-DRAWING is particularly uſed for a rent, or hole happening in the dreſſing or preparing of a piece of cloth, artfully ſewed up or mended with ſilk.

All *fine-drawings* are reputed defects or blemiſhes; and ought to be allowed for in the price of the piece—Hence, M. Savary eſtabliſhes it as a rule, which is certainly founded on natural equity, that every manufacturer mark the *fine-drawings* of his cloths with a piece of packthread tied to the liſt; to direct the draper to the ſpot: and that the draper apprize the taylor or other perſon, to whom he ſells it, of the ſame; that he may not come to damage in the cutting; there being inſtances of drapers condemned to take back their cloth, when cut to pieces, for omitting to mention the *fine-drawings*, and other flaws.

On this occaſion M. Savary extolls the proceedure of an Engliſh merchant, who ſending a piece of cloth damaged in one ſpot, to his correſpondent at Paris, put a piece of gold in the damaged place, to make up the damage—But as this example is perhaps the only one of it's kind, that author recommends it to the merchant or draper to unfold all the pieces entirely, as they come to him; to diſcover the *fine-drawings* and other flaws, in order to make the clothier accountable for them.

RENVERSE, *inverted*, in heraldry, is when any thing is ſet with the head downwards, or contrary to its natural way of being.—Thus a chevron *renverſé* is a chevron with the point downwards.

The ſame term they alſo uſe when a beaſt is laid on it's back.

RENVERSED *volt* } See the articles { VOLT.
RENVERSING } { REVERSING.

RENUENTES, in anatomy, a pair of muſcles of the head, thus called as being antagoniſts to the annuentes; and ſerving to throw the head backward, with an air of refuſal. See HEAD.

From their ſituation they are alſo called *rectus capitis, major & minor.* See RECTUS *capitis.*

RENUNCIATION, RENUNCIATIO, the act of renouncing, abdicating, or relinquiſhing any right, real or pretended. See ABDICATION, *&c.*

Renunciations are ſometimes *expreſs*; as by contracts, *&c.* ſometimes *tacit*, as by contrary acts.

Diocleſian *renounced* the empire, to live as a philoſopher—The preſent king Philip of Spain, by the treaty of Utrecht, was obliged to *renounce* the ſucceſſion of the crown of France, to which he was heir preſumptive: and has ſince by a voluntary act *renounced* his own crown, in favour of his ſon—*Renunciations* of kings are always ſuſpected of ſome view or motive not to be avowed.

To *renounce* an inheritance, a community, *&c.* is to paſs a ſolemn act before a notary, or public officer, whereby a perſon declares he will not intermeddle in an inheritance, or profit in a company; but ſurrenders his part, and quits all pretenſions.

REORDINATION, REORDINATIO, the act of conferring orders on one already ordained. See ORDINATION.

The ceremony of ordination impreſſes what the divines call an indelible character; and cannot, therefore be repeated: yet is *reordination* practiſed in England, with regard to the diſſenting miniſters, who conform to the church; the biſhops pretending that they alone have right to confer holy orders, and that every prieſt or miniſter who does not receive them at their hands, has no lawful, regular vocation.

This proves a great obſtacle to the re-union of thoſe miniſters to the church of England; many of whom, otherwiſe diſpoſed to conform, have ſcrupled to be *reordained*; inaſmuch as *reordination* implies their former vocation to be null; that they had adminiſtred the ſacraments without any right thereto; and that all their miniſterial acts were invalid. See PRESBYTERIAN.

In the eleventh century, the crime of ſimony having been very flagrant; many people fell into the error to believe that the ſimoniacal biſhops could not ordain validly; and that thoſe who had received orders at their hands ſhould be *reordained*—The people of this ſentiment made a party of themſelves; and were diſtinguiſhed by the title of *reordinantes.*

REPAIRING, in building, *&c.* See REPARATION and RESTAURATION.

The *repairing* of large walls, doors, cielings, coverings, *&c.* belongs to the proprietor or landlord—The tenant is only charged with *ſmall repairs*, as glaſs windows, locks, *&c.* by the French called *locative repairs.*

To REPAIR a *ſtatue*, or other piece of ſculpture, is to touch up a ſtatue, *&c.* (caſt in a mould) with a chiſſel, graver, or other inſtrument; to finiſh the places which have not come well off.

To REPAIR *a caſt*, figure or the like, they clear off the barb, and what is redundant in the joints and projectures. See STATUE. See alſo FOUNDERY.

To REPAIR *a medal*, is to retouch it; ſo as ruſty, and defaced as it was, to render it clean, neat and perfect—In order to this, they take off the ruſt with a graver, touch up the letters, poliſh the ground, and raiſe and reſtore the figures which before were ſcarce ſeen.

When the figures are gnawed or broke, they fit a piece of cement on the ſpot; and on this cut with a graver ſo dexterouſly that the figures appear entire and well kept—Yet nothing ſpoils medals ſo much as *repairing* them. See MEDAL.

REPAIRERS, artificers who chaſe figures, and beautify ſword-hilts, *&c.* See ENCHASING.

REPAIRS, in hunting, are the haunts and places which the hare runs to. See HUNTING.

REPARANDIS *pontibus.* See the article PONTIBUS.

REPARATION, REPARATIO, the act of repairing, re-eſtabliſhing, retrieving, or mending a building, or other work. damaged or gone to decay. See REPAIRING.

The Enemy *repaired* the breach as ſoon as it was made.—The eſtabliſhment of turn-pikes is for *repairing* of the roads.—An eccleſiaſtical patron is by ancient cuſtom obliged to repair the choir or chancel of a church, and the pariſhioners the nave. See RESTAURATION.

REPARATIONE *facienda*, is a writ which lies in divers caſes; *e. gr.* where there are tenants in common, or joint tenants of an houſe, *&c.* which is fallen to decay, and the one being willing to *repair* it, the other two will not: in this caſe the party willing ſhall have this writ againſt the other two.

REPARTEE. See the article REPARTY.

REPARTITION, REPARTITIO, a dividing or ſharing a thing a ſecond time. See PARTITION.

There are ſo many deficiencies found this year in the taxes of this pariſh, that there muſt be a *repartition* on the inhabitants; or a new impoſition.

REPARTY*, or REPARTEE, a ready, ſmart reply; eſpecially in matters of wit, humour, or raillery—It is dangerous attacking this lady, her *repartees* are ſo keen.

* The word, in the original French, *repartie*, has the ſame ſignification.

Wicquefort obſerves a world of difference between a free, ſprightly *reparty*, and an offenſive ſarcaſm. See SARCASM.

REPAST, REPASTUM, a meal, or refection, taken at a ſtated hour. See REFECTION.

In old law-books REPAST is particularly uſed for a meal's-meat given to ſervile tenants, while at work for their lord.

The French call their meal, *repaſt*; the Latins, *paſtus*; the Italians and Spaniards, *paſto*—The *repaſts* whereof the ſcripture has preſerved the memory, ſhew that the ancient Hebrews were not very delicate in their eating—Abraham, a man of wealth and eminence, entertaining the angels, ſerves them with cakes baked under the aſhes, a fatted calf haſtily dreſſed, and milk and butter—But the quantity makes amends for the quality: three meaſures of flower, and a whole calf, for three perſons!

Joſeph to ſhew his reſpect to his brother Benjamin, ordered him a portion of meat five times as big as that of his other brothers.

In antiquity the *repaſts* were frequently ſacrifices; for which reaſon we find them often prepared by kings themſelves. See SACRIFICE and FEAST.

REPEALING, in law, the revoking or annulling of a ſtatute, deed or the like. See ABROGATION, REVOCATION, *&c.*

No act of parliament ſhall be *repealed* in the ſame ſeſſion it was made in. See PARLIAMENT—A deed or will may not be *repealed* for a part and ſtand good for the reſt.

Brook uſes the word *repellance* in the ſame ſenſe.

REPEAT, in muſic, a character ſhewing that what was laſt played or ſung, muſt be *repeated*, or gone over again. See REPETITION.

The *repeat* ſerves inſtead of writing the ſame thing twice over—There are two kinds of *repeats*; the *great* and the *ſmall.*

The great REPEAT, is only a double bar, dotted on each ſide; or two parallel lines drawn perpendicular acroſs the ſtaff; with dotts on either hand. See it's form under CHARACTERS *of muſic.*

This mark ſhews that the preceding ſtrain is to be *repeated*; that is, if it be near the beginning of the piece, all hitherto ſung or played is to be *repeated*; or if towards the end of a piece all from ſuch another mark.

In gavots, we uſually find the *repeat*, at about the third part of a piece—In minuets, borees, courants, *&c.* towards the end.

Some make this a rule, that if there be dotts on each ſide the bar, they direct to a *repetition* both of the preceding and the following ſtrain; if there be only dotts on one ſide, then only the ſtrain on that ſide to be *repeated.*

The ſmall REPEAT is where only ſome of the laſt meaſures of a ſtrain are to be repeated—This is denoted by a character ſet over the place where the *repetition* begins (ſee CHARACTERS *in muſic*) and continues to the end of the ſtrain.

When the ſong ends with a *repetition* of the firſt ſtrain, or part of it, inſtead of a *repeat*, they uſe the word *da capo*, *i. e.* from the beginning.

REPEATING *watches.* See the article WATCH.

REPELLENT, REPELLENS, in medicine, a remedy which *repels* or drives back a morbid humour into the maſs of blood, from which it was unduly ſecreted. See HUMOUR and MEDICINE.

Repellents are medicines which prevent ſuch an afflux of the fluids to any particular part, as might raiſe it into a tumour; or drive them back when they are collected. See TUMOUR.

* The greek name, given by ſome writers, to what (from the latin) are called re-pellents; is *apocruſtics*, αποκρȣϛικα, compounded of απο, from; and κρȣω, to beat.

To form an idea of the manner of their operation, it may be obſerved, that all tumours ariſe either from an increaſe in the velocity or quantity of the fluids, or a weakneſs in ſome particular part: though ſometimes both concur—Now an increaſe in the velocity of the fluids makes them more forcibly puſh againſt, and diſtend all the parts in their circuit; if therefore any part be unequally preſſed or relaxed by external injuries, that will be more elevated than any other; and for want of equal reſiſtance with the reſt of the body, will at length receive ſuch a quantity of fluid, as will raiſe it into a tumour, eſpecially if any of it's veſſels be obſtructed: becauſe the protruſion of freſh matter, à tergo, will continue to add thereunto, till the part is on the utmoſt ſtretch, and can hold no more. See BLOOD.

In this caſe all thoſe means are ſaid to be *repellent*, which check the growth of the tumour, and aſſiſt the refluent blood in taking up the obſtructed matter, and waſhing it again into the common ſtream.

This intention is chiefly favoured by evacuation and revulſion; for whatſoever leſſens the quantity of the fluid, will diminiſh the force upon the tumefied part—But it concerns us moſt to know how external application to the part itſelf, helps this affair.

Herein a medicine comes to be *repellent*, by conſiſting of ſuch ſubtile parts, as may tranſmit ſome of them through the pores, and help to render the obſtructed matter more fluid, ſo that it comes the more eaſy to be looſened, and fall again into the circulating current—But in this caſe there is a hazard of ſuch things likewiſe putting the obſtructed humour into a ferment, whereby it turns ſooner into pus, and then they come under the denomination of *ſuppuratives* or *ripeners.* See SUPPURATIVE.

What, therefore, in the moſt ſtrict ſenſe, is to be reputed a *repeller*, is that which aſtringes and ſtrengthens the part, ſo as to make it reſiſt any ſuch lodgment. See ASTRINGENT and STRENGTHENER.

Theſe are ſuch whoſe qualitities are moſt manifeſt in their coldneſs, and drying properties: but there are ſo few inſtances wherein bandage is not better than ſuch application, that very little comes to be uſed for that purpoſe. In hæmorrhages, and ouzings out of ſerum, ſo as to deform the ſkin; ſimples of this nature moſtly take place; which anſwer their ends in aſtringing the fibres, whereby their apertures are ſo cloſed, as not to admit through them afterwards any ſuch fluid.

Some things alſo anſwer this end only by ſtimulating the fibres of the tumefied part, ſo as to give them ſudden and forcible twitches, whereby the obſtruction is ſometimes looſened and ſhook away, as it were, into the refluent current—Such a ſort of motion will be occaſioned by the ſudden application of any thing extremely cold as common water; but the practice is ſeldom ſafe, becauſe if the firſt efforts which the fibres are put upon by thoſe means, do not ſucceed in breaking away the incloſed matter, they will be ſtrained, and not able afterwards to repeat their natural vibrations: the conſequence of which is weakening the part, which will render the tumour more obſtinate.

REPELLING *power*, *Vis* REPELLENS, in phyſics, is a certain power or faculty reſiding in the minute particles of natural bodies, whereby under certain circumſtances they mutually fly from each other. See POWER and PARTICLE.

This power is the reverſe of the *attractive* power. See ATTRACTIVE.

Sir Iſaac Newton having eſtabliſhed the attractive power of matter from obſervation and experiment, argues, that as in algebra, where poſitive quantities ceaſe, there negative ones commence; ſo in phyſics, where the attractive force ceaſes, there a *repelling* force muſt begin—But that there is ſuch a force does likewiſe appear from obſervation. See REPULSION.

As the *repelling* power ſeems to ariſe from the ſame principle as the attractive, only exerciſed in different circumſtances; it is governed by the ſame laws: now the attractive we find is ſtronger in ſmall bodies than in great ones, in proportion to the maſſes—Therefore the *repelling* is ſo too. But the rays of light are of all others the moſt minute bodies we know of; therefore of all others their *repelling* force muſt be the greateſt. See RAY.

Sir Iſaac Newton computes that the attractive force of the rays of light is above 1000000000000000 times as ſtrong as the force of gravity on the ſurface of the earth: hence ariſes that inconceivable velocity wherewith the light muſt move, to reach from the ſun to our earth in ſeven minutes. For the rays emitted from the body of the ſun by the vibrating motion of it's parts, are no ſooner got without the ſphere of attraction of the ſun, than they come within the action of the *repelling* power. See LIGHT.

The elaſticity, or ſpringineſs of bodies, or that property whereby, after having their figure altered by any external force, they return to their former figure, follows from the *repelling* power. See ELASTICITY, AIR, *&c.*

REPERCUSSION, in mechanics. See REFLECTION.

REPERCUSSION, in muſic, a frequent repetition of the ſame ſounds. See REPETITION.

This often happens in the modulation; where the eſſential chords of each mode, or of the harmonical triad, are to be ſtruck oftener than the reſt; and of theſe three chords the two extremes, *i. e.* the final and the predominant one (which are properly the *repercuſſions* of each mode) oftener than the middle one.

REPERTORY, REPERTORIUM, a place wherein things are orderly diſpoſed, ſo as to be eaſily found when wanted.

The indices of books are *repertories*, ſhewing where the matters ſought for are handled—Common places are a kind of *repertories*, very uſeful to the learned. See COMMON *place.*

REPERTORIUM *anatomicum*, denotes a large hall near an amphitheatre of diſſections, where ſkeletons both human and brutal, are orderly preſerved—Such is the *repertory* in the French king's garden at *Paris.*

REPETITION, REPETITIO, the reiterating of an action. See REITERATION.

Habits are acquired by the frequent *repetition* of actions. See HABIT—Muſicians and comedians make ſeveral *repetitions* of their concerts and comedies, before they perform for good. See REHEARSAL.

School philoſophers call the *repetition* of the ſame numerical effect in another place, the *replication* of that effect. See REPLICATION.

REPETITION, in muſic, denotes a reiterating or playing over again of the ſame part of a compoſition; whether it be a whole ſtrain, a part of a ſtrain, or a double ſtrain.

The *repetition* is denoted by a character, called a *repeat*, which is varied ſo as to expreſs the various circumſtances of the *repetition.* See REPEAT.

When the ſong ends with a *repetition* of the laſt ſtrain, or a part of it; the *repetition* is denoted by *da capo*; that is, from the beginning.

REPETITION, REPLY, is alſo uſed in muſic, when after a little ſilence, one part *repeats* or runs over the ſame notes, the ſame intervals, the ſame motions, in a word, the ſame ſong, which a firſt part had already gone over during the ſilence of this.

REPETITION, REPLY, is alſo a doubling, or trebling, *&c.* of an interval; or a reiteration of ſome concord or diſcord.

Thus a fifteenth is a *repetition* of the octave, *i. e.* a double octave or ſecond octave. See OCTAVE.

REPETITION, in rhetoric, is a figure whereby the orator rehearſes the ſame word, or phraſe over again.

Of this there are two kinds—In the firſt, the word is repeated preciſely in the ſame ſenſe: As, *Oh*, *Jeruſalem*, *Jeruſalem*, *who killeſt the prophets*, &c. *my God*, *my God*, *why haſt thou forſaken me.*

Such *repetitions* have the ſame effect in diſcourſe, with ſecond ſtroaks of the pencil in painting; they render the colours more ſtrong and lively.

Sometimes the orator begins again and again with the ſame word; of which we have an inſtance in the beginning of

Cicero's firſt oration againſt Cataline: *nihilne te nocturnum præſidium palatii, nihil urbis vigiliæ, nihil timor populi, nihil conſenſus bonorum omnium, nihil hic munitiſſimus habendi ſenatus locus, nihil horum ora vultuſque moverunt!* Where the word *nihil* ſo often reiterated gives an admirable force and vehemence to the diſcourſe—Again, the ſame author: *quem ſenatus damnarit, quem populus R. damnarit, quem omnium exiſtimatio damnarit, eum vos ſententiis veſtris abſolvetis?* again, *non feram, non patiar, non ſinam.*

The ſecond kind of *repetition*, called πλοκη, *ploce*, is a *repetition* of the ſame word, in the ſame phraſe; but in ſuch a manner as that ſome new idea or character is added to the word, in the ſecond, which it had not in the firſt.

As Corydon is always Corydon: *ex illo Corydon, Corydon eſt tempore nobis*; by which we ſignify that Corydon is no ordinary perſon; and that nothing can diſtinguiſh him but the *repetition* of his own name: as if we ſhould ſay, *he is Corydon, that is enough* — By the ſame figure our Saviour ſpeaks, when he ſays: *let your language be yea, yea, and nay, nay.*

REPLANTING, in gardening, the act of planting a ſecond time. See PLANTING.

The gardeners uſe to diſplant their tulips every year, and *replant* them—Lettices muſt be diſplanted and *replanted* yearly, to make them head and knit — If ſtrawberries, *&c.* be not diſplanted and *replanted* once in a few years, they degenerate. It is a proverb among gardeners, that if the devil were to *replant* his wife, he would cut off her head.

REPLEADER, REPLACITARE, in law, is to plead over again what was once pleaded before. See PLEA and PLEADING.

REPLEGIARE *de averiis*, a writ brought by one whoſe cattle are diſtrained, and put in a pound by another; upon ſecurity given the ſheriff to purſue, or anſwer the action at law againſt the diſtrainer. See REPLEVY.

REPLETION, in medicine, a plenitude, or plethora. See PLENITUDE and PLETHORA.

Repletion is more dangerous than inanition — Bleeding and diet are the great reſources when a perſon is incommoded with a *repletion*. See DIET, *&c.*

REPLETION is ſometimes alſo uſed where the ſtomach is overloaden, with too much eating or drinking — The phyſicians hold all *repletion* prejudicial; but that of bread the worſt. See SURFEIT.

REPLETION, in the canon law, is where the revenue of a benefice or benefices is ſufficient to fill or occupy the whole right or title of the graduate who holds them. See BENEFICE, GRADUATE, *&c.*

When there is a *repletion*, the party can demand no more by virtue of his degrees—In England, where benefices are not appropriated to degrees, *repletion*, ſtrictly ſpeaking, has no place. See PLURALITY.

In France, 600 livres, or 45 *l.* ſterling per annum, make a *repletion*, when the benefice is obtained otherwiſe than by a degree; and 30 *l.* per annum, when it is obtained by virtue of a degree.

REPLEVIN, PLEVINA, a remedy granted on a diſtreſs; being a re-deliverance of the goods diſtrained to the firſt poſſeſſor, on ſecurity or pledges given by him to try the right with the diſtrainer, and anſwer him in the courſe of law. See REPLEVY.

If a perſon diſtrain another's goods or cattle for rent, or damage feſant, *&c.* the owner, upon giving ſecurity to the ſheriff that he will proſecute his action againſt the party diſtraining, and return the goods or cattle again, if the ſeizure ſhall be adjudged good; may have a writ of *replevin* or *replegiari facias*. See DISTRESS.

REPLEVISH, in law, is to let one to mainpriſe, upon ſurety. See MAINPRISE.

REPLEVY, REPLEVIE, in law (from the Latin *replegiare*, to re-deliver to the owner upon pledges of ſurety) is the bringing of a writ of *replevin*, or *replegiari facias*, by him whoſe cattle or goods are diſtrained by another upon any cauſe; having firſt given ſecurity to the ſheriff, that on the delivery of the thing diſtrained, he will proſecute the action againſt the perſon who made the diſtreſs. See REPLEVIN and DISTRESS.

In the Stat. 24 of Henry VIII. we read of *canes replegiari*, hounds *replevied*, in a caſe between the abbot of St Albans, and Geoffery Childwic.

Goods may be *replevied* two ways; *viz.* *by writ*, which is that uſed by the common law—And by *plaint*; which is that by ſtatute law, for the more ſpeedy having again the cattle and goods, and is brought in the ſheriff's court.

REPLICATION, REPLICATIO, in logic, the aſſuming or uſing the ſame term twice in the ſame propoſition: otherwiſe called *reduplication*. See REDUPLICATION.

Some philoſophers uſe the phraſe *replicatio mundi*, *replication* of the world, for it's converſion, or turning round —The human ſoul is ſaid to be in a place *replicatively*, *replicativè*, when conceived to be all in the whole, and all in every part thereof. See SOUL.

REPLICATION, in law, is an exception of the ſecond degree, made by the plantiff to the plea or firſt anſwer of the defendant. See REJOINDER.

The *replication* is particularly that which the plaintiff replies to the defendants anſwer in chancery; and which is either *general* or *ſpecial*—The *ſpecial* is grounded upon matter ariſing out of the defendant's anſwer, *&c.* The *general* is ſo called from the general words therein uſed.

REPORT, the relation made upon oath, by officers or perſons appointed to viſit, examine, ſtate or eſtimate any thing. Damages, repairs, *&c.* are judged from the *reports* of experienced perſons — Proviſions for perſons wounded are only granted on the *reports* of chirurgeons, *&c.* —In caſes of rapes a *report* of matrons is to be had.

REPORT in law, is a public relation, or bringing to memory of caſes judicially argued, debated, reſolved, or adjudged in any of the king's courts of juſtice, with the cauſe and reaſon of the ſame delivered by the judges.

When the chancery, or any other court, refers the ſtating of ſome caſe, or comparing an account, *&c.* to a maſter in chancery, or other referee, his certificate therein is alſo called a *report*.

Pinion of REPORT. See the article PINION.

REPOSE, in poetry, *&c.* See the articles REST, PAUSE, *&c.*

REPOSE in painting, is applied to certain maſſes, or large ſyſtems or aſſemblages of light and ſhade: which being well conducted, prevent the confuſion of objects and figures; by engaging and taking up the eye ſo as it cannot attend to the other parts of the painting, for ſome time: and thus leading it to conſider the ſeveral groups gradually, and as it were to proceed from ſtage to ſtage — See LIGHT, SHADOW, CLAIR-*obſcure*, *&c.*

REPOSITION * *of the foreſt*, an act whereby certain grounds before made purlieu, are upon a ſecond view laid to the foreſt again. See REAFFORESTING, FOREST, and PURLIEU.

* The word is formed from the Latin *re* and *ponere*, to lay again.

REPOSITION in chirurgery, the reduction of a bone. See REDUCTION.

REPOSITORY, REPOSITORIUM, a ſtore-houſe or place where things are laid up, and kept — In which ſenſe we ſay the *repoſitory* of the royal ſociety, *&c.* See MUSÆUM.

REPRESENTATION, REPRESENTATIO, in the drama, the exhibition of a theatrical piece; including the ſcenes, machines, recitation, *&c.* See SCENE, MACHINE, RECITATION, *&c.*

Sir Richard Steel's principle is, that the deſign of a play is not to be read but *repreſented*; ſo that it is on the ſtage, not in the preſs it is to be judged of: and the pit not the public, are the judges. See THEATRE, TRAGEDY, COMEDY, *&c.*

REPRESENTATIVE, one that perſonates, or ſupplies the place of another; and is inveſted with his right, and authority. See DEPUTY, LIEUTENANT, *&c.*

The word *repreſentative* is equivalent to procurator or proxy. See PROCURATOR and PROXY.

Thus we ſay the king is the *repreſentative* of God on earth; magiſtrates are *repreſentatives* of the king. See KING, *&c.* —The commons are the people's *repreſentatives* in parliament. See COMMONS, PARLIAMENT, *&c.*

There is this defect in the conſtitution of our parliament; that whereas all Engliſhmen who have conſiderable eſtates, ought not to be taxed without their own conſent in parliament, by themſelves or their *repreſentatives*; copy-holders, whereof ſome have a thouſand pounds a year, have no voice in the election of knights of the ſhire. *Chamberl.*

REPRIEVE, or REPRIVE, in law a ſuſpending or deferring the execution of the law upon a priſoner, for the preſent time.

A *reprieve* is properly a warrant from the king, for ſuſpending the execution of a perſon condemned — The king cannot pardon a condemned perſon without the concurrence of parliament, but he frequently *reprieves* him for 99 years.

REPRIMAND, a ſharp authoritative reproof— Such a perſon was *reprimanded* in court by the bench, *&c.*

REPRISALS *, or REPRIZALS, REPRESALIA, in the civil law, a right which princes have to retake from their enemies, ſuch things as they unjuſtly detain from them; or other things equivalent thereto.

* The word is formed from the Italian, *repreſaglia*, which ſignifies the ſame thing.

When a place is taken or held from a prince, he ſeizes another by way of *repriſal*—Sometimes he takes men of the oppoſite party, by right of *repriſals*.

The Romans called this *clarigatio*: and the Greeks had ſomething like it under the name of *androlepſia*. See CLARIGATIO and ANDROLEPSIA.

REPRISALS is alſo uſed for a letter or permiſſion which a prince ſometimes gives a ſubject, upon a full cognizance of the cauſe; authorizing him to retake from the firſt perſons he meets withal of the oppoſite party, as many effects as make an equivalent to what have been violently forced from him; and for which the oppoſite prince has refuſed to do him juſtice.

Theſe permiſſions are alſo called *letters of mark*, or *mart*, and in the Stat. 27 Edw. III. *law of marque*; in regard, a perſon denied juſtice in another man's territory, redreſſes himſelf by goods belonging to men in that territory. See Mark.

This merchant has ſeized the effects of the Spaniard don—— by way of *repriſal*, becauſe the Spaniards had ſeized his; and no redreſs could be had at the court of Madrid.

REPRISE *, or Reprize, in the commerce by ſea, a merchant ſhip which having been taken by a corſair, privateer, or other enemy; is retook or recovered by a veſſel of the contrary party. See Prize.

* The word is French, and ſignifies a *re-ſumption* or *re-taking*.

When a veſſel thus retaken has been 24 hours in the hands of the enemy, it is deemed a lawful prize —If the *repriſe* have been made within 24 hours; the veſſel is to be reſtored to the proprietor, with every thing therein upon his allowing one third to the veſſel who made the *reprize*.

If the *repriſe* have been abandoned by the enemy, either in a tempeſt, or from any other cauſe, before it have been led into any port, it is to be reſtored to the proprietor.

Reprizes, in law, are deductions, draws-backs, or duties paid yearly out of a manor, or lands — Such are rent-charges, penſions, fees of ſtewards or bailiffs, &c. — The manor of Doll yields 40*l.* per annum, *ultra reprizas*, beſides all *repriſes*.

REPRIVE. See the article Reprieve.

REPROBATION, Reprobatio, in theology, a decree or reſolve which God has taken from all eternity, to puniſh ſinners who ſhall die in impenitence. See Impenitence, &c.

Reprobation ſtands in direct oppoſition to *predeſtination*. See Predestination.

Divines hold it a ſymptom of *reprobation*, when a ſinner is hardened ſo as not to feel any farther remorſe or miſgivings of conſcience. See Conscience, &c.

The caſuiſts diſtinguiſh two kinds of *reprobation*, *poſitive* and *negative*.

Poſitive Reprobation is that whereby God is ſuppoſed to create men with a poſitive and abſolute reſolution to damn them eternally.

This opinion of *reprobation*, is countenanced by St Auguſtin, and others of the fathers, and ſtrongly maintained by Calvin, and moſt of his followers — Something like it is alſo found in the XXXIX articles of the church of England, but it is now generally exploded as injurious to God. See Calvinist, &c.

Negative or *conditional* Reprobation, is that whereby God, though he create all men with a ſincere deſire to ſave them, and furniſhes them with the neceſſary means thereto, ſo as all may be ſaved if they will; yet, ſees there are ſeveral who will not do it, with the aids he ſhall afford them, how powerful ſoever: and ſees at the ſame time, they would do it with certain other aids, which he ſees, but will not give them—*O altitudo!* &c. See Grace.

REPRODUCTION, Reproductio, the act whereby a thing is produced a-new, or grows a ſecond time. See Regeneration.

When the ſtock of an oak, a fruit-tree, or the like, is cut off ſhort, it *reproduces* an infinity of young ſhoots. See Stock.

By *reproduction* is uſually underſtood the reſtauration of a thing before exiſting, and ſince deſtroyed. See Restauration.

The *reproduction* of ſeveral parts of lobſters, crabs, &c. makes one of the greateſt curioſities of natural hiſtory — That in lieu of an organical part of an animal cut off, another ſhall ariſe perfectly like it, may ſeem inconſiſtent with the modern ſyſtem of generation; where the animal is ſuppoſed to be wholly formed in the egg. See Generation and Egg.

Yet has the matter of fact been well atteſted by the fiſhermen, and even by ſeveral virtuoſo's who have taken the point into examination, particularly M. de Reaumur, and M. Perrault, whoſe ſkill and exactneſs in things of this nature will hardly be queſtioned—The legs of lobſters, &c. conſiſt each of five articulations; now when any of the legs happen to break by any accident, as in walking, &c. which frequently happens, the fracture is always found to be at a future near the fourth articulation; and what they thus loſe is preciſely *reproduced* in ſome time afterwards: that is, a part of a leg ſhoots out, conſiſting of four articulations; the firſt whereof has two claws as before: ſo that the loſs is entirely repaired.

If a lobſter's leg be broke off by deſign at the fourth or fifth articulation, what is thus broke off always comes again — But it is not ſo if the fracture be made in the firſt, ſecond, or third articulation. In thoſe caſes the *reproduction* is very rare, if things continue as they are — But what is exceedingly ſurprizing, is, that they do not: for upon viſiting the lobſter maimed in theſe barren and unhappy articulations, at the end of two or three days, all the other articulations are found broke off, to the fourth; and it is ſuſpected they have performed the operation on themſelves, to make the *reproduction* of a leg certain.

The part *reproduced* is not only perfectly like that retrenched, but alſo in a certain ſpace of time grows equal to it —Hence it is, that we frequently ſee lobſters, which have their two big legs unequal; and that in all proportions — This ſhews the youth of the leſs.

A part thus *reproduced* being broke, there is a ſecond *reproduction* —The ſummer, which is the only ſeaſon of the year when the lobſters eat, is the moſt favourable time for the *reproduction*. It is then performed in four or five weeks: whereas it takes up eight or nine months in any other ſeaſon.

The ſmall legs are *reproduced*, but more rarely, as well as more ſlowly than the great ones: the horns do the ſame. Vid. Mem. Acad. R. Scienc. an. 1712. p. 295. Hiſt. p. 45. ſeq. item an. 1718. p. 31. See alſo Crab's-eyes.

REP-SILVER, money antiently paid by ſervile tenants to their lord, to be quitted of the duty of reaping his corn. See Silver.

REPTILES *, in natural hiſtory, a kind of animals denominated from their creeping or advancing on the belly — Or, *reptiles* are a genus of animals and inſects which inſtead of feet, reſt on one part of the body, while they advance forward with the reſt. See Animal, Insect, &c.

* The word is formed from the Latin, *repo*, I creep.

Such are earth-worms, ſnakes, caterpillers, &c. — Indeed, moſt of the claſs of *reptiles* have feet; only thoſe very ſmall, and the legs ſhort in proportion to the bulk of the body. See Foot and Legs.

Naturaliſts obſerve a world of artful contrivance for the motion of *reptiles* — Thus, particularly, in the earth-worm. Dr. Willis tells us, the whole body is only a chain of annular muſcles; or, as Mr Derham ſays, it is only one continued ſpiral muſcle, the orbicular fibres whereof by being contracted, render each ring narrower and longer than before: by which means it is enabled, like the worm of an augre, to bore it's paſſage into the earth — It's *reptile* motion may alſo be explained by a wire wound on a cylinder, which when ſlipped off, and one end extended and held faſt, will bring the other nearer it. So the earth-worm having ſhot out or extended his body (which is with a wreathing) it takes hold by thoſe ſmall feet it hath, and ſo contracts the hinder part of it's body—Dr Tyſon adds, that when the forepart of the body is ſtretched out, and applied to a plane at a diſtance, the hind part relaxing and ſhortning, is eaſily drawn towards it as a centre.

It's feet are diſpoſed in a quadruple row, the whole length of the worm; with which, as with ſo many hooks, it faſtens down ſometimes this, and ſometimes that part of the body to the plane, and at the ſame time ſtretches out, or drags after it another.

The creeping of ſerpents is effected after a ſomewhat different manner; there being a difference in their ſtructure; in that theſe laſt have a compages of bones articulated together.

The body here is not drawn together, but as it were complicated; part of it being applied on the rough ground, and the reſt ejaculated and ſhot from it; which being ſet on the ground in it's turn, brings the other after it — The ſpine of the back, variouſly wreathed, has the ſame effect in leaping, as the joints of the feet in other animals; they making their leaps by means of muſcles that extend the plicæ or folds.

Reptile is likewiſe uſed, abuſively, for plants and fruits which creep on the earth, or on other plants, as wanting ſtrength of ſtalk to ſuſtain themſelves. See Clasper, &c.

Such are cucumbers, melons &c. ſuch alſo are ivy, the vine, &c. See Capreolatæ.

REPUBLIC, Respublica, *commonwealth*, a popular ſtate, or government; or a nation where the people have the government in their own hands. See State Government, &c.

This amounts to the ſame with what we otherways call a *democracy*. See Democracy.

The celebrated *republics* of antiquity, are thoſe of Athens, Sparta, Rome, and Carthage—At preſent there is ſcarce any ſuch thing as a real *republic*. *i. e.* a ſtrictly popular ſtate—Indeed the Venetians and Genoeſe call their ſtates *republics*, but their government is apparently *oligarchic*. See Oligarchy, and Aristocracy.

The Dutch come the neareſt to the character of a *republic*; yet they are very defective, at leaſt in the ſenſe and ſeverity wherewith Rome, Carthage, &c. were *republics*. See States-*general*, Pensionary, Statholder, &c.

It is a remark of M. St Evremont, that if the Dutch love the *republican* form, it is more for the ſake of their trade, than of their liberty.

REPUBLIC *of letters*, is a phraſe uſed in ſpeaking collectively of the whole body of the people of ſtudy and learning.

There is a journal begun in Holland by M. Bayle, and continued by M. Bernard, conſiſting of extracts of books printed in the courſe of the year; called, *nouvelles de la republique des lettres*, news from the *republic* of letters. See JOURNAL.

REPUDIATION, REPUDIUM, in the civil law, the act of divorcing. See DIVORCE.

REPULSION, REPULSIO, in phyſics, the act of a repelling power, whereby natural bodies, under certain circumſtances, mutually fly each other. See REPELLING *power*.

Repulſion is the counter-part to *attraction* — Attraction only reaches to a little diſtance; where that terminates there *repulſion* commences. See ATTRACTION.

Indeed we meet with many obvious inſtances of *repulſion* among bodies; as, between water and oil; and in general, between water and all unctuous bodies; between mercury and iron; as alſo between the particles of duſt, &c.

Thus, if a fat body lighter than water, be laid on the ſurface thereof, or if a piece of iron be laid on mercury, the ſurface of the fluid will be depreſſed about the bodies laid on it: a plain indication of *repulſion*; as the riſing up of the fluid about the ſurfaces of other incumbent bodies is of attraction.

In the latter caſe the fluid is ſuſpended by an attractive power, above the level, and kept from falling by it's gravity: in the former a depreſſion is made by the repelling power, which the liquor, notwithſtanding it's gravity, cannot run down into and fill up.

Upon this depend all the phænomena of very light glaſs bubbles floating on water; about which, when clean, the water riſes: but when greaſed, the water ſinks into a channel all around them—Hence alſo it is that in a glaſs veſſel of water the fluid ſtands higher all about the edges near the glaſs, than towards the middle: but when the glaſs is filled till the water run down on all ſides, then, it ſtands higher at the middle than at the ſides — Hence, alſo, in a glaſs not full of water, a clean glaſs bubble always runs to the ſide, by reaſon the preſſure which is upon it towards the middle, is partly taken off by the attractive force wherewith the water is raiſed near the edge. If the glaſs be ſo full as to be ready to run over, the bubble returns from the ſide towards the middle; the force wherewith the water is raiſed in the middle, taking off part of the preſſure.

Juſt the reverſe happens, if the bubble be greaſy; in regard, there, the force whereby the water and the bubble repel each other, is greateſt where the water is higheſt. Two clean bubbles, and two greaſy ones always run towards each other; as being attracted: a greaſy and a clean one always fly each other; as being repelled.

REQUEST, in law, a ſupplication, or petition preferred to a prince, or a court of juſtice; begging relief in ſome conſcionable caſes where the common law grants no immediate redreſs. See PETITION, SUPPLICATION, LAW, EQUITY, &c.

The term *requeſt* is now, ſince the inſtitution of chancery, much diſuſed; together with the court of *requeſts*, where *requeſts* were cognizable.

The *Court of* REQUESTS, was an antient court of equity, inſtituted about the 9th year of Henry VII. of like nature, though inferiour authority, with the court of chancery; being appointed chiefly for the relief of petitioners who in conſcionable caſes ſhould addreſs themſelves, by way of *requeſt*, to his majeſty.

The chief judge of this court was the lord privy ſeal, aſſiſted by the *maſters of requeſt*, who correſponded to our maſters of chancery. See MASTER.

In the 40th and 41ſt of year of queen Elizabeth, it was adjudged, upon ſolemn argument in the court of common pleas, that the court of *requeſts* was then no court of equity. See COURT, CHANCERY, &c.

In France, *requetes civiles*, civil requeſts, ſtill obtain for the annulling of contracts, &c. made by ſurprize. See PLAINT.

They have eighty *maſters of requeſts*, to take cognizance of cauſes between the officers of the crown, the ſervants of the houſhold, &c.

REQUEST, in hunting, is when the dogs have loſt the queſt or track of the beaſt, and muſt *requeſt*, or *queſt* it again. See QUEST—They ſay, to *call to the requeſt*, *come to the requeſt*, &c. See HUNTING.

To *requeſt* the game, is chiefly uſed when after having run it down the night before, they ſeek it again the next morning with the blood-hound, or the like. See *Blood*-HOUND.

REQUIEM, a maſs ſung in the Romiſh church for the reſt of the ſoul of a perſon deceaſed. See MASS.

It is thus called, becauſe the introit begins with, *Requiem æternam dona eis domine*, &c.

RERE-WARD, *arrieregarde*. See REAR and GUARD.

RES, *thing*. See REALITY, ENS, ESSE, SUBSTANCE, &c.

RES *Mancipi*. See ABALIENATION.

RES *Naturales*. } See { NATURALS.
RES *Non Naturales*, &c. } See { NON *Naturals*, &c.

RESCEIT, RECEPTIO, in law, an admiſſion or receiving of a third perſon to plead his right, in a cauſe formerly commenced between other two.

As, were an action is brought againſt a tenant for life or years, and he makes default; in ſuch caſe he in the reverſion may come in and pray to be *received*, to defend the land, and to plead with the demandant.

RESCEIT is ſometimes alſo applied to an admittance of plea, though the controverſy be only between two—He in reverſion may come into court and pray to be *received* in a ſuit againſt his particular tenant.

RESCEIT *of homage*, RECEPTIO *homagii*, denotes the lord's receiving homage of his tenant, at his admiſſion to the lands. See HOMAGE.

RESCISCION*, RESCISSIO, in the civil law, an action intended for the annulling or ſetting aſide of any deed, contract, or the like.

* The word is formed from the Latin, *re* and *ſcindo*, q. d. I cut or divide again.

A thing's being found damaged or ſold at above double the juſt value, is a good cauſe of *reſciſſion*. See REDHIBITION.

The deed or contract thus annulled, or *reſcinded*, is ſometimes called a *reſciſſory*, though that denomination be more properly given to the action brought for *reſcinding* or ſetting it aſide: *actio reſciſſoria*.

RESCOUS, or RESCUE, RESCUSSUS, in law, an illegal taking away and ſetting at liberty a diſtreſs taken, or a perſon arreſted, by proceſs, or courſe of law.

This is properly a *reſcous in fact* — If one diſtrain beaſts for damage feaſant in his ground, and as he drives them along the highway towards the pound, they enter into the owner's houſe, and he witholds them there, and will not deliver them upon demand: this detainer is a *reſcous in law*.

Reſcous, in matters relating to treaſon, is deemed treaſon; and in matters concerning felony, is felony. See TREASON, &c. —He that commits ſuch a *reſcue* or *reſcous*, is called *reſcuſſor*.

RESCOUS is alſo uſed for a writ which lies for this fact; called *breve de reſcuſſu*.

RESCRIPT, RESCRIPTUM, an anſwer delivered by an emperor, or a pope, when conſulted by particular perſons, on ſome difficult queſtion or point of law; to ſerve as a deciſion thereof.

The civil and canon laws are full of ſuch *reſcripts*. See CIVIL and CANON *law*.

When the *Reſcript* was made in anſwer to the inquiry of a community, it was called a *pragmatic ſanction*. See PRAGMATIC.

The papal *reſcripts* are a kind of bulls or monitories beginning with theſe words, *ſignificavit nobis dilectus filius*, &c.

They never obtained either in England or France, when contrary to the liberties of the Engliſh and Gallican churches; but were declared abuſive. See BULL.

Among the Romans the contending parties, and even the magiſtrates themſelves, frequently conſulted the emperor on the meaſures they were to take in certain nice and difficult caſes; and the anſwers returned by the emperors on ſuch conſultations, were called *reſcripts*—Theſe had not, indeed, the full force of laws, but were deemed a ſtrong prejudice or preſumption.

Juſtinian has inſerted a great number of them in the Code; and by that means given them the authority they before wanted. See CODE.

The author of the life of the emperor Macrinus obſerves of that prince, that he would have his officers judge by laws, not by *reſcripts*; as eſteeming it abſurd to admit the wills of ignorant men, ſuch as Commodus, and Caracalla, for rules of judging; and becauſe Trajan never gave any *reſcripts* at all, as being loath to countenance a cuſtom, where what is frequently granted as a favour, in particular caſes, might be afterwards pleaded as a precedent—'Tis added, that Macrinus had a deſign to ſtrip the *reſcripts* of all their authority.

M. Schulting, in his diſſertations, does not at all approve of this deſign; and to the emperor's reaſons anſwers, that indeed all *reſcripts* are not to be admitted; that thoſe which appear dictated out of favour, are to be thrown aſide; but thoſe which appear founded in reaſon, and natural equity are, with Juſtinian, to be allowed—He adds, that it cannot be denied but the worſt emperors have frequently made goods laws, and uſeful *reſcripts*.

As to what is urged of the emperor Trajan's never giving any *reſcripts*; it appears but ill ſupported — For what is it but a *reſcript* that he delivers to pliny on the ſubject of the Chriſtians, *lib.* 10. *epiſt.* 28? Or that on the Iſelaſtici, *lib.* 10. *epiſt.* 120? The Digeſt, and Pliny's epiſtles, need only to be opened and compared, to find *reſcripts* of Trajan.

RESCUE. See the article RESCOUS.

RESEANTISSA, or RESEANTISA, in law. See ESSOIN.

RESEARCH *, a diligent ſearch or enquiry into any thing.

* The word is formed of the French, *recherche*, and literally denotes a *ſecond ſearch*.

RESEARCH, in muſic, is a kind of prelude or voluntary, played on the organ, harpſicord, theorbo, &c. Wherein the compoſer ſeems to *ſearch*, or look out for the ſtrains, and touches of harmony, which he is to uſe in the regular piece to be played afterwards. See PRELUDE.

This is uſually done off-hand, and conſequently requires a maſter's ſkill—When in a motetto the compoſer takes the liberty to uſe any thing that comes in his head, without applying any words to it, or ſubjecting himſelf to the ſenſe and paſſion thereof; the Italians call it *fantaſia ricercata*; the French, *recherche*; and the Engliſh *reſearch*.

RESEARCHING, in ſculpture, the repairing of a caſt figure, &c. with proper tools; or the finiſhing it with art and exactneſs, ſo as the minuteſt parts may be well defined. See FIGURE, STATUE, FOUNDERY, &c.

RESEISER, RESEISIRE, in law, a taking again of lands into the king's hands, where a general livery, or ouſter le main, was formerly miſuſed; contrary to order of law. See RESUMPTION.

RESEMBLANCE. See the article SIMILITUDE.

RESERVATION, RESERVATIO, in law, an action or clauſe whereby ſomething is *reſerved*, *i. e.* retained, kept, or ſecured to one's ſelf. See RESERVE.

Thus, when a man lets his land, he *reſerves* a rent to be paid to himſelf for his maintenance, &c. See LEASE, TENANT, RENT, &c.

William the conqueror getting all the lands of England, except thoſe belonging to the church and religious houſes, into his hands by right of conqueſt; beſtowed a great part thereof among his followers, *reſerving* ſome retribution of rents and ſervices to him and his heirs; which *reſervation* is now, as it was before the conqueſt, called the tenure of the lands. See TENURE, SERVICE, &c.

Sometimes, *reſervation* ſignifies as much as an exception: as, when a man lets an houſe, and *reſerves* to himſelf one room, that room is excepted out of the demiſe. See EXCEPTION.

Mental **RESERVATION** is a propoſition, which ſtrictly taken, and according to the natural import of the terms, is falſe; but if qualified with ſomething *reſerved* or concealed in the mind, becomes true.

Mental *reſervations* are the great refuge of religious hypocrites; who uſe them to accommodate their conſciences with their intereſts: the Jeſuites are zealous advocates for mental *reſervations*; yet are they real lyes, as including an intention to deceive.

RESERVE, in law, the ſame with *reſervation*. See RESERVATION.

He has ſettled the whole eſtate on his ſon, and has not made any *reſerve*—Benefices are ſometimes reſigned with *reſerve* of a penſion—By the canon law, no perſon may *reſerve* to himſelf a penſion out of a benefice, unleſs he hath ſerved it ten years. See RESIGNATION.

In the Romiſh church, the ordinary prieſts have only a power to abſolve, in *reſerve* of certain caſes; hence called *reſerved caſes*, as being *reſerved* to the biſhop. See ABSOLUTION and CASE.

The court *reſerves* the cognizance of ſuch an affair to itſelf—The lawyers ſay, that no prince ever grants ſuch a power by his letters or patents, but he *reſerves* to himſelf a greater.

Body of **RESERVE**, *corps de* RESERVE, in war, the forces diſpoſed in the third or laſt line of an army drawn up for battle. See LINE, GUARD, and REAR.

They are thus called, becauſe *reſerved*, or deſtined to ſuſtain the reſt as occaſion requires; and not to engage but in caſe of neceſſity.

RESERVED *caſes*. See the article CASE.

RESERVOIR, RECEPTACLE, a place where water is collected and reſerved, to be conveyed occaſionally, through pipes, &c. or to be ſpouted up, &c. See WATER, FLUID, &c.

The *reſervoir* in a building is a large baſon uſually of wood, lined with lead, where water is kept to ſupply the occaſions of the houſe—At Cannons, the noble ſeat of the duke of Chandos, is a very large *reſervoir* a-top of the houſe; to which the water is raiſed by a very curious engine contrived for the purpoſe—This *reſervoir* is of ſuch capacity, as that beſides ſupplying all parts of the houſe by means of pipes and cocks, it likewiſe turns a mill.

The *reſervoir* is ſometimes alſo a large baſon of ſtrong maſonry, clayed or paved at the bottom: where the water is reſerved to feed jets d'eau, or ſpouting fountains. See FOUNTAIN, &c.

Such is that huge one on the top of Marly, called *trou d'enfer*, hell-mouth, whoſe ſurface, Daviler tells us, contains fifty acres, and it's depth ſuch, as under that ſuperficies to contain a hundred thouſand cubic fathom of water.

RESERVOIR, in anatomy. See the article RECEPTACLE.

RESET, in law, the receiving or harbouring an outlawed perſon. See OUTLAW—Hence a receiver of an outlawed perſon, is called a *reſetter*.

RESIANCE, RESIANTIA, in law, a man's abode or continuance in a place.

The word has the ſame ſignification with regard to lay-men, as *reſidence* with regard to eccleſiaſtics. See RESIDENCE.

Glanvile obſerves, that in the antient law, *reſiance* properly ſignified a diſeaſe, whereby the perſon was diſabled from ſtirring out of doors—Whence their *eſſoin de reſiantiſa*, was the ſame as our *eſſoin de malo lecto*. See ESSOIN.

RESIDENCE, RESIDENTIA, in canon and common law, the abode of a perſon or incumbent upon his benefice; and his aſſiduity in attending on the ſame. See PARSON, BENEFICE, &c.

The default of *reſidence*, called *non-reſidence*, unleſs where the party has a diſpenſation for the ſame, with us, is the forfeiture of ten pounds for each month. See NON-*reſidence*.

By the canon law, beneficiaries are obliged to *reſidence*, under pain of deprivation of their benefices—The original reaſon is, that in the primitive church none were promoted to holy orders, but ſuch as had a benefice in promptu; which they were obliged to ſerve: ſo that this ſervice was neceſſarily attached to the orders; and whoever was honoured therewith, at the ſame time was obliged to perſonal ſervice. See ORDERS and ORDINATION.

But this ſtrict diſcipline was not obſerved long—The beneficiaries by degrees got diſpenſations from ſerving their benefices themſelves; and thus pluralities got footing. See PLURALITY.

France, of all other countries, ſeems to be that where *reſidence* is the moſt ſtrictly regarded—All their curez, or miniſters who have cures of ſouls, are obliged to actual *reſidence*; and the parliaments have declared all the diſpenſations granted by popes, &c. abuſive; as eſteeming the obligation of *reſidence* to be jure divino.

Under Charles IX. there was even a deſign to re-eſtabliſh the primitive diſcipline in all it's ſeverity; and in 1561, a declaration was regiſtered, appointing all biſhops to *reſide*, conformably to the antient canons, in their biſhoprics—The ſame parliament alſo forbad the biſhops to aſſume the quality of counſellors of the king; in regard ſuch a quality was deemed inconſiſtent with the indiſpenſable obligation they were under to *reſide* in their biſhoprics.

Du Pin adds, that the procureur general, or attorney general Buordin, even ſeized the temporalities of ſuch biſhops as continued in Paris fifteen days after this declaration; having firſt certified them, that if they had any buſineſs there, he would undertake the management thereof.

RESIDENCE, in chymiſtry, &c. the *ſettling*, or what remains of a liquor, or other ſubſtance in the veſſel, after the chief part of it has been poured or taken out; to change the manner of the operation on what is left. See SEDIMENT.

RESIDENT, a public miniſter, who manages the affairs of a king in the court of a prince, or petty ſtate; or the affairs of a prince, or petty ſtate; in the court of a king or prince. See MINISTER.

Thus the king of England has *reſidents* in the courts of the electors, and other princes of Germany, and Italy; at the republics of Genoa and Lucca: and they reciprocally, have *reſidents* in the court of Great-Britain.

Reſidents are a claſs of public miniſters inferiour to embaſſadors and envoys; but like them are under the protection of the laws of nations. See EMBASSADOR and ENVOY.

RESIDENT, RESIDENS, in our antient cuſtoms, was a tenant who was obliged to *reſide* on his lord's land, and not to depart from the ſame; called alſo, *homme levant* and *couchant*; and in Normandy, *reſſeant du fief*. *

RESIDENTIARY, RESIDENTIARIUS, a canon inſtalled to the privileges and profits of reſidence. See CANON and PREBENDARY.

RESIDUAL *figure*, in geometry, the figure remaining after ſubſtraction of a leſſer from a greater. See FIGURE.

RESIDUAL *root*, is a root compoſed of two parts or members, only connected together with the ſign—.

Thus, $a - b$, or $5 - 3$, is a *reſidual* root; and is ſo called, becauſe it's true value is no more then it's *reſidue*, or difference between the parts *a* and *b*, or 5 and 3. See ROOT.

RESIDUE, RESIDUUM, the remainder or reliqua of an account, debt, or obligation. See REMAINDER and RELIQUA.

St Paul in his epiſtle to the Romans, ſpeaks of a *reſidue* according to the election of grace; meaning a remnant or ſmall number of people preſerved from idolatry by an effect of the grace of God.

RESIGNATION, RESIGNATIO, in the canon law, the ſurrender, or giving up of a benefice into the hands of the collator or biſhop. See BENEFICE and COLLATION.

Reſignation is of equal import with *ſurrender*; only the former is reſtrained to ſpiritual benefices, and the latter to temporal offices or employments. See SURRENDER.

* *Quantumque de aliis teneat ei magis obnoxius eſt, & ejus* reſidens *eſſe debet cujus legius eſt. Leg. H.* 1.

Reſignations are either *ſimple*, or *conditional.*

Simple or *pure* RESIGNATIONS, are thoſe whereby the incumbent ſtrips himſelf of all his right, abſolutely, and without any conditions or reſerve of penſion—Theſe are made to the biſhop, or collator.

RESIGNATIONS *in favour*, or *conditional* RESIGNATIONS, are ſuch as are only made on condition that ſuch other perſons ſhall be inveſted therewith; ſo that the *reſignations* are null, unleſs the conditions be punctually executed.

Theſe *reſignations* in favorem are not above 200 years ſtanding—Strong oppoſition was made at firſt to them, they being eſteemed a kind of ſucceſſion or tranſmiſſion of benefices, as of patrimonies belonging to a family. Accordingly, theſe *reſignations* are not made into the hands of the ordinary, or collator, as pure *reſignations* are; but to the collator paramount, who in the Romiſh church is the pope: there being a ſuſpicion of ſimony, or other unlawful paction therein, where admitted of in prejudice to the lay-patron.

RESIGNEE, in law, the party to whom a thing is reſigned. See RESIGNATION.

RESIN, RESINA, a fat, viſcid, ſulphurous juice, oozing either ſpontaneouſly, or by inciſion, from ſeveral kinds of trees, particularly the pine, fir, *&c.* See JUICE, PLANT, *&c.* Camphor is a kind of *reſin.* See CAMPHOR—Maſtic is the *reſin* of the lentiſk. See MASTIC—The beſt of all the claſs of *reſins* is turpentine. See TURPENTINE—The coarſeſt is what we commonly call *roſin.* See ROSIN.

Reſin is properly a juice of the bark only. See BARK—Boerhaave will have it to be the oil of the bark farther inſpiſſated by the heat of the ſun, *&c.* ſo as to become friable. He adds, that it may be produced from any vegetable oil, by boiling it much and long. See OIL.

If turpentine be ſet over a gentle fire, it firſt diſſolves and becomes an oil, then a balſam, then pitch, and then *roſin*; in which ſtate it is friable in the cold, fuſible by fire, and withal inflammable and combuſtible, and diſſoluble in ſpirit of wine, but not in water, which are the characters of a *reſin.* See DISSOLVENT, *&c.*

There are two kinds of *reſins*, the one *liquid*, the other *dry* and hard—The firſt is the natural *reſin*, as it flows from the tree—The ſecond only differs from the firſt in that it is condenſed by the heat of the ſun, or by that of a culinary fire.

Reſins will incorporate with oil, or rectified ſpirits, but not with an aqueous menſtruum. See PRECIPITATION.

The difference betwixt *Reſins* and *gums*, conſiſts in this, that *reſins* are more ſulphurous, and gums more aqueous; ſo that the firſt diſſolve in oil or ſpirit of wine, and the laſt in water. See GUM.

M. Tournefort makes a kind of intermediate claſs of vegetable juices which he calls *gum-reſins*; which diſſolve partly in ſpirit of wine, partly in water—Such are *galbanum*, *bdellium*, *opopanax*, *ſagapenum*, &c. See GUM-*reſin.*

The *reſins* of ſeveral vegetables which abound with *reſinous* particles, but not ſo as to yield any by inciſion, as jalap, benzoin, ſcammony, turbith, *&c.* are thus obtained—The vegetable being groſly powdered, is put into a matraſs, and rectified ſpirits of wine poured on it, to the height of four fingers above the matter. Then the neck of another matraſs being luted into the former, to make a double veſſel, the matter is digeſted three or four days in a ſand heat, till it have given a good tincture to the ſpirit of wine. Then the diſſolution is filtrated, and two thirds of the clear liquor evaporated off, and the remainder poured into a large veſſel of water, where it turns into a kind of milk; whence the *reſin*, in time, precipitates to the bottom in a white powder—This when waſhed and dried in the ſun, grows into the ordinary conſiſtence of a *reſin.*

RESISTENCE, or RESITING *force*, in phyſics, any power which acts contrarily to another, ſo as to deſtroy or diminiſh it's effect. See POWER.

Of *reſiſtence* there are various kinds, ariſing from the various natures and properties of the *reſiſting* bodies, and governed by various laws: As, the *reſiſtence* of ſolids, the *reſiſtence* of fluids, the *reſiſtence* of the air, *&c.* The doctrine of each whereof will be ſeen under the following articles.

RESISTENCE *of ſolids*, in mechanics, is the force wherewith the quieſcent parts of ſolid bodies oppoſe the motion of others contiguous therewith. See SOLIDITY, *&c.*

Of this there are two kinds—The firſt, where the *reſiſting* and the *reſiſted* parts, *i. e.* the moving and quieſcent bodies, are only contiguous, and do not cohere; *i. e.* where they conſtitute ſeparate bodies or maſſes.

This *reſiſtence* is what M. Leibnitz calls *reſiſtence of the ſurface*; and we, properly, *friction*; the conſideration whereof, being of the laſt importance in the doctrine of machines, ſee it's laws under the article FRICTION.

The ſecond caſe of *reſiſtence* is where the *reſiſting* and *reſiſted* parts are not only contiguous but cohere, *i. e.* are parts of the ſame continued body or maſs—This *reſiſtence* is what we may properly call *renitency*; and was firſt conſidered by Galileo.

Theory of the RESISTENCE *of the fibres of ſolid bodies*—To conceive an idea of this *reſiſtence* or renitency of the parts, ſuppoſe a cylindrical body ſuſpended vertically by one end—Here, all it's parts being heavy, draw downwards; and tend to ſeparate the two contiguous planes, where the body is the weakeſt: but all the planes *reſiſt* this ſeparation by the force wherewith they cohere, or are bound together: here then are two oppoſite powers; *viz.* the weight of the cylinder which tends to break it, and the force of coheſion of the parts which *reſiſts* the fracture. See COHESION.

If the baſe of the cylinder be encreaſed, without encreaſing its length; it is evident the *reſiſtence* will be encreaſed in the ſame ratio as the baſe: but the weight alſo encreaſes in the ſame ratio; whence it is evident that all cylinders of the ſame matter and length, whatever their baſes be, have an equal *reſiſtence*, when vertically ſuſpended.

If the length of the cylinder be encreaſed without increaſing the baſe, it's weight is increaſed without increaſing it's *reſiſtence*; conſequently the lengthening it weakens it—To find the greateſt length a cylinder of any matter may have without breaking, there needs nothing but to take any cylinder of the ſame matter, and faſten it to the greateſt weight it will ſuſtain before it break; and then ſee how much it muſt be lengthened by the addition of it's weight, till it equals it's former weight with the addition of a foreign weight—By this means Galileo found a copper-wiar, and of conſequence any other cylinder of copper, might be extended to 4801 braccio's, or fathoms of ſix foot each.

If one end of the cylinder were fixed horizontally into a wall, and the reſt ſuſpended thence, it's weight and *reſiſtence* would then act in a different manner; and if it broke by the action of it's weight, the rupture would be at the end fixed into the wall. A circle or plane contiguous to the wall, and parallel to the baſe, and conſequently vertical, would be detached from the contiguous circle within the plane of the wall, and would deſcend. All the motion is performed on the loweſt extremity of the diameter, which remains immoveable, while the upper extremity deſcribes a quadrant of a circle, and till the circle which before was vertical become horizontal; *i. e.* till the cylinder be entirely broken.

In this fracture of the cylinder it is viſible two forces have acted, and the one has overcome the other: the weight of the cylinder, which aroſe from it's whole maſs, has overcome the *reſiſtence* which aroſe from the largeneſs of the baſe; and as the centres of gravity are points wherein all the forces ariſing from the weights of the ſeveral parts of the ſame bodies, are conceived to be united, one may conceive the weight of the whole cylinder applied in the centre of gravity of it's maſs, *i. e.* in a point in the middle of it's axis; and the *reſiſtence* of the cylinder applied in the centre of gravity of it's baſe, *i. e.* in the centre of the baſe: it being the baſe which *reſiſts* the fracture.

When the cylinder breaks by it's own weight, all the motion is on an immoveable extremity of a diameter of the baſe—This extremity, therefore is the fixed point of a lever, whoſe two arms are the radius of the baſe, and half the axis; and of conſequence the two oppoſite forces do not only act of themſelves, and by their abſolute force, but alſo by the relative force they derive from their diſtance with regard to the fixed point of the lever.

Hence it evidently follows, that a cylinder, *e. gr.* of copper, which, vertically ſuſpended, will not break by it's own weight if leſs than 480 fathom long, will break with a leſs length in a horizontal ſituation; in regard the length in this latter caſe contributes two ways to the fracture; both as it makes it of ſuch a weight, and as it is an arm of a lever to which the weight is applied—Hence, alſo, the ſmaller the baſe is, the leſs length or weight will ſuffice to break it; both becauſe the *reſiſtence* is really leſs, and becauſe it acts by a leſs arm of a lever.

If two cylinders of the ſame matter, having their baſes and lengths in the ſame proportion, be ſuſpended horizontally; it is evident that the greater has more weight than the leſſer, both on account of it's length, and of it's baſe. But it has leſs *reſiſtence* on account of it's length, conſidered as a longer arm of a lever, and has only more *reſiſtence* on account of it's baſe—Therefore it exceeds the leſſer in it's bulk and weight, more than in *reſiſtence*; and conſequently muſt break more eaſily.

Hence, we ſee why upon making models and machines in ſmall, people are apt to be miſtaken as to the *reſiſtence* and ſtrength of certain horizontal pieces, when they come to execute their deſigns in large; by obſerving the ſame proportion as in the ſmall—Galileo's doctrine of *reſiſtence* therefore is no idle ſpeculation, but becomes applicable in architecture and other arts.

The weight required to break a body placed horizontally, being always leſs than that required to break it in a vertical ſituation; and this weight being to be greater or leſs according to the ratio of the two arms of the lever: the whole theory is always reducible to this; *viz.* to find what part of the abſolute weight the relative weight is to be, ſuppoſing the figure of the body known; which indeed is neceſſary, becauſe it is the figure that determines the two centres of gravity, or the two arms of the lever—For if the body, *e. gr.* were a cone, it's centre of gravity would not be in the middle of it's axis, as in the cylinder; and if it were a ſemi-parabolical ſolid, neither it's centre of gravity would be in the middle of it's length or axis, nor the centre of gravity of it's baſe in the middle of the axis of it's baſe. But ſtill, whereſoever theſe centres fall in the ſeveral figures, it is theſe that regulate the two arms of the lever.

It may be here obſerved, that if the baſe whereby the body is faſtened into the wall be not circular, but, *e. gr.* parabolical, and the vertex of the parabola a-top, the motion of the fracture will not be on an immoveable point, but on a whole immoveable line; which may be called the *axis of equilibrium:* and it is with regard to this, that the diſtances of the centres of gravity are to be determined.

Now, a body horizontally ſuſpended, being ſuppoſed ſuch, as that the ſmalleſt addition of weight would break it; there is an equilibrium between it's poſitive and relative weight; and of conſequence thoſe two oppoſite powers are to each other reciprocally as the arms of the lever to which they are applied—On the other hand, the *reſiſtence* of a body is always equal to the greateſt weight which it will ſuſtain in a vertical ſituation, without breaking, *i.e.* is equal to it's abſolute weight. Therefore, ſubſtituting the abſolute weight for the *reſiſtence*, it appears that the abſolute weight, of a body ſuſpended horizontally, is to it's relative weight, as the diſtance of it's centre of gravity from the axis of equilibrium, is to the diſtance of the centre of gravity of it's baſe from the ſame axis.

The diſcovery of this important truth, at leaſt of an equivalent hereto, and to which this is reducible, we owe to Galileo—From this fundamental propoſition are eaſily deduced ſeveral conſequences—As, for inſtance, that if the diſtance of the centre of gravity of the baſe from the axis of equilibrium, be half the diſtance of the centre of gravity of the body; the relative weight will only be half the abſolute weight: and that a cylinder of copper horizontally ſuſpended, whoſe length is double the diameter, will break, provided it weigh half what a cylinder of the ſame baſe, 4801 fathoms long, weighs. See WEIGHT.

On this ſyſtem of *reſiſtence* of Galileo, M. Mariotte made a very ſubtile remark, which gave birth to a new ſyſtem—Galileo ſuppoſes that where the body breaks, all the fibres break at once; ſo that the body always *reſiſts* with it's whole abſolute force; *i. e.* with the whole force all it's fibres have in the place where it is to be broke—But M. Mariotte finding that all bodies, even glaſs itſelf, bends before it breaks, ſhews that fibres are to be conſidered as ſo many little bent ſprings, which never exert their whole force till ſtretched to a certain point; and never break till entirely unbent. Hence, thoſe neareſt the axis of equilibrium which is an immoveable line, are ſtretched leſs than thoſe farther off; and of conſequence employ a leſs part of their force.

This conſideration only takes place in the horizontal ſituation of the body: in the vertical, the fibres of the baſe all break at once; ſo that the abſolute weight of the body muſt exceed the united *reſiſtence* of all it's fibres: a greater weight is therefore required here, than in the horizontal ſituation; *i. e.* a greater weight is required to overcome their united *reſiſtence*, than to overcome their ſeveral *reſiſtences* one after another—The difference between the two ſituations ariſes hence, that in the horizontal there is an immoveable point or line, a centre of motion, which is not in the vertical.

M. Varignon has improved on the Syſtem of M. Mariotte, and ſhewn that to Galileo's ſyſtem, it adds the conſideration of the centre of percuſſion—The compariſon of the centres of gravity, with the centres of percuſſion, afford a fine view; and ſet the whole doctrine in the moſt agreeable light. See CENTER.

In each ſyſtem, the baſe whereby the body breaks, moves on the axis of equilibrium, which is an immoveable line in the ſame baſe; but in the ſecond, the fibres of this baſe are continually ſtretching more and more; and that in the ſame ratio as they recede farther and farther from the axis of equilibrium, and of conſequence are ſtill exerting a greater and great part of their whole force.

Theſe unequal extentions, like all other forces, muſt have ſome common centre where they all meet; and with regard to which they make equal efforts on each ſide: and as they are preciſely in the ſame proportion as the velocities which the ſeveral points of a rod moved circularly would have to one another; the centre of extenſion of the baſe whereby the body breaks, or tends to break, muſt be the ſame with it's centre of percuſſion—Galileo's hypotheſis, where fibres ſtretch equally, and break all at once, correſponds to the caſe of a rod moving parallel to itſelf; where the centre of extenſion or percuſſion does not appear, as being confounded with the centre of gravity.

The baſe of fraction being a ſurface whoſe particular nature determines it's centre of percuſſion; it is neceſſary to be firſt known to find on what point of the verticle axis of that baſe it is placed; and how far it is from the axis of equilibrium—Indeed, we know, in the general, that it always acts with ſo much more advantage as it is farther from it, in regard it acts by a longer arm of a lever; and of conſequence it is the unequal *reſiſtence* of the fibres in M. Mariotte's hypotheſis, which produces the centre of percuſſion; but this unequal *reſiſtence* is greater or leſs according as the centre of percuſſion is placed more or leſs high on the vertical axis of the baſe, in the different ſurfaces of the baſe of the fracture.

To expreſs this unequal *reſiſtence*, accompanied with all the variations it is capable of, regard muſt be had to the ratio between the diſtance of the centre of percuſſion from the axis of equilibrium, and the length of the vertical axis of the baſe—In which ratio, the firſt term, or the numerator, is always leſs than the ſecond or the denominator: ſo that the ratio is always a fraction leſs than unity; and the unequal *reſiſtence* of the fibres in M. Mariotte's hypotheſis is ſo much the greater, or which amounts to the ſame, approaches ſo much nearer to the equal *reſiſtence* in Galileo's hypotheſis, as the two terms of the ratio are nearer to an equality.

Hence it follows, that the *reſiſtence* of bodies, in M. Mariotte's ſyſtem, is to that in Galileo's, as the leaſt of the terms in the ratio, is to the greateſt—Hence, alſo, the *reſiſtence* being leſs than what Galileo imagined, the relative weight muſt alſo be leſs; ſo that the proportion already mentioned between the abſolute and relative weight, cannot ſubſiſt in the new ſyſtem, without an augmentation of the relative weight, or a diminution of the abſolute weight: which diminution is had by multiplying the weight by the ratio, which is always leſs than unity. This done, we find that the abſolute weight multiplied by the ratio, is to the relative weight, as the diſtance of the centre of gravity of the body from the axis of equilibrium, is to the diſtance of the centre of gravity of the baſe of fracture, from the ſame axis. Which is preciſely the ſame thing with the general formula given by M. Varignon, for the ſyſtem of M. Mariotte. In effect, after conceiving the relative weight of a body, and it's *reſiſtence* equal to it's abſolute weight, as two contrary powers applied to the two arms of a lever, in the hypotheſis of Galileo; there needs nothing to convert it into that of M. Mariotte, but to imagine that the *reſiſtence*, or the abſolute weight is become leſs, every thing elſe remaining the ſame.

We have here only conſidered bodies as to be broke by their own weight—It will amount to the ſame, if we ſuppoſe them void of weight themſelves, and to be broken by a weight applied to their extremities: only it is to be obſerved, that a foreign weight acts by an arm of a lever equal to the whole length of a body; whereas their own weight being all united in their centre of gravity, is only the diſtance of that centre from the axis of equilibrium.

One of the moſt curious, and perhaps the moſt uſeful queſtions in this reſearch, is to find what figure a body muſt have, that it's *reſiſtence* may be equal in all it's parts; whether it be conceived as loaden with a foreign weight; or as only ſuſtaining it's own weight—We ſhall, here, only conſider the latter caſe, from which the former will be eaſily determined.

For a body, then, ſuſpended horizontally, to reſiſt equally in all it's parts; it is neceſſary ſome part of it being conceived as cut off in a plane parallel to the baſe of fracture of the body, the weight of the part retrenched be to it's *reſiſtence*, in the ſame ratio, as the weight of the whole to it's *reſiſtence*; theſe four powers acting by arms of levers peculiar to themſelves—Now the weight of any body thus conceived, is it's whole weight multiplied by the diſtance of the centre of gravity of the body, from the axis of equilibrium; and the *reſiſtence* is the plane of the baſe of fracture multiplied by the diſtance of the centre of gravity of the baſe from the ſame axis: conſequently theſe four quantities are to be proportional in the whole, and in each part of a ſolid of *equal reſiſtence*.

From this proportion M. Varignon eaſily deduces two ſolids, which ſhall *reſiſt* equally in all their parts. Galileo had found one before: that diſcovered by M. Varignon, is in form of a trumpet, and is to be fixed into the wall at it's greater end; ſo that it's bigneſs and weight is always diminiſhed in proportion as it's length, or the arm of the lever whereby it's weight acts, increaſes. It is added, (which ſeems very remarkable) that howſoever different the two ſyſtems may be, the ſolids of equal *reſiſtence* are the ſame in both.

For the RESISTENCE *of a ſolid ſupported at each extreme; as, of a beam between two walls.* See BEAM.

RESISTENCE *of fluids*, in hydroſtatics, is the force wherewith bodies moving in fluid mediums, are impeded and retarded in their motions. See FLUID and MEDIUM.

Laws of RESISTENCE *of the fluid mediums*—A body moving in a fluid, is *reſiſted* from two cauſes; the firſt, the coheſion of the parts of the fluid—For a body in it's motion ſeparating the parts of a liquid, muſt overcome the force with which thoſe parts cohere. See COHESION.

The ſecond is the inertia, or inactivity of matter, whereby a certain force is required to move the particles from their places, in order to let the body paſs. See VIS *Inertiæ*.

The retardation from the firſt cauſe, is always the ſame in the ſame ſpace, the ſame body remaining; be the velocity what it will—Hence, the reſiſtence encreaſes, as the ſpace run through; in which ratio the velocity alſo encreaſes; therefore the *reſiſtence* is as the velocity itſelf. See VELOCITY.

The *reſiſtence* from the ſecond cauſe, when the ſame body moves through different fluids, with the ſame velocity, follows the proportion of the matter to be removed in the ſame time; which is as the denſity of the fluid. See DENSITY.

When the ſame body moves through the ſame fluid with different velocities, this *reſiſtence* increaſes in proportion to the number of particles ſtruck in an equal time; which number is as the ſpace run through in that time, that is, as the velocity. But farther, it increaſes in proportion to the force with which the body ſtrikes againſt every part; which force is alſo as the velocity of the body. And therefore if the velocity be triple, the *reſiſtence* is triple, from a triple number of parts to be removed—It is alſo triple from a ſtroke three times ſtronger againſt every particle; therefore the whole *reſiſtence* is ninefold, that is, as the ſquare of the velocity. Hence a body moved in a fluid, is *reſiſted* partly in a ratio of the velocity, and partly in a duplicate ratio of it.

The *reſiſtence* from the coheſion of parts in fluids, except glutinous ones, is not very ſenſible, in reſpect of the other *reſiſtence*, which increaſes in the ratio of the ſquares of the velocities, but the firſt in the ratio of the velocity itſelf. By how much the velocity increaſes, by ſo much more do theſe *reſiſtences* differ; wherefore in ſwifter motions the *reſiſtence* alone is to be conſidered, which is as the ſquare of the velocity.

If a fluid be included in a veſſel of a priſmatic figure, and there be moved along in it, with equal velocity and in a direction parallel to the ſides of the priſm, two bodies, the one ſpherical, the other cylindric; ſo that the diameter of the baſe of the latter be equal to the diameter of the ſphere; and the cylinder be moved in the direction of it's axis; theſe bodies will ſuffer the ſame *reſiſtence.*

To demonſtrate this, ſuppoſe the bodies at reſt, and that the fluid moves in the veſſel, with the ſame velocity that the bodies had: by this, the relative motion of the bodies, and the fluid is not changed: conſequently the actions of the bodies on the fluid, and of the fluid on the bodies, are not changed—The retardation which the liquor ſuffers in paſſing by the body, ariſes only from this, that in that place it is reduced to a narrower ſpace; but the capacity of the veſſel is equally diminiſhed by each body; therefore each body produces an equal retardation. And becauſe action and re-action are equal to one another, the fluid acts equally upon each body; wherefore alſo each body will be equally retarded, when the bodies are moved, and the fluid is at reſt.

Reſiſtence and retardation are uſed indifferently for each other, as being both in the ſame proportion; and the ſame *reſiſtence* always generating the ſame retardation—But with regard to different bodies, the ſame *reſiſtence* frequently generates different retardations; the *reſiſtence* being the quantity of motion, and the retardation the celerity—*For the difference and meaſure of the two*, See RETARDATION.

The retardations from this *reſiſtence* may be compared together, by comparing the *reſiſtence* with the gravity—It is demonſtrated, that the *reſiſtence* of a cylinder, which moves in the direction of it's axis (to which the *reſiſtence* of a ſphere of the ſame diameter is equal) is equal to the weight of a cylinder of that fluid through which the body moves, having it's baſe equal to the body's baſe, and it's height equal to half the height from which the body falling in vacuo, may acquire the velocity with which the cylinder moves through the fluid.

From the given celerity of the body moved, the height of the fluid cylinder is found, as alſo the weight of it, from the known ſpecific gravity of the liquid, and diameter of the body—Let a ball, for inſtance, of three inches diameter be moved in water with a celerity wherewith it would go ſixteen foot in a ſecond: from experiments on falling bodies, and others made on pendulums, it has been found that this is the celerity which a body acquires in falling from a height of four foot; therefore the weight of a cylinder of water, of three inches diameter, and two foot high, that is, a weight of about ſix pound and three ounces, is equal to the *reſiſtence* of the aforeſaid ball. See DESCENT.

Let the *reſiſtence* ſo diſcovered be divided by the weight of the body, which determines it's quantity of matter, and you will have the retardation.

RESISTENCE *of fluid mediums to the motion of pendulums*—The arch deſcribed by a pendulum oſcillating in vacuo, with the celerity it has acquired in deſcending, is equal to the arch deſcribed by the deſcent; but the ſame does not happen in a fluid, and there is a greater difference between thoſe arches, the greater the *reſiſtence* is; that is, the greater the arch is which is deſcribed in the deſcent.

Let the *reſiſtence* of the fluid be in proportion to the velocity; and let two pendulums, entirely alike, oſcillating in a cycloid, perform unequal vibrations, and begin to fall the ſame moment; they here begin to move by forces that are as the arches to be deſcribed. If thoſe impreſſions alone, which are made the firſt moment be conſidered; after a given time the celerities will be in the ſame ratio, as at the beginning; for the retardations, which are as the velocities themſelves, cannot change their proportions, the ratio between quantities not being changed by the addition and ſubſtraction of quantities in the ſame ratio. Therefore in equal times, however the celerities of bodies are changed in their motion by the *reſiſtence*, the ſpaces gone through are as the forces in the beginning; that is, as the arches to be deſcribed by the deſcent: therefore, after any times, the bodies are in the correſpondent point of thoſe arches. But in theſe points the forces generated are in the ſame ratio as in the beginning, and the proportion of the celerities, which is not varied by the *reſiſtence*, ſuffers no change from the gravity. In the aſcent, gravity retards the motion of the body; but in correſpondent points, it's actions are in the ſame ratio as in deſcents. And therefore every where in correſpondent points, the celerities are in the ſame ratio. But as in the ſame moments the bodies are in their correſpondent points, it follows that the motion of both is deſtroyed in the ſame moment, that is, they finiſh their vibrations in the ſame time. The ſpaces run through in the time of one vibration, are as the forces by which they are run through; that is, the arches of whole vibration are as the arches deſcribed by the deſcent, the doubles whereof are the arches to be deſcribed in vacuo. The deficiences of the arches to be deſcribed in fluids, from the arches to be deſcribed in vacuo, are the differences of quantities in the ſame ratio, and are as the arches deſcribed in the deſcent. See PENDULUM.

RESISTENCE *of fluid mediums to the motion of falling bodies.*—The *reſiſtences* are as the ſquares of the celerities, and therefore every where in correſpondent points, as the ſquares of the arches deſcribed by the deſcent; in which ratio alſo, the retardations are: but as each of them retain the ſame proportion in correſponding points, the ſums of them all will be in the ſame proportion; that is, the whole retardations, which are the defects of the arches deſcribed in the fluid, from the arches to be deſcribed in vacuo, or which is the ſame, the difference between the arches deſcribed in the deſcent, and the next aſcent. Therefore theſe differences, if the vibrations are not very unequal, are nearly as the ſquares of the arches deſcribed by the deſcent: which is alſo confirmed by experiments in greater vibrations; for in theſe the proportion of *reſiſtence*, here conſidered, obtains.

A body freely deſcending in a fluid is accelerated by the reſpective gravity of the body, which continually acts upon it, yet not equally, as in a vacuum: the *reſiſtence* of the fluid occaſions a retardation, that is, a diminution of acceleration, which diminution increaſes with the velocity of the body. Now there is a certain velocity, which is the greateſt a body can acquire by falling; for if it's velocity be ſuch that the *reſiſtence* ariſing from it becomes equal to the reſpective weight of the body, it's motion can be no longer accelerated; for the motion here continually generated by the reſpective gravity, will be deſtroyed by the *reſiſtence*, and the body forced to go on equably. A body continually comes nearer and nearer to this greateſt celerity, but can never attain to it.

When the denſities of a fluid body are given, the reſpective weight of the body may be known; and by knowing the diameter of the body, it may be found from what height a body falling in vacuo, can acquire ſuch a velocity, as that the *reſiſtence* in a fluid ſhall be equal to that reſpective weight, which will be that greateſt velocity above mentioned—If the body be a ſphere, it is known that a ſphere is equal to a cylinder of the ſame diameter, whoſe height is two third parts of that diameter; which height is to be increaſed in the ratio wherein the reſpective weight of the body exceeds the weight of the fluid, in order to have the height of a cylinder of the fluid, whoſe weight is equal to the reſpective weight of the body; but if you double this height, you will have a height from which a body falling in vacuo, acquires ſuch a velocity as generates a *reſiſtence* equal to this reſpective weight, and which therefore is the greateſt velocity which a body can acquire by falling in a fluid from an infinite height. Lead is eleven times heavier than water, wherefore it's reſpective weight is to the weight of water as ten to one; therefore a leaden ball, as it appears from what has been ſaid, cannot require a greater velocity in falling in water, than it would acquire in falling in vacuo, from an height of $13\frac{1}{3}$ of it's diameters.

A body lighter than a fluid, and aſcending in it by the action of the fluid, is moved exactly by the ſame laws as an heavier body falling in the fluid. Wherever you place the body, it is ſuſtained by the fluid, and carried up with a force equal to the difference of the weight of a quantity of the fluid of the ſame bulk as the body, from the weight of the body. Therefore you have a force that continually acts equably upon the body; by which not only the action of gravity of the body is deſtroyed, ſo as that it is not to be conſidered in this caſe, but the body is alſo carried upwards by a motion equably accelerated; in the ſame manner as a body heavier than a fluid deſcends by it's reſpective gravity; but the equability of the acceleration is deſtroyed in the ſame manner by the *reſiſtence*, in the aſcent of a body lighter than the fluid, as it is deſtroyed in the deſcent of a body heavier.

When a body ſpecifically heavier than a fluid is thrown up in it, it is retarded upon a double account; on account of the gravity of the body, and on account of the *reſiſtence* of the fluid: conſequently, a body riſes to a leſs height than it would riſe to in a vacuo with the ſame celerity. But the defects of the height in a fluid from the height to which a body would riſe in vacuo with the ſame celerity, have a greater proportion to each other than the heights themſelves; and in leſs heights the defects are nearly as the ſquares of the heights in vacuo.

Resistence *of the air*, in pneumatics, is the force wherewith the motion of bodies, particularly projectiles, is retarded by the oppoſition of the air or atmoſphere. See Air and Projectile.

The air being a fluid, the general laws of the *reſiſtence* of fluids obtain therein; only the different degrees of denſity in the different ſtages or regions of the atmoſphere, occaſion ſome irregularity. See Atmosphere.

Different **Resistence** *of the ſame medium to bodies of different figures*—Sir Iſaac Newton ſhews, that if a globe and a cylinder of equal diameters, be moved with equal velocity in a thin medium, conſiſting of equal particles, diſpoſed at equal diſtances, according to the direction of the axis of the cylinder; the *reſiſtence* of the globe will be leſs by half than that of the cylinder.

Solid of the leaſt **Resistence**—From the laſt propoſition the ſame author deduces the figure of a ſolid, which ſhall have the *leaſt reſiſtence* of any containing the ſame quantity of matter and ſurface. See Solid.

The figure is this—Suppoſe DNFG (*Tab. Mechanics*, *fig.* 57.) to be ſuch a curve, as, that if from any point N, be let fall a perpendicular N M, to the axis A B; and from a given point G, be drawn a right line G R, parallel to a tangent to the figure in N, and cut the axis when continued in R: M N be to G R as G R *cub.* to 4 B R × G B *q*: a ſolid deſcribed by the evolution of this figure about it's axis A B, moving in a medium from A towards B, is leſs *reſiſted* than any other circular ſolid of the ſame area, *&c. Newt. Princ.* p. 300.

Resistence *of a globe*, perfectly hard and in a medium, whoſe particles are ſo too; is to the force wherewith the whole motion may either be deſtroyed or generated which it has at the time, when it has deſcribed four thirds of it's diameter; as the denſity of the medium, to the denſity of the globe—Hence alſo, infers Sir Iſaac Newton that the *reſiſtence* of a globe, is cæteris paribus, in a duplicate ratio of it's velocity. Or it's *reſiſtence* is cæteris paribus, in a duplicate ratio of it's diameter. Or, cæteris paribus, as the denſity of the medium. Laſtly, that the actual *reſiſtence* of a globe is in a ratio compounded of the duplicate ratio of the velocity, and of the duplicate ratio of the diameter, and of the ratio of the denſity of the medium.

In theſe articles, the medium is ſuppoſed to be diſcontinuous, as air probably is; if the medium be continuous, as water, mercury, *&c.* where the globe does not ſtrike immediately on all the particles of the fluid generating the *reſiſtence*, but only on thoſe next it, and thoſe again on others, *&c.* the *reſiſtence* will be leſs by half. And a globe in ſuch a medium undergoes a *reſiſtence* which is to the force wherewith the whole motion it has after deſcribing eight thirds of it's diameter, might be generated or taken away, as the denſity of the medium to the denſity of the globe.

Resistence *of a cylinder* moving in the direction of it's axis, is not altered by any augmentation or diminution of it's length, and therefore is the ſame with that of a circle of the ſame diameter moving with the ſame velocity in a right line perpendicular to it's plane.

The *reſiſtence* of a cylinder moving in an infinite unelaſtic fluid, ariſing from the magnitude of a tranſverſe ſection, is to the force wherewith it's whole motion while it deſcribes four times it's length may be taken away or generated, as the denſity of the medium to that of the cylinder, very nearly.

Hence, the *reſiſtences* of cylinders moving length-wiſe, in infinitely continued mediums, are in a ratio compounded of the duplicate ratio of their diameters, the duplicate ratio of their velocities, and the ratio of the denſity of the mediums.

The *reſiſtence* of a globe in an infinite unelaſtic medium is to the force whereby it's whole motion while it deſcribes eight thirds of it's diameter, might be either generated or taken away, as the denſity of the fluid, to the denſity of the globe, quam proximè.

Mr James Bernoulli demonſtrates the following theorems.

Resistence *of a triangle*—If an iſoſceles triangle be moved in a fluid according to the direction of a line perpendicular to it's baſe; firſt, with the vertex foremoſt, and then with it's baſe; the *reſiſtences* will be as the legs, and as the ſquare of the baſe, and as the ſum of the legs.

The **Resistence** *of a ſquare* moved according to the direction of it's ſide, and of it's diagonal, is as the diagonal to the ſide.

The **Resistence** *of a circular ſegment*, leſs than a ſemicircle carried in a direction perpendicular to it's baſis, when it goes with the baſe foremoſt, and when with it's vertex foremoſt, (the ſame direction and celerity continuing;) is as the ſquare of the diameter, to the ſame, leſs $\frac{1}{3}$ of the ſquare of the baſe of the ſegment.—Hence the *reſiſtences* of a ſemicircle, when it's baſe and when it's vertex go foremoſt, are to one another in a ſeſquialterate ratio.

Resistence *of a parabola*—A parabola moving in the direction of it's axis, firſt with it's baſis, and then it's vertex foremoſt, has it's *reſiſtences* as the tangent to an arch of a circle, whoſe diameter is equal to the parameter, and the tangent equal to half the baſis of the parabola.

The *reſiſtence*, if the vertex go foremoſt, may be thus computed—Say, as the ſum (or difference) of the tranſverſe axis, and latus rectum, is to the tranſverſe axis; ſo is the ſquare of the latus rectum to the ſquare of the diameter of a certain circle, in which circle apply a tangent equal to half the baſis of the hyperbola or ellipſis—Then ſay again, as the ſum (and difference) of the axis and parameter, is to the parameter; ſo is the aforeſaid tangent to another right line. And farther, as the ſum (or difference) of the axis and parameter, is to the axis; ſo is the circular arch correſponding to the aforeſaid tangent, to another arch. This done, the *reſiſtences* will be as the tangent to the ſum (or difference) of the right line thus found, and the arch laſt mentioned.

In the general, the *reſiſtences* of any figure whatever, going now with it's baſe foremoſt, and then with it's vertex, are as the figures of the baſe to the ſum of all the cubes of the element of the baſe, divided by the ſquares of the element of the curve line.

All which rules may be of uſe in the conſtruction of ſhips, and in perfecting the art of navigation univerſally: as alſo for determining the figures of the balls of pendulums for clocks, *&c.* See Ship, Navigation, Pendulum, *&c.*

RESOLUTION, Resolutio, or Solutio, in phyſics, the reduction of a body into it's original, or natural ſtate, by a diſſolution, or ſeparation of it's aggregated parts. See Dissolution.

Thus, ſnow and ice are ſaid to be *reſolved* into water; a compound is *reſolved* into it's ingredients, *&c.* See Thawing, Decomposition, *&c.*—Water *reſolves* into vapour by heat; and vapour is again *reſolved* into water by cold. See Vapour, Heat, *&c.*

Some of the modern philoſophers, particularly Mr Boyle, M. Mariotte, Boerhaave, *&c.* maintain that the natural ſtate of water is to be congealed, or in ice; inaſmuch as a certain degree of heat, which is a foreign and violent agent, is required to make it fluid: ſo that near the pole, where this foreign force is wanting, it conſtantly retains it's fixed or icy-ſtate. See Water—On this principle, the *reſolution* of ice into water, muſt be an improper expreſſion. See Freezing.

Resolution, in chemiſtry, is the reduction of a maſs or mixed body into it's component parts, or firſt principles; by a proper analyſis. See Principle, Analysis, *&c.*

The *reſolution* of bodies is performed variouſly; by diſtillation, ſublimation, diſſolution, fermentation, *&c.* See each operation under it's proper article, Distillation, *&c.*

Resolution, in logic, is a branch of method, called alſo *analyſis*. See Method and Analysis.

The buſineſs of *reſolution* is to inveſtigate, or examine the truth, or falſhood of a propoſition by aſcending from ſome particular known truth, as a principle, by a chain of conſequences, to another more general one in queſtion. See Proposition, Truth, *&c.*

Reſolution, or the analytic method, ſtands in direct oppoſition to *compoſition*, or the ſynthetic method; in which laſt we deſcend from ſome general known truths to a particular one, in queſtion. See Composition.

For an inſtance of the method of *reſolution*—Suppoſe the queſtion this: whether on the ſuppoſition of man's exiſtence, we can prove that God exiſts?

To *reſolve* this, our method is thus—“ Mankind did not al-
“ ways exiſt. It is evident from a thouſand conſiderations,
“ the ſpecies had a beginning; and that according to all hiſto-
“ ry, not 6000 years ago; but if it had a beginning; there
“ muſt be ſome cauſe of it's beginning; ſomething to in-

“ duce it to exiſt then more than it did before; in effect
“ there muſt be a cauſe or author of it's exiſtence, for from
“ nothing, nothing ariſes: this cauſe, whatever it is, muſt
“ at leaſt have all the faculties we find in ourſelves; for none
“ can give more than he has: nay, he muſt have others
“ which we have not, ſince he could do what we cannot
“ do, *i. e.* create, make man exiſt, *&c.*—Now, this cauſe
“ either exiſts ſtill, or has ceaſed to do ſo: if the former, he
“ did not exiſt from eternity; for what is from eternity is
“ neceſſary, and can neither by itſelf nor any other cauſe be
“ reduced to nothing: if the latter, it muſt have been pro-
“ duced from ſome other; and then the ſame queſtion will
“ return upon the producer—There is then ſome firſt cauſe;
“ and this cauſe has all the properties and faculties we have;
“ nay more, exiſted from eternity, *&c.* Therefore, from
“ the ſuppoſition of man's exiſtence, it follows there is a
“ God, *&c.*

Resolution, or **Solution**, in mathematics, is an orderly enumeration of the ſeveral things to be done, to obtain what is required in a problem. See Problem.

Wolfius makes a problem to conſiſt of three parts—The *propoſition* (which is what we properly call the *problem)* the *reſolution*, and the *demonſtration.* See Proposition, *&c.*

The general tenor of all problems is, thoſe things being done which are enjoyned by the *reſolution*; the thing is done which was to be done.

As ſoon as a problem is demonſtrated, it is converted into a theorem; whereof the *reſolution* is the hypotheſis; and the propoſition the theſis. See Theorem, Thesis, *&c.*

The proceſs of a mathematical *reſolution*, ſee in the following article.

Resolution, in algebra, or algebraical, is of two kinds; the one practiſed in numerical problems, the other in geometrical ones. See Algebra.

To reſolve a given numerical problem algebraically, the method is thus: 1°. diſtinguiſh the given quantities from the quantities ſought; and note the former with the firſt letters of the alphabet, and the latter with the laſt. See Quantity and Character.

2°. Find as many equations as there are unknown quantities: if that cannot be, the problem is indeterminate; and one or more of the ſought quantities may be aſſumed at pleaſure—The equations, unleſs they be contained in the problem itſelf, are found by theorems relating to the equality of quantities. See Equation and Equality.

3°. Since, in an equation, the unknown quantities are mixed with the known; it muſt be reduced, in ſuch manner as that only one unknown quantity be found on one ſide, and none but known quantities on the other—This reduction is performed by adding the ſubtracted quantities, dividing the multiplied quantities, and multiplying the divided ones, extracting the roots out of powers, raiſing roots to their powers, *&c.* ſo as that the equality may be ſtill preſerved. See Reduction.

To **Resolve** *a geometrical problem algebraically*—The proceſs in the former article is to be obſerved throughout; but as it rarely happens we come at an equation in geometrical problems by the ſame means as in numerical ones; there are ſome farther things to be noted: firſt then, ſuppoſe the thing done which was propoſed to be done—2°. Examine the relations of all the lines in the diagram, without any regard to known or unknown; in order to find which depend on which; and from which being had, what others are had, whether by ſimilar triangles, or rectangles, *&c.*—3°. To obtain the ſimilar triangles or rectangles, the lines are to be frequently produced, till they become either directly or indirectly equal to given ones, or interſect others, *&c.* Parallels and perpendiculars to be frequently drawn: points to be frequently connected; and angles to be made equal to others.

If thus you do not arrive at a neat equation; examine the relations of the lines in another manner—Sometimes it is not enough to ſeek the thing directly, but another thing muſt be ſought, whence the firſt may be found.

The equation being produced, the geometrical conſtruction is to be deduced therefrom, which is done in various manners, in the various kinds of equations. See Construction *of equations.*

Problematical **Resolution**. See Problematical.

Resolution, in medicine, that coction, or alteration of the crude, peccant matter of any diſeaſe, either by the natural ſtrength of the patient, or of it's own accord, or by the application of remedies; whereby it's bulk, figure, coheſion, *&c.* are ſo far changed, as that it ceaſes to be morbid, and becomes laudable. See Coction, Disease, *&c.*

This, the learned Boerhaave obſerves, is of all others the moſt perfect cure, where it is effected without any evacuation; as ſuppoſing the matter favourable, the conſtitution excellent, and the medicines good. See Crisis, *&c.*

Resolution, in muſic, is when a canon or perpetual fugue is not wrote all on the ſame line, or in one part; but all the voices that are to follow the guida, or firſt voice, are wrote ſeparately, either in ſcore, *i. e.* in ſeparate lines, or ſeparate parts, with the pauſes each is to obſerve, in the beginning, and in the tone proper to each.

RESONANCE, **Resounding**, in muſic, *&c.* a ſound returned by the air incloſed in the bodies of ſtring-muſical-inſtruments as lutes, *&c.* or even in the bodies of wind-inſtruments, as flutes, *&c.* See Sound, Music, Instrument, *&c.*

Elliptic, and parabolic vaults, *reſound* ſtrongly, *i. e.* reflect or return the ſound. See Echo.

The mouth, and the parts thereof, as the palate, tongue, teeth, noſe, and lips, Monſ. Dodart obſerves, contribute nothing to the tone of the voice; but their effect is very great as to the *reſonance.* See Voice.

Of this we have a very ſenſible inſtance in that vulgar inſtrument called the *Jews-harp*, or *trompe de Bearn:* for, if you hold it in your hand, and ſtrike the tongue or ſpring thereof, which yields all the ſound of the inſtrument, it ſcarce makes any noiſe at all. But, holding the body of the inſtrument between the teeth, and ſtriking the ſpring as before, it makes a muſical buzz, which is heard to a good diſtance, and eſpecially the lower notes.

So alſo in the haut-boys, the tone of the reed is always the ſame; being a ſort of drone: the chief variety is in the tone of the *reſonance*, produced in the mouth by the greater or leſs aperture, and the divers motions of the lips. See Haut-boy.

RESOLVENTS, **Resolventia**, in medicine, remedies proper to reſolve and diſſipate tumours and gatherings, to ſoften indurations, and by their tenuity and warmth, evacuate redundant or peccant humours through the pores. See Resolution.

Under this claſs come various unguents, emplaſters, *&c.* See Discutient.

RESORT. See the article Ressort.

RESPECTU *computi vicecomitis habendo*, a writ for the reſpiting a ſheriff's accompt, upon juſt occaſion, directed to the treaſurer and barons of the exchequer. See Sheriff.

RESPECTUANDO *homagio.* See Homagio.

RESPIRATION, **Respiratio**, the act of *reſpiring*, or breathing the air. See Air.

Reſpiration is an involuntary motion of the breaſt, whereby the air is alternately taken in and thrown out: it therefore includes two contrary motions; the one called *inſpiration*, whereby the fluid is received into the cavity of the lungs—The other, *expiration*, whereby it is again expelled. See Inspiration and Expiration.

The principal organs of *reſpiration* are the lungs, trachea, larynx, *&c.* the deſcriptions whereof ſee under their proper articles, Lungs, Trachea, Larynx, *&c.*

For the manner wherein **Respiration** *is performed*—It is to be obſerved, that the lungs, when ſuſpended in the open air, by the contractive power of the muſcular fibres which tie together the ſquamous parts of the bronchia, are reduced to leſs ſpace than they poſſeſſed while in the cavity of the thorax: and when thus contracted, if a quantity of new air be injected through the glottis, they again become diſtended, ſo as to poſſeſs an equal, nay a greater ſpace than that aſſigned them in the thorax. See Muscle.

Hence it appears, that the lungs, by their proper force, are always endeavouring to contract themſelves into leſs compaſs than they poſſeſs when incloſed in the thorax; and that therefore they are always in a ſtate of violent dilatation while the man lives—For the air that encompaſſes them in the thorax, ſhut up between their external membrane and the pleura, is not of equal denſity with common air.

In effect, the ingreſs of the air through the glottis into the lungs, is always free; but that on the outſide wherewith they are compreſſed, is impeded by the diaphragm, ſo as it cannot enter the thorax in quantity ſufficient to make an equilibrium.

Since then, in inſpiration, the air enters the lungs in greater quantity than it was before; it will dilate them more, and will overcome their natural force—The lungs therefore are wholly paſſive in the matter: what it is that acts muſt be learnt from the phænomena.

1°. Then, it is obſerved, that in inſpiration, the nine upper ribs articulated to the vertebræ and the ſternum, riſe archwiſe towards the clavicles; and the three lower are turned downwards; and the eighth, ninth, and tenth, are drawn inwards. 2°. That the abdomen is dilated; and 3°. the thorax enlarged. 4°. The diaphragm is brought from it's convex and ſinuous poſition to a flat figure.

Now, as theſe are the only viſible actions in inſpiration, the cauſe of the operation muſt be referred to them; or rather to the muſcles of theſe parts, which are the intercoſtals, the ſubclavian, *&c.*

The capacity of the thorax being enlarged by the action of theſe muſcles on the ribs, *&c.* a ſpace is left between the pleura and the ſurface of the lungs; ſo that the air entering the glottis, inflates them till ſuch time as they become contiguous to the pleura and diaphragm—In this caſe, now, the air preſſes the lungs as much as the thorax reſiſts them. And hence, the lungs become at reſt; the blood paſſes leſs freely, and is forced in leſs quantity into the left ventricle of the heart, and ſo leſs comes into the cerebellum, and it's nerves, and the arterial blood acts leſs on the intercoſtal muſcles and diaphragm.

The cauſes, therefore, which at firſt dilated the thorax, grow weaker; conſequently the ribs become depreſſed, the diſtended fibres of the muſcles of the abdomen reſtore themſelves, the viſcera thruſt the diaphragm up again into the thorax, the ſpace whereof being thus contracted, the air is drove out of the lungs; and thus is *expiration* performed. Immediately, the blood being quickened in it's motion, begins to flow ſtronger and more plentifully to the cerebellum and muſcles; and thus the cauſes of the contraction of the intercoſtals and diaphragm, being renewed, inſpiration is repeated—Such is the true, immediate, adequate manner of vital *reſpiration*. See Heart.

For the uſes and effects of *reſpiration*, they are greatly diſputed among anatomiſts—The learned Boerhaave takes the principal uſes thereof to be the farther preparation of the chyle, it's more accurate mixture with the blood, and it's converſion into a nutritious juice proper to repair the decays of the body. See Nutrition.

Borelli takes the great uſe of *reſpiration* to be the admiſſion and mixture of air with the blood, in the lungs, in order to form thoſe elaſtic globules it conſiſts of; to give it it's red florid colour; and to prepare it for many of the uſes of the œconomy: but how ſuch admiſſion ſhould be effected is hard to ſay—It is impoſſible it ſhould be done in the pulmonary arteries; nor can it be proved in the pulmonary veins—In effect, ſuch a communication muſt be hindered and obſtructed by the air's diſtending the veſiculæ, and compreſſing the veins in inſpiration; by the ſlimy humour that lubricates the membrane lining the inſide of the trachea.

Add to this, the difficult paſſage of air through ſuch ſmall pores as will admit water; and the ill effect air ordinarily has when admitted into the blood. See Pore and Water.

As to the arguments for ſuch communication, *viz.* the florid colour the blood here firſt aſſumes, and the abſolute neceſſity of *reſpiration* to life; they are both well accounted for otherwiſe. See Blood.

Other authors, as Sylvius, Etmuller, *&c.* take a great uſe of *reſpiration* to be, by the neighbourhood of the cold nitrous air, to cool the blood coming reeking hot out of the right ventricle of the heart, through the lungs; and to act as a refrigeratory. See Refrigeratory.

Mayow, and others, aſſert one grand uſe of expiration to be to throw off the fuliginous vapours of the blood along with the expelled air; and for inſpiration, he aſſerts that it conveys a nitro-aerial ferment to the blood, to which the animal ſpirits and all muſcular motion are owing.

But Dr Thurſton rejects all theſe from being principal uſes of *reſpiration*, which he ſhews to be, to move or paſs the blood from the right to the left ventricle of the heart, and ſo to effect the circulation. See Circulation.

Whence it is that perſons hanged, drowned, or ſtrangled, ſo ſuddenly die, *viz.* becauſe the circulation of the blood is ſtopped; and for the ſame reaſon it is that animals die ſo ſpeedily in the air-pump. See Drowning, Vacuum, *&c.* He inſtances an experiment made by Dr Croon, before the royal ſociety, who, by ſtrangling a pullet, ſo as not the leaſt ſign of life appeared; yet by blowing into the lungs through the trachea, and ſo ſetting the lungs a playing, he brought the bird to life again—Another experiment of the ſame kind is that of Dr Hook, who after having a dog, cut away the ribs, diaphragm, and pericardium, as alſo the top of the wind-pipe, that he might tie it on to the noſe of a pair of bellows; and thus by blowing into the lungs he reſtored the dog to life; and then ceaſing to blow, the dog would ſoon fall into dying fits, but recover again by blowing: and thus alternately as long as he pleaſed.

This uſe of *reſpiration* Dr Drake not only confirms, but carries farther; making it the true cauſe of the diaſtole of the heart; which neither Borelli, Dr Lower, nor Mr Cowper had well accounted for. See Diastole.

The weight of the incumbent atmoſphere, he ſhews, is the true antagoniſt to all the muſcles, ſerving both for ordinary inſpiration, and the contraction of the heart—As in the elevation of the ribs, that author obſerves, the blood by the paſſage opened for it, is in a manner ſollicited into the lungs; ſo in the depreſſion thereof by the ſubſidence of the lungs, and the contraction of the blood veſſels conſequent thereon, the blood is forcibly driven through the pulmonary vein into the left ventricle of the heart. And this, together with the general compreſſion of the body by the weight of the atmoſphere, is that power which cauſes the blood to mount in the veins, after the force impreſſed on it by the heart is ſpent; and which forces the heart itſelf, from it's natural ſtate of contraction, to that of dilatation. See Heart.

The reciprocal dilatation and contraction of the ſuperficial dimenſions of the body conſequent on *reſpiration*, are ſo neceſſary to animal life, that there is no animal how imperfect ſoever as to want it.

Though moſt kinds of fiſhes and inſects want both lungs and moveable ribs, and conſequently have no dilatable thorax, yet that want is made up to them by an analogous mechaniſm. Fiſhes, for inſtance, have gills which do the office of lungs, receiving and expelling alternately the water, whereby the blood-veſſels ſuffer the ſame alteration of dimenſions as they do in the lungs of more perfect animals. See Gills. Inſects having no thorax, or ſeparate cavity for the heart and lungs or air-veſſels, have the latter diſtributed through the whole trunk of their bodies; by which they communicate with the external air through ſeveral ſpiracles or vent-holes, to which are faſtened ſo many little tracheæ or wind-pipes, which ſend their branches to all the muſcles and viſcera, and ſeem to accompany the blood-veſſels all over the body, as they do in the lungs only, of the more perfect animals—By this diſpoſition, in every inſpiration, the whole body of theſe little animals is inflated, and in every expiration compreſſed; conſequently the blood-veſſels muſt ſuffer a viciſſitude of extenſion and compreſſion. See Insect.

The only animal exempted from this neceſſity of breathing, is a fœtus: but this, while included in the womb, ſeems to have little more than a vegetative life, and ought ſcarce to be reckoned among the number of animals: It is rather a graft on, or branch of the mother. See Foetus.

The laws of Respiration, are of the laſt importance to a right underſtanding of the animal œconomy; for which reaſon a computation of the force of the *reſpiring* organs, and of the ſtreſs and preſſure of the air upon the ſame, will not be unacceptable—It may therefore be obſerved, that by blowing into a bladder, a conſiderable weight will be raiſed by the mere force of the breath: for with a bladder that is oblong, nearly of a cylindrical figure, and tied at both ends, if a pipe be fixed at one end, and a weight at the other, and the pipe faſtened at ſuch a diſtance from the ground, as juſt allows the weight to reſt upon the ground; the bladder by an eaſy inſpiration will raiſe ſeven pound weight, and by the greateſt inſpiration of a pretty ſtrong man, twenty eight pound weight. Now, the force by which the air enters this pipe, is that force by which it is driven out of the lungs; if therefore the force by which the air enters the pipe can be determined, we ſhall have the force by which the air is drove into the trachea—But the preſſure of air upon the bladder is equal to twice the weight it can raiſe; becauſe the upper part of the bladder being fixed, it reſiſts the force of the air, juſt as much as at the weight at the other end. And again, ſince the air preſſes every way equally, the whole preſſure will be to that part of it which preſſes on the orifice of the pipe, as the whole ſurface of the bladder is to the orifice of the pipe; that is, as the ſurface of a cylinder, whoſe diameter, for inſtance, is four inches, and axis ſeven, is to the orifice of the pipe.

Thus, if the diameter of the pipe be 0. 28, and it's orifice 0. 616; the ſurface of the cylinder will be 88. Therefore, as 88 : 0. 616 : : 14. double the leaſt weight ariſed, to 0. 098. which is almoſt 2 ounces; and in raiſing the greateſt weight, it is near 7 ounces.

Theſe therefore are the forces by which the air is drove through the trachea, in an eaſy and ſtrong expiration—Now if we conſider the lungs as a bladder, and the larynx as a pipe; the preſſure upon the orifice of the trachea, when the air is drove out, will be to the preſſure upon the lungs, as the whole ſurface of the lungs to the orifice of the trachea.

Suppoſe, *e. gr.* the diameter of the larynx to be 5; the orifice of the larynx will be 0. 19. And ſuppoſe the two lobes of the lungs to be two bladders, or ſpheres, whoſe diameters are each ſix inches; their ſurfaces are each 113 inches, and the preſſure on the larynx will be to the preſſure upon the whole external ſurface, as 0. 19 to 226, which is as 1 to 1189; and therefore if the preſſure upon the larynx in an ordinary breathing be two ounces, the preſſure upon the whole external ſurface of the lungs will be 148 pounds; and the utmoſt force, when the preſſure upon the larynx is ſeven ounces, will be equal to 520 pounds—But the lungs are not like an empty bladder, where the air preſſes only upon the ſurface; for they are full of veſicles, upon the ſurface of each of which the air preſſes as it would upon the ſurface of an empty bladder: and therefore to know the whole preſſure of the air, we muſt determine the internal ſurfaces of the lungs.

To do this, ſuppoſe that $\frac{1}{3}$ part of the lungs is taken up with the branches of the trachea, that another third part the blood-veſſels fill, and the remainder is veſicles, where we ſuppoſe the chief preſſure upon the blood-veſſels to be made: now, both lobes of the lungs contain 226 ſolid inches, of which one third, or 75 inches, are full of veſicles—Let the diameter of each veſicle be $\frac{1}{50}$ part of an inch, the ſurface of a veſicle will be .001256, and the ſolidity 0000043, by which ſum if we divide 75 (the ſpace filled by the veſicles) the quotient gives us 17441860 for the number of veſicles in both lobes of the lungs—This number multiplied by .001256, the ſurface of a veſicle gives the ſum of the ſurfaces of all the veſicles, to wit, 21906.976 inches. And therefore the preſſure upon the larynx will be to the preſſure upon the whole ſurface of the lungs, as 0.19 to 21906.976; and conſequently, when in an ordinary expiration the preſſure upon the larynx is two ounces, the preſſure on the whole internal ſurfaces of the lungs will be 14412 pound weight; and the utmoſt force of the air in breathing, when the preſſure upon the larynx is ſeven ounces, will be 50443 pound weight. Though theſe ſeem to be prodigious weights, yet it muſt ſtill be underſtood, that the preſſure upon each part of the ſurface of the lungs equal to the orifice of the larynx, is not greater than it is at the larynx; and that theſe vaſt weights ariſe from the vaſt extent of the ſurfaces of the veſicles upon which it was neceſſary that the blood ſhould be ſpread in the ſmalleſt capillary veſſels, that each globule of blood might, as it were, immediately receive the whole force and energy of the air, and by that be broke into ſmaller parts fit for ſecretion and circulation.

And hence we may learn the mechanical reaſon of the ſtructure of the lungs: for, ſince the whole blood of the body was to paſs through them in order to receive the effect of the air, and that this could not be unleſs the blood were diffuſed in ſmall capillary veſſels; it was neceſſary that the ſurfaces upon which they were to be ſpread, ſhould be proportioned to their number: which is admirably well provided for by the wonderful fabric of the lungs.

If the gravity of the air was always the ſame, and if the diameter of the trachea, and the time of every expiration were equal in all; this weight upon the lungs would be always the ſame. But ſince we find by the barometer, that there is three inches difference between the greateſt and the leaſt gravity of the air, which is a tenth part of it's greateſt gravity; there muſt be likewiſe the difference of a tenth part of it's preſſure upon the lungs at one time and another: for the momenta of all bodies, moved with the ſame velocity, are as their gravities. See Barometer.

This is a difference which ſuch as are aſthmatic muſt be very ſenſible of; eſpecially if we conſider that they likewiſe breathe thicker, that is, every expiration is performed in leſs time; if in half the time, and the ſame quantity of air be drawn in, then the weight of the air upon the lungs muſt be 57648 pounds, of which a tenth part is 5764 pounds: and conſequently aſthmatic people upon the greateſt riſe or fall of the barometer, feel a difference of the air, equal to above one third of it's preſſure in ordinary breathing. See Asthma, Weather, *&c.*

Again, if the trachea be ſmall, and it's aperture narrow, the preſſure of the air increaſes in the ſame proportion as if the times of expiration were ſhorter; and therefore a ſhrill voice is always reckoned amongſt the prognoſtic ſigns of a conſumption, inaſmuch as that proceeds from the narrowneſs of the larynx or trachea; and conſequently increaſes the preſſure of the air upon the lungs, which upon every expiration beats the veſſels ſo thin, that at laſt they break, and a ſpitting of blood comes on apace. See Phthisis.

RESPITE*, Respectus, in law, *&c.* a delay, forbearance, or prolongation of time, granted any one for the payment of a debt, or the like.

* Menage derives the word *reſpite* from the Latin, *reſpectus*; as *deſpite* from *deſpectus*.—Du Cange will rather have it come from *reſpirare*, to breathe; *reſpite* being, in effect, a breathing-while, granted a debtor, *&c.*

Letters of Respite, or Credit, are inſtruments antiently granted by ſovereign princes to honeſt, but unfortunate debtors, to ſcreen them from their too rigorous creditors. See Letter.

Theſe ſtill obtain in France.—They were firſt introduced by pope Urban II. in favour of the Croiſes, *i. e.* of perſons who went to the holy war. See Croises.

S. Louis granted three years *reſpite* to all who made the voyage of the holy land with him.—In the cuſtomary of Normandy, *reſpite* is a judicial delay, or demur, given to procedures.

Respite *of homage*, is a forbearance of the homage due from the vaſſal or tenant holding by homage, or by knight-ſervice to his lord. See Homage, *&c.*

Antiently thoſe who held by theſe tenures, paid a ſmall ſum every fifth year into the Exchequer, to be *reſpited* doing their homage or ſervice.

By Stat. 12 Car. II. this *reſpite* of homage is taken away, as a charge ariſing from knight-ſervice; which is thereby likewiſe annulled. See Tenure, *&c.*

RESPONDEAT *ſuperior*, a law phraſe.—Where the ſheriffs are removeable, as in London, for inſufficiency; *reſpondeat ſuperior*, that is, the mayor and commonalty are to anſwer for them. See Sheriff, *&c.*

For the inſufficiency of a bailiff of a franchiſe, *reſpondeat ſuperior*, that is, the lord of the franchiſe is to anſwer.

RESPONDENT, Respondens, in the ſchools, a perſon who maintains a theſis in any art or ſcience. See Thesis.

He is thus called as being to *anſwer* all objections propoſed by the opponent or impugner, *&c.* See Opponent.

The *reſpondent*'s buſineſs is to ſee whether the oppoſition made by the contrary party be juſt and legitimate; or whether ſome of the laws and conditions of oppoſition be not broke, which is called *ignoratio elenchi*.—He is alſo to examine the moods and figures of the ſyllogiſms, to ſee whether the premiſſes be juſt, *&c.* And through the whole to anſwer rather by diſtinguo's than by direct negation. See Syllogism, Mood, Figure, Distinction, *&c.*

Respondent*, in law, a perſon who undertakes to anſwer for another; or binds himſelf as ſecurity for the good behaviour of another. See Surety.

* The word is formed from the Latin, *reſpondere*, to anſwer; q. d. *pro alio ſpondere*, to promiſe for another.

The *reſpondent* is to anſwer for the damages done by the perſon for whom he *reſponds*—There are four ordonnances of the kings of France, whereby the citizens are expreſly forbid to take ſervants without *reſpondents*, bound in writing.

RESPONSALIS, in law, he who appears for another in court at a day aſſigned. See Proctor.

Fleta makes this difference between *reſponſalis atturnatus*, and *eſſoniator*: that the *eſſoniator* comes only to alledge the cauſe of the parties abſence, be he demandant or tenant; whereas *reſponſalis* comes for the tenant, not only to excuſe his abſence, but to ſignify what trial he means to undergo, the combat or the country. See Attorney.

RESPONSARY *ſong*, an anthem in which the choriſters ſing by turns. See Anthem.

RESPONSE, Responsal, Responsatio, an anſwer, reply, or reparty. See Replication and Reparty.

The word is chiefly uſed in ſpeaking of the anſwers made to the prieſt, by the people, in the litany, the pſalms, and other parts of the office.

It has it's uſe too in ſpeaking of the opinions or anſwers of the antient juriſconſulti; when conſulted on points of law. See Civil *law* and Jurisconsultus.

The fifty books of the *digeſt* are compoſed of *reſponſa prudentum*, the *reſponſes* of Papinian, Ulpian, Scævola, *&c.* collected by Juſtinian, who afterwards gave them the force of laws. See Digest.

The *reſponſes* of the emperors were more properly called *reſcripts*. See Rescript.

RESPONSIONS, Responsiones, a term uſed in the military orders for certain penſions or charges which the knights, or the commanderies they held, paid to the order.

Such a knight-templer paid a *reſponſion* of fifty pounds *per annum* to his order, on account of ſuch a commandery. See Commandery and Conventual.—In *Rot. Parl.* 9 *Richard* II. it is written *reſponcies*.

RESSAULT*, in architecture, the effect of a body which either projects or falls back; *i. e.* ſtands either more out or in than another; ſo as to be out of the line, or range therewith. See Return.

* The term is French; and but little uſed in Engliſh; though the want of a word of equal import, plead for its naturalization.

RESSORT, or Resort, a term purely French, yet frequently uſed by our late writers, to ſignify the juriſdiction or authority of a court.

The word in it's popular meaning ſignifies *ſpring*, or the force of elaſticity.—Hence it is alſo uſed for a juriſdiction, and the extent or diſtrict thereof; as when we ſay ſuch a thing belongs to his *reſſort*; a judge out of his *reſſort* has no authority. But it's chief uſe among us is in ſpeaking of a court or tribunal, where appeals are judged; or of a court or perſon who judges finally and ultimately, and whence there is no appeal. See Court, Appeal, *&c.*

The houſe of lords judge in the laſt *reſſort*, *en dernier reſſort*.—Preſidials judge in the laſt *reſſort* of all criminals proſecuted by the provoſts of the marſhals.

Ressort, or Resort, is alſo uſed in a writ of ayel or couſenage, in the ſame ſenſe, as *deſcent* in a writ of right. See Descent, Ayel, Right, *&c.*

RESSOURCE*, a term purely French, yet uſed by Engliſh writers, to denote a means or foundation of a man's recovering himſelf from his fall or ruin; or an after-game for the repairing his damages.

* Skinner derives the word from the French, *reſoudre*, to reſolve: a *reſſource* ſtrictly and literally, expreſſes a means which preſents itſelf a-freſh.

This merchant has credit and friends ſtill left; he has great *reſſources*.—His laſt *reſſource* was to throw himſelf into a convent.—The jargon of a diſtinction, is the ordinary *reſſource* of a divine at a pinch.

REST, *quies*, in phyſics, the continuance of a body in the ſame place: or it's continual application or contiguity to the ſame parts of the ambient and contiguous bodies. See Space.

Reſt is either *abſolute* or *relative*; as place is. See Place.

Some define *reſt*, the ſtate of a thing without motion; and hence, again, *reſt* becomes either abſolute or relative, as motion is. See MOTION.

Sir Iſaac Newton defines true or abſolute *reſt* to be the continuance of a body in the ſame part of abſolute and immoveable ſpace: and relative *reſt* to be the continuance of a body in the ſame part of relative ſpace.

Thus, in a ſhip under ſail, relative *reſt* is the continuance of a body in the ſame region of the ſhip, or the ſame part of its cavity.—True, or abſolute *reſt* is it's continuance in the ſame part of univerſal ſpace, wherein the ſhip with its cavity and contents are all contained.

Hence, if the earth be really and abſolutely at *reſt*, the body relatively at *reſt* in the ſhip, will really and abſolutely move; and that with the velocity wherewith the veſſel moves.—But if the earth do likewiſe move, there will then ariſe a real and abſolute motion of the body at *reſt*, partly from the real motion of the earth in abſolute ſpace; and partly from the relative motion of the ſhip on the ſea.—Laſtly, if the body be likewiſe relatively moved in the ſhip, it's real motion will ariſe partly from the real motion of the earth in immoveable ſpace, and partly from the relative motion of the ſhip on the ſea, and of the body in the ſhip.

Thus, if that part of the earth where the ſhip is, move eaſtward with a velocity of 10010 parts; and the veſſel be carried by the winds weſtward 10 parts; and at the ſame time a ſeaman aboard walk with a velocity of 1 part: the ſeaman will be moved really and abſolutely in immoveable ſpace eaſtwards with 10001 parts of velocity; and relatively on the earth, with nine parts of velocity weſtwards. See EARTH.

It is an axiom in philoſophy, that matter is indifferent as to *reſt*, or motion. See MATTER—Hence, Sir Iſaac Newton lays it down as a law of nature, that every body perſeveres in it's ſtate either of *reſt* or uniform motion; except ſo far as it is diſturbed by external cauſes. See NATURE.

The Carteſians will have firmneſs, hardneſs, or ſolidity of bodies to conſiſt in this, that their parts are at *reſt*, with regard to each other: and this *reſt* they eſtabliſh as the great nexus, or principle of coheſion, whereby the parts are connected together. See FIRMNESS, HARDNESS, *&c.*

Fluidity, they add, conſiſts in a perpetual motion of the parts, *&c.*—But the Newtonian philoſophy furniſhes us with much better ſolutions. See SOLIDITY, FLUIDITY, and COHESION.

REST, *repoſe*, or *pauſe*, in poetry, is uſed for the cæſura, which in Alexandrine verſes, falls on the ſixth ſyllable; and in verſes of ten or eleven ſyllables, on the fourth. See CÆSURA.

This verſe is naught, there wants a *reſt* or pauſe in it.—The *reſt* ſhould never fall on a monoſyllable, whereon the voice may not dwell: It is called *reſt*, becauſe the ear, and the pronunciation have both a repoſe or reſpite. See PAUSE.

REST, in muſic, is a pauſe or interval of time, during which there is an intermiſſion of the voice or ſound. See PAUSE and TIME.

Reſts are ſometimes uſed in melody, that is in muſic of a ſingle part, to expreſs ſome ſimple paſſion, or even for variety ſake; but more frequently in harmony, or compoſitions of ſeveral parts, for the ſake of the pleaſure of hearing one part move on while another *reſts*; and this interchangeably. See MELODY and HARMONY.

Reſts are either for a whole bar, or more than a bar, or but for a part of a bar.—When the *reſt* is for a part, it is expreſſed by certain ſigns correſponding to the quantity of certain notes of time; as minim, crotchet, *&c.* and is accordingly called *minim-reſt*, *crotchet-reſt*, &c.

The characters or figures, whereof, ſee under CHARACTERS *of muſic*; where the notes and correſponding *reſts* are found together.

When any one of thoſe characters occurs either on a line or ſpace; that part is always ſilent for the time of a minim, or crotchet, *&c.*—Sometimes a *reſt* is for a crotchet and quaver together; or for other quantities of time, for which there is no particular note: In which caſe the ſigns of ſilence are not many *reſts*, but ſuch ſilence is expreſſed by placing together as multiplied; of different time, as make up the deſigned *reſt*.

When the *reſt* is for a whole bar, the ſemibreve *reſt* is always uſed.—If the *reſt* be for two meaſures, it is marked by a line drawn a-croſs a whole ſpace.—For three meaſures it is drawn a-croſs a ſpace and a half; and for four meaſures a-croſs two ſpaces. But to prevent ambiguity, the number of bars is uſually writ over the ſign.

Some of the more antient writers in muſic, make theſe *reſts* of different value in different ſpecies of time.—*E. gr.* The character of a minim-*reſt*, in common time, ſay they, expreſſes the *reſt* of three crotchets in triple time; in that of the triples $\frac{6}{8}$, $\frac{6}{16}$, $\frac{12}{8}$, $\frac{12}{16}$, it always marks an half meaſure, how different ſoever theſe may be among themſelves.

They add that the *reſt* of a crotchet in common time is a *reſt* of three quavers in the triple $\frac{9}{8}$; and that the quaver *reſt* of common time is equal to three ſemi-quavers in the triple $\frac{9}{16}$. But this variety in the uſe of the ſame character is now lay'd aſide.

RESTAUR, RESTOR, in antient cuſtoms, the remedy or recourſe which aſſurers have againſt each other, according to the date of their aſſurances; or againſt the maſters, if the average ariſe through their default, as through ill loading, want of caulking, or want of having the veſſel tight. See ASSURANCE.

The word is alſo uſed for the remedy or recourſe a perſon has againſt his guarantee or other perſon, who is to indemnify him from any damage ſuſtained.—Hence *reſtaurant* and *reſtauration.*—In the lower Latin they alſo uſe the words, *reſtor* and *reſtour*.

RESTAURATION, RESTAURATIO, RESTORATION, the act of re-eſtabliſhing, or ſettling a thing in its former good eſtate. See RESTITUTION, REDINTEGRATION, *&c.*

Thus we ſay, the *reſtauration* of a minor to the poſſeſſion of his effects, alienated in the time of his minority. In the French laws is an antient formula, uſed for the *reſtoring* a perſon to his good name, after he has been wrongfully accuſed and condemned.

Sour and decayed beer and ale are *reſtored* various ways.—By a handful of wheat thrown into the veſſel, or by ſalt made of the aſhes of barly-ſtraw, put into the veſſel and ſtirred.

Glauber commends three or four handfuls of beech aſhes applied in the ſame manner.—Chalk ſcraped into it, renders it drinkable immediately. The ſame effect is produced by calcined oyſter-ſhells, burnt egg-ſhells, ſea-ſhells, or crab's eyes. See BEER, ALE, BREWING, *&c.*

In England we ſay, the RESTAURATION, by way of eminence, for the return of king Charles II. in 1660; after the civil wars.

The 29th of May is an anniverſary feſtival held in commemoration of the *reſtauration*; the *reſtauration* of regal, and epiſcopal government.

RESTAURATION, in architecture the act of repairing all the parts of a building gone to decay, either through the courſe of time, or other injuries; in ſuch manner, as that it is not only re-eſtabliſhed in its firſt form, but conſiderably augmented. See REPAIR and REPARATION.

It is evident from the plinths of the corinthian columns of the Pantheon, which are almoſt wholly under ground, that the pavement of this temple is only a *reſtauration* made in the time of Septimius Severus. *Daviler.*

The temple of concord, behind the capitol at Rome, having been burnt long after it was built, and having angular baſes different from the reſt; ſeems to have been *reſtored* from the ruins of ſeveral ancient buildings. *Id.*

RESTAURATION, in ſculpture, is the repairing of a mutilated ſtatue, *&c.* See REPAIRING.

Moſt of the antique ſtatues have undergone a *reſtauration*; as the Farneſe Hercules, the Faunus in the Villa Borgheſe at Rome, the wreſtlers, in the gallery of the great duke of Florence; the Venus of Arles in the gallery at Verſailles.—But theſe *reſtaurations* have all been made by the ableſt ſculptors. *Daviler.*

RESTINCTION, RESTINCTIO, in chymiſtry, the quench- of a metal or mineral in ſome liquor; in order either to correct, or to exalt it, by giving it ſome new quality, power, *&c.* See EXTINCTIO, *&c.*

RESTITUTION, RESTITUTIO, in phyſics, the returning of elaſtic bodies forcibly bent, to their natural ſtate: by ſome called, the *motion of reſtitution.* See ELASTICITY.

Contraction being the proper and natural action of muſcular fibres, ſome authors aſcribe dilatation to a motion of *reſtitution*; but the expreſſion, as well as the idea, is very faulty. See FIBRE, MUSCULAR, *&c.* See alſo HEART, *&c.*

RESTITUTION, in a moral and legal ſenſe, is the act of reſtoring a perſon to his right; or of returning ſomething unjuſtly taken or detained from him. See RESTAURATION.

Reſtitution is reducible to commutative juſtice; and till it be made, the caſuiſts determine the party all the while guilty of theft. See JUSTICE, INJURY, *&c.*

The illegal incumbents of benefices are condemned to a *reſtitution* of the fruits of the benefices.—In the Romiſh church uſurers, *&c.* are obliged to a *reſtitution* of their ill-gotten goods, otherwiſe the prieſt has no authority to give them abſolution. See USURY.

RESTITUTION *in integrum*, is uſed for what is otherwiſe called *reſciſſion*. See RESCISSION.

Religious obtain *reſtitution* againſt their vows, *i. e.* are freed from their obligation, when they proteſt againſt them within five years of their profeſſion. See VOW, *&c.*

In the hiſtory of Germany for the XVIIth century, the firſt day of January 1624, is called the *term of reſtitution*: becauſe by the peace of Munſter, then concluded, the Lutheran and Calviniſt princes were obliged to *reſtitute*, reſtore what they had taken from the Roman catholic churches in their territories, till that day.

RESTITUTIONS *of medals*, or RESTITUTED *medals*, is a phraſe uſed by antiquaries, for ſuch medals as were ſtruck by the emperors, to renew or retrieve the memory of their predeceſſors. See MEDAL.

Hence it is that in ſeveral medals we find the letters REST. —Claudius was the firſt who begun this practice, by ſtriking a-freſh ſeveral medals of Auguſtus. Nero did the ſame; and Titus, after the example of his father, ſtruck *reſtitutions* of moſt of his predeceſſors.

Gallienus ſtruck a general *reſtitution* of all the preceding emperors in two medals, the one bearing an altar, the other an eagle, without the REST.— F. Joubert chuſes rather to call them *conſervations*, than *reſtitutions*; as being done quite a-new.

RESTITUTIONE *extracti ab eccleſia*, a writ antiently granted for the reſtoring a man to the church or ſanctuary from which he had been forced away. See SANCTUARY.

RESTITUTIONE *temporalium*, a writ which lies where a man is elected and confirmed biſhop of a dioceſe; for the recovery of the temporalities or barony of the ſaid biſhopric. See BISHOP, TEMPORALITIES, *&c.*

It is directed from the king to the eſcheator, or rather ſheriff of the county.

RESTIVE, or RESTY, a term applied to a horſe, *&c.* that ſtops, or runs back, inſtead of advancing forwards.

In the manage, a *reſtive* horſe is a rebellious, refractory, ill-broken horſe; which only goes where it will, and when it will.—The word is formed from the Latin, *reſtivus*, which ſignifies the ſame thing.

RESTOR. See the article RESTAUR.

RESTORATION. See the article RESTAURATION.

RESTORATIVE, in medicine, a remedy proper for the reſtoring and retrieving of ſtrength and vigour. See MEDICINE.

Reſtoratives belong to the claſs of balſamics; and are otherwiſe called *analeptics*. See BALSAMIC and ANALEPTIC.

The medicines that come under this denomination are of an emollient, ſoftening nature, but nutritive withal; and are rather adminiſtred to repair the waſtes of the conſtitution, than to alter and rectify it's diſorders. See NUTRITION.

Such are the leaves of white, and black maiden-hair, black hellebore; rocket, eruca; ſcabious; colts-foot; bohea-tea; chich-peas; hops; chocolate; piſtachio-nuts; balſam of Tolu; bdellium; benzoin; ſtorax; eryngo; iris; ſatyrion, *&c.* See HELLEBORE, TEA, PISTACHIO, CHOCOLATE, BALSOM, BDELLUM, STORAX, *&c.*

RESTRAINT, is when an action is hindered or ſtopped, contrary to volition, or the preference of the mind. See LIBERTY, NECESSITY, WILL, VOLITION, VOLUNTARY, *&c.*

RESTRICTION, the act of modifying, limiting, or reſtraining a thing to narrower bounds.

General laws always bear ſome *reſtriction*.—In contracts 'tis uſual to have *reſtrictive clauſes*, which bind the covenants down to certain bounds. See CLAUSE, CONDITION, *&c.*

Mental RESTRICTION. See RESERVATION.

RESTRICTION, among logicians, is underſtood of the limitting a term, ſo as to make it ſignify leſs than it uſually does.

In which ſenſe the name Philoſopher is *reſtrained* to Ariſtotle; Great to Alexander; City to Rome, *&c.*

It is obſerved to be good arguing affirmatively from a non-reſtrained to a reſtrained term; but not contrarily: And negatively, from a reſtrained to a non-reſtrained term; but not contrarily.

RESTRICTIVE *propoſition*. See the article PROPOSITION.

RESTRICTIVE *ſuture*. See the article SUTURE.

RESTRINGENT, in medicine. See ASTRINGENT.

RESTY. See the article RESTIVE.

RESULT, what is gathered from a conference, an enquiry, meditation, diſcourſe, or the like; or the concluſion and effect thereof.

The aſſembly was ſo tumultuous that there was no knowing the *reſult*.—The uſual *reſult* of diſputes, Mr Bayle obſerves, is that each perſon remains more attached to his own opinion.

RESUMMONS, RESUMMONITIO, a ſecond ſummons, or calling a man to anſwer an action where the firſt ſummons is defeated, or ſuſpended by any accident; as the death of a party, *&c.* See SUMMONS.

RESUMPTION, RESUMPTIO, in a law ſenſe, ſignifies the taking again into the king's hands ſuch lands or tenements as before, upon falſe ſuggeſtion, or other error, he had delivered to the heir, or granted by letters patent to any man.

RESUMPTION, in the ſchools, a ſummary repetition, or running over of an argument, or of the ſubſtance thereof, in order to refute it.

The reſpondent *reſumed* all the points of the objection, and anſwered them one by one. See RECAPITULATION, *&c.*

RESUMPTION is alſo uſed by logicians for the reduction of ſome figurative or quaint propoſition, to a more intelligible and ſignificant one. See REDUCTION.

As, Peter is half-ſeas over; that is, he is half fuddled.—The meadows ſmile; that is, look pleaſant.

RESUMPTIVE, in pharmacy, an epithet given to a kind of unguent, uſed to recruit and reſtore arid languiſhing conſtitutions, and to diſpoſe the dry body to receive nouriſhment. —It is called in Latin, *unguentum reſumptivum*. See RESTORATIVE and UNGUENT.

RESURRECTION, RESURRECTIO, RESUSCITATION, the act of returning, to a new, or ſecond life, after having been dead. See LIFE and DEATH.

The great argument for the truth of chriſtianity, and that urged with the moſt force and conviction for the ſame; is drawn from the *reſurrection* of our Saviour.—The circumſtances thereof are ſuch as almoſt admit of a demonſtration; which has accordingly been attempted on the ſtrict principles of the geometricans. See Ditton *on the reſurrection*.

The chriſtians generally believe the *reſurrection* of the ſame identic body, the very ſame fleſh and bones at the day of judgment.—The two principal philoſophical objections againſt it are theſe.

1°. That the ſame piece of matter or ſubſtance may happen to be a part of two or more bodies—Thus a fiſh feeding on a man, and another man afterwards feeding on the fiſh; part of the body of the firſt man becomes firſt incorporated with the fiſh, and afterwards in the fiſh, with the laſt man. Again, inſtances have been known of one man's feeding immediately on another; and among the cannibals of the Weſt-indies the practice is frequent. See ANTHROPOPAGI.

Now, where the ſubſtance of one is thus converted into the ſubſtance of another, each cannot ariſe with his whole body; and to which ſhall the common part be allotted?

To this objection ſome anſwer, that as all matter is not fit or diſpoſed to be aſſimilated to the body, and incorporated with it: human fleſh may very probably be of this kind, and therefore what is thus eaten, may be again excreted and carried off—But Mr Leibnitz's anſwer ſeems the more ſolid— All that is eſſential to the body, he urges, is the original ſtamen, which exiſted in the ſemen of the father; nay, and on the footing of the modern theory of generation, which exiſted in the ſemen of the firſt man. This we may conceive as the moſt minute ſpeck or point imaginable, and therefore not to be ſeparated, or tore aſunder, and any part of it united with the ſtamen of any other man. All this bulk we ſee in the body, is only an acretion to this original ſtamen; an addition of foreign matter, of new juices to the primary, ſolid ſtamen. There is therefore no reciprocation of the proper matter of the human body. See STAMINA, SOLID, *&c.*

The ſecond objection is this—The human body, we know by the late diſcoveries in the animal œconomy, is continually changing: a man has not entirely the ſame body to day as he had yeſterday; and it is even computed, that in leſs than ſeven years time, his whole body undergoes a change, and not a particle of the ſame body remains—Which of thoſe many bodies, then, which the ſame perſon has in the courſe of his life, is it that ſhall riſe? or does all the matter that has ever belonged to him, riſe again? or does only ſome particular ſyſtem thereof? the body, *e. gr.* he had at 20, at 30, or at 60 years old? if only this or that body ariſe, how ſhall it be rewarded or puniſhed for what was done by the other? with what juſtice does one perſon ſuffer, *&c.* for another?

To this it may be anſwered, on Mr Lock's principles, that perſonal identity, or the ſameneſs of a rational being, conſiſts in ſelf-conſciouſneſs; in the power of conſidering it ſelf the ſame thing in different times and places—By this every one is to himſelf what he calls *ſelf*; without conſidering whether that ſelf be continued in the ſame or divers ſubſtances. So far reaches the identity of that perſon. It is the ſame ſelf now it was then, and it was by the ſame ſelf which now reflects on an action, that action was performed.

Now, it is this perſonal identity is the object of rewards and puniſhments, which we have obſerved may exiſt in different ſucceſſions of matter; ſo that to render the rewards and puniſhments juſt and pertinent, nothing needs but that we riſe again with ſuch a body as that we retain the conſciouſneſs of our paſt actions. See IDENTITY.

RESUSCITATION. See RESURRECTION and REVIVICATION.

RETAIL, in commerce, *&c.* the buying of goods in the great, or by wholeſale, and ſelling them out again in ſmall parcells—*Qui rem integram ementes, per minuitiores eam partes diſtrahebant*. See COMMERCE.

To **RETAIN**, ſpoken of mares, ſignifies to hold, *i. e.* to conceive after covering.

RETAINER, in law, a ſervant not menial or domeſtic, that is, not continually dwelling in the houſe of his lord or maſter, but only wearing his livery, and attending on ſpecial occaſions. See SERVANT.

This livery was antiently given by a great man, and frequently for the maintenance of quarrels; whence it was juſtly prohibited by ſeveral ſtatutes: as, under Richard II. on pain of impriſonment, and grievous forfeiture to the king. See LIVERY, YEOMAN, *&c.*

It was farther prohibited by other ſtatutes of the ſucceeding kings, whereby the delinquents were ſubjected to make ranſom at the king's pleaſure; and knights and eſquires hereof duly attained, where to loſe their ſaid liveries, and forfeit their fees for ever.

Edward IV. added a ſpecial penalty of five pounds per month on every man that gave ſuch livery, and as much on every perſon ſo *retained*, either by writing, word, or oath — But moſt of theſe ſtatutes are repealed by a ſtatute 3 Car. I.

RETAINING-*fee*, is the firſt fee given in any cauſe to a ſerjeant or counſellor at law, whereby to make him ſure, that he ſhall not be on the contrary ſide. See FEE.

RETALIATION, RETALIATIO, the act of returning like for like. See TALIONIS *lex*.

RETARDATION, RETARDATIO, in phyſics, the act of *retarding*, that is, of delaying the motion or progreſs of a body, or of diminiſhing it's velocity. See MOTION.

The *retardation* of moving bodies ariſes from two great cauſes: the *reſiſtence of the medium*, and the *force of gravity*.

The RETARDATION *from the reſiſtence* is frequently confounded with the reſiſtence itſelf; becauſe with reſpect to the ſame moving body, they are in the ſame proportion. See RESISTENCE.

With reſpect to different bodies, however, the ſame reſiſtence often generates different *retardations*— For if bodies of equal bulk, but different denſities, be moved through the ſame fluid with equal velocity, the fluid will act equally on each; ſo that they will have equal reſiſtences, but different *retardations*. And the *retardations* will be to each other as the velocities which might be generated by the ſame forces in the bodies propoſed: that is, they are inverſely as the quantities of matter in the bodies, or inverſely as the denſities.

Suppoſe, then, bodies of equal denſity, but of unequal bulk, to move equally faſt through the ſame fluid; the reſiſtences increaſe according to their ſuperficies, that is, as the ſquares of their diameters; but the quantities of matter are increaſed in proportion to the cubes of the diameters: the reſiſtences are the quantities of motion, the *retardations* are the celerities ariſing from them; and dividing the quantities of motion by the quantities of matter, you will have the celerities; therefore the *retardations* are directly as the ſquares of the diameters, and inverſely as the cubes of the diameters, that is, inverſely, as the diameters themſelves.

If the bodies be equal, move equally ſwift, and are of the ſame denſity, but moved through different fluids; their *retardations* are as the denſities of thoſe fluids. See FLUID.

When bodies equally denſe, and of bulk equal, are carried through the ſame fluid with different velocities, the *retardations* are as the ſquares of the velocities. See DENSITY, *&c.*

The RETARDATION *from gravity* is peculiar to bodies projected upwards — A body thrown upwards is *retarded* after the ſame manner as a falling body is accelerated; only in the one caſe the force of gravity conſpires with the motion acquired: and in the other acts contrary to it. See ACCELERATION.

As the force of gravity is uniform, the *retardation* from that cauſe will be equal in equal times. See GRAVITY.

Hence, as it is the ſame force which generates motion in the falling, and diminiſhes it in the riſing body, a body riſes till it has loſt all it's motion; which it does in the ſame time wherein a body falling would have acquired a velocity equal to that wherewith the body was thrown up. See PROJECTILE.

Thus alſo, a body thrown up will riſe to the ſame height from which falling it would acquire the velocity wherewith it is thrown up: therefore the heights which bodies thrown up with different velocities can riſe to, are to each other as the ſquares of the velocities. See PROJECTILE and DESCENT.

Hence the *retardations* of motions may be compared together: for they are firſt, as the ſquares of the velocities; ſecondly, as the denſities of the fluids, through which the bodies are moved; thirdly, inverſely, as the diameters of thoſe bodies; laſtly, inverſely, as the denſities of the bodies themſelves. The numbers in the ratio compounded of thoſe ratio's, expreſs the proportion of the *retardations*; multiplying the ſquare of the velocity by the denſity of the fluid, and dividing the product by the product of the diameter of the body, multiplied into it's denſity, and working thus for ſeveral motions; the quotients of the diviſions will have the ſame compound ratio to one another.

Laws of RETARDATION *of motion* — 1°. If the motion of a body be uniformly *retarded*; that is, if it's celerity be diminiſhed equally in equal times, the ſpace it paſſes over is one half of that it would paſs over in the ſame time by an uniform motion.

2°. The ſpaces deſcribed in equal times by an uniformly *retarded* motion; decreaſe according to the uneven numbers, 9, 7, 5, 3, *&c.*—See further under ACCELERATION.

RETCHING, or REACHING, the effort or endeavour to vomit. See NAUSEA and VOMITING.

RETE *mirabile*, in anatomy, a ſmall plexus, or net-work of veſſels in the brain, ſurrounding the pituitary gland. See PLEXUS and BRAIN.

The *rete mirabile* is very conſpicuous in brutes, but either not exiſtent in man, or ſo very minute that it's exiſtence is fairly doubted.

Willis will have it to conſiſt of arteries, veins, and nerves; Vieuſſens of arteries only; and others, of arteries and ſmall veins. Vieuſſens aſſerts, with many other anatomiſts, that there is no *rete mirabile* in man, in the horſe, dog, *&c.* But it is found in the calf, ſheep, goat, *&c.*

It was obſerved and deſcribed by Galen; who upon finding it in ſome brutes, concluded it to be likewiſe in man: but all we ſee like it in man, is, that on the ſides of the pituitary gland, where it's place ſhould be, the carotid arteries make a double flexure, in form of ∽, before they penetrate the dura mater.

The uſe of the *rete mirabile*, Galen takes to be for concocting and elaborating the animal ſpirits; as that of the epididymides is for elaborating the ſeed. See SPIRIT and SEED.

Dr Willis thinks, with more probability, it may ſerve to bridle the too rapid incurſions of the blood into the brain of thoſe creatures whoſe head hangs down much to ſeparate ſome of the ſuperfluous ſerous parts of the blood, and ſend them to the ſalival glands as the blood enters the brain; and to obviate obſtructions which may happen in the arteries.

RETE *penny*, in antient records, a cuſtomary due of one penny for every perſon to the pariſh-prieſt.

RETEINER or RETAINER. See RETAINER.

RETENTIO, RETINENTIA, in our law books, is ſometimes uſed to ſignify *retinue*. See RETINUE.

RETENTION, RETENTIO, a faculty of the human mind, whereby in order to a farther progreſs in knowledge, it keeps or *retains* thoſe ſimple ideas which it before received by ſenſation or reflection. See FACULTY, IDEA, *&c.*

This is done two ways —Firſt, by keeping the idea which is brought into the mind, for ſome time, actually in view; called *contemplation*. See CONTEMPLATION.

Secondly, by reviving thoſe ideas in our minds which have diſappeared, and have been, as it were, laid out of ſight: this is *memory*, which is, as it were, the repoſitory of our ideas. See MEMORY, RECOLLECTION, and REMINISCENCE.

Our ideas being nothing but actual perceptions in the mind, which ceaſe to be any thing, when there is no perception of them; this laying up of our ideas in the repoſitory of the memory, amounts to no more than this, that the mind has a power in many caſes to revive perceptions it once had: with this additional perception annexed to them, that it has had them before. See PERCEPTION.

It is by the aſſiſtance of this faculty, that we are ſaid to have all thoſe ideas in our underſtanding which we can bring in ſight, and make the objects of our thoughts, without the help of thoſe ſenſible qualities, which firſt imprinted them there. See UNDERSTANDING.

Attention and repetition help much to the fixing ideas in our memories; but thoſe which make the deepeſt and moſt laſting impreſſions, are ſuch as come accompanied with pleaſure and pain—Ideas but once taken in, and never again repeated, are ſoon loſt; as thoſe of colours, in ſuch as loſe their ſight when very young.

The memory in ſome men is tenacious, even to a miracle; but yet there ſeems to be a conſtant decay of all our ideas, even of thoſe which are ſtruck deepeſt; and in the minds the moſt *retentive*: ſo that if they be not ſometimes renewed, the print wears out, and at laſt there remains nothing to be ſeen. See TRACE.

Thoſe ideas which are often renewed by a frequent return of the objects or actions that produce them, fix themſelves beſt in the memory, and remain longeſt there: ſuch are the original qualities of bodies; *viz.* ſolidity, extenſion, figure, motion, *&c.* and thoſe that almoſt conſtantly affect us, as heat and cold; and thoſe that are the affections of all kinds of beings, as exiſtence, duration, number; which are ſeldom quite loſt, while the mind retains any ideas at all. See QUALITY, HABIT, *&c.*

RETENTION, is alſo uſed in medicine, *&c.* for the ſtate of contraction in the ſolids, or vaſcular parts of the body, which makes them hold faſt their proper contents. See SOLID, VESSEL, *&c.*

In this ſenſe *retention* ſtands oppoſed to *evacuation* and *excretion*. See EVACUATION and EXCRETION.

Retention and excretion make one of the ſix non-naturals. See NON-NATURAL.

RETENTION is alſo frequently conſidered as a diſorder; and defined the act of retaining the excrements, humours, *&c.* ſo as they cannot be voided out of the body. See Excrement.

It is the *retention* of peccant humours which cauſes ſuch a diſeaſe — A *retention* of urine is very painful and dangerous. See Urine.

RETIARII *, in antiquity, a kind of gladiators, thus denominated from a net which they made uſe of againſt their antagoniſts, who were called *ſecutores*, and ſometimes *mirmillones*. See Gladiator and Secutor.

* The word is formed from the Latin, *rete, net*; or perhaps from *retejaculum*, for they called their net *jaculum*, and ſometimes in one word, *retejaculum*.

This net they carried under their buckler, and when opportunity ſerved, caſt it over the head of their antagoniſt, and in this condition killed him with a trident which they bore in the other hand.

Lipſius, and others obſerve that they fought in tunics, and were furniſhed with ſpunges to wipe off the ſweat, blood, *&c.* and to ſtop their wounds.

RETICENCY, Reticentia, a figure in rhetoric, whereby we make oblique mention of a thing, in pretending to paſs it over unmentioned. See Figure.

Thus: *To ſay nothing of the nobility of his anceſtors: I forbear to ſpeak of his courage, and paſs over the ſeverity of his morals.* See Preterition.

RETICULA, Reticule, in aſtronomy, a contrivance for the exact meaſuring the quantity of eclipſes; introduced about fifty years ago by the royal academy of Paris. See Eclipse.

The *reticule* is a little frame, conſiſting of thirteen fine ſilken threads, equidiſtant from each other, and parallel; placed in the focus of object-glaſſes of teleſcopes; that is, in the place where the image of the luminary is painted, in it's full extent — Of conſequence, therefore, the diameter of the ſun or moon is hereby ſeen divided into twelve equal parts or digits; ſo that to find the quantity of the eclipſe, there is nothing to do but to number the luminous and the dark parts. See Digit.

As a ſquare *reticle* is only proper for the diameter, not for the circumference of the luminary; it is ſometimes made circular, by drawing ſix concentric equi-diſtant circles, which repreſents the phaſes of the eclipſe perfectly.

But it is viſible that the *reticule*, whether ſquare or circular, ought to be perfectly equal to the diameter or circumference of the ſtar, ſuch as it appears in the focus of the glaſs; otherwiſe the diviſion cannot be juſt.

Now this is no eaſy matter to effect, by reaſon the apparent diameter of the ſun and moon differ in each eclipſe; nay that of the moon differs from itſelf in the progreſs of the ſame eclipſe.

Another imperfection in the *reticule* is, that it's bigneſs is determined by that of the image in the focus; and of conſequence will only fit one certain magnitude.

But M. de la Hire has found a remedy for all theſe inconveniences, and contrived that the ſame *reticule* ſhall ſerve for all teleſcopes, and all altitudes of the luminary in the ſame eclipſe—The principle whereon his invention ſtands, is, that two object-glaſſes applied againſt each other, having a common focus, and there forming an image of a certain magnitude; this image will increaſe in proportion as the diſtance between the two glaſſes is increaſed, as far as a certain limit.

If then a *reticule* be taken of ſuch a magnitude as juſt to comprehend the greateſt diameter the ſun or moon can ever have in the common focus of two object-glaſſes applied to each other; there needs nothing but to remove them from each other, as the ſtar comes to have a leſs diameter, to have the image ſtill exactly comprehended in the ſame *reticule*.

Another improvement is, that whereas the ſilken threads are ſubject to ſwerve from the paralleliſm, *&c.* by the different temperature of the air; a *reticule* may be made of a thin looking-glaſs, by drawing lines or circles thereon, with the fine point of a diamond; which ſhall be ſafe from any alteration of the air.

RETICULAR *body*, *corpus* Reticulare, in anatomy, a body of veſſels lying immediately under the cuticle or ſcarf-ſkin. See Cuticle, *&c.*

Theſe veſſels contain a mucous liquor, from the tincture whereof Malpighi imagines the colour of the ſkin to be derived; founding his conjecture on this, that the cutis as well as cuticle of blacks, is white; and that they differ in no other circumſtance from thoſe of Europeans, but in this particular. See Negro. See alſo Cutis and Papilla.

Reticular, *plexus*, *plexis*, Reticularis, ſometimes denotes the choroides, which is thus called, becauſe it's fibres are interwoven like a net. See Choroides.

RETICULUM, the *caul*, or *omentum*; a name ſometimes given this part from it's net-like ſtructure. See Omentum.

RETIFORMIS *lacis*, in anatomy, the ſame with rete mirabile. See Rete.

RETINA, in anatomy and optics, one of the tunics of the eye; called alſo *amphibleſtroides*, *retiformis*, and *reticularis tunica*, as being woven in manner of a net. See Tunic and Eye.

The *retina* is the laſt or innermoſt of the coats of the eye, lying immediately under the choroides. See Choroides. It is formed of an expanſion of the medullary part of the optic nerve; whence it is found very thin, ſoft, white, *&c.* reſembling the ſubſtance of the brain, with the tranſparency of the horn of a lantern. See Optic *nerve* — When ſeparated from the choroides, it runs into a mucous maſs, or lump.

The *retina* is uſually ſuppoſed to be the great organ of viſion, which is effected by means of the rays of light reflected from each point of objects, refracted in their paſſage through the aqueous, vitreous, and cryſtallin humours, and thus thrown on the *retina*; where they paint the image of the object; and where they make an impreſſion, which is continued thence, by the fine capillaries of the optic nerves, to the ſenſory. See Vision.

Indeed, whether the *retina* or the choroides be the principal organ of viſion, and that whereon the images of objects are repreſented; has been much controverted between ſeveral members of the royal academy, particularly Meſſ. Mariotte, Pecquet, Perrault, Mery, and de la Hire — Mariotte firſt ſtood up for the choroides, and was ſeconded by Mery: the reſt aſſerted the cauſe of the *retina*.

The *retina* was always judged to have all the characters of the principal organ—It is ſituate in the focus of the refraction of the humours of the eye; and of conſequence receives the vertices of the cones of rays, proceeding from the ſeveral points of objects. It is very thin, and conſequently very ſenſible. It has it's origin from the optic nerve; and is itſelf wholly nervous, and it is the common opinion that the nerves are the vehicles of all ſenſations. Laſtly, it communicates with the ſubſtance of the brain, where all ſenſations terminate. See Brain, Sensation, *&c.*

As to the choroides, it's uſe was ſuppoſed to be to ſtop the rays, which the extreme tenuity of the *retina* ſhould let paſs; and to do the ſame office to the *retina* which the quickſilver does to a looking-glaſs; eſpecially in animals wherein it is black. See Choroides.

But from an experiment of a cat plunged into water, M. Mery conceived a different opinion —He obſerved the *retina* to diſappear abſolutely on that occaſion, as well as all the other humours of the eye; while the choroides ſtill appeared diſtinctly, and even with all the lively colours it has in that animal — Hence he concluded, that the *retina* was as tranſparent as the humours, but the choroides opake: conſequently the *retina* was not a proper inſtrument to terminate and ſtop the cones of rays, or to receive the images of objects: but that the light muſt paſs through it, and could only be ſtopped on the choroides; which therefore would become the principal organ of viſion.

The black colour of the choroides in man is extremely favourable to this ſentiment: the principal organ ſhould ſeem to require that the action of the light ſhould terminate on it, as it arrives; which it is certain it here does in the black that abſorbs all the rays, and reflects none; and it ſhould alſo ſeem neceſſary that the action of the light ſhould be ſtronger on the organ of ſight than any where elſe: now, it is certain that the light being received and abſorbed in a black body, muſt excite a greater vibration there than any where elſe; and hence it is that black bodies are kindled by a burning glaſs much ſooner than white ones. See Blackness, *&c.*

The ſituation of the choroides behind the *retina* is another circumſtance on it's ſide; M. Mery having obſerved the ſame poſition of the principal organ behind a mediate organ in the other ſenſes: which makes a happy analogy —Thus the cuticle extended over the ſkin, is the mean organ of feeling; but the cutis underneath is the principal organ. The like is obſerved in the ear, noſe, *&c.*

The *retina*, therefore, ſhould ſeem, a kind of mediate or ſecondary organ, ſerving to break the too ſtrong impreſſion of the light on the choroides, or to preſerve it; which is the uſe aſcribed to the cuticle — Add to all this, that the *retina* is inſenſible, as having it's origin from the medullary ſubſtance of the brain, which is ſo too; and the choroides, on the contrary, very ſenſible, as ariſing from the pia mater, which is certainly ſenſible in a great degree. See Nerve, Medulla, Meninx.

This laſt argument being doubted of, M. Mery was engaged to prove it; which he did before the royal academy, where he ſhew'd that the optic nerve is not compoſed like the other nerves, of fibres; that it is only a train of the medulla incloſed in a canal, out of which it is eaſily ſeparable. See Optic *nerve*.

This ſtructure of the optic nerve, hitherto unknown, ſhews that the *retina* can be no membrane; it is only a dilatation of the medulla, incloſed under two membranes, and a pith or medulla ſeems no proper ſubſtance to be the ſeat of ſenſation —It can ſcarce ſerve for any thing but to filtrate the ſpirits neceſſary for the action of viſion — The vibration whereby the ſenſation itſelf is effected, muſt be made on a part more ſolid, more firm, and more ſuſceptible of a briſk impreſſion.

RETINUE, Retinentia, the attendants or followers of a prince, or perſon of quality; chiefly in a journey.

In law, thoſe perſons are properly ſaid to be of a nobleman's *retinue* who belong to him in quality either of ſervants or retainers. See Retainer, and Livery.

RETIRADE, in fortification, a kind of retrenchment made in the body of a baſtion, or other work, which is to be diſputed inch by inch, after the firſt defences are diſmantled. See Retrenchment, *&c.*

It uſually conſiſts of two faces, which make a re-entering angle—When a breach is made in a baſtion, the enemy may alſo make a *retirade*, or a new fortification behind it. See Bastion.

RETIRED *flank*, in fortification. See Flank.

RETORNO *falſo brevium*. See the article Falso.

RETORT, Retorta, in chymiſtry, a kind of crooked matraſs, or a round, bellied veſſel, either of earth or glaſs, with a ſlender crooked beak, or noſe, to which the recipient is to be faſtened. See Matrass.

When the *retort* is of glaſs, it is uſually lined with a lute of paſte an inch thick; to enable it to bear the fire the better. See Lute and Heat.

The *retort* ſerves to draw ſpirits and oils from woods, gums, minerals, earths, and other matters which require a ſtrong fire. See Spirit, *&c.*

The *retort* is a kind of compendium or improvement on the cucurbit and bolt-head; anſwering all the purpoſes of both, without the aſſiſtance of a capital or head, which the other frequently require. See Cucurbit.

RETRACTATION, Retractatio, the act of unſaying what a perſon had ſaid, or wrote. See Palinody.

Galileo made a public *retractation* of his doctrine of the world, *de mundo*, after it's being cenſured and condemned by the pope. Among St Auguſtin's works is a book of *retractations*; where, however, the word is to be underſtood in a new ſenſe; not as if he recanted or unſaid any thing he had taught, but only treated of the ſame matter, or handled the ſame ſubject a ſecond time — This ſenſe the word will very well bear; being a compound of *re*, again, and *tracto*, I handle, treat of.

RETRACTION *, Retractio, in anatomy, the contraction or ſhortening of a part. See Contraction.

* The word is formed from the Latin, *retrahere*, to draw back.

A *retraction* of the nerves takes away the uſe of the limbs. See Nerve.

RETRACTS, among horſemen, pricks in a horſe's feet, ariſing from the fault of the farrier in driving nails that are weak, ill-pointed, or driven amiſs. See Shoe.

Theſe, unleſs timely prevented, feſter, and prove very dangerous. —When the farrier, in ſhoeing, perceives the horſe to ſhrink at every blow on the nail; it is a ſign of a *retract*, and the nail is to be pulled out again, which is done without any harm.

When the horſe halts immediately after he is ſhod, it is concluded ſome of the nails preſs the veins, or touch him in the quick.

To find where the grievance lies, they knock the nails round with a hammer, till the horſe's ſhrinking upon hitting a particular nail, diſcovers the place.

Some farriers give this as a rule, that throwing water on the hoof, the place where he is hurt will be dry ſooner than any of the reſt. The places where the horſes are moſt uſually pricked, are the heel in the fore-foot, and the toe in the hind-foot. See Hoof.

RETRACTOR *alæ naſi*, in anatomy, a pair of muſcles, called alſo *elevator labii ſuperioris*. See Elevator.

RETRAHENS *auriculam*, in anatomy, a pair of muſcles, of the external ear; conſiſting of a parcel of fleſhy fibres, which in ſome bodies are divided into three diſtinct muſcles ariſing from the os temporale, and fixed to the hind part of the concha. See Auricle.

But theſe muſcles are ſo ſmall in men, that the auricle is ſeldom moveable at all. See Ear.

RETRAXIT, in law, is where the plaintiff comes into court in perſon, alone, or with the defendant; and declares he will proceed no further in his action.

A *retraxit* is peremptory, and a perpetual bar; and may be pleaded as ſuch to the plaintiff in the ſame action for ever.

RETREAT, in war, the retiring or moving back again of an army, or part thereof.

We ſay, to ſound a *retreat*, ſecure a *retreat*, *&c.* What they call a *retreat* in the armies, is really a flight; only a flight made by deſign, and with conduct.

The ſkill and ability of the general, is known by his *retreats*, more than his engagements. — The *retreat* of the ten thouſand Greeks under the command of Xenophon, has been admired in all antiquity.

Retreat, or Relay, in maſonry, denotes a little receſs or diminution of the thickneſs of a wall, rampart, *&c.* in proportion as it is raiſed. See Wall, *&c.*

The *retreat* is properly the diminution of a wall, withoutſide; or the contraction of it's upper courſes more than the foundation. —Where the foundation is very large, they uſually make two or three *retreats* — Parapets are always built with *retreats*.

RETRENCHMENT*, literally ſignifies ſomething cut off, or taken from a thing: In which ſenſe it coincides with ſubſtraction, diminution, *&c.*

* The word is French, *retrenchment*, formed of *re*, and *trancher*, to cut.

By a gradual *retrenchment* of the ordinary quantity of food, a man may bring himſelf to a great degree of abſtinence. See Abstinence, Fasting, Food, *&c.*

The reformation of the calendar in 1582, occaſioned a *retrenchment* of ten days which had crept into the account more than there ſhould have been. See Calendar.

The frugality ſo much boaſted of among the antient Romans, St Evremont obſerves, did not ſo much conſiſt in a voluntary abſtinence or *retrenchment* of things ſuperfluous, as a coarſe and ſordid way of employing or uſing them.

Retrenchment, in architecture, carpentry, *&c.* is uſed not only for what is cut off from a piece when too large, in order to a better proportioning it, or ſome other convenience; but alſo for the projectures taken out of ſtreets, public ways, *&c.* to render them more even, and in a line.

Retrenchment, in war, denotes any kind of work caſt up to ſtrengthen, or defend a poſt againſt the enemy. See Fortification, Defence, Work, *&c.*

Such are ditches, with parápets, gabions, faſcines, *&c.* for a covering, *&c.* See Ditch, *&c.*

The enemy came with deſign to oblige them to raiſe the ſiege, but could not force the *retrenchments*.

Retrenchment, is more particularly uſed for a ſimple retirade made on a horn-work, or baſtion; when it is intended to diſpute the ground inch by inch. See Retirade.

It is uſually a re-entering angle, whoſe faces flank each other; and fortified with ditches, parapets, gabions, *&c.*

RETRIBUTION, Retributio, a handſome preſent, gratuity, or acknowledgement given in lieu of a formal ſalary or hire, to perſons employed in affairs that do not ſo immediately fall under eſtimation, nor within the ordinary commerce of money. See Hono.

Thoſe who miniſtered at the altar antiently lived of *retributions*, which they received for the ſervices they did the church. But theſe *retributions* were afterwards judged proper to be fixed to preciſe ſums. See Tithe.

RETRIEVE, Retrouver, to recover, get again, or repair a thing loſt or damaged. See Recovery, Reparation, *&c.*

To *retrieve* in falconry, ſignifies to ſpring or find patridges again, which have been once ſprung before. See Hawking.

RETROACTIVE*, in law, that which has an influence or effect on time paſt.

* The word is compounded of the latin, *retro*, backwards, and *ago*, I act.

New laws and ſtatutes, we ſay, have no *retroactive* effect; that is, they have no force or effect as to what is already paſſed; nor can be alledged as rules for any thing done before their promulgation. —Their authority is wholly as to what is to come.

Indeed we have ſome inſtances of laws that have a retroſpect, or *retroaction*, *i. e.* are made with expreſs deſign to extend to things already paſſed — Theſe we uſually call laws *ex poſt facto*. See Law, *&c.*

RETROCESSION, Retrocessio, the act of going backwards; more uſually expreſſed by *retrogreſſion*, or *retrogradation*. See Retrogradation, *&c.*

Retrocession of the equinox. See Precession.

Retrocession of curves, *&c.* See Retrogradation, *contrary* Flexure, *&c.*

RETROGRADATION, or Retrogression, the act or effect of a thing moving backwards. See Retrograde.

Retrogradation, in aſtronomy, is an apparent motion of the planets, wherein they ſeem to go backwards in the ecliptic, and to move contrary to the order, or ſucceſſion of the ſigns. See Planet, Ecliptic, *&c.*

When a planet moves in *conſequentia*, i. e. towards the following ſigns, or according to the order of the ſigns, as from Aries to Taurus, from Taurus to Gemini, *&c.* that is, from weſt to eaſt, it is ſaid to be direct. See Direct.

When it appears for ſome days in the ſame point of the heavens, it is ſaid to be *ſtationary*. See Stationary.

And when it goes in *antecedentia*, i. e. towards the antecedent ſigns, or contrary to the order of the ſigns, *viz.* from eaſt to weſt, it is ſaid to be *retrograde*. See Antecedentia, Sign, *&c.*

The ſun and moon always appear direct—Saturn, Jupiter, Mars, Venus, and Mercury, ſometimes direct, ſometimes ſtationary, and ſometimes *retrograde*. See SATURN, JUPITER, VENUS, &c.

The ſuperior planets are *retrograde* about their oppoſition with the ſun; the inferior ones about their conjunction. See OPPOSITION and CONJUNCTION.

The intervals of time between two *retrogradations* of the ſeveral planets, are unequal—In Saturn it is a year and 13 days; in Jupiter a year and 43 days; in Mars two years 50 days; in Venus one year 220 days; in Mercury 115 days. Again, Saturn continues *retrograde* 140 days, Jupiter 120, Mars 73, Venus 42, Mercury 22: yet are not the ſeveral *retrogradations* of the ſame planet conſtantly equal.

Theſe changes of the courſes and motions of the planets are not real, but apparent: when viewed from the centre of the ſyſtem, *i. e.* from the ſun, they appear always uniform and regular—The inequalities ariſe from the motion and poſition of the earth whence they are viewed, and are thus accounted for.

Suppoſe PNO (*Tab. Aſtronomy*, *fig.* 58.) a portion of the zodiac, ABCD the earth's orbit, and EMGHZ the orbit of a ſuperior planet, *e. gr.* Saturn. And ſuppoſe the earth in A, and Saturn in E; in which caſe he will appear in the zodiac at the point O—If now Saturn remained without any motion, when the earth arrives at B, he would be ſeen in the point of the zodiac L, and would appear to have deſcribed the arch OL, and to have moved according to the order of the ſigns from weſt to eaſt. But becauſe while the earth is paſſing from A to B, Saturn likewiſe moves from E to M, where he is ſeen in conjunction with the ſun, he will appear to have deſcribed the arch OQ greater than that OL. In this ſtate the planet is direct, and it's motion, from weſt to eaſt, or according to the order of the ſigns. And it's motion, now that it is in conjunction with the ſun and moſt remote from us, is quicker than at any other time. See DIRECTION.

The earth arriving at C, while Saturn deſcribes the arch MG, he will be obſerved in the zodiac at R. But the earth being advanced to K, and Saturn to H, ſo as the line KH joining the earth and Saturn, be for ſome time parallel to itſelf, or nearly ſo; Saturn will be ſeen all that time in the ſame point of the zodiac at P, and with the ſame fixed ſtars; and is therefore ſtationary. See STATION.

But the earth being come to D, and Saturn arrived in oppoſition to the ſun in Z, he will appear in the zodiac in V, and will ſeem to have been *retrograde*, or to have gone backwards through the arch PV—Thus the ſuperior planets, on optical conſiderations, are always *retrograde*, when in oppoſition to the ſun. See SUN, OPPOSITION, &c.

The arch which the planet deſcribes while thus *retrograde*, is called the *arch of retrogradation*. See ARCH.

The arches of *retrogradation* of the ſeveral planets are not equal—That of Saturn is greater than that of Jupiter; that of Jupiter than that of Mars, &c.

RETROGRADATION *of the nodes*, is a motion of the line of the nodes, whereby it continually ſhifts it's ſituation from eaſt to weſt, contrary to the order of the ſigns; compleating its *retrograde* circulation in the compaſs of about 19 years: after which time either of the nodes having receded from any point of the ecliptic returns to the ſame again. See NODE.

RETROGRADATION *of the ſun*—When the ſun is in the torrid zone, and has his declination, AM, (*Tab. Aſtronomy*, *fig.* 59.) greater than the latitude of the place AZ, but either northern or ſouthern as that is; the ſun will appear to go backwards, or to be *retrograde* both before and after noon. See SUN and ZONE.

For, draw the vertical circle ZGN to be a tangent to the ſun's diurnal circle in G, and another ZON, through the ſun riſing in O—It is evident all the intermediate vertical circles cut the ſun's diurnal circle twice: firſt, in the arch GO, and the ſecond time in the arch GI—Wherefore, as the ſun aſcends through the arch GO, it continually arrives at further and further verticals. But as it continues it's aſcent through the arch GI, it returns to it's former verticals; and therefore is ſeen *retrograde* for ſome time before noon—The ſame, it may be ſhewn after the ſame manner, it does for ſome time after noon.

Hence, as the ſhadow always tends the oppoſite way to that of the ſun, the ſhadow will be *retrograde* twice every day in all places of the torrid zone, where the ſun's declination exceeds the latitude. See SHADOW.

RETROGRADATION, or **RETROGRESSION**, in the higher geometry, is the ſame with what we otherwiſe call *contrary flexion*. See *Contrary* FLEXION.

The *retrogreſſion* of curves may be thus conceiv'd—Suppoſe a curve line AFK, (*Tab. Geometry*, *fig.* 82.) to be partly concave, partly convex, in reſpect of the right line AB, or in reſpect of the determinate point B; the point F which ſeparates the concave part of the curve from the convex, or which makes the end of one, and the beginning of the other, is called the *point of contrary flexion*, when the curve is continued from F towards the ſame ſide as before—When the curve is continued backwards towards A, then is F the point of *retrogreſſion*. Set POINT and CURVE.

RETROGRADE*, **RETROGRADUS**, ſomething that goes backwards, or in a direction contrary to the natural one—Such is the motion of the lobſter, the crab, &c.

* The word is formed from the Latin, *retro*, backwards, and *gradior*, I go.

If the eye and the object move both the ſame way, but the eye much faſter than the object; the object will appear to be *retrograde*, i. e. to go back, or to advance the contrary way from what it really does. See VISIBLE.

Hence, the planets in ſome parts of their orbits appear to be *retrograde*. See PLANET and RETROGRADATION.

RETROGRADE *order*, in matters of numeration, is when in lieu of accounting 1, 2, 3, 4, we count 4, 3, 2, 1. See PROGRESSION, SERIES, NUMBER, &c.

RETROGRADE *verſes* are ſuch as give the ſame words, whether read backwards or forwards; called alſo *reciprocal verſes*, and *recurrents*.

Such is—*Signa te ſigna temere me tangis et angis.*

RETROGRESSION, or **RETROCESSION**, the ſame with *retrogradation*. See RETROGRADATION.

RETROMINGENTS*, in natural hiſtory, a claſs or diviſion of animals, whoſe characteriſtic is, that they ſtale, or piſs backwards; both males and females—Such are lions, cats, &c. See ANIMAL.

* The word is compounded of the Latin, *retro*, backwards, and *mingo*, I make water.

RETROPANNAGIUM*, **RETROPANNAGE**, in our antient law-books, *afterpannage*; or what is left when the beaſts have done, or eat the beſt. See PANNAGE.

* *Et debent habere* retropannagium *a feſto ſancti Martini uſquod feſtum pur. beatæ Mariæ. Petit. in parl. temp. Edw.* III.

RETROSPECT, a look or view backwards. See RETROACTIVE.

RETURN, **RETURNA** or **RETORNA** in law, hath divers acceptations—A

RETURN *of writs* by ſheriffs and bailiffs, is a certificate made to the court by the ſheriff, bailiff, &c. of what is done with regard to the execution of the writ directed to them. See WRIT.

Such alſo is the *return of a commiſſion*, which is a certificate, or anſwer of what is done by the commiſſioners, to whom ſuch commiſſions, precepts, mandates, or the like, are directed. See COMMISSION.

RETURN is alſo uſed in caſe of a replevin. If a man diſtrain cattle for rent, &c. and afterwards juſtify or avow his act, ſo as it is found lawful; the cattle before delivered unto him that was diſtrained, upon ſecurity given to proſecute the action, ſhall now be *returned* to him that diſtrained them. See DISTRESS, REPLEVY, and RETURNO.

RETURNS, **RETURN**-*days*, or *days in bank*, are certain days in each term, peculiarly ſet a-part for the ſeveral kinds of proceedings, in any cauſe to be determined. See TERM, DAY, &c.

Hillary term has four ſuch *returns*—viz. *octabis hillarii*, eight days after hillary day *quindena hillarii*, fifteen days; *craſtina purificationis*, the day after the purification; and *octabis purificationis*, eight days after, incluſive.

Eaſter term has five *returns*, viz. *quindena paſchæ*, fifteen days after eaſter; *tres paſchæ*, three weeks after; *menſe paſchæ*, the day-month after eaſter; *quinque paſchæ*, the day five weeks from eaſter; and *craſtino aſcenſionis domini*, the day after aſcenſion-day.

Trinity term has four *returns*; viz. *craſtino trinitatis*, the day after trinity; *octabis trinitatis*, eight days after, incluſive; *quindena trinitatis*, fifteen days after; and *tres trinitatis*, three weeks after.

Michaelmas term has ſix *returns*; viz. *tres michaelis*, three weeks after michaelmas; *menſe michaelis*, the day month after michaelmas; *craſtino animarum*, the day after all-ſouls; *craſtino martini*, the day after martinmas day, *octabis martini*, eight days after, incluſive; and *quindena martini*, fifteen days. See TERM.

RETURN, in building, denotes a ſide, or part that falls away from the foreſide of any ſtraight work. See RESSAUT.

RETURNS, of a trench, in fortification, are the turnings and windings which form the lines of a trench. See TRENCH.

RETURNO *habendo*, or **RETURNUM** *averiorum*, a writ which lies for him who has avowed a diſtreſs made of cattle, and proved his diſtreſs to be lawfully taken; for the *return* of the cattle diſtrained unto him, which before were replevied by the party diſtrained, upon ſurety given to purſue the action. See DISTRESS, RETURN, &c.

The ſame writ is granted when the plaint or action is removed by recordare, or accedas ad curiam, into the court of common-pleas; and he whoſe cattle were diſtrained, makes default, and does not proſecute his action.

RETURNUM *irreplegiabile*, a judicial writ, ſent out of the common-pleas to the ſheriff, for the final reſtitution or return of cattle to the owner, unjuſtly diſtrained damage-feſant, and ſo found by the jury before juſtices of aſſize in the county, or otherwiſe through default or proſecution. See Return, Distress, Replevy, &c.

REVE*, **Reeve**, or **Greve**, in antient cuſtoms, the bailiff of a franchiſe, or manor; thus called, eſpecially in the weſtern parts. See Greve and Bailiff.

* M. du Cange derives the word from the Latin, *roga* of *rogare*, to aſk; as being a tribute antiently granted princes at their requeſt, as a free-gift.

Hence, *ſhire-reve*, ſheriff, *port-greve*, *church-reve*, &c. See Shefiff, Port-greve, &c.

Reve, **Reva**, is alſo uſed in antient cuſtoms for a duty or impoſition on merchandizes imported. See Duty and Custom.

REVEALED *religion*. See Religion and Revelation.

Revealed *theology*. See the article Theology.

REVEILLE*, a beat of drum in the morning, intended to give notice that it is day-break; and that the ſoldiers are to riſe, and the ſentries forbear challenging. See Drum.

* The word is French, formed of the verb *reveiller*, to awake.

REVELATION*, **Revelatio**, the act of revealing, or making a thing public which before was a ſecret, or unknown.

* The word is formed from the Latin, *revelo*, of *re* and *velum*, *q. d.* to unvail.

The *revelation* of a confeſſion made by the confeſſor, is adjudged in the Romiſh church, to deſerve the moſt exemplary puniſhment. See Confession.

Revelation is uſed, by way of eminence, for the diſcoveries made by God to his prophets, &c. and by them to the world. See Prophecy.

The Romaniſts have two huge volumes of the *revelations* of St Bridget. See Legend, Vision, &c.

Revelation, is more particularly uſed for the diſcovery which God has made to the world, by the mouths of his prophets, of certain points of faith and duty, which they could not learn from natural reaſon. See Nature, Reason, Faith, &c.

Religion is divided into natural religion, and *revelation* or *revealed* religion. See Religion.

The Chriſtian *revelation* is that made by Chriſt, and his apoſtles, in the new teſtament—The Jewiſh *revelation* is that made by Moſes and the prophets, in the old teſtament. See Bible, Prophet, &c.

A late author obſerves, ſomewhat invidiouſly, that it is the common method of all new *revelations*, to be built on precedent ones—Thus, the miſſion of Moſes to the Iſraelites, ſuppoſes a former *revelation* to Abraham, &c. The miſſion of Chriſt ſuppoſes that of Moſes; and the pretended miſſion of Mahomet, ſuppoſes the miſſion of Chriſt. The miſſion of Zoroaſter to the Perſians, ſuppoſes the religion of the Magi, &c.

The general foundation of all *revelation* is this, that God is pleaſed man ſhould know ſomething relating to himſelf, his own nature, diſpenſation, &c. which the natural faculties he was pleaſed to create him withal, could not attain to; and that he requires ſome duty or ſervice at our hands, more than what neceſſarily follows from the relation we are under to him as our creator, preſerver, &c.

Particular or occaſional *revelations* have their particular genius's, characteriſtics, and deſigns—That made by Moſes and the prophets, chiefly related to the nation of the Jews, conſidered as the deſcendants of Abraham: it's deſign ſeems to have been to reſcue that people from their ſlavery; to ſettle them in a new plantation; to give them a ſet of laws; to new form their manners; to ſupport them under difficulties and dangers of their enemies, from an opinion of their being under the immediate direction and appointment of God; to keep them from intermixing again with their neighbours, from an opinion of their being a choſen people, and of a Meſſiah to be born among them; and to lay a foundation for a reſtoration, in caſe of their being oppreſſed, from the opinion of a deliverer—To ſome or other of theſe ends do all the old teſtament propheſies ſeem to tend.

The Chriſtian *revelation* is founded on a part of the Jewiſh. The Meſſiah promiſed in the one, is *revealed* in the other. All the reſt of the Jewiſh *revelation*, which related peculiarly to the Jewiſh people, is here ſet aſide; and only that part of it which was to affect the world in general, we mean that relating to the coming of the Meſſiah, is here built upon. See Messiah.

Indeed it muſt be owned the Jews ever looked on this as peculiar to themſelves, as any of the reſt: the Meſſiah was promiſed to them; he was to be their deliverer, their reſtorer, &c.—But upon the taking place of this new *revelation*, a new ſcene was opened—This part of the old *revelation*, it was ſhewn, was all typical, or allegorical; and the propheſies relating hereto, not to be underſtood in their primary or literal ſenſe. The Meſſiah was not to be the reſtorer of the Jewiſh ſovereignty and liberties, which were now fallen into the hands of the Romans, but to reſtore and re-eſtabliſh the world, who had loſt their original righteouſneſs, and were become ſlaves of ſin; to preach repentance and remiſſion; and at laſt to ſuffer death, that all who believed in him, might not die, but have everlaſting life.

Such is the tenour and deſign of the Chriſtian *revelation*, which in the event, was ſo far from being what it had been apprehended to be, by the people to whom it was firſt promiſed; that it proved the very reverſe; and inſtead of re-eſtabliſhing and confirming the other branches of their *revelation*, ſuperſeded, and ſet them all aſide—The pale was now broken down, and the being of the ſeed of Abraham, ceaſed to be a privilege; all the world being invited on the ſame terms with the Jews.

The conſequence was, that the Jews denying this to be the Meſſiah that had been promiſed to them, as not able to ſee the propheſies fulfilled in him, for want of the typical meanings thereof, were generally excluded from the privileges of that miſſion which had been ſuppoſed wholly intended for them; and had their ruin compleated from the very means whence they expected their redemption. See Type, Prophecy, &c.

REVELS*, entertainments of dancing, maſking, gaming, acting comedies, farces, &c. antiently very frequent in inns of courts, at certain ſeaſons, and in noblemen's houſes, &c. but now much diſuſed.

* The word is formed from the French, *reveiller*; to awake, as alluding to the night ſeaſon, when they were chiefly held.

The officer who has the direction, or ordering of the *revels*, at court, is called the *maſter of the revels*. See Master.

REVENUE*, the yearly rent, or profits ariſing to a man from his lands, poſſeſſions, &c. See Rent.

* The word is French, formed from *revenir*, to return—Whence *revenue* is ſometimes alſo uſed in antient authors for a return: as the *revenue* of Eaſter. See Return.

The *revenue* of this manor conſiſts in tiths, rents, &c. See Manor, Tith, &c.

The *revenues* of the Engliſh clergy were firſt fixed by king Ethelwolf, anno 855; who granted them for ever, the tithe of all goods, and the tenth part of all the lands of England, free from all ſecular ſervice, taxes, impoſitions, &c. See Tithe and Clergy.

The certain *reuenues* of the king of England were antiently greater than thoſe of any king in Europe; and till the time of the civil wars they enjoyed in domains and fee-farm rents almoſt enough to diſcharge all the ordinary expences of the crown, without any tax or impoſition on the ſubject. See Tax, &c.

Upon the reſtauration, the crown *revenues* being found much alienated, and the crown charges increaſed; the parliament ſettled a yearly revenue of 1,200,000 *l.* upon the king; ſo much as the former crown *revenues* fell ſhort of that ſum, to be raiſed on goods exported and imported, upon liquors, and fire-hearths. See Duty, &c.

At the death of king Charles II. the *revenue* amounted to 1,800,200 *l.* per ann.—In king James the ſecond's time, it was raiſed to 2,000,000 *l.* which was computed to be one tenth of the *revenues* of the whole kingdom.

At the ſame time, the *revenues* of the king of France were computed at ſeven millions ſterling; and thoſe of the ſtates of Holland, at three millions—*For more particulars of this kind*, ſee Political *arithmetic*.

Auditors of the **Revenue**. See Auditor.

Revenue, **Revenu**, in hunting, a fleſhy maſs or lump formed chiefly of a cluſter of whitiſh worms on the heads of deer, and occaſioning them to caſt their horns, by gnawing the roots thereof. See Head, &c.

The *revenue* diſtilled, is ſaid to help women in travel.

Revenue is alſo uſed for a new tail of a partridge, growing out after the loſs of a former—The *revenue* is meaſured by fingers: thus they ſay a partridge of two, three, four fingers *revenue*.

REVERBERATION*, **Reverberatio**, in phyſics, the act of a body repelling or reflecting another, after it's impinging thereon. See Reflection.

* The word is formed from the Latin, *re* and *verbero*, *q. d.* I beat again.

In the glaſs-mens furnaces the flame *reverberates*, or bends back again, to ſcorch the matter on all ſides. See Glass and Furnace. Echoes are occaſioned by the *reverberation* of ſounds from arched obſtacles. See Echo.

Reverberation and *reſilition* refer to the ſame action; only the one to the agent, the other to the patient—A poliſhed body *reverberates* the rays all around; the *reſilition* of the rays does not ariſe from their ſtriking againſt the ſolid parts of bodies. See Reflection.

Reverberation, in chymiſtry, denotes a kind of circulation of the flame, by means of a *reverberatory*; or the return of the flame from the top of the furnace, back to the bottom, chiefly uſed in calcination. See Reverberatory, Calx, and Calcination.

Reverberation is of two kinds—The firſt with a *cloſe fire*;

that is, in a *reverberatory* furnace, where the flame has no vent a-top; being covered with a dome, or capital, which repels it's action back on the matter, or the veſſel that contains it, with increaſed vehemence.

After this manner, are refining, the diſtillation of acid ſpirits, *&c.* performed. See DISTILLATION and REFINING.

Reverberation with an *open fire*, is that performed in a furnace or *reverberatory*, whoſe regiſters are all open; uſed in calcination, *&c.* See CALCINATION, FIRE, HEAT, AIR, *&c.*

REVERBERATORY, or **REVERBERATING** *furnace*, is a chymical furnace built cloſe all around, and covered a-top with a capital of bricks or tiles, ſo as not to give any vent to the heat or flame, but to determine it to *reverberate* or turn back from the brick work with new force, upon the matters placed at bottom. See REVERBERATION.

When the fire has no vent or paſſage a-top, it is a whole *reverberatory*; when the middle of the capital is open, and only the ſides cloſe, ſo that there is only a half circulation of the flame, it is called a *half reverberatory*.

The *reverberating* furnace is chiefly uſed in the fuſion and calcination of metals, and minerals, and on other occaſions where the moſt intenſe heat is required, as in aſſaying, *&c.* Whence it is alſo called the *melting furnace*, and *aſſaying furnace*. See FURNACE, FIRE, FUSION, ASSAY, *&c.*

REVEREND, **REVERENDUS**, a title of reſpect given to eccleſiaſtics. See TITLE and QUALITY.

The religious abroad are called *reverend* fathers; abbeſſes, prioreſſes, *&c.* are called *reverend* mothers. See ABBOT, RELIGIOUS, *&c.*

With us, biſhops are *right reverend*; and archbiſhops *moſt reverend*—In France their biſhops, archbiſhops, and abbots, are all alike *reverendiſſime's*, *moſt reverend*. See BISHOP, *&c.*

REVERIE, a term purely French, frequently uſed of late in Engliſh, to ſignify a delirium, raving, or diſtraction—It is an ill ſign when the patient falls into a *reverie*. See DELIRIUM.

Hence alſo REVERY comes to be uſed for any ridiculous, extravagant imagination, action, or propoſition; a chimera or viſion—Thus we ſay, authors obtrude abundance of their *reveries* upon us for ſolid truths.

But the moſt ordinary uſe of *revery* among Engliſh writers is for a deep, diſorderly muſing, or meditation; equivalent to what we popularly call a *brown-ſtudy*—Thus: a little diſtraction I would allow; but for that continued ſeries of *reveries* ſome people are guilty of, who are even abſent from the place where you ſee them, and are never preſent any where, it is inexcuſable.

REVERS. *Battery de* REVERS. See the article BATTERY.

REVERSATA *arma*. See the article ARMA.

REVERSE*, in law, *&c.*—To *reverſe*, ſignifies to undo, repeal, or make void. See REPEAL, ANNUL, *&c.*

* The word is formed of the Latin, *re*, again, and *verſus*, turned.

REVERSE, of a medal, coin, *&c.* denotes the ſecond, or backſide; in oppoſition to the head or principal figure. See COIN, MEDAL, *&c.*

F. Chamillart, a jeſuit, has an expreſs diſſertation on this point, whether or no the *reverſes* of medals have always a regard to the emperors or empreſſes whoſe heads are repreſented on the front ſide of the medal? he ſays, that till of late the antiquaries have made no doubt of it; but that there are now ſeveral authors of another opinion.

REVERSE, in fencing, a back-ſtroke. See GUARD, FENCING, *&c.*

REVERSED, in heraldry, a thing turned backwards, or upſide down. See INVERSE and INVERSION.

REVERSED *talon*, in architecture. See TALON.

REVERSING, or **RENVERSING**, in muſic, the inverting the order of the parts; that is, placing the higher part or treble, in the room of the lower part or baſs. See PART, BASS, TREBLE, *&c.*

Reverſing is frequently practiſed in figurative counterpoint, where the baſs ſerves as treble; and the treble, at the ſame time, as baſs; and all this, in ſuch manner, as that the harmony, though very different, is yet as correct as before the *reverſing*, when the parts were in their natural order.

To know how to diſpoſe the parts, ſo as the *reverſing* may not do any damage, is a ſecret, whereon M. Broſſard has promiſed a treatiſe expreſs.

A *reverſed* fugue or counterfugue, called by the Italians, *per contrarii movementi*, is when the guida falls, and the other inſtead of imitating by falling, imitates by riſing; or a figure *per arſin* and *theſin*. See ARSIS.

REVERSION, **REVERSIO**, in law, is defined by Coke, a returning of lands, *&c.* into the poſſeſſion of the donor, or his heirs; after the expiration of the term for which they were given or granted to another. See DONATION, *&c.*

The word has a double acceptation—The firſt is, *jus revertendi cum ſtatus poſſeſſionis defecerit*, which is no more than an intereſt in the land, when the occupation or poſſeſſion of it ſhall fall.

The ſecond is, when the poſſeſſion and eſtate, which was parted with for a time, ceaſeth, and is determined in the perſon of the alienees, aſſignees, grantees or their heirs; or effectually returns to the donor, his heirs or aſſigns, whence it was derived.

This is the moſt proper ſignification of the word, which is derived from *revertor: Et aptè dici non poteſt reverſio antequam revertatur in facto.* Littlet.

The difference between a *reverſion* and a *remainder* conſiſts in this, that a remainder is general, and may remain or belong to any man but him that granteth or conveyeth the land, *&c.* See REMAINDER.

Whereas a *reverſion* is to himſelf, from whom the conveyance of the land, *&c.* proceeded, and is commonly perpetual, as to his heirs alſo—And yet ſometimes *reverſion* is confounded with remainder.

For the values of *reverſions*, or eſtates in *reverſion*, the little book of tables for renewing and purchaſing college and church leaſes, printed at Cambridge in 1700, and recommended by Sir Iſaac Newton, furniſhes us with a very uſeful table, which ſhews what one pound due at the end of any number of years to come, not exceeding 40, is worth in ready money, at 5, 6, 7, 8, and 10 per cent. per annum.

Suppoſe, it required, what 1 *l.* due a year hence, is worth in ready money: to find this by the common operations, the method is this—Let 100*l.* with the intereſt of a year added to it, be the firſt term in the rule of three; 100 *l.* the ſecond, and 1 *l.* the third; (for as 100 *l.* with it's intereſt going on to the end of the year, is to a bare 100*l.* then due: ſo muſt 1 *l.* with it's growing intereſt, be to the decreaſe of 1 *l.* at the year's end) then, at 6 *l.* *e.gr.* and 10 *l.* per cent, the work will ſtand thus:

As, 106 . 100 : : 1 . . 0,9433071, or 18*s.* 10*d.* $\frac{1}{4}$.
110 . 100 : : 1 . . 9,0909, or 18*s.* 2*d.*

Whence it appears, that 1*l.* due a year hence, at 6*l.* per cent, is worth 18*s.* 10*d.* $\frac{1}{4}$; and at 10 per cent, to 18*s.* 2*d.* So that 18*s.* 10*d.* $\frac{1}{4}$ ready money, is worth 20*s.* to be paid a year hence at 6 per cent; and 18*s.* 2 *d.* ready money, is worth 20 *s.* to be paid a year hence at 10 per cent. See INTEREST.

But this table ſhortens the work—To find by it how to renew a leaſe of 21 years, that hath but one year lapſed, at the rate of 10 per cent; look into the ſame, and under the rate of intereſt mentioned, and right againſt 21 years, in the common angle of meeting, you have 2 *s.* 8 *d.* $\frac{1}{2}$, which is the fine to be paid to renew one year lapſed in the ſaid leaſe; ſuppoſing the rent to be 1 *l.* per annum. For it is 21 years before the leaſe is compleated, in which time the fine of 2 *s.* 8 *d.* $\frac{1}{2}$, will amount to 20 *s.* and therefore by paying that fine, the leaſe may fairly be made up again.

Suppoſe again, an eſtate in fee-ſimple, whoſe real value is 100*l.* but mortgaged, or leaſed out for 20 years; what is the *reverſion* of it now worth at 6*l.* per cent. intereſt?—By the table you find, that 1 *l.* to be paid 20 years hence, is worth but 6 *s.* 2 *d.* $\frac{3}{4}$, and multiplying that with 100, you will find 100 times 6 *s.* is 30 *l.* 00 *s.* 00 *d.* 100 times 2*d.* or 200*d.* makes 00 *l.* 16*s.* 8 *d.* and 100 times $\frac{3}{4}$, or 300*q.* makes 00*l.* 6*s.* 3 *d.* the ſum is 31 *l.* 2 *s.* 11 *d.* which is the preſent value of 100*l.* to be paid 20 years hence.

A Table of *reverſions* ſhewing what 1*l.* due any number of years hence, under 41, is worth in ready money at 5, 6, 7, 8, and 10 *per cent.*

Years.	5 *per Cent.*			6 *per Cent.*			7 *per Cent.*			8 *per Cent.*			10 *per Cent.*

Reversion *of ſeries*, in algebra, is a method of finding a natural number from it's logarithm given; or the ſine from it's arch; or the ordinate of an ellipſis from an area given to be cut off from any point in the axis. See Series. See alſo Logarithm, Sine, Ordinate, *&c.*

REVERT, in law—A thing is ſaid to *revert* when it returns or falls back to its firſt owner. See Reversion.

All honours, and royal fees, alienated, *revert* to the crown; or are *revertible*—Apanages, or portions of younger ſons of kings, are granted on condition of *reverſion*. See Apannage.

REVESTIARY or Revestry. See Vestry.

REVIEW, in war, the ſhew or appearance of a body of troops, ranged in form of battle, and afterwards made to file off; to ſee if the companies be compleat, as to number and good condition; or to receive their pay, or the like.

The general always *reviews* his troops before they go into winter quarters, *&c.* See Quarter.

Review in chancery—A bill of Review is, where the cauſe has been heard, and a decree therein ſigned and enrolled; but ſome error in law appears in the body of the decree or ſome new matter is diſcovered in time after the decree made. See Decree—A bill of *review* is not exhibited but by leave of the court. See Bill, Chancery, *&c.*

REVISE, among printers, a ſecond proof of a ſheet to be printed, taken off after correcting the firſt. See Printing.

REVIVER. See the article Revivor.

REVIVIFICATION, or Resuscitation, in chymiſtry, the art of reſtoring a mixed body to it's firſt ſtate, after it had been altered and diſguiſed by diſſolution, calcination, or the like.

Thus cinnabar and other preparations of mercury are *revived* or *revivified* into fluid mercury—Olaus Borrichius aſſures us. that having tormented mercury with ſeveral fires, for the ſpace of a whole year; having reduced it into water, turbith, into aſhes, *&c.* it *revivified*, and reſumed it's firſt form in the middle of the flames, by the attraction of ſalt of tartar. See Mercury.

Gold and other metals, it is ſaid, may be recovered or *revivified* into running mercury, by the uſe of certain ſalts, which penetrating the ſubſtance of the metals, abſorb the fixing ſulphur or cement by which the mercury was before bound into a malleable maſs. See Metal, Gold, *&c.*

Revivified *antimony*. See the article Antimony.

REVIVING, in law, a renewing of rents and actions, after they had been extinguiſhed. See Rent, Extinguishment, *&c.*

REVIVOR, or Reviver in law—A *bill of* Revivor is where a bill has been exhibited in chancery againſt one who anſwers; but before the cauſe is heard, or at leaſt before the decree is inrolled, one of the parties dies.

In this caſe, a bill of *revivor* muſt be brought, praying the former proceedings may ſtand *revived*; and be put in the ſame condition as at the time of the abatement. See Bill.

REVOCATION, Revocatio, in law, the act of *revoking*, calling back, or annulling a power, grant, *&c.* made before. See Repealing.

The *revocation* of an offer after it is accepted of is invalid—All preceding wills or teſtaments are *revoked* by the laſt—A prior clauſtral is *revocable* at pleaſure—The *revocation* of the edict of Nants was fatal to the French proteſtants. See Edict.

REVOLUTION*, in politics, denotes a grand turn or change of government. See Government.

* The word is formed from the Latin, *re-volvo*, to roll backwards.

There are no ſtates in the world but have undergone frequent *revolutions*—The abbot de Vertot has furniſhed us with two or three good hiſtories of the *revolutions* of Sweden, the *revolutions* of Rome, *&c.*

The **Revolution**, uſed by way of eminence, denotes the great turn of affairs in England in 1688; when king James II. abdicating, the prince and princeſs of Orange were declared king and queen of England, *&c.* See Abdication.

Revolution, in geometry. The motion of any figure quite round a fixed line as an axis, is called the *revolution* of that figure; and the figure ſo moving is ſaid to *revolve*. See Axis.

Thus a right angled triangle revolving round one of it's legs, as an axis, generates by that *revolution*, a cone. See Cone.

Revolution, in aſtronomy, denotes the period of the ſtar, planet, comet, or other phænomenon; or it's courſe from any point of it's orbit, till it return to the ſame. See Planet, Period, *&c.*

The planets have a twofold *revolution*—the one about their own axis, uſually called their *diurnal rotation*, which conſtitutes what we call their *day*. See Diurnal and Day—The other about the ſun, called their *annual revolution*, or *period*; conſtituting their *year*. See Annual and Year. Saturn according to Kepler, makes his *annual revolution* in the ſpace of 29 years, 174 days, 4 hours, $58' 25'' 30'''$. Jupiter in 11 years, 317 days, 14 hours, $49' 31'' 56'''$. Mars in 1 year, 321 days, 23 hours, $31' 56'' 49'''$. Venus in 224 days, 17 hours, $44' 55'' 14.'''$ Mercury in 87 days, 23 hours, $14' 24''$. See Saturn, Jupiter, Mars, *&c.*

REVULSION, Revulsio, in medicine, the turning a flux of humours, from one part of the body to another either neighbouring, or oppoſite part. See Humour. Derivation, *&c.*

In very dangerous wounds, where the loſs of blood is great, and the ſtopping it ſpeedily enough, impracticable; it is uſual to open a vein in ſome remote part, to cauſe a *revulſion*; that is, to turn the courſe of the blood from the former part, to that where the aperture is made. See Phlebotomy.

Revulſions were alſo cauſed by cupping, friction, *&c.* See Cupping and Friction.

Revulsion is alſo uſed for a ſpontaneous turn, or re-flux of humours in the body—Sudden diſeaſes are occaſioned by great *revulſions* of humours, which fall all at once on certain parts.

RHABDOIDES, Ῥαϐδοειδης, in anatomy, a name given the ſecond true ſuture of the ſkull; called alſo the *ſagittal ſuture*. See Suture and Sagittalis.

* The word is formed from the Greek, ῥαϐδος rod, or ſtaff, and ειδος, form.

RHABDOLOGY, or Rabdology, in arithmetic, a name ſometimes given to the method of performing the two moſt moſt difficult and operoſe rules, *viz.* multiplication and diviſion, by the two eaſieſt, *viz.* addition and ſubſtraction; by means of two little rods or laminæ, whereon are inſcribed the ſimple numbers, and which are to be ſhifted according to certain rules.

Theſe rods are what we popularly call *Nepair's bones*, from their inventor, a Scotiſh baron, who likewiſe invented logarithms—For their deſcription and uſe, ſee Nepair's-*bones*.

RHABDOMANCY*, an ancient method of divination, performed by means of rods, or ſtaves. See Divination.

* Whence it's name, from the Greek, ῥαβδος, rod, and μαντεια, divination.

St Jerom makes mention of this kind of divination, in his commentary on Hoſeah, chap. iv. 12. where the prophet ſays in the name of God, *my people aſk council at their ſtocks* ; *and their ſtaff declareth unto them* : which paſſage that father underſtands of the Grecian *rhabdomancy*.

The ſame he finds over again in Ezekiel xxi. 21, 22, where the prophet ſays, *for the king of Babylon ſtood at the parting of the way, at the head of the two ways, to uſe divination* ; *he made his arrows bright* : or as St Jerom renders it, *he mixed his arrows*, *he conſulted with images*, *he looked in the liver*.

If it be the ſame kind of divination that is mentioned in the two paſſages ; *rhabdomancy* muſt have been the ſame ſuperſtition with *belomancy*. See BELOMANCY.

In effect the two are ordinarily confounded — The ſeventy themſelves tranſlate the חצים of Ezekiel by ῥαϐδος, a rod ; through in ſtrictneſs it ſignifies an arrow.

This, however, is certain, the inſtruments of divination mentioned by Hoſeah, are different from thoſe of Ezekiel. In the former, it is, עצו *etſo*, מקלו *maklo*, his wood is ſtaff: in the latter, חצים *hhitſim*, arrows. Though it is poſſible they might uſe rods or arrows indifferently ; the military men arrows, and the reſt rods.

It appears by the laws of the Friſones, that the antient inhabitants of Germany practiſed *rhabdomancy* — The Scythians were likewiſe acquainted with the uſe hereof ; and Herodotus obſerves, *lib.* iv. That the women among the Alani ſought and gathered together fine ſtraight rods or wands, and uſed them in the like ſuperſtition.

RHACHITIS, Ῥαχιτις, in medicine. See RICKETS.

RHAGADES, Ῥαγαδες, in medicine, a Greek term uſed for the chaps or clefts in the lips, hands, anus and other ſoft parts of the body.

Rhagades are a ſort of fiſſures, or little chapped ulcers of the oedematous kind ; formed of a ſharp ſaline humour, and occaſioning a great contraction, and ſtreightening of the part, which is by this means ſhrivelled up like a wet parchment when held to the fire. See OEDEMA.

They are chiefly on the fundament, the neck of the womb, the præputium, lips, *&c.* ſometimes even in the mouth ; in which caſe the patient is not able to ſpeak, chew, or the like. They are ſometimes moiſt, and of a cancerous nature, eating deep, and difficult of cure ; but are more commonly of a leſs malignant tendency, being the conſequences of a diarrhæa, dyſentery, or the like. See TUMOUR, ULCER, *&c.*

RHAGOIDES *, Ῥαγοειδης, in anatomy, the ſecond coat, or tunic of the eye ; more uſually called *uvea*. See UVEA and CHOROIDES.

* It has it's name *rhagoides*, as reſembling a grape-ſtone.

In the tunica *rhagoides* is the hole called the *pupil*. See PUPIL.

RHAPONTICUM*, a medicinal root, in form reſembling rhubarb ; and nearly of the ſame virtues, whence it is ſometimes called Turkiſh *rhubarb*.

* It was called *rhaponticum, q. d.* root of Pontus ; becauſe chiefly produced in the country of Pontus in Aſia.

It is frequently mixed with rhubarb by thoſe who ſend that drug into Europe : they are diſtinguiſhed by this, that the rhubarb is uſually in roundiſh pieces, the internal ſtreaks or lines whereof run tranſverſe, and *rhaponticum* in longiſh pieces, having it's ſtreaks running lengthwiſe—Beſides, that *rhaponticum* chewed in the mouth, leaves a viſcidity behind it, which rhubarb does not. See RHUBARB.

The ſcarcity of the *rhaponticum* of the Levant, occaſions the mountain *rhaponticum*, or monk's rhubarb, to be frequently ſubſtituted for it, which is a wild ſort of lapathum, by botaniſts called *alpinum*—They are diſtinguiſhed by this, that the former is yellow without, and reddiſh within ; but the latter blackiſh without and yellow within.

Dr. Quincy, however, confounds the two, when he ſays, the *rhaponticum* grows plentifully in England ; and that it is only uſed as an alterative, and does not come up to a cathartic.

It is certain, what now obtains in the ſhops, under the name of *rhaponticum*, is no other than the mountain *rhapontic*, or monk's rhubarb ; and is much inferior in virtue to the *rhaponticum verum*.

RHAPSODI, Ῥαψωδοι, RHAPSODISTS, in antiquity, perſons who made a buſineſs of ſinging pieces of Homer's poems.

Cuper informs us, that the *rhapſodi* were clothed in red when they ſung the Iliad ; and in blue when they ſung the Odyſſee.

They performed on the theatres ; and ſometimes for prizes, in conteſt of poetry, ſinging, *&c.*

After the two antagoniſts had finiſhed their parts, the two pieces, or papers they were wrote in, were joined together again : whence the name, *viz.* from ῥαπτω, *ſuo*, I join together ; and ωδη, ode, ſong.

But there muſt have been other *rhapſodi* of more antiquity than theſe ; people who compoſed heroic poems, or ſongs in praiſe of heroes and great men, and ſung their own compoſitions from town to town for a livelihood : of which profeſſion was Homer himſelf.

Hence, ſome critics inſtead of the former origin, fetch the word *rhapſodiſt* from ῥαϐδω αδειν, *to ſing with a lawrel rod in the hand*, which it ſeems was the badge of the primitive *rhapſodi*.

Philocorus, again, derives the word from ῥαπτειν τας ωδας, q. d. συντιθεναι, to compoſe ſongs or poems as if they were the authors of the poems they ſung. This opinion, to which Scaliger inclines, reduces theſe *rhapſodi* to the ſecond kind.

In effect, it is probable that they were all of the ſame claſs, whatever diſtinction ſome authors may imagine ; and that their buſineſs was to ſing or rehearſe poems, either of their own, or other people's compoſition, as might beſt ſerve their purpoſe, the getting of a penny—So that we do not apprehend it any injury to them, to ſet them on the foot of our ballad-ſingers ; many of whom, no doubt, pen their own ditties. After Homer's time, it is no wonder they confined themſelves altogether to his pieces, for which the people had the utmoſt veneration ; nor is it ſurpriſing they ſhould erect ſtages, *&c.* and diſpute the point of recitation in fairs and markets.

RHAPSODOMANCY, Ῥαψωδομαντεια, an antient kind of divination performed by pitching on a paſſage of a poet at hazard, and reckoning on it as a prediction of what was to come to paſs. See DIVINATION and CHANCE.

There were various methods of practiſing *rhapſodomancy* — Sometimes they wrote ſeveral verſes or ſentences of a poet, on ſo many pieces of wood, paper, or the like ; ſhook them together in an urn, and drew out one, which was accounted the lot.

Sometimes they caſt dice on a table, whereon verſes were wrote ; and that whereon the dye lodged, contained the prediction.

A third manner was by opening a book, and pitching on ſome verſe, at firſt ſight. This method they particularly called the *ſortes præneſtinæ* ; and, afterwards, according to the poet thus made uſe of *ſortes Homericæ*, *ſortes Virgilianæ*, &c. See SORTES.

RHAPSODY, Ῥαψωδια, in antiquity, a diſcourſe in verſe, ſung or rehearſed by a rhapſodiſt. See RHAPSODI.

Others will have *rhapſody* properly to ſignify a collection of verſes, eſpecially thoſe of Homer ; which having been a long time diſperſed in pieces and fragments, were at length by Piſiſtratus's order, digeſted into books, called *rhapſodies* : from the Greek ῥαπτω, *ſuo*, I ſew ; and ωδη, ſong.

Hence among the moderns, *rhapſody* is alſo uſed for an aſſemblage of paſſages, thoughts, and authorities, raked together from divers authors, to compoſe ſome new piece — Lipſius's politics makes ſuch a *rhapſody*, wherein there is nothing of the author's own, but conjunctions, and particles.

RHETORIANS, RHETORII, a ſect of heretics in Egypt, denominated from their leader Rhetorius.

The diſtinguiſhing doctrine of this hereſiarch, as repreſented by Philaſtrius, was, that he approved of all the hereſies before him ; and taught that they were all in the right — But what Philaſtrius mentions of him appears ſo abſurd and ridiculous that St Auguſtin, *Hæreſ.* 7. could not perſuade himſelf it was true.

RHETORIC *, RHETORICA, the art of ſpeaking copiouſly on any ſubject, with all the advantages of beauty and force. See SPEAKING.

* The word is Greek, formed from Ῥητορικη, of ῥεω, *dico*, I ſpeak ; whence ῥητορ, ſpeaker, orator, *&c.*

Lord Bacon defines *rhetoric*, very philoſophically, the art of applying and addreſſing the dictates of reaſon to the fancy, and of recommending them there, ſo as to effect the will and deſires — The end of *rhetoric*, the ſame author obſerves, is to fill the imagination with ideas and images, which may aſſiſt nature, without oppreſſing it. See IMAGE and IMAGINATION.

Voſſius defines *rhetoric* the faculty of diſcovering what every ſubject affords of uſe for perſuaſion—Hence, as every author muſt invent arguments to make his ſubject prevail ; diſpoſe thoſe arguments thus found out in their proper places : and give them the embelliſhments of language proper to the ſubject ; and, if this diſcourſe be to be delivered in public, utter them with that decency and force which may ſtrike the reader : *rhetoric* becomes divided into four parts, *invention*, *diſpoſition*, *elocution* and *pronunciation* ; each whereof ſee under it's proper head, INVENTION, DISPOSITION, ELOCUTION, and PRONUNCIATION.

Rhetoric and *oratory* differ from each other as the theory from the practice ; the *rhetorician* being he who preſcribes the rules of eloquence ; and the orator he who uſes them to advantage and ſpeaks elegantly, *&c.* —Ordinarily, however, the two are uſed indifferently for each other. See ORATORY.

Characters in RHETORIC. See the article CHARACTER.

RHETORICAL *Numbers*. See the article NUMBER.

RHEUM *, Rheuma, 'Ρευμα, a thin ſerous humour, occaſionally oozing out of the glands about the mouth and throat. See Humour.

* The word is formed from the Greek, ῥεω, *fluo*, I flow.

A fluxion of *rheum*, uſually happening after taking cold, occaſions excoriations and inflammations of the fauces, lungs, *&c.* See Fluxion and Defluxion.

Rheum is alſo uſed for a *catarrh*, or a defluxion of ſuch humours on the trachea, and the neighbouring parts; occaſioning a coughing, ſpitting, hoarſeneſs, running at the noſe, *&c.* See Catarrh, Cough, Hoarseness, *&c.*

The *rheum* is not cauſed by a pituita falling from the brain on theſe parts, as the antients imagined, there being no paſſage from the brain thither; but from a thin, ſharp, ſerous humour, oozing out of the extremities of the glands about the fauces and throat.

The moſt ordinary occaſion of *rheums*, is external cold; eſpecially the being expoſed to it when the body is much heated, —And hence the diſorder itſelf is popularly called a *cold*.

Rheums falling on the breaſt, lungs, *&c.* are dangerous; others, not very violent, ſerve to clear the head, *&c.* The uſual remedies are aſtringents, agglutinants and abſorbents. See Astringent, *&c.*

RHEUMATISM, 'Ρευματισμος, in medicine, a painful diſorder felt in various external parts of the body, accompanied with heavineſs, difficulty of motion, and frequently a wandering fever.

A *rheumatiſm* is a pain uſually wandering, but ſometimes fixed in the muſcular and membranous parts of the body; happening chiefly in autumn.

The proper ſeat of the *rheumatiſm* is ſuppoſed to be in the membrana communis of the muſcles; which it renders rigid and unfit for motion without great pain. See Membrane.

The *rheumatiſm* is either *univerſal* or *particular*.

Univerſal Rheumatism is that which attacks all the parts of the body, even the internal ones.

Particular Rheumatism is that which is confined to particular parts.

In which caſe the pains are uſually erratic, paſſing from one ſide to another; but ſometimes fixed. This is alſo called a *windy* or *ſcorbutic rheumatiſm*.

The *rheumatiſm* bears a great analogy to the gout; whence ſome call it the *univerſal gout*—The difference between them conſiſts chiefly in this, that the *rheumatiſm* attacks not only the joints, as the gout does, but alſo the muſcles and membranes between the joints. See Gout.

A fit of the *rheumatiſm* is frequently preceded by a fever of two or three days; and ſometimes by a ſhivering.—The attack happens in various parts of the body, as the hands, arms, thighs, legs, feet, *&c.* a redneſs, ſwelling, and lameneſs often ſucceeding.

The pain ſometimes fixing on the loins, and reaching as far as the os ſacrum; this diſorder is called *lumbago*; and bears a near reſemblance to the nephritis; being only diſtinguiſhable therefrom by this, that the latter is attended with a vomiting, which the former is not.

The *rheumatiſm* is ſuppoſed to ariſe from a ſharp ſerous humour thrown on the ſenſible parts, and occaſioning a pain by it's vellication—Dr Quincy ſays, it proceeds from the ſame cauſe, as that whereby the mucilaginous glands become ſtiff and gritty in the gout. See Gout.

Dr Muſgrave takes it to be occaſioned by a ſharp alcaline ſalt, rather than an acid one; from this conſideration, that the urine of *rheumatic* people does not afford above a thirtieth part of the alcaline ſalt found in that of healthful people.

Hence, he conjectures, that the ſalt is retained in the blood, implicated and embaraſſed in the pituita; by which means it forms a viſcidity which occaſions all the pains and tumours of the *rheumatiſm*.

The expoſing of the body too ſuddenly to the cold air, after having heated it to a great degree, is the moſt uſual remote cauſe.—The cure is by evacuation; chiefly, according to Sydenham, by repeated phlebotomy, with a plentiful uſe of volatiles and diluters—Schmitzius recommends ſudorifics; and Muſgrave, cathartics, and emetics.

The *rheumatiſm* uſually proves a tedious, laſting diſeaſe; holding for ſeveral months, ſometimes years; not continually, but by paroxyſms. In aged perſons, and thoſe of weak conſtitutions, and decayed viſcera, it ſometimes ſeizes the head.

RHEXIS *, or Rhegma, among occuliſts, denotes a rupture of the cornea of the eye. See Cornea.

* The word is formed from the Greek, ῥηξις, rupture, of ῥηγνυμαι, *frango*, I break.

RHIME, or Rime, in poetry. See Rhyme.

RHINE-Grave, in Germany, a count-palatine of Rhine. See Grave and Palatine.

RHINE-Land-*Rod*, in fortification, *&c.* a meaſure of two fathom, or 12 foot, uſed by the Dutch and German engineers, *&c.* See Measure, Foot, and Decempeda.

RHODIUM *lignum*, rhodian-wood. See Aspalath.

RHODON, in pharmacy, from ῥοδον, *roſa*; a name given to ſome compoſitions wherein roſes are the chief ingredient; as *diarrhodon*, &c. See Diarrhodon, *&c.*—Hence alſo, Rhodosaccharum, *i. e. ſugar of roſes*, &c. See Rose.

RHOMBOIDES, in geometry, a quadrilateral figure, whoſe ſides and angles are unequal; but the oppoſite ones equal. See Figure.

Or, *rhomboides* is a quadrilateral figure, whoſe oppoſite ſides and angles are equal; but is neither equilateral nor equiangular.

Such is the figure NOPQ. *Tab. Geometry*, *fig.* 24.

For the method of finding the area of a *rhomboides*, ſee Rhombus.

Rhomboides, in anatomy, a muſcle thus called from it's figure—See *Tab. Anat.* (Myol.) *fig.* 6. n. 29. See alſo Muscle.

It lies under the cucullaris, and ariſes from the two inferior ſpines of the neck, and four ſuperior of the back; and is inſerted fleſhy into the whole baſis of the ſcapula, which it draws backwards, and a little upwards.

RHOMBUS *, 'Ρομβος, in geometry, an obliqueangular parallelogram; or a quadrilateral figure, whoſe ſides are equal and parallel, but the angles unequal: two of the oppoſite ones being obtuſe, and the other two acute—Such is the figure ABCD. *Tab. Geometry*, *fig.* 83. See Figure.

* The word is formed of the Greek ῥομβος, of ῥεμβειν, to incompaſs, turn round.

To find the area of a rhombus, *or* rhomboides—Upon CD, which is here aſſumed as a baſe, let fall a perpendicular A e; which will be the altitude of the parallelogram: multiply the baſe by the altitude, the product is the area—Thus, if CD be = 456, and A e = 234; the area will be found 102704.

For it is demonſtrated that an obliqueangular parallelogram is equal to a rectangle upon the ſame baſe CD, *fig.* 25. and of the ſame altitude AE. (See Parallelogram.) But the area of a rectangle is equal to the factum of the baſe into the altitude. Therefore the area of an obliqueangular triangle is equal to the ſame. See Rectangle.

Rhombus, among ſurgeons, denotes a ſort of bandage of a *rhomboidal* figure. See Bandage.

RHOPALIC *verſes*, among the antients, a kind of verſes which began with monoſyllables, and were continued in words growing gradually longer and longer to the laſt, which was the longeſt of all. See Verse.

They had their name from the Greek ῥοπαλον, a club, which, like them begins with a ſlender tip, and grows bigger and bigger to the head—Such is that verſe of Homer,

Ω μακαρ Ατρειδη μοιρηγενες, ολβιοδαιμων.

And this Latin one of Auſonius:

Spes deus æternæ ſtationis conciliator.

RHOPOGRAPHI *, 'Ροπωγραφοι, in antiquity, an appellation given to certain painters, who confined themſelves to low ſubjects; ſuch as animals, plants, landſcapes, *&c.*

* The word is formed from the Greek ῥοπος, toys or odd ware, and γραφω, I write, I paint.

The ſame appellation was alſo given to ſuch as cut figures of men, *&c.* in box, phileria, yew, *&c.* in gardens.

RHUBARB, Rhabarbarum, a medicinal root, large, compact and heavy; yellow without, of a nutmeg colour within; an aſtringent, bitteriſh taſte; and an agreeable, aromatic ſmell: of great uſe in medicine, as a purgative. See Root and Purgative.

Conſidering the mighty uſe of this drug, it is ſurpriſing we ſhould know ſo little of the place where the plant grows that produces it—Some ſay it comes from the kingdom of Boutan, in the extremities of India; others, that it is found in the provinces of Xenſi and Suchen in China. Others will have it only grow in Perſia; and others on the confines of Muſcovy; deriving it's name from *rha*, the river among us called *Wolga*, and *barbarum*, q. d. root found by the barbarians on the river *rha*.

Rhubarb, in Latin, *rhabarbarum officinarum*, was not known to the antients; and their *rhaponticum*, which indeed reſembles it, is not the real *rhubarb*. See Rhaponticum.

Good *rhubarb* ſteeped in water gives it a ſaffron colour; and when broke, looks bright, with ſomewhat of a vermillion caſt.—Some druggiſts have the art of renewing their old roots, by dying them of a yellow hue; but the cheat is eaſily known by handling them; the powder wherewith they colour them ſticking to the fingers.

Rhubarb is eſteemed an excellent cathartic; proper in diarrhæas, to fortify the ſtomach, and to create an appetite.

M. Boulduc informs us, in the memoirs of the royal academy, that he drew extracts from *rhubarb* both with water and ſpirit of wine; but the purgative virtue, he ſays, was much more viſible in the former than the latter; which ſhews that it conſiſts more in a ſalt than an oil.—He obſerves, however, that *rhubarb* taken in ſubſtance, has a ſtill better effect; and adds, that of all the operations he performed on it, none gave any credit to the common opinion, which aſcribes an aſtringent quality to *rhubarb*.

Monks RHUBARB. See the article RHAPONTICUM.

White RHUBARB. See the article MECHOACAN.

RHUMB, RUMB, or RUM, in navigation, a verticle circle, of any given place; or the interſection of a part of ſuch a circle with the horizon. See VERTICAL.

Rhumbs therefore coincide with *points* of the world, or of the horizon. See POINT and HORIZON.

And hence the mariners diſtinguiſh the *rhumbs* by the ſame names as the points, and winds. See WIND.

They uſually reckon 32 *rhumbs*; which are repreſented by the 32 lines in the roſe, or card of the compaſs. See COMPASS.

Aubin defines a *rhumb*, a line on the terreſtrial globe, ſea-compaſs, or ſea-chart, repreſenting one of the 32 winds which ſerve to conduct a veſſel—So that the *rhumb* a veſſel purſues is conceived as it's rout, or courſe. See COURSE.

Rhumbs are divided, and ſubdivided like points—Thus, the whole *rhumb* anſwers to the cardinal point—The half *rhumb*, to a collateral point, or makes an angle of 45 degrees with the former — The quarter *rhumb* makes an angle of 22° 30′ therewith — And the half-quarter *rhumb* makes an angle of 11° 15′. See CARDINAL, COLLATERAL, QUARTER, &c.

A table of the *rhumbs*, or points, and their diſtances from the meridian. See under the article WIND.

RHUMB-LINE, *loxodromia*, in navigation, is the line which a ſhip keeping in the ſame collateral point or *rhumb*, deſcribes, throughout it's whole courſe. See LOXODROMY.

The great property of the *rhumb-line*, or loxodromia, and that from which ſome authors define it, is, that it cuts all the meridians under the ſame angle. See MERIDIAN.

This angle is called the *angle of the rhumb*, or the *loxodromic* angle. See ANGLE.

The angle which the *rhumb-line* makes with any parallel to the equator is called the *complement of the rhumb*. See COMPLEMENT.

An idea of the origin and properties of the *rhumb-line*, the great foundation of navigation, may be conceived thus — A veſſel beginning it's courſe, the wind wherewith it is driven makes a certain angle with the meridian of the place; and as it is ſuppoſed the veſſel runs exactly in the direction of the wind, it makes the ſame angle with the meridian which the wind makes.

Suppoſing, then, the wind to continue the ſame; as each point or inſtant of the progreſs may be eſteemed the beginning, the veſſel always makes the ſame angle with the meridian of the place where it is each moment, or in each point of it's courſe, which the wind makes.

Now, a wind, *e. gr.* that is north-eaſt, and which of conſequence makes an angle of 45°, with the meridian, is equally north-eaſt wherever it blows; and makes the ſame angle of 45°, with all the meridians it meets — A veſſel therefore driven by the ſame wind, always makes the ſame angle with all the meridians it meets withal on the ſurface of the earth.

If the veſſel ſail north and ſouth, it makes an angle infinitely acute with the meridian, *i. e.* it is parallel to it, or rather ſails in it—If it run eaſt and weſt, it cuts all the meridians at right angles.

In the firſt caſe it deſcribes a great circle; in the ſecond, either a great circle, *viz.* the equator, or a parallel to it. —If it's courſe be between the two, it does not then deſcribe a circle; ſince a circle drawn in ſuch a manner would cut all the meridians at unequal angles, which the veſſel cannot do.

It deſcribes, therefore, another curve, the eſſential property whereof is, that it cuts all the meridians under the ſame angle — This curve is what we call the *loxodromic curve*, *rhumb-line*, or *loxodromy*. See CURVE.

It is a kind of ſpiral, which, like the logarithmic ſpiral, makes an infinity of circumvolutions without ever arriving at a certain point to which it ſtill tends, and towards which it approaches every ſtep. See SPIRAL.

This aſympotic point of the *rhumb-line* is the pole; to which were it poſſible for it to arrive, it would find all the meridians conjoined, and be loſt in them. See POLE.

The courſe of a veſſel, then, except in the two firſt caſes is always a *rhumb-line*; which line is the hypothenuſe of a rectangle-triangle, whoſe two other ſides are the ſhips way or diſtance run in longitude, and latitude. Now the latitude is uſually had by obſervation (ſee LATITUDE) and the angle of the *rhumb*, with one or other of the two ſides, by the compaſs. See COMPASS.

All therefore that is required by calculation in ſailing, is the value of the length of the *rhumb-line*, or the diſtance run. See COURSE.

But as ſuch curve line would prove very perplexing in the calculation; it was neceſſary to have the ſhip's way in a right line; which right line however muſt have the eſſential property of the curve line, *viz.* to cut all the meridians at right angles — *The method of effecting which ſee under the article* CHART.

If PA, PF, PG, &c. (*Tab. Navigation, fig.* 19.) be ſuppoſed meridians, AI the equator, and AE another great circle of the ſphere: AO will repreſent a *rhumb-line*, the angles whereof with the ſeveral meridians, being leſs than thoſe of the great circle; it follows, that the *rhumb* is not a great circle of the ſphere—If a ſhip therefore be at firſt directed towards E, and conſtantly perſiſt in the ſame *rhumb*, it will never arrive at the place E, but at the place O, which is further from the equator AI.

Hence, as on the ſurface of a ſphere, the ſhorteſt way between A and O is an arch of a great circle between A and O; the *rhumb-line* is not the ſhorteſt way, or leaſt diſtance from one place to another. See CIRCLE, SPHERE, DISTANCE, &c.

Uſe of the RHUMB-LINES *in navigation.* 1°. If the meridians PA, PC, PD, &c. (*fig.* 20.) be not very far apart, the *rhumb-line* AIHG is divided by the equidiſtant parallels BI, KH, FG, &c. into equal parts.

Hence, 1°. the parts of the *rhumb* AI, and AG, are as the latitudes AL and AN of the places I and G—2°. Since the arches AB, IK, HF, are equal in magnitude, and therefore unequal in number of degrees; the ſum of the arches, called the *latus mecodynamicum*, or *miles of longitude*, is not equal to the difference of longitude AB of the places A and G. See MECODYNAMICUM.

2°. The length of the *rhumb-line* AG is to the change or difference of latitude GD, in the ſame ratio, as the whole ſine to the co-ſine of the angle of the *rhumb*.

Hence, 1°. the *rhumb* ſailed on being given, together with the difference or change of latitude, turned into miles; the length of the *rhumb-line*, or the diſtance from the place A to the place G upon the ſame *rhumb*, is had by the rule of three—2°. The *rhumb* being given, together with the quantity of the ſhip's way on the ſame *rhumb*, *i. e.* the length of the *rhumb* AG; the difference of latitude DG, is had by the rule of three, in miles to be converted into degrees of a great circle—3°. The difference of latitude DG being given in miles; as alſo the length of the *rhumb-line* AG: the angle of the *rhumb*, and conſequently the *rhumb* ſailed on is had by the rule of three — 4°. Since the co-ſine is to the whole ſine as the whole ſine to the ſecant; the difference of latitude GD, is to the length of the *rhumb-line* AG, as the whole ſine to the ſecant of the angle of the *rhumb*.

3°. The length of the *rhumb-line*, or of the ſhip's way in the ſame *rhumb* AG, is to the *latus mecodynamicum*, or *mecodynamic* ſide AB+IK+HF, as the whole ſine to the ſine of the *loxodromic* angle GAP.

Hence, 1°. the *rhumb*, or angle of the *rhumb*, being given, as alſo the ſhip's way in the ſame *rhumb-line* AG; the *mecodynamic* ſide is had by the rule of three, in miles; *i. e.* in the ſame meaſure wherein the length of the *rhumb* is given—2°. In like manner the *mecodynamic* ſide AB+IK+HF being given, as alſo the *rhumb-line* or ſhip's way AG; the *rhumb* ſailed in is found by the rule of three.

4°. The change of latitude GD, is to the *mecodynamic* ſide AB+IK+HF; as the whole ſine, to the tangent of the *loxodromic* angle PAG or AIB.

Hence, the *rhumb*, or *loxodromic* angle PAG, and the change of latitude GD, being given; the *mecodynamic* ſide is found by the rule of three.

5°. The *mecodynamic* ſide AB+IK+HF is a mean proportional between the aggregate of the *rhumb* AG, and the change of latitude GD and their difference.

Hence, the change of latitude GD, and the *rhumb-line* AG, being given in miles; the *mecodynamic* ſide is found in the ſame meaſure.

6°. The *mecodynamic* ſide AB+IK+HF being given; to find the longitude AD.

Multiply the change or difference of latitude GD by ſix, which reduces it into parts, of ten minutes each; divide by the product the *mecodynamic* ſide; the quotient gives the miles of longitude anſwering to the difference of latitude in ten minutes. Reduce theſe miles of longitude in each parallel into differences of longitude, from a *loxodromic* table. The ſum of theſe is the longitude required. See LONGITUDE.

7°. If a ſhip ſail on a north or ſouth *rhumb*, it deſcribes a meridian; if on an eaſt or weſt *rhumb*, it deſcribes either the equinoctial, or a parallel thereto. See SAILING.

8°. *To find the rhumb between two places, by calculation, or geometrically.* We have two canons, or proportions: the firſt—As the radius, is to the co-ſine of the middle latitude; ſo is the difference of longitude to the whole departure from the meridian, in the courſe between the two places propoſed. The ſecond—As the radius is to the half ſum of the co-ſines of both latitudes; or (rather for geometrical ſchemes) as the diameter, is to the ſum of the co-ſines of both latitudes; ſo is the difference of longitude, to the departure from the meridian.

For an example of the former proportion — Let the *rhumb* be required between Cape Finiſterre, latitude 43°, longitude 7° 20′, 20′, and St Nicholas Iſle, latitude 38°, longitude 352°. The middle latitude is 40° 30′, the complement 49° 30′; and the difference of longitude 15° 20′. Out of theſe leſſer equal parts, prick down 15° from C to L, (*fig.* 21) and deſcribe the arch B D with 60° of the chords, and make it equal to 49° 30′, and draw C D continued farther to A — From L take the neareſt diſtance to A C which is equal to L M, and make it one leg of a right angled triangle; make the other leg the difference of latitude 5°, which prick from the equal parts from L to B — Then, the extent M B meaſured on the ſame parts, ſhews the diſtance to be 13° 24′; which allowing 20 leagues to a degree, is almoſt 268 leagues—Then, with the radius C B ſetting one foot at M, croſs the *rhumb* triangle at G H; which extent meaſured on the greater chord is almoſt 22°, the complement whereof is 68°; and ſo much is the *rhumb* from the meridian between the two places, amounting to 6 points, and upwards of 80 minutes.

For an inſtance of the latter proportion — Let it be required to find the *rhumb* and diſtance between the Lizard and Bermudas. The latitude of the Lizard being 56°, and that of Bermudas 32°, 20′, or 32°, 41 centeſms, and their difference of longitude, 55 degrees; draw the lines A C and C D (*fig.* 21. N°. 2.) at right angles, and with 60° of the leſſer chords deſcribe the quadrant H I, and prick the radius from I to D; ſo is C D the diameter; then count both latitudes from H to F and G, the neareſt diſtance from F to C I, is the co-ſine of Bermudas latitude, which prick from C to E: Again, the neareſt diſtance from G to C I, is the co-ſine of the Lizard's latitude, which place from C to S, ſo is C S the ſum of both co-ſines; draw D S, and prick down 55 degrees, the difference of longitude from C to V, out of the greateſt equal parts, and draw V B parallel to D S, ſo is C B the departure from the meridian in the courſe between both places—Making that therefore, one leg of a right-angled triangle, prick down 17°, 59 centeſms, the difference of latitude between thoſe places, out of the ſame equal parts from C to L, and draw B L — This repreſents the courſe and diſtance between the Lizard and Bermudas; and the extent L B meaſured on the ſame equal parts, ſhews the diſtance to be 44°, 31 centeſms, which allowing 20 leagues to a degree, is 886 leagues.

Then, to find the courſe —With 60° of the chords, ſetting one foot in L, with the other make marks at Y and Z; then the extent Z Y, meaſured on the chord, ſhews the *rhumb* to be 66°, 37′ from the meridian. This proportion in the preſent example, holds very juſt, according to Mercator's chart; whereas the former proportion, by the middle latitude, would have given the *rhumb* 67°, 2′, from the meridian, and the diſtance 902 leagues.

Again, making C A equal to C V, a line joining L A would be the courſe and diſtance according to the ſame longitudes and latitudes laid down on the plain chart; whereby the courſe ſhould be 72°, 17′ from the meridian, and the diſtance 1155 leagues. See Sailing, Chart, *&c.*

RHYAS*, Ῥυας, in medicine, a diminution or conſumption of the caruncula lachrymalis ſituate in the great canthus or angle of the eye. See Caruncula.

* The word is formed from the Greek, ῥεῖν, to flow.

The *rhyas* is uſed in oppoſition to the *encanthis*, which is an exceſſive augmentation of the ſame caruncle. See Encanthis.

The cauſe of the *rhyas* is a ſharp humour falling on this part; and gnawing and conſuming it by degrees; though it is ſometimes alſo produced by the too great uſe of catheretics in the fiſtula lachrymalis—It is cured by incarnatives.

RHYME, Rhime, Ryme, or Rime, in poetry, the ſimilar ſound, or cadence and termination of two words which end two verſes, *&c.* See Verse.

Or, *rhyme* is a ſimilitude of ſound between the laſt ſyllable or ſyllables of one verſe, and the laſt ſyllable or ſyllables of a verſe ſucceeding either immediately or at a diſtance of two or three lines.

Rhyme is a modern invention, the product of a Gothic age: Milton calls it the *modern bondage*. Yet ſome authors will have it, that the Engliſh, French, *&c.* borrow their *rhyme* from the Greeks and Latins—The Greek orators, ſay they, who endeavoured to tickle the ears of the people, affected a certain cadence of periods, which ended alike, and called them ὁμοιοτελευτα. The Latins, who imitated them, called theſe chiming terminations, *ſimiliter deſinentia.*

This affectation increaſed as the Latin tongue declined; ſo that in the later Latin writers, ſcarce any thing is more common than *rhyming* periods.

The French, and from them the Engliſh, *&c.* adopted this cadence of *rhyme*, which ſeemed to them more pretty, and agreeable than the metrical verſes of the Greek and Roman poets. See Measure, Quantity, Versification, *&c.*

This kind of Latin poetry in *rhyme* was much in vogue in the XIIth century; and the verſes thus running were called *leonine verſes*; for what reaſon Camden owns he does not know; (for a lion's tail, ſays he, does not anſwer to the middle parts as theſe verſes do) but doubtleſs they had their name from a canon called *Leoninus*, who firſt compoſed them with ſucceſs, and of whom we have ſeveral pieces remaining, addreſſed to pope Adrian IV. and Alexander III. See Leonine *verſes.*

Camden has given us a collection of Latin *rhymes* of our antient Engliſh writers; among whom Walter de Mapes, archdeacon of Oxford, in the time of king Henry II. makes a principal figure: eſpecially for two pieces, the one in praiſe of wine, beginning,

Mihi eſt propoſitum in taberna mori,
Vinum ſit oppoſitum morientis ori;
Ut dicant, cum venerint, angelorum chori,
Deus ſit propitius huic potatori.

The other againſt the pope, for forbidding the clergy to have wives; beginning,

Priſciani regula penitus caſſatur,
Sacerdos per hic *&* hæc *olim declinatur;*
Sed per hic *ſolummodo, nunc articulatur,*
Cum per noſtrum præſulem hæc *amoveatur.*

Since the reſtoration of learning in the 16th century, attempts have been made to baniſh *rhyme* out of the modern poetry, and to ſettle the Engliſh and French verſes on the footing of the antient Greek and Latin ones; by fixing the quantities of the ſyllables, and truſting wholly to thoſe, and the numbers or meaſure. See Quantity, Numbers, *&c.*

This, Milton has done with great ſucceſs, in his *Paradiſe Loſt*, and other pieces; and after him Philips, Addiſon, and ſome others—Verſes of this kind we call *blank verſes.*

The French have attempted the ſame, but not with the ſame ſucceſs—Jodelet made the firſt eſſay; and after him Paſquier; but they failed. Paerſſat and Rapin followed them, and failed like them. Their hexameter and ſapphic verſes were neither imitated nor approved; and the cadence of *rhyme* was preferred to quantity, or the uſe of long and ſhort ſyllables. Des Portes likewiſe made ſome eſſays of verſes conſtructed of long and ſhort verſes without *rhyme*, but the attempt only ſerved to convince the world that this kind of meaſure is inconſiſtent with the genius of the French tongue.

To ſucceed in ſuch kind of verſes there muſt be a liberty of varying the order of the words, or of changing their ſituation as may beſt ſuit the occaſions of the poet; of making the ſubſtantive either go before, or follow after the verb, as the verſe requires, *&c.* Now none of the modern tongues admit of ſuch an arbitrary ſituation of the words equally with the antient; yet none more than the Engliſh, nor leſs than the French. See Construction.

Rhymes are either *ſingle*, or *double*, or *treble*; though the two laſt are now diſuſed.

Single Rhymes are divided into perfect or whole *rhymes*, and imperfect or half *rhymes.*

A *whole* or *perfect* Rhyme is where there is a ſimilitude of ſound, without any difference; or where a thorough identity of ſound appears in the pronunciation of the two ſyllables, notwithſtanding that there may by ſome difference in the orthography.

An *imperfect* or *half* Rhyme is where there is a ſimilitude with a difference, either in reſpect of the pronunciation or the orthography; but chiefly the former.

In the time of S. Louis, the French began to be more exact in their verſification; and to diſtinguiſh their *rhymes* into *maſculine* and *feminine*; and to obſerve a regular mixture of the two, in their verſes — The invention of this mixture is uſually attributed to Marot; however it was Ronſard who firſt practiſed it with ſucceſs. See Masculine.

The feminine Rhyme is that where the laſt ſyllable of the *rhyme* ends with an *e* mute or quieſcent: as in *dove*, *belle*, &c.

Maſculine Rhymes are thoſe of all other words.

Menage obſerves that maſculine *rhymes* cloſe the periods better: but that feminines, being the ſofter and more languiſhing, end more agreeably, eſpecially in mournful ſubjects.

Double Rhymes by the French called *rich rhymes*, are thoſe where the two words terminate alike through the whole two laſt ſyllables, as *ſquabble* and *rabble*, &c.

Plain Rhymes are thoſe where the two *rhyming* verſes ſucceed immediately to each other.

Croſs Rhymes, thoſe where the verſes are ſo diſpoſed as that the firſt *rhymes* with the third, and the ſecond with the fourth, *&c.*

Aſſonant Rhymes. See the article Assonant.

RHYPTICS, Rhyptica, Ῥυπτικα, in medicine, detergent remedies, or cleanſers. See Detergent.

RHYTHM, Rhythmus, Ῥυθμος, in muſic, the variety in the movement as to the quickneſs or ſlowneſs, length and ſhortneſs of the notes. See Note and Heterorhythmus.

Or, the *rhythmus* may be defined more generally, the proportion which the parts of a motion bear to each other. See Rhythmica.

Ariſtides among the antient muſicians, applies the word *rythmus*

mus three ways: *viz.* either to immoveable bodies, when their parts are rightly proportioned to each other; as a well-made ſtatue, *&c.* or to things that move regularly, as in handſome walking, in dancing, in the dumb ſhews of the pantomimes, *&c.* or thirdly, to the motion of ſound, or the voice; in which, the *rythmus* conſiſts of long and ſhort ſyllables or notes joined together in ſucceſſion in ſome kind of order, ſo as their cadence on the ear may be agreeable.

This, in oratory conſtitutes what we call *a numerous ſtile*, and when the tones of the voice are well choſon, an *harmonious ſtyle*. See STYLE and NUMBERS.

In effect, *rythmus* in the general is perceived either by the eye or ear; and may either be with or without metre: but the ſtrict muſical *rhythm* is only perceived by the ear, and cannot exiſt without it—The firſt either exiſts without ſound, as in dancing; or with ſound; it may be either without any difference of acute and grave, as in a drum, or with a variety of theſe as in a ſong.

The *rhythmus* of the antients Mr Malcom obſerves, was very different from that of the moderns—The former was only that of the long and ſhort ſyllables of the words and verſes: it depended altogether on the poetry, and had no other forms or varieties than what the metrical art afforded. The changes therein are none but thoſe made from one kind of metre to another, as from Iambic to Choraic, *&c.*

In the modern muſic, the conſtitution of the *rhythmus* differs from that of the verſe, ſo far, that in ſetting muſic to words, the thing chiefly regarded is to accommodate the long and ſhort notes to the ſyllables in ſuch manner, as that the words be well ſeparated, and the accented ſyllable of each word ſo conſpicuous, that what is ſung may be diſtinctly underſtood. See MELODY.

Voſſius in his book *de poematum cantu & viribus rhythmi*, extols the antient *rhythmus*—Though he owns it was confined to the metrical feet; yet ſo well did they cultivate their language, eſpecially in what relates to the *rhythmus*; that the whole effect of the muſic was aſcribed to it, as appears by that ſaying of theirs, το παν παρα μυσικοις ὁ ῥυθμος. See MUSIC, PANTOMIME, *&c.* See alſo ODE, *&c.*

RHYTHM, RHYTHMUS, in the antient poetry, denotes the meaſure of the feet, or the number and combination of long and ſhort ſyllables; called alſo *metre* and *quantity*. See MEASURE, QUANTITY, *&c.*

Voſſius attributes the whole force of the antient muſic to their happy *rhythmus*: but this is ſomewhat inconceivable. Mr Malcolm rather takes it, that the words and ſenſe of what was ſung had the chief effect: hence it was that in all the antient muſic the greateſt care was taken, that not a ſyllable of the words ſhould be loſt, leſt the muſic ſhould be ſpoiled.

Pancirollus ſeems of this opinion; and the reaſon he gives why the modern muſic is leſs perfect than the antient, is, that we hear ſounds without words. See MUSIC.

Voſſius ſays, the *rhythm* which does not expreſs the very forms and figures of things, can have no effect; and that the antient poetical numbers alone are juſtly contrived for this end—He adds, that the modern languages and verſe is altogether unfit for muſic; and that we ſhall never have any right vocal muſic till our poets learn to make verſes capable of being ſung, *i. e.* till we new model our languages, reſtore the antient quantities and metrical feet, and baniſh our barbarous rhymes.

Our verſes, ſays he, run all as it were on one foot; ſo that we have not any real *rhythmus* at all in our poetry: he adds, that we mind nothing farther than to have ſuch a number of ſyllables in a verſe, of whatever nature, and in whatever order. But this is an unjuſt exaggeration. See VERSE.

RHYTHMICA, RHYTHMICE, Ῥυθμικη, in the antient muſic, that branch of muſic which regulated the *rhythmus*. See RHYTHMUS.

The *rhythmica* conſidered the motions; regulated their meaſure, order, mixture, *&c.* ſo as to excite the paſſions, keep them up, augment, diminiſh, or allay them.

Ariſtides and other antient muſical writers, divided artificial muſic into *harmonica*, *rhythmica*, and *metrica*. See Muſic.

But the *rhythmica* with them likewiſe comprehended dumb motions, and in effect, all *rhythmical*, *i. e.* regular motion. Porphyry divides muſic into *harmonica*, *rhythmica*, *metrica*, *organica*, *poetica*, and *hypocritica*. See HARMONICA, *&c.*

The antients ſeem to have had no rhythm in their muſic beſide the long and ſhort ſyllables of their words and verſes, which were ſung, and always made a part of their muſic; ſo that the *rhythmica* with them was only the application of the metrical feet, and the various kinds of verſes uſed by them—The modern goes much farther. See RHYTHM.

RHYTHMOPOEIA, one of the muſical faculties, as they are called, which preſcribes rules for the motions, or *rhythm*. See RHYTHM.

The antient *rhythmopœia* is very defective—We find nothing of it in the books of the antients but ſome general hints; which can ſcarce be called rules. In their explications there appears nothing but what belongs to the words and verſes of their ſongs, which is a ſtrong preſumption they had no other. See RHYTHMICA.

RIAL*, or **RYAL**, a ſpaniſh ſilver coin; being the eighth part of the piaſter or pieces of eight. See PIECE *of eight.*

* The word in the original Spaniſh, *real*, ſignifies *royal.*

The *rial* is equal to about ſix pence ¾ ſterling. See COIN.

The ſilver *rial* is equal to 34 ſilver maravedis; the copper *rial* to 44 copper maravedis, which only amounts to 18 ſilver maravedis. See MARAVEDI.

There are alſo *rials* of eight, *rials* of four, *rials* of two, and half *rials*—The *rials* of eight are the piaſters; thoſe of four, half piaſters, *&c.*

Great quantities of *rials*, or *rials* of eight, are carried into the Eaſt-Indies, where they are divided into three claſſes, and received on different footings, *viz.* the *old rial*, known by the chaplet around, whereof 100 are current for 215 rupees: the *ſecond*, known by the largeneſs of it's bead, current at 212¼ rupees for 100; and the *new* at 208¼ rupees for 100 *rials*. See RUPEE.

RIAL or ROYAL is alſo the name of a piece of gold, antiently current among us for ten ſhillings. See COIN.

In 1 Henry VI. by indenture of the mint, a pound weight of gold of the old ſtandard was coined into 45 *rials*, going for ten ſhillings a-piece, or a proportional number of *half rials*, going at five ſhillings a-piece: or *rial farthings*, which went at 2 *s.* and 2 *d.*

In 1 Henry VIII. the gold *rial* was ordered to go at 11 *s.* 3 *d.*—In 2 Elizabeth gold *rials* were coined at 15 *s.* a-piece, when a pound weight of old ſtandard gold was to be coined into 48 *rials.*—In 3 James I. *roſe rials* of gold were coined at 30 *s.* a-piece, and *ſpur-rials* at 15 *s.* See MONEY.

RIBBAND, or **RIBBOND**, a narrow ſort of ſilk, chiefly uſed for head ornaments, badges of chivalry, *&c.* See SILK.

The knights of the garter wear a blue *ribbond*, thoſe of the thiſtle, a green *ribbond*, &c. ſcarfwiſe. See COLLAR, GARTER, *&c.*

RIBBAND, or **RIBBON**, in heraldry, is the eighth part of a bend. See *Tab. Herald. fig.* 82. See alſo the article BEND. It is borne a little cut off from the out-lines of the eſcutcheon; thus; he beareth or, a *ribband* gules.

RIBBING *nails*. See the article NAIL.

RIBS, *coſtæ*, in anatomy, long, arched bones; ſerving to form or ſuſtain the inner ſides of the thorax, or breaſt—See *Tab. Anat. (Oſteol) fig.* 7. *lit. p. p. p.* &c. ſee alſo BONE and THORAX.

The *ribs* are in number 24; twelve on each ſide—Their figure is an imperfect ſegment of a circle, harder, rounder, and more incurvated towards their articulation with the vertebræ, than at the other extremity towards the ſternum, which is thinner, broader, and more ſpungy.

The *ribs* are divided into *true* or genuine, and *ſpurious*.

The *true* **RIBS** are the ſeven upper pair, which are thus diſtinguiſhed, as forming the moſt perfect arches, and as having a ſtrong articulation with the ſternum—See *Tab. Anat. (Oſteol) fig.* 3. *lit. a. a.* &c. ſee alſo STERNUM.

The five lower are called *nothæ*, or *ſpurious* **RIBS**, as being ſmaller, ſhorter, and more cartilaginous than the reſt, and not reaching ſo far as the ſternum, which makes their articulation very lax; in regard they terminate in long, ſoft cartilages, which bending upwards are joined to the upper ribs. —See *Tab. Anat. (Oſteol) fig.* 3. *lit. c. c.* &c.

On the inſide of the true *ribs*, except the loweſt, and ſometimes the next to it, runs a pretty deep ſinus, reaching from the end next the ſpine, almoſt to it's juncture with the cartilage.

All the *ribs*, together with the ſternum, are raiſed by the reſpiratory muſcles, in the action of inſpiration; by which means, and the deſcent of the diaphragm in that action, the cavity of the thorax is enlarged for the more commodious expanſion of the lungs. See RESPIRATION.

RIBS *of a ſhip*, are the timbers of the futtocks, when the planks are off; ſo called becauſe they are bent like the *ribs* of a carcaſe or ſkeleton.

RICE, *oriza*, a grain or a ſeed of a leguminous plant of the ſame name; frequent in the Eaſt-Indies, in Greece, and Italy. See LEGUMINOUS.

The grains of *rice* which grow in cluſters each terminated with a ſpica or beard, are incloſed ſeverally in yellow rough capſulæ, or caſes. When ſtript of their ſkin they appear almoſt oval; of a ſhining white colour, and as it were tranſparent. *Rice* grows in moiſt marſhy places.

Throughout the Eaſt, and a great part of the Levant, *rice* is the principal food, and ſerves for bread—In the Indies the women thraſh and dreſs all the *rice*, which is a very painful office, that the men leave to them either out of idleneſs, or diſreſpect.

Rice is a great food in the Roman Catholic countries in time of Lent—The ordinary preparation is by firſt ſteeping it in water, then boiling it in milk—Some make it into a ſort of farina, or flower, by pounding it in a mortar, after having firſt put it hot water, and again waſhed it out in cold.

Rice is of ſome uſe in medicine, being eſteemed proper to ſoften and thicken ſharp humours, to moderate fluxes of the belly, *&c.* —The northern nations eat their fowls and other meats with *rice* and ſaffron —The Chineſe make a wine of *rice*, which is of an amber colour, taſtes like Spaniſh wine, and ſerves them for their common drink—In ſome parts of Europe they alſo draw a very ſtrong brandy or ſpirit from *rice*. See Brandy and Spirit.

RICKETS, Rhachitis, in medicine, a diſorder affecting the bones of children, and cauſing a conſiderable protuberance, incurvation, or diſtortion thereof. See Children, Bone, *&c.*

It ſometimes ariſes from a fault in ſwathing the child; rolling him too tight in ſome places, and too looſe in others; placing him in an inconvenient, or too often in the ſame poſture, or ſuffering him to be long wet—It is likewiſe attributed to the want of proper motion, and the uſing of the child to be borne in one arm only; whence the legs and knees remain too long in the ſame incurvated ſituation.

Or it may be occaſioned by ſome fault in the digeſtion, occaſioning the aliment to be unequally applied to the body, by which ſome parts of the bones increaſe in bulk more than the reſt.

The *rickets* uſually appear between the firſt eight months, and the ſixth year of the child's age: the part it affects grows lax, flaccid, and weak; and if it be the legs, they become unable to ſupport the body— All the parts ſubſervient to voluntary motion are likewiſe debilitated and enfeebled; and the child grows pale, ſickly, ſlothful, and cannot ſit erect.

His head generally becomes too large for the trunk, and cannot be ſupported or managed by the muſcles of the neck, which gradually wear away. Swellings, and knotty excreſcencies appear in the wriſts, ancles, and tips of the ribs; and the bones of the legs and thighs grow bowed or crooked —The like diſorder ſometimes alſo ſeizes the bones of the arms.

If the ſymptoms continue long, the thorax becomes ſtrait, a difficulty of reſpiration enſues, as alſo a cough, and a hectic fever; the abdomen ſwells, the pulſe grows weak and languid, and the ſymptoms increaſing, at length prove mortal.

When the child is able to talk before he can make uſe of his legs, he is preſumed to have the *rickets*.

When the diſorder is taken early, it may be remedied by proper bolſters and bandages, ſuited to the parts affected: but when the bones are grown rigid and inflexible, other mechanical contrivances, as padding, ſtrait boots, and ſeveral ſorts of machines or engines, made of paſte-board, whale-bone, tin, *&c.* are made uſe of; to reſtore the diſtorted bones to their natural ſtraitneſs.

Cold bathing is alſo found of ſervice in the *rickets*, before the diſtemper comes to be confirmed, during May and June; continuing the child in the water two or three ſeconds at each plunge.

Others chuſe a liniment of rum and palm oil; and others a plaiſter de minio and oxycroceum, applied along the back, to cover the whole ſpine — Dry frictions over the whole body, with a warm linnen cloth before the fire, eſpecially on the parts affected, are found of ſervice. The oil of ſnails is very famous for the ſame intention, being what drops from them, after bruiſing and ſuſpending them in a flannel bag. With this the limbs and ſpinal bone are anointed.

RIDDLE. See the article Ænigma.

RIDE, of hazle, or other wood, is a group or plump of ſprigs ſhooting out of the ſame root, or foot.

Ride, in the manage — To *ride* ſignifies to learn to *ride* — Thus, he rides under a good maſter. See Horse, Heel and Genet.

Ride, in the ſea language, is a term variouſly applied —Thus, a ſhip is ſaid to *ride*, when her anchors hold her faſt, ſo that ſhe drives not away by the force of the wind or tide.

A ſhip is ſaid to *ride well*, when ſhe is built ſo as not to overbeat herſelf into an head ſea, as that the waves over-rake her (that is, over waſh her) from ſtem to ſtern.

A ſhip *rides a croſs*, when ſhe *rides* with her main-yards and fore yards hoiſted up to the hounds; and both yards and arms topped alike.

She is ſaid to *ride a peek* when one end of the yard is peeked up, and the other hangs down: this is alſo ſaid of a ſhip when in weighing, ſhe is brought directly over her anchor. See Peek.

She is ſaid to *ride athwart*, when her ſide is to the tide — and to *ride betwixt wind and tide*, when the wind hath equal force over her one way and the tide another —If the wind have more power over her than the tide, ſhe is ſaid to *ride wind road*.

She is ſaid to *ride hawſeful*, when in a ſtreſs of weather ſhe falls ſo deep, that the water runs in at her hawſes.

She is ſaid to *ride-por-toiſe*, when her yards are ſtruck down upon the deck, or when they are down a-port-laſt.

RIDEAU*, in fortification, a ſmall elevation of earth, extending itſelf lengthways on a plain; ſerving to cover a camp, or give an advantage to a poſt.

* The word in it's orignial French ſignifies a curtain or cover; formed from the Latin, *ridellum*—Borel derives it from *ridere*.

A *rideau* is alſo convenient for thoſe who would beſiege a place at a near diſtance, and to ſecure the workmen in their approaches to the foot of a fortreſs.

Rideau, is ſometimes alſo uſed for a trench, the earth whereof is thrown up on it's ſide; to ſerve as a parapet for covering the men. See Trench.

RIDERS, in a ſhip, are great timbers both in the hold and aloft, which are bolted on to other timbers to ſtrengthen them when the ſhip is diſcovered to be too ſlightly built — See *Tab. Ship*, *fig.* 2. *n.* 47. 49. 50.

Rider is alſo uſed for after-clauſes, added to bills, whilſt they are depending in parliament. See Bill and Parliament.

***Out*-Riders.** See the article Out-*riders*.

Rider-*roll*. See the article Roll.

RIDGE, in building, the higheſt part of the roof or covering of a houſe. See Roof.

Ridge is particularly uſed for the piece of wood wherein the rafters meet. See Rafter.

RIDGE-Tyle. See the article Tyle.

RIDGES *of a horſe's mouth*, are wrinkles or riſings of the fleſh in the roof of the mouth, running a-croſs from one ſide of the jaw to the other, with interjacent furrows. See Horse.

It is commonly in the third or fourth *ridge* that the farriers ſtrike with the horn in order to bleed a horſe whoſe mouth is over-heated.

RIDGLING, or Ridgel, among farriers, *&c.* the male of any beaſt that has been but half gelt. See Gelding.

RIDICULE. See Laughter, Risibility, *&c.*

RIDING, a diviſion of Yorkſhire; whereof there are three, *viz.* the Eaſt-*riding*, Weſt-*riding*, and North-*riding*.

In indictments in that county, it is neceſſary the town and *riding* be expreſſed.

RIDING-CLERK, one of the ſix clerks in chancery, who in his turn, for one year, keeps the controllment books of all grants that paſs the great ſeal that year. See Clerk, Grant, *&c.*

RIENS *arrear*, in law, a kind of plea uſed to an action of debt, upon arrearages of accounts; whereby the defendant alledges that there is *nothing in arrear*. See Arrear.

Riens *paſſe par le fait*, nothing paſſes by the deed, is the form of an exception taken in ſome caſes to an action. See Exception and Deed.

Riens *par deſcent*, nothing by deſcent, is the plea of an heir, when ſued for his anceſtor's debt, though he had no lands from him by deſcent, nor has aſſets in hand. See Descent.

RIER, or Reer-county, Retro Comitatus, is uſed in our law books in oppoſition to *open county*. See County.

This appears to be ſome public place, which the ſheriff appoints for the receipt of the king's money, after the end of the county court—Fleta ſays it is *dies craſtinus poſt comitatum*.

RIGADOON*, a kind of dance, borrowed originally from Provence; performed in figure, by a man and a woman— The *rigadoon* is gay, merry, *&c.*

* The word is formed from the French *rigodon*, which ſignifies the ſame.

RIGEL. See the article Regel.

RIGGING, *of a ſhip*, includes her whole cordage; or all the ropes belonging to her maſts, and yards, *&c.*—See *Tab. Ship*, *fig.* 1. ſee alſo Cordage, Rope, *&c.*

A ſhip is ſaid to be *well-rigged* when all her ropes are of their fit ſize, in proportion to her burden — She is *over-rigged*, when her ropes are too big for her; which wrongs her much in her ſailing, and is apt to make her heel. See Ship.

RIGHT, in geometry, ſomething that lies evenly, and without inclining or bending one way or another.

Thus, a *right line* is that whoſe ſeveral points all tend the ſame way. See Line, Inclination, and Parallel.

In this ſenſe *right* ſignifies as much as *ſtraight*, and ſtands oppoſed to *curved* or *crooked*. See Curve.

Right *angle* is that formed by two lines falling perpendicularly on one another. See Perpendicular.

The quantity or meaſure of a *right angle* is a quadrant of a circle, or 90° — All *right angles* therefore are equal. See Angle.

In this ſenſe the word *right* ſtands oppoſed to *oblique*. See Oblique.

Right-*angled* is underſtood of a figure when it's ſides are at right angles, or ſtand perpendicularly one upon another. See Figure.

This ſometimes holds in all the angles of the figure, as in ſquares and rectangles; ſometimes, only in part, as in *right angled* triangles.

Right-*cone*. See the article Cone.

RIGHT *lined angle*. See the article ANGLE.

RIGHT *ſine*. See the article SINE.

The word here ſtands contradiſtinguiſhed to *verſed*. See VERSED.

RIGHT *ſphere*, is that where the equator cuts the horizon at right angles—Or, that wherein the poles are in the horizon, and the equator in the zenith. See SPHERE.

Such is the poſition of the ſphere with regard to thoſe who live directly under the equator—The conſequences hereof are, that they have no latitude nor elevation of the pole—They can ſee nearly both poles of the world; all the ſtars riſe, culminate, and ſet with them, and the ſun always riſes and deſcends at right angles to their horizon, and makes their days and nights equal. See LATITUDE, STAR, RISING, DAY, NIGHT, *&c.*

In a *right ſphere* the horizon is a meridian; and if the ſphere be ſuppoſed to revolve, all the meridians ſucceſſively become horizons, one after another. See HORIZON, *&c.*

RIGHT *Aſcenſion*, of the ſun, or a ſtar, is that degree of the equinoctial, accounted from the beginning of aries, which riſes with the ſun or ſtar in a *right* ſphere. See ASCENSION.

Angle of RIGHT *aſcenſion*. See ANGLE.

Parallax of RIGHT *aſcenſion*. See PARALLAX.

RIGHT *deſcenſion*. See the article DESCENSION.

Parallax of RIGHT *deſcenſion*. See PARALLAX.

RIGHT, *ſailing*, is when a voyage is performed on ſome one of the four cardinals points. See SAILING and CARDINAL *point*.

If a ſhip ſail under the meridian, that is, on the north or ſouth points, ſhe varies not in longitude at all, but only changes the latitude, and that juſt ſo much as the number of degrees ſhe hath run. See LATITUDE.

If a ſhip ſail under the equinoctial, upon the very eaſt or weſt points, ſhe alters not her latitude at all, but only changes the longitude, and that juſt ſo much as the number of degrees ſhe has run. See LONGITUDE.

If ſhe ſail directly eaſt or weſt, under any parallel, ſhe there alſo altereth not her latitude, but only the longitude; yet not according to the number of degrees of the great circle ſhe hath ſailed in, as under the equinoctial, but more according as the parallel is remoter from the equinoctial towards the pole. For the leſs any parallel is, the greater is the difference of longitude. See RHUMB.

RIGHT *circle*, in the ſtereographical projection of the ſphere, is a circle at right angles to the plane of projection, or that which paſſes through the eye. See CIRCLE, PROJECTION and STEREOGRAPHIC.

RIGHT, RECTUM, in logics and ethics. See RECTITUDE.

In this ſenſe the word ſtands oppoſed to *wrong*, *erroneous*, *falſe*, &c. See ERROR, FALSHOOD, *&c.*

RIGHT, *jus*, in law, ſignifies not only a property, for which a writ of right lies, but alſo any title or claim, either by virtue of a condition, mortgage, or the like, for which no action is given by law, but only an entry. See PROPERTY. Such are, *jus proprietatis*, a right of property: *jus poſſeſſionis*, a right of poſſeſſion, and *jus proprietatis & poſſeſſionis*, a right both of property and poſſeſſion. See POSSESSION, *&c.*

This laſt was formerly called *jus duplicatum*—As, if a man be diſſeiſed of an acre of land, the diſſeiſee hath *jus proprietatis*; the diſſeiſor hath *jus poſſeſſionis*, and if the diſſeiſee releaſe to the diſſeiſor, he hath *jus proprietatis & poſſeſſionis*.

Hereditary RIGHT. See the article HEREDITARY.

Pretenſed RIGHT. See PRETENSED.

RIGHT *of reformation*. See REFORMATION.

Writ of RIGHT. See the article WRIT.

RIGHT *in court*. See RECTUS *in curia*.

RIGHT *diſtillation*. See DISTILLATION.

RIGHT *the helm*, a ſea phraſe, ordering to keep the helm even with the middle of the ſhip. See HELM.

RIGID *marble*. See the article MARBLE.

RIGIDITY, among philoſophers, a brittle-hardneſs; or that kind of hardneſs ſuppoſed to ariſe from the mutual indentation of the component particles within one another. See HARDNESS.

Rigidity is oppoſed to ductility, malleability, *&c.* See DUCTILITY.

RIGLET. See the article REGLET.

RIGOL, a kind of muſical inſtrument, conſiſting of ſeveral ſticks bound together, only ſeparated by beads—It makes a tolerable harmony, being well ſtruck with a ball at the end of a ſtick.

RIGOR, in medicine, a convulſive ſhuddering, from ſevere cold, an ague-fit, or other diſorder. See HORROR, FEVER, AGUE, *&c.*

RILL, or RIVULET. See the article RIVER.

RIM, in a watch or clock, the circumference, or circular part of a wheel. See WHEEL, WATCH, CLOCK, *&c.*

RIMA, litterally denotes a fiſſure, or chink. See FISSURE and RHAGADES.

Hence, it is applied to ſeveral parts of the body that bear a reſemblance thereto: as *rima pudendi*, fiſſura magna, the ſame with *vulva*; *rima laryngis*, the aperture of the larynx, called the *glottis*. See GLOTTIS, *&c.*

RIMA, is alſo uſed for a narrow aperture of a ſmall cavity under the fornix, opening into the infundibulum; called alſo the third ventricle of the brain. See BRAIN and VENTRICLE.

RIME *in poetry*. See the article RHYME.

RIND, the ſkin of any fruit that may be cut off, or pared. See SKIN, FRUIT, *&c.*

The outer coat of the cheſnut, ſet with prickles, is particularly called the *urchin-like rind*.

RIND, is alſo uſed for the inner bark of trees; or that ſoft, whitiſh, juicy ſubſtance, adhering immediately to the wood. See TREE and WOOD.

Through this it is that the ſap, in the modern theory of vegetation, is ſuppoſed to return from the extremities of the branches to the root; the veſſels hereof being ſuppoſed to do the office of arteries; whence Mr Bradley calls them *arterial* veſſels. See BARK. See alſo PLANT and VEGETATION.

Grafting in the RIND. See ENGRAFTING.

RING, *annullus*, a little moveable, put on the finger, either by way of ceremony, or of ornament.

The biſhop's *ring*, makes a part of the pontifical apparatus; and is eſteemed a pledge of the ſpiritual marriage between the biſhop and his church. See BISHOP.

The epiſcopal *ring* is of a very antient ſtanding—The fourth council of Toledo, held in 633, appoints, that a biſhop condemned by one council, and found afterwards innocent by a ſecond, ſhall be reſtored, by giving him the *ring*, ſtaff, *&c.* From biſhops, the cuſtom of the *ring* has paſſed to cardinals, who are to pay, I know not what ſum, *pro jure annuli cardinalitii*. See CARDINAL.

Origin of RINGS—Pliny, lib. xxxvii. cap. I. obſerves, that we are in the dark as to the perſon who firſt invented, or wore the *ring*; for that what is ſaid of Prometheus, as alſo of Midas's *ring*, are fables. The firſt among whom we find the *ring* in uſe, are the Hebrews, Gen. xxxviii. where Judah, Jacob's ſon, gives Tamar his *ring* or ſignet, as a pledge of his promiſe: but the *ring* appears to have been in uſe at the ſame time among the Egyptians, from Gen. xii. where Pharaoh puts his *ring* upon Joſeph's hand as a mark of the power he gave him. And in the firſt book of Kings, chap. xxi. Jezebel ſeals the warrant ſhe ſent for the killing of Naboth with the king's *ring*.

The antient Chaldeans, Babylonians, Perſians and Greeks, had likewiſe the uſe of the *ring*; as appears from ſeveral paſſages in Scripture, and from Quintus Curtius, who tells us that Alexander ſealed the letters he wrote into Europe, with his own ſeal; and thoſe into Aſia with Darius's *ring*.

The Perſians will have Guiamſchild the fourth king of their firſt race, to have firſt introduced the *ring*, to ſeal his letters and other acts withal—The Greeks, Pliny thinks, knew nothing of the *ring* in the time of the Trojan war: the reaſon he gives is, that we find no mention thereof in Homer, but that when letters, *&c.* were to be ſent away, they were tied up, and the ſtrings knotted.

The Sabins had *rings* in Romulus's time; and it is to them probably, the practice firſt came from the Greeks; and from them paſſed to the Romans, though it was ſome time before it got footing there—Pliny cannot learn which of the kings of Rome firſt adopted it; but there are no ſigns of it in any of their ſtatues, before thoſe of Numa, and Servius Tullus. He adds, that it was in uſe among the antient Gauls and Britons. See SEAL.

Matter of RINGS—There were ſome of one ſingle metal, and others of a mixture, or of two. For the iron and ſilver were frequently gilt; or at leaſt the gold was encloſed within the iron, as appears from Artemidorus, lib. ii. cap. 5.—The Romans were contented with iron *rings* a long time; and Pliny aſſures us, that Marius firſt wore a gold one in his third conſulate, which was in the year of Rome 650. Sometimes the *ring* was iron, and the ſeal gold; ſometimes it was hollow, and ſometimes ſolid; ſometimes the ſtone was engraven, and ſometimes plain; and the graving ſometimes in relievo, and ſometimes in creux; the laſt were called *gemmæ ectypæ*; the former *gemmæ ſculptura prominente*.

The *manner of wearing the* RING has been various: from Jeremy, chap. xxii. it appears that the Hebrews wore it on their right hand. Among the Romans, before they came to be adorned with ſtones, and while the graving was yet on the metal itſelf, every body wore them with pleaſure, on what hand and finger he liſted—When ſtones came to be added; they wore them altogether on the left hand; and it would have been held an exceſſive foppery to have put them on the right.

Pliny ſays, they were at firſt wore on the fourth finger, then on the ſecond or index; then on the little finger; and at laſt on all the fingers, excepting the middle one—The Greeks wore them altogether on the fourth finger of the left hand, as we are informed by Aul. Gellius, lib. x. and the reaſon he gives for it is, that having found from anatomy, that this finger had a little nerve that went ſtraight to the heart, they eſteemed it the moſt honourable, by reaſon of this communication with that noble part—Pliny ſays, the Gauls and antient Britons wore it on the middle finger.

At firſt they only wore a ſingle *ring*; then one on each finger; and at length ſeveral on each finger. Martial, lib. xi. epig. 60. At laſt one on each joint of each finger. Ariſtoph. *in Nub.* &c.—Their delicacy, at length went to that pitch, that they had their weekly *rings*. Juvenal, ſat. 7. ſpeaks of *annuli ſemeſtres*; as alſo of winter and ſummer *rings*. But of all others Lampridius, cap. 32. obſerves, Heliogabalus carried the point fartheſt, who never wore the ſame *ring*, or the ſame ſhoe twice.

Rings have been alſo wore in the noſe, as pendants in the ears —Barthlin has an expreſs treatiſe, *de annulis narium*, *of rings of the noſtrils*. St Auguſtin aſſures us, it was the faſhion of the Moors; and Pietro della Valle obſerves the ſame of the modern Orientals.

In effect, there is no part of the body where it has not been wore—Several Eaſt-India travellers affirm, that the natives commonly wear them on their noſe, lips, cheeks, and chin. Ramuſio tells us, that the ladies of Narſingua in the Levant, and Diodorus Siculus, lib. 3. that thoſe of Ethiopia, uſed to adorn their lips with iron *rings*.

As to the ears, the cuſtom ſtill obtains of wearing *rings* therein, both by men and women, all over the world. See PENDANT.

The Indians, particularly the Guzzerattes, have wore *rings* on their feet—And when Peter Alvarez had his firſt audience of the king of Calicut, he found him all covered with ſtones ſet in *rings*; bracelets and *rings* both on the hands and fingers, and even the feet and toes. Louis Bartome repreſents a king of Pegu, as ſtill more extravagant, having *rings* ſet with precious ſtones on every toe.

Uſe of RINGS—The antients had three different kinds: the firſt ſerved to diſtinguiſh conditions or qualities. Pliny aſſures us, that the ſenators at firſt were not allowed to wear the gold *ring*, unleſs they had been embaſſadors at ſome foreign court. Nor was it even allowed them to wear the gold *ring* which was given them, in public; except on public occaſions. At other times they wore an iron one. And thoſe who had had a triumph, obſerved the ſame rules.

At length the ſenators and knights were allowed the common uſe of the gold *ring*; but Acron on Horace, lib. ii. ſat. 7. obſerves, they could not do it unleſs it were given them by the prætor.

In after days the gold *ring* became the badge of the knights; the people wearing ſilver *rings*, and the ſlaves iron ones. Though the gold *ring* was ſometimes alſo allowed the people, and Severus granted it his common ſoldiers. Auguſtus allowed it the liberti, or freedmen; and though Nero made a regulation to the contrary, yet it was ſoon ſet aſide.

A ſecond kind of *rings* were the *annuli ſponſalitii*, *wedding-rings*. Some carry the origin of this cuſtom as far back as the Hebrews, on the authority of a text in Exodus xxxv. 22—Leo of Modena, however, maintains that the antient Hebrews did not uſe any nuptial *ring*. Selden, in his *Uxor Ebraica*, lib. ii. cap. 14. owns, that they gave a *ring* in the marriage, but that it was only in lieu of a piece of money of the ſame value, which had uſed to have been given before—The Greeks and Romans did the ſame; and from them the Chriſtians took it up very early, as appears from Tertullian, and in ſome antient liturgies, where we find the form of bleſſing the nuptial *ring*. See MARRIAGE.

The third kind of *rings* were thoſe uſed as ſeals, called *cerographi*, or *cirographi*, an account whereof ſee under the article SEAL.

Richard biſhop of Saliſbury, in his conſtitutions, *anni* 1217, forbids the putting of *ruſh-rings* or any the like matter, on women's fingers, in order to the debauching them more readily: and he inſinuates the reaſon of his prohibition, that there were ſome people weak enough to believe, that what was thus done in jeſt was a real marriage.

De Brevil in his antiquities of Paris, ſays, it was an antient cuſtom to uſe a *ruſh-ring* in the marriage of ſuch as had had an affair together before marriage. See CONCUBINE, *&c.*

RING, in aſtronomy—The *ring of Saturn* is a thin, luminous circle, incompaſſing the body of that planet, but without touching the ſame. See SATURN.

The diſcovery hereof is owing to M. Huygens, who after frequent obſervation of Saturn, perceived two lucid points, or *anſæ*, ariſing out from the body, in a right line. See ANSÆ.

Hence, as in ſubſequent obſervations, he always found the ſame appearance, he concluded that Saturn was incompaſſed with a permanent *ring*; and accordingly produced his new ſyſtem of Saturn in 1659.

The plane of the *ring* is inclined to the plane of the ecliptic in an angle of 23° 30′—It ſometimes appears oval; and according to Campani, it's greateſt diameter is double it's leaſt. See PLANET.

RING, is alſo the name of an inſtrument uſed in navigation, for taking the altitudes of the ſun, *&c.* See ALTITUDE.

It is uſually of braſs, about 9 inches diameter, ſuſpended by a little ſwivel, 45° from the point whereof is a perforation, which is the centre of a quadrant of 90° divided in the inner concave ſurface.

To uſe it, they hold it up by the ſwivel, and turn it to the ſun, till the ſun-beams falling through the hole, make a ſpot among the degrees, which is the altitude required.

This inſtrument is preferred to the aſtrolabe, by reaſon the diviſions are here larger than on the aſtrolabe. See ASTROLABE.

RING is alſo uſed for the ſound or tone of a bell. See BELL, SOUND, *&c.*

Baſe RING. See the article BASE.

RING-*Bone*, among farriers, *&c.* a hard callous ſubſtance growing in the hollow circle of the little paſtern of a horſe, above the coronet. See HORSE.

It ſometimes goes quite round like a *ring*; whence it's name: ſometimes it is hereditary, derived from the ſtallion, or mare, but oftener comes by accident, as a ſtrain, blow of a horſe, *&c.*

Corniche RING. See the article CORNICHE.

RING-*dial*, is a kind of a dial, uſually ſmall, and portable, conſiſting of a braſs ring, or rim, ſeldom exceeding two inches in diameter, and one third of an inch in breadth. See DIAL.

In a point of this rim, is a hole, through which the ſun-beams being received, make a lucid ſpeck on the concavity of the oppoſite ſemicircle, which gives the hour of the day in the diviſions marked therein.

But it only holds good about the times of the equinox—To have the dial perform throughout the whole year, the hole is made moveable; and the ſigns of the zodiac, or the days of the month are marked on the convex ſide of the *ring*; by means whereof the dial is rectified for the time.

To uſe it, put the moveable hole to the day of the month, or the degree of the zodiac the ſun is in; then ſuſpending it by the little ring, turn it towards the ſun, till his rays, as before, point out the hour among the diviſions on the inſide.

Univerſal, or *aſtronomical* RING-*dial*, is a ring-dial which ſerves to find the hour of the day in any part of the earth; whereas the former is confined to a certain latitude—It's figure ſee repreſented in *Table Dialling*, *fig.* 7. See alſo DIAL.

It conſiſts of two rings, or flat circles, from two to ſix inches in diameter; and their breadth, *&c.* proportionable—The outward ring, A, repreſents the meridian of any place you are at; and contains two diviſions of 90° each, diametrically oppoſite to one another; ſerving, the one from the equator to the north, the other to the ſouth pole—The inner ring repreſents the equator, and turns exactly within the outer, by means of two pivots in each ring at the hour of 12.

Acroſs the two circles goes a thin reglet or bridge, with a curſor, C, that ſlides along the middle of the bridge. In the curſor is a little hole for the ſun to ſhine through.

The middle of this bridge is conceived as the axis of the world, and the extremities as the poles; and on the one ſide are drawn the ſigns of the zodiac, and on the other the days of the month. On the edge of the meridian ſlides a piece, to which is fitted a ring to ſuſpend the inſtrument by.

Uſe of the univerſal RING-*dial*—Place the line *a* (on the middle of the ſliding piece) over the degree of latitude of the place (*e. gr.* 51° for London) put the line which croſſes the hole of the curſor to the degree of the ſign, or day of the month. Open the inſtrument ſo as the two rings be at right angles to each other, and ſuſpend it by the ring H, that the axis of the dial, repreſented by the middle of the bridge, may be parallel to the axis of the world. Then turn the flat ſide of the bridge towards the ſun, ſo as his rays ſtriking through the little hole in the middle of the curſor, fall exactly on a line drawn round the middle of the concave ſurface of the inner ring; in which caſe the bright ſpot ſhews the hour of the day in the ſaid concave ſurface of the ring.

Note, The hour of 12 is not ſhewn by this dial; by reaſon the outer circle being then in the plane of the meridian, hinders the ſun's rays from falling on the inner: nor will this dial ſhew the hour when the ſun is in the equinoctial, by reaſon his rays, then, fall parallel to the plane of the inner circle.

Fairy RING.	See the articles	FAIRY.
Natal RING.		NATAL.
Reinforced RING.		REINFORCED.
Trunnion RING.		TRUNNION.

RING-*walk*, among hunters, a round walk. See HUNTING.

RING-*worm*, in medicine. See the article SERPIGO.

RIOT, in law, the forcible doing of an unlawful thing, of a private nature, by three or more perſons aſſembled together for that purpoſe.

The word is formed from the Latin, *riota*, of *arietare*, to run at each other as rams do. Though, from an antient Gauliſh verſion of the bible, quoted by Skinner, *riot* ſhould rather ſeem originally to ſignify luxury and exceſs: whence our law *riot* might proceed; in regard theſe are frequently attended with quarrels.

For the difference between a *riot*, rout, and unlawful aſſembly. See ROUT and UNLAWFUL *Aſſembly*.

Kitchen gives us the following caſes of *riots*, *viz.*—The breach of incloſures, banks, conduits, parks, pounds, barns, the burning of ſtacks of corn, *&c.* Lambard adds, the beating a man, and entering on a poſſeſſion forcibly.

By a late act of parliament, made on occaſion of the frequent pulling down of meeting-houſes, *&c.* by mobs, or riotous aſſemblies, about the time of the laſt rebellion; a *riot* was made felony, if the *rioters* did not diſperſe after reading a proclamation made for that purpoſe.

RIPENERS, in medicine, a ſort of topical remedies, called alſo *drawers*, *digeſtives*, *maturantia*, *ſuppuratives*, &c. See DIGESTIVES, SUPPURATIVES, *&c.*

RIPENING. See MATURATION, DIGESTION, SUPPURATION, *&c.*

RISIBILITY, the faculty of laughter. See LAUGHING.

Riſibility is commonly ſuppoſed an attribute peculiar to man; as being the only creature capable of judging of what is ridiculous—Some philoſophers go ſo far as to aſſert, that the degree of judgment is always ſeen in that of laughter; fools either have too little or too much.

Authors do not agree as to the peculiar mechaniſm in man, whereby laughter is raiſed—It is uſually attributed to the communication between the plexus nervoſus, and the diaphragmatic nerves. See CONSENT *of parts*.

RISING, in aſtronomy, the appearance of the ſun, a ſtar, or other luminary above the horizon, which before was hid beneath it. See HORIZON, SUN, STAR, *&c.* See alſo AMPLITUDE.

By reaſon of the refraction of the atmoſphere, the heavenly bodies always *riſe* before their time, *i. e.* are ſeen above the horizon, while they really are below it. See REFRACTION.

There are three poetical kinds of *riſing* of the ſtars—The *coſmical* RISING, when a ſtar riſes at the ſame time with the ſun. See COSMICAL.

Acronycal RISING is when the ſtar riſes at the ſame time that the ſun ſets. See ACRONYCAL.

Heliacal, *ſolar*, or *apparent* RISING, is when the ſtar emerges out of the ſun's rays near the horizon, and is no longer hid in his brightneſs; which happens about 20 days after the conjunction of ſuch ſtar with the ſun; more or leſs, according to the magnitude of the ſtar, it's diſtance, *&c.* See HELIACAL.

Heſiod long ago obſerved, that Sirius was hid 40 days; *viz.* 20 days before his *coſmical riſing*, and 20 after—Some nations of America, and among others the ſavages of Cayenna, regulate their civil year by the courſe of Sirius; beginning it with the *heliacal riſing* of that ſtar. See CANICULA and CANICULAR.

To find the riſing, &c. *of the ſun and ſtars by the globe.* See GLOBE.

RISK, or RISQUE, the hazard or chance of a loſs, damage, *&c.* See CHANCE.

There is a great *riſk* run in letting goods go upon credit to great lords, wives not authoriſed by their huſbands, and young people not yet arrived at the age of majority.

Skinner derives the word from the Spaniſh, *riſco*, ſteep: Covarruvias, from *rigeo*. In the barbarous Greek, they ſay, ριζικαρω, for *periclitor*, I hazard; and ριζικον, for lot or chance; which words as well as *riſque*, Skinner thinks, may be deduced from ῥιπτω, for αναῤῥιπτω τον κυβον, I caſt the dye.

To prevent any *riſk* in invoices of merchandizes by ſea, 'tis uſual to inſure them. See POLICY *of inſurance*.

The *riſk* of merchandiſes commences from the time they are carried aboard—In matters of inſurance, it is a maxim, that all is never to be *riſked* on one bottom, or in the ſame veſſel; to denote, that aſſurers muſt act with diſcretion in the ſigning of policies, and not hazard too much on each veſſel; there being more to be expected from ſeveral than from one.

RISUS, *laughter*. See the article LAUGHTER.

RISUS *caninus* is a kind of laughter wherein the lips are contracted, ſo as to ſhew all the teeth.

RISUS *ſardonius*, ſardonian laughter, is a forced, ſpightful laughter; or a laughter that does not go beyond the teeth.

The phraſe is by ſome ſaid to be founded on this, that in Sardinia there is a venemous plant, which occaſions ſuch a contraction of the muſcles of the face in perſons it kills, that they ſeem to die laughing.

RITE, RITUS, in ſchool divinity, denotes the particular manner or form of celebrating or performing the religious ceremonies, which obtains in this or that place. See CEREMONY.

The Eaſtern people, Armenians, *&c.* celebrate divine ſervice according to the Greek *rite*—The Weſtern world follow the Latin *rite*; or that of the Roman church.

The Engliſh obſerve the *rite* of the church of England, preſcribed in the book of Common-prayer, *&c.* See RITUAL.

RITORNELLO, or REFRET, in muſic, the burthen of a ſong, or a repetition of the firſt verſes of the ſong, at the end of each ſtanza or couplet. See REPETITION.

The word is Italian, and ſignifies properly a *little return*, or a ſhort repetition, ſuch as that of an eccho, or of the laſt words of a ſong; eſpecially when the repetition is made after a voice, by one or more inſtruments.

But cuſtom has extended the uſe of the word to all ſymphonies, played before the voices begin, and which ſerve by way of prelude or introduction to what follows.

In the partitions or ſcore of the Italian muſic, we frequently find the *ritornello's* ſignified by the words *ſi ſuona* to ſhew that the organ, ſpinnet, or the like, are to repeat what the voice has been ſinging. See REPEAT.

RITUAL, RITUALE, a church-book, directing the order and manner of the ceremonies to be obſerved in celebrating divine ſervice, in a particular church, dioceſe, religious order, or the like. See RITE, CEREMONY, *&c.*

The antient heathens had, likewiſe, their *rituals*, *rituales libri*; whereof thoſe of the Hetrurians were famed—Theſe books contained the rites and ceremonies to be obſerved in the building a city, in the conſecrating a temple or an altar, in ſacrificing, deifying, in dividing the curiæ, tribes, centuries, and in general, all their religious ceremonies. See SACRIFICE, APOTHEOSIS, ALTAR, *&c.*

There are ſeveral paſſages in Cato's books, *de re ruſtica*, which may give us ſome idea of the *rituals* of the antients.

RIVAGE, RIVAGIUM, a toll antiently paid to the king in ſome rivers, for the paſſage of boats or veſſels therein. See FERRY.

RIVAL, RIVALIS, a term of relation, applied to two perſons who have the ſame pretenſion. See CORRIVAL.

It is properly uſed for a competitor in love; and figuratively for an antagoniſt in any other purſuit—The intrigues of comedies and romances uſually turn on the jealouſies of *rivals*, who diſpute for the ſame miſtreſs.

The lawyers derive the word from the Latin, *rivus*, ſtream, *quod ab eodem rivo aquam hauriant.* Donatus ſuppoſes it to have been formed hence, that beaſts coming to drink at the ſame brook, or fountain, frequently quarrel.

Cælius ſays, that *rivales* were originally ſuch whoſe fields were parted by a brook or rivulet; the courſe whereof being liable to be varied ſeveral ways, occaſioned frequent diſputes and law-ſuits.

RIVER, *fluvius*, or *flumen*, in geography, a ſtream or current of freſh water, flowing in a bed or channel, from a ſource or ſpring, into the ſea. See WATER, *&c.*

If the ſtream be not large enough to bear boats, or ſmall veſſels, loaden; it is properly called in Engliſh, by the diminutive, *rivulet* or *brook*; by the Latins, *rivus*; and the French, *riviere*—If it will only bear ſuch veſſels, the Latins call it *amnis*—If it be conſiderable enough to carry larger veſſels, it is called by the general name *river*; by the Latins, *fluvius*, and *flumen*; and by the French, *fleuve*—In all which, the difference is only as to greater and leſs.

Some will have none to be properly *rivers*, except thoſe which bear the ſame name from their ſource to their mouth. Others, none but thoſe which empty themſelves immediately into the ſea; and not into any other river. See SEA and OCEAN.

Rivulets, have their riſe, ſometimes, from great rains, or great quantities of thawed ſnow; eſpecially in mountainous places; as in the long ridges in Africa, India, Sumatra, *&c.* But the generality of *rivulets* ariſe from ſprings. See SPRING.

Rivers themſelves all ariſe either from the confluence of ſeveral *rivulets*, or from lakes, nor is there any great *river*, ſuch as the Rhine, Elbe, *&c.* known to flow from a ſingle ſpring—The Volga, *e. gr.* conſiſts of above two hundred *rivulets*, all flowing into it, before it reach the Caſpian: and the Danube receives as many. Pliny, indeed, and Cardan, ſay, that the Nile receives none; but the later travellers into Abyſſinia aſſure us of the contrary.

The Rhine, Rhone, Danube, Boryſthenes, *&c.* ariſe originally from ſprings in the mountains; the Nile, Volga, the great *river* of St Laurence, *&c.* from lakes. See LAKE.

Phænomena and variations of RIVERS—*Rivers* are found ſubject to great alterations, at different ſeaſons of the year, day, *&c.* from frequent rains and melted ſnow—Thus in Peru and Chili many of the rivers are almoſt inſenſible in the night-time, and only flow by day, as being then augmented by the diſſolution of the ſnow on the mountains Andes—Thus the Volga abounds in water in May and June, ſo as to cover the ſand-banks, *&c.* which all the reſt of the year lie bare, ſo as ſcarce to allow a paſſage to the loaden ſhips. —Thus alſo the Nile, Ganges, Indus, *&c.* are frequently ſo increaſed as to overflow; and that either in the winter, from rain, or in the ſummer, from the melting of the ſnow.

Some *rivers* bury themſelves under ground in the middle of their courſe, and break out again in other places, like new *rivers* — Thus the Niger, which ſome coſmographers derive by a ſubterraneous channel from the Nile, becauſe it ſwells at the ſame time with the Nile without any other apparent cauſe of it's ſwelling: The Niger itſelf meeting the mountains of Nubia, is hid under them, and riſes again on the weſtern ſide of the mountains. Thus alſo the Tygris is loſt in the mountain Taurus, *&c.*

Ariſtotle, and the poets, mention ſeveral ſuch *rivers* about Arcadia: Alpheus, a *river* of Arcadia, is particularly famed — This, being ſwallowed up in the ground, is ſuppoſed by the Greek authors to continue it's progreſs under earth and ſea, into Sicily; were breaking up near Syracuſe, it forms the *river* Arethuſa. The great reaſon of this opinion is, that every fifth ſummer the *river* Arethuſa in Sicily, caſts up the dung of cattle about the time of the celebration of the olympic games, in Achaia, when the dung of victims was uſed to be caſt into the Alpheus.

Some *rivers* empty themſelves into the ſea by one mouth, ſome by ſeveral — Thus the Danube opens into the Euxine ſea by ſeven mouths, the Nile by ſeven, and the Volga by at leaſt ſeventy. The cauſe of this variety of mouths Varenius attributes principally to banks of ſand, *&c.* formed therein; which gradually increaſing, form iſlands, whereby the channel is divided into ſeveral branches—Indeed, the antients tell us that the Nile formerly only emptied itſelf at one mouth, called the *oſtium canobicum*; and add, that the other ſix are artificial.

The channels of *rivers*, except ſuch as were formed at the creation, Varenius endeavours to prove to be all artificial, and dug by men —His reaſons are, that when a new ſpring breaks forth, the water does not make itſelf a channel, but ſpreads over the adjacent land; ſo that the people have been neceſſitated to cut it a channel to ſecure their grounds; and that a great number of channels of *rivers* are certainly known, from hiſtory, to have been dug by men, *&c.*

As to the queſtion, whether thoſe *rivers* which run into others, have made themſelves that way by their own motion, or have been turned thither in canals cut by men? he takes the latter to be the more probable; and concludes the ſame of the arms or branches of *rivers*; and of the turns whereby iſlands are formed in the Tanais, Volga, *&c.*

To the queſtion, why we have no ſalt *rivers*, when there are ſo many ſalt ſprings? he anſwers, that it is becauſe men having no occaſion for ſalt water, have not dug channels to conduct the water of ſalt ſprings; ſalt being procureable at leſs expence. See SALT.

The water of moſt *rivers* flows impregnated with particles of metals, minerals, ſands, oily and fat bodies, *&c.* — Thus ſome *rivers* bring ſands intermixed with grains of gold; of which kind is, 1°. A *river* in Japon; 2°. Another in the iſland Lequeo, near Japon; 3°. A *river* in Africa called Arroe, breaking out of the roots of the mountains of the moon, wherein are gold mines: 4°. A *river* in Guinea, where the negroes ſeparate the gold duſt from the ſand, and ſell it to the Europeans, who traffic hither for that very purpoſe. 5°. In ſome *rivulets* near the city of Mexico, are grains of gold taken up, eſpecially after rain; which is to be underſtood of all the other *rivers*; none of which yield any thing conſiderable except in rainy ſeaſons. 6°. In Peru, Sumatra, Cuba, Hiſpaniola, and Guiana. Laſtly, there are ſeveral brooks in the countries about the Alps, eſpecially Tirol, out of whoſe waters gold is drawn, though there be no grains conſpicuous therein. Add to this, that the Rhine in many places affords a golden mud. See GOLD.

As to *rivers* that bring grains of ſilver, iron, copper, lead, *&c.* we find no mention of them in authors; though doubtleſs there are great numbers of each; and many of the medicinal effects of mineral waters are doubtleſs owing thereto. We muſt not here omit a *river* in Germany which is ordinarily ſuppoſed to change iron into copper — The truth is, there is no real converſion of the metal; all that is done is, that the cuprine, and vitriolic particles in the water, corrode the iron, and detaching parts thereof by means of the motion of the water, ſucceed in their room. See TRANSMUTATION.

From this variety in the mixture of the *river* water, reſult various qualities, different ſpecific gravities, different colours, *&c.* See *mineral* WATER.

Some *rivers*, at certain ſeaſons of the year, ſwell, ſo as to overflow their banks, and drown the neighbouring lands — Of theſe the moſt eminent is the Nile, which riſes ſo as to cover all Egypt, except the hills. The inundation begins about the 17th day of June, and increaſes for the ſpace of forty days; and decreaſes for as many: during which period the cities of Egypt, which are all built on hills, appear as ſo many iſlands. See NILOMETER.

To theſe inundations Egypt owes all it's fertility; the heavens there affording no rain, or at leaſt none in any reſpect conſiderable—Hence as the inundation is great or ſmall, Egypt for that year is fruitful or barren.

The antient Greeks, *&c.* were miſtaken as to the cauſe of this inundation; no body in thoſe days having travelled up to the ſource of the *river*: but the modern Engliſh and Portugueze traders into Congo, Angola, Monomotapa, *&c.* have let us into the ſecret — From them we learn that the ſpring or ſource of the Nile is in a large lake called Zaire, round which are a great number of huge mountains, called the mountains of the moon. Now as theſe lie in the ſouthern hemiſphere, their winter will be at the time of our ſummer: but by reaſon of their nearneſs to the equator (being only 10° diſtant from it) they never feel any notable cold: hence it is, that inſtead of ſnow in the winter, they have rain every day, at leaſt two hours before, and two after noon. In effect, the tops of theſe mountains are always covered with clouds, and the rains almoſt continual. Hence torrents are conſtantly guſhing down from the mountains; all ending in the lake of Zaire: whence they flow into the channel of the Nile, and other *rivers* ariſing from the ſame lake, as the Cuamar, the Zaire, *&c.* Hence the inundation of the Nile.

The other *rivers*, which have any notable ſtated inundations, are, the Niger, or Gambia, which overflows at the ſame time with the Nile. Leo Africanus ſays, it begins on the 15th day of June, increaſes for 40 days, and decreaſes as long —The Zaire, a *river* of Congo, proceeding from the ſame lake with the Nile, and therefore affected in the ſame manner: the Rio de la Plata in Braſil, which Maffeus obſerves, overflows at the ſame time with the Nile: the Ganges: the Indus; both which laſt overflow in June, July, and Auguſt; at which times the natives ſave great quantities of the water in ponds, to ſerve them the reſt of the year: ſeveral *rivers* flowing out of the lake Chiama, into the bay of of Bengal, which overflow in September, October, and November. Theſe all bring a very great fertility with them to the ground; the *river* Macoa in Camboia: the *river* Parana or Paranaguaſa, which ſome will have to be the ſame with the ſilver *river*: ſeveral *rivers* in Coromandelia, a part of India, which overflow in the rainy months from the great quantity of water iſſuing from the mountain Gatis: the Euphrates, which overflows Meſopotamia certain days in the year. Laſtly, the *river* Sus in Numidia.

The *rivers* moſt celebrated for their length, breadth, ſwiftneſs of current, *&c.* are—The Nile, which runs almoſt in a ſtraight courſe 2520 geographical miles. The Niger, which runs 2400 miles. The Ganges, 1200 miles. The Ob, 1600 miles. The Jeniſcea in Aſia about the ſame length with the Ob. The *river* Orellana in America, 60 miles broad at it's mouth, and 5000 miles long. The Rio de la Plata, 80 miles broad at the mouth. The Omarannan, another *river* of Braſil: and the great *river* of St Laurence, near 2500 miles long. See DANUBE and WOLGA.

RIVER, in phyſics, denotes a ſtream of water running by it's own gravity, in a channel open above—Such is A E *Tab. Hydroſtatics*, *fig.* 34—See alſo WAVE.

Laws of the motion of RIVERS — The modern philoſophers endeavour to bring the motion and flux of *rivers* to preciſe laws; and with this view have applied geometry and mechanics thereto: ſo that the doctrine of *rivers* is become a part of the new philoſophy.

The Italian authors have diſtinguiſhed themſelves herein; and it is chiefly to them we are indebted for the improvement; particularly S. Guglielmini, who in his treatiſe, *della Natura de Fiumi*, has abundance of new obſervations and diſcoveries relating thereto.

Rivers, he obſerves, uſually have their ſources in mountains or elevations of ground; and it is in their deſcent from theſe, that they acquire the velocity or acceleration which maintains their future current — In proportion as they advance farther, this velocity diminiſhes; by reaſon of the continual friction of the water againſt the bottom and ſides of the channel, of the various obſtacles they meet withal in their progreſs, and of their arriving at length in plains, where the deſcent is leſs, and their inclination to the horizon, of conſequence, greater —Thus the Reno, a *river* of Italy, which gave occaſion in ſome meaſure to theſe ſpeculations, is found near it's mouth, to have ſcarce a deſcent of 52 ſeconds.

If the acquired velocity be quite ſpent through the many obſtacles; ſo that the current becomes horizontal; there will then nothing remain to propagate the motion, and continue the ſame, but the depth, or the perpendicular preſſure of the water which is always proportional to the depth— And, happily for us, this reſource increaſes as the occaſion for it increaſes: for in proportion as the water loſes of the velocity acquired by the deſcent, it riſes and augments in depth.

The upper parts of the water of a *river*, and thoſe at a diſtance from the banks, may continue to flow from the ſingle cauſe or principle of declivity, how ſmall ſoever it be; for not being detained by any obſtacle, the minuteſt difference of level will have it's effect: but the lower parts, which roll a long the bottom, will ſcarce be ſenſible of ſo ſmall a declivity, and will only have what motion they receive from the preſſion of the ſuperincumbent waters.

The natural viſcidity and coheſion of the particles of water, and that implication, as it were, which they ſeem to have with one another, make the lower, which are moved by means of the depth, carry along with them the upper, which in a horizontal channel would have no motion at all, or in a channel very little inclined, next to none. So that the lower, in this caſe, communicate to the upper, a part of the motion they have received from the preſſure of it. Hence the preſſure of it frequently happens that the greateſt velocity of a *river* is about the middle of it's depth; ſuch middle parts having the advantage of being preſſed with half the depth of the *river*, and of being free, at the ſame time, from the friction of the bottom.

To find whether the water of a *river* almoſt horizontal, flows by means of the velocity acquired in it's deſcent, or by the preſſure of it's depth; ſet up an obſtacle perpendicular thereto: if the water riſe and ſwell immediately againſt ſuch obſtacle, it runs in virtue of it's fall; or if it ſtop a little while, in virtue of it's preſſion.

Rivers according to this almoſt author, always make their own beds — If the bottom originally have been a large declivity; the water in conſequence hereof falling with a great deal of force, will have ſwept away the moſt elevated parts of the ſoil, and carrying them lower down, will gradually render the bottom horizontal; where the ſtream is ſwifteſt, there will the earth be moſt dug up, and conſequently there the greateſt cavity will be made.

The water having made it's bed horizontal, becomes ſo itſelf, and conſequently rakes with the leſs force againſt the bottom; till at length that force becomes only equal to the reſiſtence of the bottom. The bottom is now arrived at a ſtate of permanency, at leaſt for a conſiderable time: and the longer, according to the quality of the ſoil; clay and chalk reſiſting longer than ſand or mud.

On the other hand, the water is continually gnawing and eating off the brims of it's channel; and this with the more force as by the direction of it's ſtream it impinges more perpendicularly againſt them. By this means is has a continual tendency to render them parallel to it's own courſe; and when it has arrived as near that as poſſible, it ceaſes to have any effect that way. At the ſame time that it has thus rectified it's edges, it has inlarged it's own bed; that is, has loſt of it's depth, and conſequently of it's force and preſſure: this it continues to do till there is an equilibrium between the force of the water and the reſiſtence of it's banks, upon which they will remain without farther mutation—And it is evident from experience, that theſe equilibriums are all real; inaſmuch as we find that *rivers* only dig and widen to a certain pitch.

The very reverſe of all theſe things does alſo on ſome occaſions happen—*Rivers* whoſe waters are thick and muddy, raiſe their bed by letting part of the heterogeneous matters contained in them fall to the bottom: they alſo contract their banks by a continual appoſition of the ſame matter in bruſhing over them. This matter being thrown aſide far from the ſtream of water, might even ſerve, by reaſon of the obſcureneſs of the motion, to form new banks.

Now, theſe oppoſite effects ſeem almoſt always to concur, and are differently combined, according to the circumſtances; whence it is very difficult judging of the reſult. Yet muſt this combination be known very accurately, before any meaſures can be taken about *rivers*, eſpecially as to the diverting their courſes — The Lamona, which emptied itſelf into the Po, being turned another way to make it diſcharge itſelf into the Adriatic, was ſo altered, and it's force ſo far diminiſhed, now that it's waters were left to themſelves, that it raiſed it's bed a great heighth, by continual depoſitions of mud; till it became much higher then the Po, in it's utmoſt accretions, and needed very high banks or dykes to keep it from overflowing. See Alluvion.

A little *river* may be received into a large one, without either augmenting it's width or depth—This ſeeming paradox ariſes hence, that the addition of the little *river* may only go towards moving the waters before at reſt near the banks of the large one, and thus augmenting the velocity of the ſtream, in the ſame proportion as it does that of the quantity of water—Thus the Venetian branch of the Po ſwallowed up the Ferrareſe branch, and that of Panaro, without any enlargement of it's own dimenſions. And the ſame may be concluded proportionably of all other acceſſions to *rivers*; and in the general, of all new augmentations of water.

A *river* offering to enter into another, either perpendicularly, or in an oppoſite direction, will be diverted by degrees from that direction, and obliged to make itſelf a new and more favourable bed towards the mouth.

The union of two *rivers* into one, makes it flow the ſwifter; by reaſon, in lieu of the friction of four ſhores, they have only two to ſurmount, and that the ſtream, being farther diſtant from the banks, goes on with the leſs interruption; beſide that a greater quantity of water moving with a greater velocity digs deeper in the bed, and of courſe retrenches of it's former width—Hence alſo it is that *rivers*, by being united, take up leſs ſpace on the ſurface of the earth, and are more advantageous to low grounds which diſcharge their ſuperfluous moiſture into them, and have likewiſe leſs occaſion for dykes to prevent their overflowing.

Theſe advantages are ſo conſiderable, that S. Guglielmini thinks them worthy of nature's having had a view to them in her contriving to make the confluences of *rivers* ſo frequent as we find them.

To determine more preciſely the general laws of the motion of *rivers*, it may be obſerved that a *river* is ſaid to remain in the *ſame ſtate*, or to be in a *permanent ſtate*, when it flows uniformly, ſo as to be always at the ſame heighth in the ſame place. 2°. That a plane, which cutting a *river* is perpendicular to the bottom, as $p o n q$, is called the *ſection of a river* —See *Tab. Hydroſtat. fig.* 34.

Hence, when a *river* is terminated by flat ſides, parallel to each other, and perpendicular to the horizon, and the bottom alſo is a plane, either horizontal or inclined, the ſection of the *river* with theſe three planes makes right angles, and is a parallelogram.

Now in every *river* that is in a permanent ſtate, the ſame quantity of water flows in the ſame time through every ſection; for unleſs there be in every place as great a ſupply of water, as what runs from it, the *river* will not remain in the ſame ſtate. This will hold good, whatever be the irregularity of the bed, or channel, from which in other reſpects ſeveral changes in the motion of the *river* may ariſe: for example, a greater friction, in proportion to the inequality of the channel.

The irregularities in the motion of a *river* may be infinitely varied, nor can any rules be given to ſettle them.—To aſcertain their general courſe, all irregularities muſt be ſet aſide; only the general tenor or flux be conſidered.

Suppoſe then, the water to run in a regular channel, without any ſenſible friction, and that the channel is terminated with plane ſides, parallel to one another, and vertical; and alſo that the bottom is a plane, and inclined to the horizon—Let A E be the channel into which the water runs from a greater receptacle or head; and let the water always remain of the ſame depth at the head, ſo that the *river* may be in a permanent ſtate: the water here deſcends along an inclined plane, and is accelerated; whereby, becauſe the ſame quantity of water flows through every ſection, the depth of the water, as you recede from the head of the *river*, is continually diminiſhed, and it's ſurface will acquire the figure $i q s$.

To determine the velocity of the water in different places; ſuppoſe the aperture of the channel A D C B to be ſhut up with a plane; if there be an hole made in the plane, the water will ſpout the faſter through the hole, as the hole is more diſtant from the ſurface of the water $h i$; and the water will have the ſame celerity that a body falling from the ſurface of the water to the depth of the hole below it, would acquire: all which ariſes from the preſſure of the ſuperincumbent water—There is the ſame preſſure, that is, the ſame moving force, when the obſtacle at A C is taken away, upon which every particle of water enters into the channel with the celerity a body would acquire in falling from the ſurface of the water to the depth of the particle. This particle is moved along in an inclined plane in the channel, with an accelerated motion; and that in the ſame manner, as if falling vertically, it had continued it's motion to the ſame depth below the ſurface of the water in the head of the *river*.

So, if you draw the horizontal line $i t$, the particle at r will have the ſame celerity as a body falling the length iC, and running down C r can acquire; which is the celerity acquired by the body in falling down $t r$. Therefore the celerity of a particle may be every where meaſured, by drawing from it a perpendicular to the horizontal plane, which is conceived to run along the ſurface of the water in the head of the *river*; and the velocity which a body acquires in falling down that perpendicular, will be the celerity of the particle; which is greater, the longer the perpendicular is. From any point, as r, draw $r s$ perpendicular to the bottom of the *river*; this will meaſure the heighth or depth of the *river* — Since $r s$ is inclined to the horizon, if from the ſeveral points of that line, you draw perpendiculars to $i t$, they will be ſhorter the more diſtant they are from r, and the ſhorteſt of them will alſo be $s v$: therefore the celerities of the particles in the line $r s$, are ſo much the leſs, the nearer they are to the ſurface of the *river*, and the lower water is moved faſter than the upper water.

Yet the celerities of thoſe waters, as the *river* runs on, continually approach nearer and nearer to an equality: for the ſquares of thoſe celerities are as $r t$ to $s v$, the difference of which lines, as you recede from the head of the *river* is continually leſſened, becauſe of the depth $r s$, which is alſo continually diminiſhed as the lines themſelves are lengthened. Now as this obtains in the ſquares, it will much more obtain in the celerities themſelves, whoſe difference therefore is diminiſhed as they increaſe.

If the inclination of the bottom be changed up to the head of the *river*, ſo as to become y Z, and a greater quantity of water flow into the channel, it will be deeper every where in the *river* but the celerity of the water will not be changed—For this celerity does not depend on the depth of the water in the *river*, but, on the diſtance of the moved particle from the horizontal plane of the ſurface at the head continued over the ſaid particle; which diſtance is meaſured by the perpendicular *r t*, or *s v:* but theſe lines, are not changed by the afflux of water, provided the water remain at the ſame height in the baſon or head.

Suppoſe the upper part of the channel ſtopped by an obſtacle, as X, which deſcends a little way below the ſurface of the water; here, the whole water which comes cannot run through, therefore it muſt riſe: but the celerity of the water below this cataract is not increaſed; and the water that comes on, is continually heaped up, ſo that at laſt it muſt riſe ſo as to flow over the obſtacle, or the banks of the *river*. If the banks be raiſed, and the obſtacle be continued; the height of the water would raiſe above the line *i t:* but before that, the celerity of the water cannot be increaſed; in which caſe the heighth of all the water in the head will be increaſed; for, as we ſuppoſe the *river* in a permanent ſtate, there muſt continually be as great a ſupply of water to the head, as there runs from it down the channel; but if leſs water runs down, the heighth muſt neceſſarily be increaſed in the head, till the celerity of the water flowing under the obſtacle be increaſed to ſuch degree, that the ſame quantity of water ſhall run under the obſtacle, as uſed to run in the open channel before. See Wave.

RIVULET, a diminutive of *river*. See River.

RIXDOLLAR, or Rixdaller, a ſilver coin, ſtruck in ſeveral ſtates and free cities of Germany; as alſo in Flanders, Poland, Denmark, Sweden, *&c.* See Coin.

There is but little difference between the *rixdollar* and the *dollar*, another ſilver coin ſtruck in Germany; each being nearly equal to the French crown of three livres, the Spaniſh piece of eight, or 4*s.* 6*d.* ſterling. See Dollar, Crown, *&c.*

The *rixdollar* is one of the moſt current and univerſal coins in the world—It is uſed equally in the commerce of the Levant, the North, Muſcovy, and the Eaſt-Indies.

ROACH-*fiſhing*. See the article Fishing.

ROAD, Via, an open way or paſſage, forming a commodious communication between one place and another. See Way.

The Romans, of all people took the moſt pains in their *roads:* the labour and expences they were at to render them ſpacious, ſtraight, ſmooth, and agreeable to the very extremities of their empire, are incredible. See Bergier's *Hiſtory of the great roads of the Roman empire*.

Uſually, they ſtrengthened the ground by ramming it, laying it with flints, pebbles, or ſand; ſometimes by a lining of maſonry, rubbiſh, bricks, potſhards, *&c.* bound together with mortar.

F. Meneſtrier obſerves, that in ſome places in the Lyonnois he has found huge cluſters of flints cemented with lime, reaching 10 or 12 foot deep, and making a maſs as hard and compact as marble itſelf; and which, after reſiſting the injuries of time for 1600 years, is ſtill ſcarce penetrable by all the force of hammers, mattocks, *&c.* and yet the flints it conſiſts of are not bigger than eggs.

Sometimes they even paved their *roads* regularly, with large, ſquare free-ſtones: ſuch are the Appian and Flaminian ways, *&c.* See Paving.

The *roads* paved of very hard ſtones they uſually called *viæ ferreæ*, either becauſe they reſembled iron, or becauſe they reſiſted the iron of the horſe's feet, chariots, *&c.*

Roads are either *natural* or *artificial: terreſtrial* or *aquatic*, *public* or *private*.

Natural Road is that which has been frequented for a long ſucceſſion of time, and ſubſiſts with little expence, by reaſon of it's diſpoſition, *&c.*

Artificial Road is that made by labour of the hand, either of earth, or maſonry; and in the making whereof ſeveral difficulties were to be ſurmounted, ſuch are moſt of thoſe along the banks of rivers, through marſhes, lakes, *&c.*

Terreſtrial, or *land* Roads, are not only thoſe made upon the ground, but alſo thoſe formed of earth heaped up in manner of a bank, and ſuſtained by ſpurs, buttreſſes, and counterforts.

Aquatic Road, is a *road* made in the waters, whether currant, as over rivers, *&c.* or ſtagnant, as banks and cauſeways over moraſſes, *&c.* See Causeway.

Under this denomination are alſo comprehended navigable rivers, and artificial canals; as thoſe in Italy, Holland, *&c.*

Public Road, or *grand road*, is any common road, whether ſtraight, or a-croſs, military or royal, *&c.*—*Private road* is that made for the convenience of ſome particular houſe, *&c.*

Military Roads, ſo called among the Romans, were grand roads appointed for the marching of their armies into the provinces of the empire, for the aſſiſtance of their allies, *&c.* See Military.

The principal of theſe *roads* in England, are Watling-ſtreet, Ikenild-ſtreet, Foſs-way, and Erminage-ſtreet; which ſee under the article Way.

Double-Roads, among the Romans, were roads for carriages, having two pavements, or cauſe-ways; the one for thoſe going one way, the other for thoſe returning the other; to prevent claſhing, ſtopping, and confuſion.

Theſe two ways were ſeparated from each other by a bank raiſed in the middle, paved with bricks, for the convenience of foot-people, with borders, mounting ſtones from ſpace to ſpace, and military columns to mark the diſtance—Such was the *road* from Rome to Oſtia, called *Via Portuenſis*. See Military.

Subterraneous Road, is that dug in a rock, with the chiſſel, and left vaulted—Such is that of Puzzuoli near Naples, which is near half a league long, fifteen foot broad, and as many high. See Subterraneous.

Strabo ſays it was made by one Cocceius, a relation, probably, of Nerva's; but it has ſince been widened by Alphonſus king of Arragon and Naples, and made ſtraight by the viceroys — There is another of the ſame kind in the ſame kingdom, between Baiæ and Cumæ, called the *Grotto of Virgil*, becauſe mentioned by that poet in the ſixth book of his Æneid. See Grotto.

Road, in navigation, denotes a place of anchorage, at ſome diſtance from ſhore, and ſheltered from the winds; where veſſels uſually moor, to wait for a wind or tide proper to carry them into harbour, or to ſet ſail. See Harbour, Mooring, Anchor, *&c.*

When the bottom is clear of rocks, and the hold firm; and the place well covered from the wind; the *road* is ſaid to be good —An open *road* is one which has but little land on any ſide.

The *roads* within his majeſty's dominions are free to all merchant veſſels, either of his ſubjects or allies — Captains and maſters of ſhips who are forced by ſtorms, *&c.* to cut their cables, and leave their anchors in the *roads*, are obliged to fix up marks or buoys, on pain of forfeiture of their anchors, *&c.* See Buoy.

The maſters of ſhips coming to moor in a *road*, muſt caſt anchor at ſuch diſtance as that the cables, *&c.* may not mix, on pain of anſwering the damages: when there are ſeveral veſſels in the ſame *road*, the outermoſt to the ſeaward, is obliged to keep a light in his lanthorn in the night-time, to apprize veſſels coming in from ſea. See Mooring.

Cock-Road. See the article Cock-*road*.

ROADER, among ſailors, a ſhip that rides at anchor in a road. See Road and Anchor.

ROB, in pharmacy, *ſapa*; a preparation antiently much uſed, conſiſting of the juices of fruits, purified, and boiled to a conſumption of two thirds of their moiſture. See Medicine, *&c.*

There are *robs* made of quinces, ſloes, cherries, mulberries, elderberries, barberries, gooſeberries, and other fruits, for various diſeaſes — The juice of grapes thus prepared is more particularly called *rob* or *ſapa ſimplex*, which is almoſt of the conſiſtence of honey. See Sapa.

When only one third of the humidity is boiled away, it is called *defrutum:* and when only boiled to the conſiſtence of a ſoft electuary, a *reſin*.

The word *rob* is pure Arabic; and ſignifies, originally, a juice dried in the ſun, or over the fire; that it may keep the longer without damage.

Sometimes it alſo denotes a compoſition of ſome juice made up with honey or ſugar; in which ſenſe it is confounded with loche or lohoc. See Lohoc.

The *rob* is a form now much out of uſe: though there are ſeveral directed in the college diſpenſatory; as *robs* of black cherries, of ſloes, of quinces, *&c.*

ROBBERY, Robberia, or Roberia, in law, a felonious taking away another man's goods, from his perſon, preſence, or eſtate, againſt his will; putting him in fear, *&c.* —This is ſometimes alſo called *violent theft*; and it's puniſhment, be the value of the thing taken ever ſo ſmall, is death. See Theft, Felony, *&c.*

The word is ſaid to have taken it's riſe hence, that antiently *robbers* only took away the *robes*, or clothes from travellers. Though my lord Coke, in the third of his Inſtitutes, takes the name to have had it's riſe from Robin Hood, who lived under Richard I. in the borders of England and Scotland, by *robbery*, burning houſes, rape and ſpoil—Hence alſo,

Robers-men or *roberds-men*, mentioned in ſeveral ſtatutes for mighty thieves.

ROBBING. See the article House-*robbing*.

ROBE, Roba. See the article Gown.

Maſter of the Robes, is an officer of the houſhold, who has the ordering of all his majeſty's *robes*; as thoſe of the coronation, thoſe of St George's feaſt, of parliament, *&c.* as alſo of his wearing apparel, collar of SS's, *&c.*

He has ſeveral officers under him, as a clerk of the *robes*, a yeoman, three grooms, a page, a bruſher, ſempſtreſs, laundreſs, ſtarcher, keeper of the wardrobe at Whitehall, *&c.* See Wardrobe.

ROBERVALLIAN *lines*, a name given to certain lines, uſed for the transformation of figures; thus called from their inventor M. de Roberval. See Transmutation, &c.

The abbot Gallois, in the memoirs of the royal academy, an. 1693. obſerves, that the method of transforming figures, explained at the latter end of M. de Roberval's *treatiſe of indiviſibles*, is the ſame with that ſince publiſhed by Mr James Gregory, in his *univerſal geometry*; and that, by a letter of Torricelli's, it appears that *Roberval* was the inventor of this manner of transforming figures, by means of certain lines which Torricelli called *Robervallian lines*.

He adds, that it is highly probable that J. Gregory firſt learned the method in the journey he made to Padua in 1668; the method itſelf having been known in Italy from the year 1646; though the book was not publiſhed till the year 1692. This account Dr David Gregory has endeavoured to refute, in vindication of his brother — His anſwer is inſerted in the *Phil. Tranſact.* an. 1694, and the abbot has rejoined in the French memoirs of the academy, an. 1703. See Abbot.

ROBIGALIA, or Rubigalia, in antiquity. See Rubigalia.

ROBORANTIA, in medicine, *ſtrengtheners*; or ſuch medicines as ſtrengthen the parts, and give new vigour to the conſtitution. See Strengthener.

ROCAMBOLES, a mild ſort of garlic, by ſome called Spaniſh garlic; being much of the nature of ſhalot; and well known in cookery, in quality of a ſauce.

ROCHE, or Roch *allum*. See the article Allum.

ROCHET *, or Rocket, a law garment, wore by biſhops and abbots; reſembling a ſurplice, except in this, that the ſleeves are gathered at the wriſt; whereas the ſurplice is quite open.

* Menage derives the word from the Latin, *rochettus*, a diminutive of *rocchus*, uſed in writers of the lower latin for *tunica*, and formed originally from the German, *rok*.

The regular canons of St Auguſtin do alſo wear *rochets* under their copes.

Rochets alſo denote the mantles wore on days of ceremony, by the peers ſitting in the Engliſh parliament. See Peer and Parliament.

Thoſe of viſcounts have two bands or borders and a half; thoſe of earls, three; thoſe of marquiſſes, three and an half; and thoſe of dukes four. *Larrey*.

Rochet *fiſhing*. See the the article Fishing.

ROCK *, Rupes, a large maſs or block of hard ſtone, rooted in the ground. See Stone.

* The word is formed of the Greek ῥωξ, *rima*, cleft, chink; and ῥωξ from ῥηγνυμαι, I break; whence ῥακια, a ſtony ſhore.

There are various ways of breaking *rocks* with wood, gunpowder, &c. See Quarry, Wood, &c.

We have roads, grotto's, labryrinths, &c. dug through *rocks*. See Road, Grotto, Labyrinth, &c.

Rock *allum*. See the article Allum.

Rock-*cryſtal*, or *cryſtal of the rock*, is that ſuppoſed to be formed by a congelation of the lapidific juice which trickles down in *rocks*, and caverns. See Crystal and Stalactites.

Rock-*Salt*. See the article Salt.

ROCKET, in pyrotechny, an artificial fire-work, conſiſting of a cylindrical caſe of paper, filled with a compoſition of certain combuſtible ingredients; which being tied to a ſtick, mounts in the air to a conſiderable heighth, and there burſts. See Pyrotechny and Fire-Works.

The *rocket* has a great part in all fire works of entertainment, being not only uſed ſingly, but ſometimes, alſo, as an ingredient in others.

Beſides the *rocket* here defined, which is properly called the *ſky-rocket*, there is another, which from the ſphere it moves in, the water, is denominated *water-rocket*—The mechaniſm, preparation, &c. of each whereof, we ſhall here deſcribe.

Method of making Sky-Rockets — 1°. A concave cylindrical mould, or frame, AB (*Tab. Miſcellany*, *fig.* 7.) is turned, of hard wood, with a baſe BD, and a capital HC, uſually adorned with architectonical mouldings—The cylinder is to be open at both ends, and it's dimenſions, for *rockets* of various ſizes, as in the following article—When large, it is ſometimes alſo made of braſs or tin; and when ſmall, of bone.

2°. Of the ſame matter with the cylinder, is prepared a quadra, or foot E; in the middle whereof is turned a hemiſphere G, conſiderably leſs than that of the cavity of the frame; making the cap or head of another cylinder IK, and reaching up within the caſe; where it is kept ſteady by a pin LM.

Authors do not agree about the proportions — Simionowitz preſcribes thoſe that follow. If the diameter of the aperture HN be equal to that of a leaden-ball of a pound, or at moſt two pound weight; the heighth of the cylinder, with the baſe and capital HC, to be ſeven diameters, and the heighth of the quadra FE 1 $\frac{1}{3}$. The altitude of the cylinder KI, 1. The diameter IN $\frac{10}{23}$. The diameter of the hemiſphere G, $\frac{2}{3}$. The heighth of the capital AC, 1—The ſame author adds, that he finds by abundant experience, that if the diameter of the aperture be divided into 100 parts, according to the different weight of the leaden-balls to whoſe diameter it is equal, the following numbers being multiplied by 7 give the heighth HE.

Weight of Leaden-Ball.	Subſeptuple of Altitude HE.	Weight of Leaden-Ball.	Subſeptuple of Altitude HE.
1	100	20	86
2	98	30	82
4	96	40	78
6	94	50	75
10	91	70	67
15	88	100	57

The mould being ready, a wooden cylinder or mould AB (*fig.* 8.) is provided, whoſe diameter is $\frac{3}{4}$ of the aperture of the frame, and it's length equal to the height of the ſame; to which is fixed a haft or hilt AD. About this mould is a thick ſtrong paper rolled, till ſuch time as it fill the cavity of the frame. This done, where the haft is joined to the cylinder, as at A, it is choaked, *i. e.* firmly bound round with fine pack-thread, ſo as to conſtringe or ſtraighten the cavity thereof — The part thus choaked or bound up FG (*fig.* 9.) to be equal to the hemiſphere G (*fig.* 7.)

The caſe is now taken of the mould, and put into the cavity of the frame, *fig.* 7. the choak GF upon the hemiſphere; and in this diſpoſition is filled with a compoſition deſcribed in the following article, rammed ſtrongly in by means of a wooden cylinder or rammer fitting the cavity, and a mallet.

When filled, a paper cap of a conical form is glued over the end of the caſe filled laſt; and the ſpace left a-top filled with whole gun-powder, to the heighth of about one diameter; then the *rocket* bound, or choaked in E, as before in G. Laſtly, the *rocket* is bored, as is repreſented in AL *fig.* 9. care being taken to do it in the middle — Some, indeed, bore the *rocket* as they fill it, by thruſting a long, ſharp ſpike through the lower baſis, and drawing it out again when the *rocket* is full: But it is beſt not to bore till the *rocket* be uſed.

The boring is to go two thirds of the heighth of the *rocket*, abating one diameter of the cavity. The diameter of the bore in G is to be $\frac{1}{4}$ of the diameter of the cylinder; and in L $\frac{1}{8}$ of the lower diameter.

To make the *rocket* mount ſtraight up, it is tied faſt to the end of a long ſlender ſtick, MD, eight times as long as the *rocket*; in ſuch manner as that when poiſed on the finger near the touch-hole F, the ſtick (which is uſually made biggeſt at this end, and ſloping gently to the other) may preponderate though very little—The *rocket* thus equipped, is hung at freedom, aad lighted with port-fire.

Note, Some inſtead of a ſtick to make the *rocket* mount, furniſh it with two wings, as MN (*fig.* 10.) which have the ſame effect: and inſtead of paper ſome make the caſes of wood covered with leather; others of a thin iron plate. And ſome, inſtead of a wooden ſtick uſe an iron wire, with a plummet at the end of it.

The compoſition wherewith *rockets* are filled, conſiſts of the three following ingredients, *viz.* Salt-petre, charcoal and ſulphur; all well ground: but the proportions of theſe are various for *rockets* of various ſizes: as in the following table. Noting, that in ſmall *rockets* gun-powder duſt is added.

Compoſitions for Rockets *of various ſizes.*

Weight of Rocket.		Salt-pet.	Sul-phur.	Char-coal.	Gun-powder Duſt.
	℔	℔	℔	℔	
100 or	60	30	10	20	
50	30	30	7	18	
20	18	42	12	26	
15	12	23	8	16	
10	9	62	9	20	
9	6	35	5	10	
5	4	64	8	16	
3	2	60	2	15	
	1		2	6	32
Ounces.		Oun.	Oun.	Oun.	Ounces.
9		4	1	2	9
6		12	1 $\frac{1}{2}$	4	15
3		2	$\frac{1}{2}$	1 $\frac{1}{2}$	12
1				2	15

Note, ſeveral *rockets* being diſpoſed round the circumference of a wheel, whether circular or polygonous, the head of the one applied to the tail of another, and the wheel put in motion; as one *rocket* is ſpent another will take fire: and the wheel be continued in it's rotation.

As an additional ornament to *rockets*, it is uſual to furniſh them either with ſtars or with ſerpents, or ſparks, which take fire when the *rocket* burſts: and ſometimes little *rockets* are incloſed in great ones, to take fire when the great one is at it's greateſt heighth.

To make ſtars for Rockets — Mix 3 pound of ſalt-petre, with 11 ounces of ſulphur, 3 ounces of beaten gun-powder, and 10 of antimony. Moiſten the maſs with gum-water, and form them into little balls of the ſize of filberds; drying them well, either in the ſun or an oven. When dry incloſe a number of them in the conical cap of the *rocket*.

Method of making a water-Rocket—Make a *rocket* A B after the uſual manner, excepting in the number of choaks, expreſſed in *fig.* 11 — Let it's diameter be equal to that of a leaden-ball of two or three inches diameter, and let it be bored to a third part of it's heighth. Incloſe the *rocket* in a hollow paper cylinder; which ſmear over with melted pitch or wax, that it may reſiſt the moiſture.

Note, The weight of the *rocket* is to be ſo proportioned to that of the water, that the whole cylinder may be immerged —Some inſtead of a cylinder uſe a truncated cone, or even a ſpheriod; and ſome hang a weight to the end at which it is lighted.

Theory of the flight of ſky-Rockets — Mariotte takes the riſe of *rockets* to be owing to the impulſe or reſiſtence of the air againſt the flame: Dr Deſaguliers accounts for it otherwiſe.

Conceive the *rocket* to have no vent at the choak, and to be ſet on fire in the conical bore; the conſequence would be, either that the *rocket* would burſt in the weakeſt place, or that if all it's parts were equally ſtrong and able to ſuſtain the impulſe of the flame, the *rocket* would burn out immoveable—Now, as the force of the flame is equable, ſuppoſe it's action downwards, or that upwards ſufficient to lift 40 pounds. As theſe forces are equal, but their directions contrary, they will deſtroy each other's action. See Action and Reaction.

Imagine, then, the *rocket* opened at the choak: by this means the action of the flame downwards is taken away, and there remains a force equal to 40 pounds acting upwards, to carry up the *rocket*, and the ſtick it is tied to—Accordingly, we find that if the compoſition of the *rocket* be very weak, ſo as not to give an impulſe greater than the weight of the *rocket* and ſtick, it does not riſe at all: or if the compoſition be ſlow, ſo that a ſmall part of it only kindles at firſt, the *rocket* will not riſe.

The ſtick ſerves to keep it perpendicular: for if the *rocket* ſhould begin to tumble, moving round a point in the choak, as being the common centre of gravity of *rocket* and ſtick, there would be ſo much friction againſt the air, by the ſtick between the centre and the point, and the point would beat againſt the air with ſo much velocity, that the reaction of the medium would reſtore it to it's perpendicularity.

When the compoſition is burnt out, and the impulſe upwards is ceaſed, the common centre of gravity is brought lower towards the middle of the ſtick; by which means the velocity of the point of the ſtick is decreaſed, and that of the point of the *rocket* increaſed: ſo that the whole will tumble down, with the *rocket*-end foremoſt.

All the while the *rocket* burns, the common centre of gravity is ſhifting and getting downwards, and ſtill the faſter and the lower as the ſtick is the lighter: ſo that it ſometimes begins to tumble before it be burnt out: but when the ſtick being a little too heavy, the weight of the *rocket* bears a leſs proportion to that of the ſtick, the common centre of gravity will not get ſo low, but that the *rocket* will riſe ſtrait, though not ſo faſt.

Rocket, uſed for a habit. See Rochet.

ROD, Virga, Verge, a wand, or long ſlender ſtick or ſtaff. See Verge, Staff, &c.

Rod, is alſo uſed for a land meaſure of 16 foot ½: the ſame with *perch* and *pole*. See Perch.

Rod, in gauging. See Gauging-*rod*.

Rod-*knights*, in antient cuſtoms. See Redmans.

Black-Rod. See Black-*rod* and Usher.

Ezechiel's Rod. See the article Ezechiel.

Fiſhing-Rod. See the article Fishing.

Rhineland-Rod. See the article Rhineland.

ROE, of a fiſh, is that part which contains the ſperm or ſeed thereof. See Fish, Seed, &c.

That of male-fiſhes is uſually diſtinguiſhed by the name of *ſoft-roe*, or milt; that of the female by *hard roe*, or ſpawn. The ſoft *roe* when ſqueezed, yields a liquor reſembling milk; whence it's name *milt*: the French call it expreſly *milk*, *laite*. See Milt.

M. Petit found 342144 ovula or little eggs in the hard roe of a carp 18 inches long. Leewenhoeck, Tom. 1. p. 216, only found 211629 eggs in a carp; but four times the number in a cod; and page 188 he ſays, that a cod contains 9344000 eggs; and that the eggs of a fiſh of one year old, are as big as thoſe of a fiſh of 25 years old. *Mem. Acad. R. Scienc. an.* 1733. p. 290.

Roe, is alſo one of the beaſts of chaſe. See Beast and Game.

Roe-Buck, a beaſt of chace or foreſt. See Beast, Game, &c.

The *Roe-buck* is called an *hind* the firſt year; *gyrle* the ſecond; *henuſe* the third; *roe-buck of the firſt head* the fourth; and a *fair roe-buck* the fifth.

The *roe-buck* is a deer well known in Germany; and ſeems to have alſo been formerly found in England, though now the race be extinct. See Hunting.

ROFFENSIS *textus*. See the article Textus.

ROGA*, Ῥογα, in antiquity, a donative, or preſent which the auguſti or emperors made to the ſenators, magiſtrates, and even the people; and the popes or patriarchs to their clergy. See Donative.

The emperors uſed to diſtribute theſe *rogæ* on the firſt day of the year, or on their birth day; or on the natalis dies of the cities—The popes and patriarchs, in paſſion week.

This cuſtom of *rogæ*, or largeſſes, was firſt introduced by the tribunes of the people, to gain the populace more effectually over to their intereſt. The emperors at length took it up, and made ſuch diſtributions to the people, and even to the ſoldiery, who are hence called by the Greek writers of the middle age ῬΟΓΑΤΟΡΕΣ.

Roga is alſo uſed for the ordinary pay of the ſoldiery.

ROGATIO, Rogation, in the Roman juriſprudence, a demand made by the conſuls, or the tribunes, of the Roman people, when a law was propoſed to be paſſed. See Law.

The demand was made in theſe terms: *do you will and appoint that*. (for inſtance) *war be declared againſt Philip?* this was the *rogatio*; and what the people returned in anſwer, as, *the Roman people do appoint war to be made againſt Philip*, was the *decretum*, decree, or reſolve.

The word Rogatio is frequently alſo uſed for the decree it ſelf; to diſtinguiſh it from a ſenatus conſultum, or decree of the ſenate. See Senate.

Frequently, alſo, Rogatio is uſed in the ſame ſenſe with *law*; becauſe there never were any laws eſtabliſhed among the Romans, but what were done by this kind of *rogation*—Otherwiſe they were null. See Law.

ROGATION-*week*, the week immediately preceding Whitſunday; thus called from three faſts therein, *viz.* on the Monday, Tueſday, and Wedneſday, called alſo *rogations*, or *rogation days*, becauſe of the extraordinary prayers, and proceſſions then made for the fruits of the earth. See Procession.

The firſt who appointed theſe *rogations* was St Mamertus, biſhop of Vienne, who in 474 aſſembled ſeveral biſhops, to implore the mercy of God by a faſt of three days; on occaſion of an incurſion then made into the country by a great number of wild beaſts — Others ſay, it was firſt ſet on foot by the ſame Mamertus in 468, on occaſion of ſome public calamities.

ROGUE, in law, an idle and ſturdy beggar; who by antient ſtatutes, for the firſt offence, *is called a rogue of the firſt degree*; and puniſhed by whipping, and boring through the griſtle of the right ear with an hot iron, an inch in compaſs: and for the ſecond offence is called *a rogue of the ſecond degree*, and ordered to be put to death as felon, if he be above eighteen years of age. See Felony, &c.

ROLL, in the manufactories, ſomething wound and folded up in a cylindrical form. See Rolling.

Few ſtuffs are made up in *rolls*, except ſattins, gawſes, and crapes, which are apt to break, and take plaits not eaſy to be got out if folded otherwiſe—Ribbonds, however, and laces, galloons, and paduas of all kinds, are thus *rolled*.

To *roll hot*—By an arret of council in 1698, fullers, ſhearmen, &c. in Poictou, are prohibited to *roll* any ſtuff *hot*, either by having fire over or under it, or by heating the rollers, or otherwiſe, on forfeiture of 100 livres for the firſt offence; or of being degraded from the privileges of maſterſhip in caſe of a relapſe.

The antients made all their books up in form of *rolls*, or little columns; and in Cicero's time, the libraries conſiſted wholly of ſuch *rolls*—The dearneſs of parchment, and the cheapneſs of papyrus, whereof the *rolls* were made, was the reaſon that ſcarce any but paper *rolls* were uſed. See Book, Paper, Parchment, &c.

Voſſius ſays, they paſted ſeveral ſheets end to end, when filled on one ſide, and *rolled* them up together; beginning with the laſt, which they called *umbilicus*, and to which they faſtened an ivory or boxen ſtick, to ſuſtain the *roll*—To the other extremity they paſted a piece of parchment, to cover and preſerve it. See VOLUME, UMBILICUS, *&c.*

---

* The word is derived by ſome from the Latin *erogare*, to give, diſtribute; according to others from *rogo*, I aſk; hence, ſay they, it is that St Gregory the great calls ſuch diſtributions *precaria*; as being to be demanded, in order to be had — Others, again, derive it from the Greek ῥόγος, ſometimes uſed for corn; becauſe it antiently conſiſted in corn diſtributed among the populace, the ſoldiery, &c.

Theſe *rolls* were placed in the libraries, perpendicularly to the horizon — The Jews ſtill preſerve the antient uſage of *rolls* for the books they read in their ſynagogues. See BOOK-*binding*, &c.

ROLL *of tobacco*, is tobacco in the leaf, twiſted on the mill, and wound twiſt over twiſt, about a ſtick or roller.

The generality of tobacco in America is there ſold in *rolls*, of various weights: and it is not till after it's arrival in England, Spain, France, and Holland, that it is cut — *Roll* tobacco is what is chiefly uſed both for chewing and raſping. See TOBACCO.

ROLL, ROTULUS, in law, denotes a ſchedule of paper or parchment, which may be wound up by the hand into the faſhion of a pipe. See SCHEDULE, *&c.*

Of theſe, there are in the Exchequer ſeveral kinds, *viz.* the great *wardrobe-roll*, the *cofferer's-roll*, the *ſubſidy-roll*, &c. See PIPE, *&c.*

The word is formed from the French *rolle*, of the latin *rotulus*, becauſe moſt inſtruments and expeditions in law were antiently wrote on papers, or parchments ſewed or glewed together, and thus rolled up: whence the words *enroll*, *controll.* See INROLMENT, CONTROLL, *&c.*

ROLLS *of parliament*, are the manuſcript regiſters of the proceedings of our antient parliaments. See PARLIAMENT, REGISTER, *&c.*

Before the uſe of printing, and till the reign of Henry VII. our ſtatutes were all engroſſed in parchment (and by virtue of the king's writ for that purpoſe) proclaimed openly in every county.

In theſe *rolls* we have alſo a great many deciſions of difficult points of law, which were frequently in former times referred to the deciſion of that high court. See STATUTE, COMMON-LAW, *&c.*

Rider-ROLL, a ſchedule or ſmall piece of parchment, frequently ſewed or added to ſome part of a *roll*, or record.

Noy obſerves that the court ex officio, may award a *certiorari, ad informandam conſcientiam*; and that which is certified ſhall be annexed to the record, and called a *rider-roll.*

ROLL, is alſo uſed for a liſt of the names of ſeveral perſons of the ſame condition, or entered in the ſame engagement. See ROTULUS.

Court-ROLL, of a manor, is that wherein the names, rents, and ſervices of each tenant are copied and enrolled. See COURT, MANOR, TENANT, RENT, COPYHOLD, *&c.*

Muſter-ROLL, that wherein are entered the ſoldiers of every troop, company, regiment, *&c.* See MUSTER.

As ſoon as a ſoldier's name is wrote down on the *roll*, it is death for him to deſert. See DESERTION.

Calves-head-ROLL, is a *roll* in the two Temples, wherein every bencher is taxed yearly at 2 *s.* every barriſter at 1 *s.* 6 *d.* and every gentleman under the bar, at 1 *s.* to the cook, and other officers of the houſe, in conſideration of a dinner of calves-heads, provided in Eaſter term. See TEMPLE.

Ragman's ROLL, or *Ragimund's*-ROLL, is a roll denominated from *Ragimund*, a papal legate in Scotland, who calling before him all the people who held benefices in that kingdom, cauſed them upon oath to give in the value of their eſtates; according to which they were taxed in the court of Rome.

ROLLS, or *office of* ROLLS, in Chancery-lane, London, is an office appointed for the cuſtody of the *rolls* and records in chancery. See CHANCERY, RECORD, *&c.*

The maſter of this office is the ſecond perſon in that court; and in the abſence of the lord-chancellor, ſits as judge. See MASTER *of the rolls.*

This houſe or office was antiently called *domus converſorum*, as being appointed by king Henry III. for the uſe of converted Jews; but their irregularities occaſioned king Edward III. to expell them thence: upon which the place was deputed for the cuſtody of the *rolls*. See CONVERSORUM.

ROLL or ROUL among military men. See ROUL.

Bead-ROLL.	See the articles	BEAD-*roll.*
Check-ROLL.		CHECK-*roll.*
Counter-ROLL.		COUNTER-*roll.*

ROLL *of parchment*, denotes the quantity of ſixty ſkins. See PARCHMENT.

ROLL, in antiquity — From the time of Anaſtaſius, we find in the hands of the emperors, on medals, a kind of narrow long *roll* or ſachel, the meaning whereof has puzzled the antiquaries.

Some imagine it to be a *roll* or bundle of papers, memoirs, petitions, *&c.* preſented occaſionally to princes, conſuls and the like—Others take it to be a plaited handkerchief, which the perſons who preſided at the games, caſt forth as a ſignal for their beginning — Others will have it a bag of duſt and aſhes, preſented the emperor at the ceremony of his coronation, and called ΑΚΑΚΙΑ *q. d.* a means of preſerving innocence, by the remembrance of duſt, *&c.* See ACACIA.

ROLL, or ROLLER, is alſo a piece of wood, of a cylindrical form, uſed in the conſtruction of ſeveral machines, and in ſeveral works and manufactures; though ſometimes under other names. See ROLLING, *&c.*

It is on ſuch *rolls*, properly called *beams*, that the woollen, ſilken, and other threads are wound, whereof the weaver's works conſiſt — For which end each loom has uſually two, that of the gawſe-weavers, three. See LOOM.

In the glaſs manufacture they have a *running-roll*, being a thick cylinder of caſt braſs, ſerving to conduct the melted glaſs to the end of the table whereon large looking glaſſes, *&c.* are to be caſt. See GLASS.

The founders alſo uſe a *roller* to work the ſand which they uſe in making their moulds. See FOUNDERY.

The preſſes called calenders, as ſerving to calender ſtuffs withal, conſiſt, among other eſſential parts, of two *rollers.* See CALENDER.

It is alſo between two *rollers* that the waves are given to ſilks, mohairs, and other ſtuffs proper to be tabbied. See TABBY.

Prints, or impreſſions from copper-plates, are alſo taken by paſſing the plate and the paper between two *rollers.* See PRINT and ROLLING-*preſs-printing.*

ROLLS, in coining, are two iron inſtruments of a cylindrical figure, which ſerve to draw or ſtretch out the plates of gold, ſilver, and other metals, whereof the planks or pieces are to be formed for the ſpecies. See COINING.

ROLLS, in printing, are two large cylinders or barrels of wood, faſtened in the middle of what they call the cradle or gallows of the preſs; and which by means of a cord, or girt, paſſing over each, and a handle, which gives motion to one of them, draws the carriage of the preſs backwards and forwards. See PRINTING.

ROLLS, in the ſugar-works, are two large iron barrels which ſerve to bruiſe the canes, and expreſs the juice—They are caſt hollow, and their cavities filled up with wood; the cylinders of which are properly the *rollers.* See SUGAR.

ROLLS, or ROLLERS, among carpenters, maſons, *&c.* are plain cylinders of wood, ſeven or eight inches in diameter, and three or four foot long; uſed for the removing of beams, huge ſtones, and other like burdens, which are cumberſome, but not exceeding heavy.

Theſe *rollers* are placed ſucceſſively under the fore-part of the maſſives to be removed; which, at the ſame time, are puſhed forwards by levers, *&c.* applied behind, See LEVER.

Endleſs ROLLS — When blocks of marble, or other exceſſive heavy loads are to be removed; they uſe what they call *endleſs-rolls.*

Theſe to give them the greater force, and prevent their burſting are made of wood joined together by croſs-quarters: they are about double the length and thickneſs of the common *roller*; and beſides, are girt with ſeveral large iron hoops at each end—At a foot's diſtance from the ends are four mortiſes, or rather only two, but pierced through and through; into which are put the ends of long levers, which the workmen draw by ropes faſtened to the ends; ſtill changing the mortiſe, as the *roll* has made a quarter of a turn.

ROLL-*rich ſtones*, in antiquity, a ſeries of huge ſtones, ranged in a circle, near Morton in Marſh, in Oxfordſhire — There are a world of fabulous traditions about them — Among the antiquaries, ſome take them to be a monument of a victory, others a burying-place; and others a place for the coronation of the Daniſh kings.

Near Penros in cornwall is a like monument called.

ROLLER. See the article ROLL.

ROLLER in ſurgery, a long and broad ligature, uſually of linen cloth, for binding, ſurrounding and containing the parts of the human body, and keeping them in, or diſpoſing them to a ſtate of health.

A *Roller* conſiſts of two parts; the *body*, and the two extremities, which ſome call *heads*, or *chiefs*, and others *tails* —There are ſingle headed *rollers*, that is, ſuch as are rolled at one head only: double headed rollers, *&c.*

Again ſome are equally rolled and gathered together, as thoſe applied to fractures and diſlocated joints — Others are cut into ſeveral chiefs or heads; as thoſe for the head, chin, *&c.* —Others are compoſed of ſeveral ſwaths gathered and ſtitched together, as thoſe for the teſticles, *&c.* — Some again are *broad*, as thoſe for the breaſt, belly, *&c.*—Others narrow, as thoſe for the lips, fingers, *&c.* Guidon directs the roller for the ſhoulder to be ſix fingers broad; that for the thigh five; for the leg four; for the arm three; and the finger one.

ROLLING, ROTATION, in mechanics, a kind of circular motion, wherein the moveable turns round it's own axis, or centre, and continually applies new parts of it's ſurface to the body it moves upon. See MOTION, REVOLUTION, AXIS, *&c.*

Such is that of a wheel, a ſphere, or the like — Such particularly,

ticularly, are the motions of the earth, the planets, &c. See WHEEL, PLANET, EARTH, &c.

The motion of *rolling* is oppoſed to that of *ſliding*, wherein the ſame ſurface is continually applied to the plane it moves along. See SLIDING.

It muſt be noted, that in a wheel, it is only the circumference that properly *rolls*; the reſts proceeds in a compound, angular kind of motion, and partly *rolls*, partly ſlides—The not diſtinguiſhing between which two, occaſioned the difficulty of that celebrated problem the *rota Ariſtotelica*, Ariſtotle's wheel. See ROTA *Ariſtotelica*, and ANGULAR-*motion*.

The friction of a body in *rolling*, or the reſiſtence made to it by the roughneſs of the plane it moves on, is found to be much leſs than the friction in ſliding. See FRICTION.

Hence the great uſe of wheels, rolls, &c. in machines; as much of the action as poſſible being laid thereon, to make the reſiſtence the leſſer. See WHEEL, MACHINE, &c.

For the laws of bodies ROLLING *on inclined planes*, ſee *Inclined* PLANE, DESCENT, &c.

ROLLING-*preſs printing*. See PRINTING and PRESS.

ROMAN, ſomething belonging to the city of Rome—The *Roman* commonwealth laſted from the expulſion of the Tarquins, to the battle of Pharſalia, 460 years: The *Roman* empire, from the battle of Pharſalia to the building of Conſtantinople by Conſtantine, in the year 330, laſted 378 years; from the building of Conſtantinople to the taking of it by the Turks in 1453, was a farther period of 1123 years. See COMMONWEALTH, EMPIRE, &c.

A *Roman* citizen, at firſt, was only a citizen of Rome; at length the right of citizenſhip was given to other cities and people, both in Italy and the provinces. It was thus St Paul was a Roman citizen, Acts xvi. 21, 37, 38. xxii. 25, 26, 27. xxiii. 27, the city of Tarſus in Cilicia, a native of which he was, having the right of *Roman* citizens. See CITIZEN.

For the *Roman* ſenate, their magiſtracy, conſuls, ſoldiery, tribes, courts, names, weights, meaſures, coins, and other matters relating to the antiquities of that people, their policy, religion, law, cuſtoms, &c. ſee the reſpective articles in this work.

ROMAN *purple*, now denotes the dignity of a cardinal. See CARDINAL.

ROMAN, or ROMISH *church*, is that whereof the pope is head; in oppoſition to the reformed churches. See CHURCH, POPE, &c.

The *Roman* law is the civil law, or the written law, as compiled by the emperor Juſtinian. See CIVIL *law*.

A ROMAN *charity* among painters, is a picture of a woman ſuckling an old man—*Roman* knight, &c. See KNIGHT, &c.

King of the ROMANS, in our age, is a prince elected, and deſigned ſucceſſor to the German empire. See KING, EMPIRE and ELECTOR.

ROMAN *games*, *ludi* ROMANI, were ſolemn games held in antient Rome; thus called by way of eminence, and on account of their antiquity, as having been inſtituted by Romulus. See GAMES.

They were ſometimes, alſo called, *magni ludi*, from the great pomp and expence thereof; ſometimes *conſualia*, becauſe performed in honour of the god Neptune, who was alſo called *conſus*, in his quality of god of ſecret councils. See CONSUALIA.

They alſo bore the denomination of *ludi circenſes*, becauſe held in the circus. See CIRCENSES *ludi*, &c.

This ſolemnity, Halicarnaſſeus obſerves, was originally inſtituted by Evander, in honour of Neptune under the name of ἱππιος; whence the feſtival itſelf was called ἱππιοκρατια; and was afterwards renewed by Romulus in honour of the ſame deity, only under another name.

For Romulus, needing the advice of a god to counſel him in the deſign he had to furniſh his new citizens with wives, applied to the god of ſecret counſel himſelf, Conſus; proclaimed the conſualia, and invited his neighbours all a-round to the firſt celebration thereof—The conſequence was, the rape of the Sabine women, who came to be ſpectators thereof.

The great ceremony in theſe games conſiſted in a cavalcade of horſes and aſſes, adorned with garlands; Neptune being reputed the firſt author of riding on horſeback.

Their horſes here were of two kinds, *viz.* πομπικοι, or ſuch as were merely led up and down for ſtate; and δρομικοι, which were for race and exerciſe.

The other diverſions were fencing, and that till one of the combatants were killed on the ſpot; fighting with beaſts, and cæſtus, or whirlbats; wreſtling, running, leaping, ſea-fights, horſe-races, chariot-races, &c. See CIRCUS, GLADIATOR, GYMNASIASTICS, &c.

Theſe games, Livy tells us, were improved, and rendered much more magnificent by Tarquinius Priſcus—Manutius ſays, they were held on the eve of the nones of September, *i. e.* on the 14th day of the month.

ROMAN *order*, in architecture, is that more uſually called the *compoſite*. See COMPOSITE.

ROMAN *ballance*, *ſtatera* ROMANA, the ſteelyard. See BALLANCE and STEELYARD.

ROMAN *indiction*.	See the articles	INDICTION.
ROMAN *year*, &c.		YEAR, &c.
ROMAN *language*, &c.		LATIN, &c.

ROMANCE, antiently ROMAUNT, and ROMANT, a fabulous relation of certain intrigues and adventures in the way of love and gallantry; invented to entertain and inſtruct the readers. See FABLE, NOVEL, &c.

M. Fontenelle calls *romance*, poems in proſe; and Boſſu is not averſe to their being admitted as poetical pieces. See POEM and POETRY.

Setting aſide the verſification, it is certain an epic poem, and a *romance* are almoſt the ſame thing—The juſt notion, therefore of a *romance*, is, that it is a diſcourſe invented with art to pleaſe and improve the mind, and to form or mend the manners, by inſtructions diſguiſed under the allegory of an action or ſeries of actions, related in proſe, in a delightful, probable, yet ſurprizing manner. See EPIC.

A juſt *romance* conſiſts of two parts, *viz.* a moral, as it's foundation and end; and a fable, or action, as the ſuperſtructure and means. See ACTION, FABLE, &c.

It muſt alſo have the manners; that is, the characters muſt be diſtinguiſhed, and the manners muſt be neceſſary, and have all the other qualities of poetical manners. See MANNERS.

The incidents muſt be delightful, and to that end rightly diſpoſed and ſurprizing—The ſentiments fall under the ſame rules as in the drama. See SENTIMENT.

But the diction is allowed to be more lofty and figurative; as being a narration; and not having terror or pity, but admiration for it's end. See NARRATION, PASSION, &c.

As compoſitions of this kind have a long time been little elſe but hiſtories of amorous adventures, and feats of knight-errantry: the origin of *romances* is referred to that of love hiſtories; and accordingly Dearchus, a diſciple of Ariſtotle, who firſt wrote of thoſe matters, is uſually eſteemed the author of *romances*. Though Photius is of opinion that Antonius Diogenes's book on the errors and amours of Dinias and Dercyllis, gave birth to moſt of the works of this kind. Be this as it will, it is certain the antients have had their *romances* as well as we—Such are the amours of Rhodanis and Sinonides, deſcribed in iambics: ſuch is the *romance* of Leucippe and Clitophon, compoſed by Achilles Tatius, a Greek writer, afterwards a biſhop: ſuch are the four books of incredible things, wrote by Damaſius: ſuch are the Ethiopics of Heliodorus, wherein he relates the amours of Theagines and Chariclea—Laſtly, under the ſame claſs may be ranked the fables of Parthenius Nicenus, of Athenagoras, Theodorus Prodromus, Euſtathius, and Longus.

Indeed antiquity could ſcarce be reconciled to ſuch pieces, and always looked on them as abuſes—Photius, in his *Bibliotheca*, Cod. LXXXVII. gives a frightful account of that of Tatius: and the Ethiopics of Heliodorus, though one of the modeſteſt and moſt reſerved pieces of the kind, met with very ſevere treatment—That author was biſhop of Tricca in Theſſalia in the fourth century. Nicephorus tells us, that a ſynod, conſidering the danger which might accrue to youth from reading his *romance*, authoriſed as it was by the dignity of it's author, propoſed it to him, either to ſuppreſs his book, or renounce his biſhopric; and that he choſe the latter—But this hiſtory is a little doubtful.

Be this as it will, Heliodorus has ſerved as a model to all the *romances* wrote ſince; the marriage of Theagenes and Chariclea has produced a very numerous iſſue; even all the *romances* now extant in the world.

In imitation of the archbiſhop Turpinus, who paſſed for author of the *romance* of the feats of Charlemaign and Orlando, a great number of hiſtories of the like kind were wrote in France, during the time of Philip the fair; the authors whereof ſeemed to improve on each other, contending who ſhould go fartheſt in the merveilleux—Theſe books, being intended for the polite people, were wrote in the court language of that age; which was called the *romans*, *romant*, or *romanic*; whence the books themſelves were called by thoſe names: and thus by degrees *romans*, &c. became the general name of all books of this kind: whence at length our *romance*. See ROMANS.

Others derive the word from the Spaniſh *romanſero*, I invent, as intimating *romances* to be meer fictions — And hence it is that the antient poets of Provence, who were the firſt great dealers in *romances*, are called *troubadours*, q. d. finders, or inventors. See TROUBADOUR.

The French above all other nations, have applied themſelves to this kind of writing; whether it be owing to the natural taſte and genius of the people, or to the freedom, &c. wherewith they converſe with the women — They began chiefly with *romances* of chivalry; hence their Amadis, in 24 volumes; Palmerin d'Oliva, and of England, king Arthur, &c. whereof we have an agreeable critique in Don Quixote. See CHIVALRY, &c.

The later *romances* are much more polite; the beſt of which are the Aſtrea of D'Urfe; the Cyrus and Clelie of mademoiſelle de Scuderi; the Caſſandre and Cleopatre of la Calprenede; Ariane, Françion; and the Adventures of Telemachus by the late archbiſhop of Cambray, worth all the reſt.

The Germans, too, have their *romances*; eſpecially Hercules and Herculiſcus, the Aramena, Octavia, Arminius Otbert, *&c.*

The Italians have their Eromena, by Biondi; the works of Loredano, Marino, *&c.*—The Spaniards, their Diana, and Don Quixote—The Engliſh their Arcadia, *&c.* The Argenis of Barclay is rather a ſatyr than a *romance*. See Novel.

ROMANS, Romant, or Romanic, the polite language formerly ſpoke at the court of France; in contradiſtinction to the *Waloon*, or ancient Gauliſh, ſpoke by the common people. See Language and Waloon.

The Romans having ſubdued the Gauls, introduced part of their language among them; a mixture then of half Latin, half Gauliſh, or Celtic, conſtituted the *romans*; whereof the modern French is only an improvement. See French.

Hence to *enromance*, was to write in *romans*, &c. See Romance.

ROME-*ſcot*.	See the article Peter-*pence*.
Rome-*penny*.	

ROMPEE, or Rompu, in heraldry, is applied to ordinaries, that are repreſented as broken; and to chevrons whoſe upper points are cut off—As in *Tab. Herald. Fig.* 83—He beareth a chevron rompee, between three mullets, argent, by the name of Sault.

RONDEL, in fortification, a round tower, ſometimes erected at the foot of a baſtion. See Tower.

ROOD, a quantity of land, equal to the fourth part of an acre; and containing 40 ſquare perches or poles. See Acre, Perch, *&c.*

ROOF, in architecture, the uppermoſt part of a building; being that which forms the covering of the whole. See Building.

The *roof* contains the timber-work and it's furniture of ſlate or tile, wherewith a houſe is covered, or that which ſerves it as a cover.—Though carpenters uſually reſtrain *roof* to the timber-work only. See Covering and Ridge.

The form of the *roof* is various: ſometimes it is pointed, in which caſe the moſt beautiful proportion is to have it's profile an equilateral triangle.

Sometimes it is ſquare, that is, the pitch or angle of the ridge, is a right angle; which therefore, is a mean proportion between the pointed and the flat form.

A flat-*roof*, is that in the form and proportions of a triangular pediment. See Pediment—This is chiefly practiſed in Italy, and the hot countries, where little ſnow falls.

Sometimes the *roof* is in the pinnacle form. See Pinnacle.

Sometimes it has a double ridge—Sometimes it is cut, or mutilated, that is, conſiſts of a true, and a falſe *roof* which is laid over the former: this laſt is particularly called a *manſard*, from it's inventor M. Manſard, a famous French architect.

Sometimes, again, it is in form of a platform; as in moſt of the eaſtern buildings. See Platform.

Sometimes it is truncated, that is, inſtead of terminating in a ridge or angle, it is cut ſquare off at a certain height, and covered with a terrace, and ſometimes alſo incompaſſed with a balluſtrade. See Terrace.

Sometimes it is in manner of a dome, that is, it's plan is ſquare, and the contour circular. See Dome, Cupola, *&c.*

Sometimes it is round, that is, the plan is round or oval, and the profile ſpherical—Sometimes the baſe being very large, it is cut off to diminiſh it's height, and covered with a terrace of lead, raiſed a little in the middle, with ſky-lights from ſpace to ſpace, to give light to ſome corridore, or other intermediate piece, which without ſuch an expedient would be too dark. See House, *&c.*

Roof-*trees*, or Ruff-*trees*, are the timbers in a ſhip which go from the half-deck to the fore-caſtle.

The term is alſo uſed for the upper timbers of any building; whence, in the northern counties, it is common to ſignify a whole family, by ſaying, all under ſuch a-one's *roof-tree*.

Falſe Roof.	See	False.
Hip-Roof.		Hip-*roof*.
Attic of a Roof.		Attic.
Roof-*tyles*.		Tyle.

ROOM, in building—See Building, House, Apartment, Distribution, Chamber, *&c.*

Cook-Room. See the article Cook-*room*.

Flight of Rooms. See the article Fugue.

ROOMER, in the ſea language: a ſhip is ſaid to be a *roomer*, when ſhe is larger than ordinary. See Ship, Vessel, *&c.*

ROOT, Radix, in botany, that part of a plant which immediately imbibes the juices of the earth, and tranſmits them to the other parts, for nutrition. See Nutrition, Plant, Vegetable, *&c.*

The *root* conſiſts of woody fibres, covered with bark, more or leſs thick—It ariſes from a little point in the ſeed, called the *radicle*. See Radicle.

It is no ſmall difficulty to conceive, how the *root* ſhould always get downwards, and turn up the ſtem perpendicularly; conſidering that in the ſowing of plants the *radicle* muſt frequently happen to be upwards, and the plumule downwards! See Seed, Semination, Perpendicularity, *&c.*

The *root* is always found in the ground, in terreſtrial plants, except in a very few caſes: the ivy and cuſcuta, being perhaps the only plants where part of the *root* lies bare.

The *root* in plants has been obſerved to do the office of the ſtomach in animals, that is, to make the firſt and principal digeſtion of the alimentary matter—M. Reneaume ſhews that the *root* does the office of all the parts in the belly of animals deſtined for nutrition; it being the *root* that receives the nouriſhment, that prepares it, digeſts it, alters and changes it into ſap, to be afterwards diſtributed to all the parts. See Sap.

The ſmell, colour, and even taſte, ſhew how conſiderable an alteration the juices undergo in the *root*; ſo that the *root* may be laid down as the principle of vegetation. See Vegetation.

Plants growing at the bottom of the ſea have this peculiar to them, that they have no *roots*; at leaſt the parts which do the office of *roots* have nothing of the uſual figure of other roots—Theſe plants are uſually faſtened to ſome ſolid body; adhering to it by a very ſmooth poliſhed lamina, which does not ſend forth any fibre. Add to this, that the body to which they adhere, being frequently a rock or flint, appears very unfit to feed them, in caſe they had *roots*. M. Tournefort, therefore, conjectures that they are fed by a juice afforded them by the thick oily mud at the bottom of the ſea, which they receive by the pores of the exterior ſurface of this lamina.

Boerhaave obſerves, that the *root* may have any ſituation at pleaſure, with reſpect to the body of the plant; nor needs to be either loweſt or higheſt—Accordingly in the aloe, coral, moſſes, funguſes, *&c.* the *root* is frequently uppermoſt, and it's growth downwards. See Coral, Moss, *&c.*

Roots are divided by botaniſts into

1°. *Fibrous*, which ſend out only ſmall ſtrings from the bottom of the plant, diſtinct from each other—Such are thoſe of moſt ſpecies of graſs.

2°. More *thick and groſs*, which have a body thick and groſs, either branched out into ſubdiviſions, or elſe ſending out fibres from it all along.

These laſt are either *carnous*, which again are either,

- 1. *Broad* and ſwelling, or
- 2. *Long* and ſlender, which are commonly harder and more woody.

- *Broad* and ſwelling *roots* are either,
  - 1. *Bulbous*, which conſiſt but of one globe or head, and ſend out fibres from the bottom, and are either,
    - *Squammoſe*, and ſcaly, as lillies, martagon, *&c.*
    - *Coated*, which are involved in ſkins or coats, as cepa, hyacinthus, allium, *&c.* See Bulb.
  - 2. *Tuberous*, which are of a carnous, ſolid, and continued conſiſtence, and theſe either,
    - 1°. *Simple*, with but one globe or head, as rapa, crocus, *&c.*
    - 2°. *Manifold*, as aſphodelus, pæonia, *&c.*
- *Long roots* are either,
  - (1) *Sarmentous*, i. e. twiggy or branching, which ſhoot or creep out tranſverſe or in breadth: of theſe ſome are geniculated, knotty or jointy; as couch-graſs, mints, *&c.*
  - (2) *Cauliformes*, i. e. ſtemmy or ſtalky, which ſhoot down deep directly, though often ſending out fibres and ſtrings from the great ſtem; which alſo itſelf is ſometimes divided or branching.

Roots, in medicine—The principal *roots* uſed in the practice of phyſic, are rhubarb, rhaponticum, ſarſaparilla, ipecacuanha, jalap, zedoary, galangal, caſſumenar, gentian, turmeric, liquorice, madder, *&c.* See each deſcribed under it's proper article Rhubarb, Rhapontic, Sarsaparilla, Ipecacuanha, *&c.*

Root-*grafting*. See the article Engrafting.

Root, in mathematics, denotes a quantity which is multiplied by itſelf; or a quantity conſidered as the baſis or foundation of a higher power. See Quantity, Power, *&c.*

Thus if any number, as 2 be multiplied by itſelf, the product 4 is called the *ſquare*, or ſecond power of 2; and 2 itſelf, with regard to that power, is called the *root*; or particularly the *ſquare root* of 4. See Square-*root*.

Since, as unity is to the ſquare *root*, ſo is the *root* to the ſquare; the *root* is a mean proportional between unity and the ſquare—Thus 1 : 2 : : 2 : 4.

If a ſquare number, as 4, be multiplied by its *root* 2, the product 8 is called the *cube*, or third power of 2; and with reſpect to this cubic number 8, the number 2 is called *root*; or particularly the *cube-root*. See CUBE-*root*.

Since as unity is to the *root*, ſo is the *root* to the ſquare; and as unity is to the *root*, ſo is the ſquare to the cube; the *root* will be to the ſquare, as the ſquare to the cube, *i. e.* unity, the root, the ſquare, and the cube, are in continual proportion: thus: 1 : 2 : : 4 : 8. And the *cube-root* is the firſt of the two mean proportionals between unity and the cube.

To extract the ROOT out of a given number, or power, as 8, is the ſame thing as to find a number, as 2, which being multiplied by itſelf a certain number of times, *v. gr.* twice, produces the given number, 8. See EXTRACTION.

A *root*, whether ſquare or cubic, or of any higher power; if it conſiſt of two parts, is called a *binomial root*, or ſimply a *binomial*; as 24, or 20 + 4. See BINOMIAL.

If it conſiſt of three, a *trinomial*; as 245, or 240 + 5: Or 100 + 140 + 5. See TRINOMIAL—If of more than three, it is called *multinomial*; as 2456, or 2450 + 6, or 2400 + 56, or 2000 + 456, or 2000 + 400 + 50 + 6. See MULTINOMIAL.

ROOT *of an equation*, in algebra, denotes the value of the unknown quantity in an equation. See EQUATION.

Thus, if the equation be $a^2 + b^2 = x^2$, the *root* of the equation is the ſquare *root* of a, and that of b; expreſſed thus, $\surd(a^2 + b^2.)$

Real ROOT—If the value of x be poſitive, *i. e.* if x be a poſitive quantity; *e. gr.* $x = r$, the *root* is called a *real* or *true root*. See POSITIVE.

Falſe ROOT—If the value of x be negative, *e. gr.* $x = -5$, the *root* is ſaid to be falſe. See NEGATIVE.

Imaginary ROOT—If the value of x be the *root* of a negative quantity, *e. gr.* $\surd -5$; it is ſaid to be *imaginary*.

The great uſe of algebra is to bring problems to equations; then to reduce thoſe equations, or to exhibit them in the moſt ſimple terms. See REDUCTION.

What remains after this to the ſolution of the problems, is to extract the *roots* of the equations thus reduced, be they lines or numbers. See RESOLUTION.

Reſidual ROOT. See the article RESIDUAL.

Extraction of the ROOTS *of equations*. See EXTRACTION.

ROOTS, RADICES, in grammar, are the primitive words of a language, whence others are compounded or derived. See PRIMITIVE, COMPOUND, and DERIVATIVE.

Thus the Latin *fluo* is the *root* of *fluctus*, *fluxio*, *flumen*, *fluvialis*, *influxus*, *refluens*, *fluctifer*, *fluctiſonus*, *fluctivagus*, &c.—Thus alſo the Greek, θεος, is the *root* of αθεος, ενθεος, ενθουσιασμος, *&c.*

And thus alſo, though in a leſs proper ſenſe, the Daniſh *rood* is the *root* of the Engliſh word *root*; the Latin *radix* the *root* of the French *racine*, as *rado* is the *root* of *radix*; and perhaps ραδος the *root* of *rado*.

The Greek and Hebrew tongues are learnt by *roots*—Of dictionaries, ſome are in alphabetical order, others are diſpoſed by *roots*, as Scapula, Faber's Theſaurus, and the firſt edition of the dictionary of the French academy: in the edition of 1718, this laſt is thrown into the uſual alphabetical order. See DICTIONARY.

ROPE, an aſſemblage of ſeveral twiſts or ſtrings of hemp, twiſted together by means of a wheel: of various uſes, as in binding, ſtaying, drawing, ſuſpending, *&c.* See HEMP and CORDAGE.

When the *rope* is made very thick, it is called a *cable*, and when very ſmall, a *cord*. See CABLE and CORD.

The greateſt conſumption of *ropes* is in navigation, for the tackling of ſhips; where, though *ropes* include the whole cordage. See TACKLE and SHIP.

Yet there are ſeveral *ropes* particularly ſo denominated: as, the *entering rope*, hung at the ladder to help people up—The *top-rope*—A *bolt-rope*, wherein the ſail is ſowed—*Buoy-rope*, to which the buoy of the anchor hangs—*Gueſt-rope*, to tow the long-boat—The *keel-rope*—The *bucket-rope*—*Rudder-rope*, to ſave the rudder if it ſhould chance to be beat off—*Preventer-rope*, to ſave the yard in caſe any part of the tyes ſhould be broke—*Breaſt-rope*, to laſh the pannels to the maſts—*Guy-rope*, to keep the foremaſt forwards, directly over the hatch-way—And *boat-rope*, by which the boat hangs, or is faſtened a-ſtern of the ſhip—*Port-ropes*. See PORT-*ropes*.

ROPE, *cord*, or *ſtrap*, in the manage, is any of theſe tied round a pillar to which the horſe is faſtened when they begin to quicken and ſupple and teach him to fly from the ſhambrier, and not gallop faſtly or incompactly. See PILLAR.

In thoſe manages where there is no pillar, a man ſtands in the centre of the ground, and holds the end of the *rope*.

ROPES *of two pillars*, are the ropes or reins of a cavezon, uſed to a horſe that works between two pillars. See PILLAR.

ROPE *dancer*. See the article DANCER.

ROPE *deck*. See the article DECK.

ROPE *yarn*, is the yarn of any *rope* untwiſted—It commonly conſiſts of cable-ends, which are worn out; and are called *junks of the cables*—It ſerves for many purpoſes among the ſailors.

RORIFEROUS-*duct*, q. d. *dew dropping pipe*; a name given by ſome to the thoracic duct; from its ſlow manner of conveying, and as it were, inſtilling, the chyle into the common ſtream of blood. See THORACIC-*duct*, &c.

ROS, *dew*. See the article DEW.

ROS *vitrioli*, among chymiſts, is ſometimes uſed for the firſt phlegm diſtilled from vitriol in balneo mariæ. See VITRIOL.

ROSADE, a kind of liquor, prepared of pounded almonds and milk, mixed with clarified ſugar.

ROSARUM *acetum*. See ACETUM.

ROSARY, in the Romiſh church, a chaplet conſiſting of five, or fifteen decads of beads, to direct the recitation of ſo many ave maria's, in honour of the virgin. See CHAPLET.

ROSARY, alſo denotes a particular maſs or form of devotion addreſſed to the virgin, to which the chaplet of that name is accommodated. See VIRGIN.

Some attribute the inſtitution of the *roſary* to St. Dominic; but F. d'Achery ſhews it was in uſe in the year 1100; ſo that St. Dominic could only make it more celebrated—Others attribute it to Paulus Libycus, and others to St. Benedict; others to the Chartreux; others to venerable Bede; and others to Peter the hermit.

Thoſe who aſcribe it to St. Dominic, differ as to the particular time of its inſtitution; ſome referring it to the year 1208, when he preached againſt the Albigenſes; others will have him to have ſet it on foot in the courſe of his miſſions in Spain, before he paſſed into France.

Order of the ROSARY, or of *our lady of the* ROSARY, is an order of knights, ſuppoſed by Schoonebeck, and the jeſuit Bonanni, to have been inſtituted by St. Dominic; but by miſtake: for that ſaint never inſtituted any order under this name, and theſe authors apparently make a military order of an army of croiſees, who under the command of the count de Montfort, fought againſt the Albigenſes. See CROISADE and ALBIGENSES.

The abbot Juſtiniani, and M. Hermant, will have this order to have been eſtabliſhed by an archbiſhop of Toledo, named Frederick, after St. Dominic's death; and to have bore for a badge, a black and white croſs, in the middle whereof was repreſented our lady, holding her little ſon in one hand, and in the other a *roſary*—F. Mendo adds, that they were obliged to rehearſe the *roſary* on certain days—After all, F. Helyot doubts whether or no ſuch an order ever exiſted. See ORDER.

ROSATA *aloe.*	See	ALOE.
ROSATUM *acetum.*		ACETUM.
ROSATUM *aromaticum.*		AROMATICUM.
ROSATUM *vinum.*		VINUM.

ROSE, ROSA, Ῥοδον, a medicinal flower, produced by a ſhrub of the ſame name; which gives the denomination to ſeveral preparations in pharmacy. See FLOWER.

The kinds of *roſes* are various: thoſe chiefly uſed in medicine are the *red* and *damask roſes*—The *damask* are a good and ſafe purgative, adminiſtred in infuſion, or by way of ſyrup—The *red* are aſtringent; and the conſerve thereof uſed with ſucceſs againſt diſtempers of the breaſt and lungs, and diſorders of the eyes. See CONSERVE.

It is a tradition among the ancients, that the god of love made a preſent to Harpocrates the god of ſilence, of a beautiful *roſe*, the firſt that had been known; to engage him not to diſcover any of the private practices of his mother Venus—And hence it became a cuſtom to have a *roſe* placed in their rooms of mirth and entertainment, that under the aſſurance thereof they might be induced to lay aſide all conſtraint, and ſpeak what they pleaſed—Thus did the *roſe* become a ſymbol of ſilence; ſo that to be *ſub roſa*, under the *roſe*, denotes as much as to be out of danger of having any converſation divulged.

Sugar of ROSES, is made of red roſe leaves, dried in an oven, pulverized, and put into a proper quantity of ſugar diſſolved with a little water in a chafing-diſh over the fire. See SUGAR.

ROSE-WATER, a water drawn by diſtillation from red or damaſk *roſes*. See WATER.

It is a good cordial, and was formerly highly eſteemed; but is ſince fallen from its reputation, and is little uſed but in diſeaſes of the eyes, and in perfumes and waſhes.

It is however, in great eſteem throughout the Eaſt, particularly in China and Perſia, where the trade thereof is very conſiderable. The *roſe*-leaves remaining at the bottom of the ſtill, have the natural cathartic quality; and are alſo kept for a perfume.

Golden Roſe, is a roſe which the pope bleſſes at maſs on the firſt ſunday in Lent, while they ſing lætare Jeruſalem; and which, after maſs, he carries in proceſſion; and then ſends it as a preſent to ſome ſovereign prince.

The factions of the red and white **Roſe**, are famous in our Engliſh hiſtories—They had their riſe in 1454, under Henry VI. between the houſes of York and Lancaſter, and ended in Henry VII. who united the two branches—The houſe of Lancaſter had for its badge a *white roſe*; that of York a *red* one. See Faction.

Roſe-wood, *lignum rhodium*, or *aſpalathum*. See Aspalath.

Roſe, in architecture and ſculpture, an ornament cut in reſemblance of a *roſe*—See *Tab. Archit. fig.* 54. *fig.* 26. *lit. b.* See alſo Ornament.

It is chiefly uſed in frizes, corniches, vaults of churches, and particularly in the middle of each face of the corinthian abacus. See Abacus—And in the ſpaces between the modillions; under the plafonds of corniches. See Modillion.

Roſe *nails*. See the article Nail.

Roſe *diamond*. See the article Diamond.

Roſe-noble, an ancient Engliſh gold coin, firſt ſtruck in the reign of Edward III. and then called the *penny of gold*; ſince called *roſe-noble*, becauſe ſtamped with a *roſe*: It was current at 6 *s.* 8 *d.* See Noble and Coin.

ROSEMARY, Rosmarinus, a medicinal plant, whoſe flower, called *anthos*, is of conſiderable uſe in the preſent practice. See Anthos.

Roſemary flowers are eſteemed the principal aromatic of our growth—Dr. Quincy ſpeaks of them as good in moſt nervous complaints, eſpecially ſuch as ariſe from too great moiſture and cold, as they are hot and drying—In epilepſies, apoplexies, palſies, *&c.* they are rarely omitted in preſcription, under one form or other. See Aromatic.

They abound with a ſubtile detergent oil, which makes them deobſtruent and opening, whence their uſe in uterine obſtructions, the jaundice, *&c.*

They are the baſis of the celebrated Hungary water; with a ſmall quantity of which, diluted in common water, the confectioners make conſerve of *roſemary* flowers, eſſence of *roſemary*-water, *&c.* See Hungary-*water*.

ROSICRUCIANS. See the article Rosycrucians.

ROSIN, Resina, in pharmacy. See Resina.

Roſin, is particularly uſed for a reſinous matter prepared from the juice of the pine-tree; in ordinary uſe for the making of wax, *&c.*

Mr. Bent in the *Phil. Tranſ.* N°. 243, gives us the manner of preparing this coarſe drug, in the ſouthern parts of France; thus—The bark being pared off the pine, to make the ſap run down into a hole made at bottom to receive it; as the juice runs it leaves a cream or cruſt a-top; which being tempered with water, is ſold, by a cheat, for white bees-wax. See Wax.

When they have got a quantity of the juice they ſtrain it through a baſket, and what runs through is the common turpentine. See Turpentine.

What ſtays behind, they mix with water, and diſtilling it in an alembic, the matter that riſes is the oil of turpentine; and the calx that remains is the common *roſin*.

ROSOLIS, or Ros-solis, popularly, Rosa-solis, *ſun-dew*, an agreeable ſpirituous liquor, chiefly taken after meals, by way of dram, to aid digeſtion: being compoſed of burnt brandy, ſugar, cinnamon, and milk-water, and ſometimes perfumed with a little muſk.

It had its name, becauſe anciently prepared wholly of the juice of the plant *ros ſolis*; but that plant is no longer any ingredient therein.

The beſt is that of Turin—The French have a particular kind not called *ros ſolis*, but *du roy*; becauſe uſed with good effect by the late king Lewis XIV.—It is compoſed of Spaniſh wine, wherein are infuſed aniſe, fennel, aneth, coriander, *&c.* for three weeks.

ROSTING. See the articles Dressing, Food, *&c.*

ROSTRA, in antiquity, a part of the Roman forum, wherein orations, pleadings, funeral harangues, *&c.* were delivered. See Forum.

The *roſtrum* was a kind of chapel, taken out of the forum, and furniſhed with a ſuggeſtum, or eminence called more particularly the *roſtra*, where the orators ſtood to ſpeak.

It was adorned, or, as Livy ſays, built, with the beaks of ſhips taken from the people of Antium, in a naval engagement; whence the name. See Rostrum.

ROSTRALIS *corona*, Rostral *crown*, in antiquity. See Crown.

Roſtralis *columna*, Rostral *column*. See Column.

ROSTRI-FORMIS *proceſſus*, in anatomy, the ſame as coracoides. See Coracoides.

ROSTRUM litterally denotes the beak or bill of a bird. See Bird.

Hence the word is alſo figuratively applied to the beak, or fore-part of the head of a ſhip. See Head, Prow, Ship, *&c.* See alſo Rostra.

Roſtrum, in chymiſtry, ſignifies the noſe, or beak of the common alembic, which conveys the liquor diſtilled into its receiver. See Alembic, Receiver, Distillation, *&c.*

Roſtrum, is alſo a ſort of crooked ſciſſars, which the ſurgeons in ſome caſes make uſe of for the dilation of wounds.

ROSYCRUCIANS, Rosicrucians, or *brothers of the* Rosy-cross, a name aſſumed by a ſect or cabal of hermetical philoſophers; who aroſe, or at leaſt became firſt taken notice of in Germany, in the beginning of the laſt century. See Hermetical.

They bound themſelves together by a ſolemn ſecret, which they ſwore inviolably to preſerve; and obliged themſelves at their admiſſion into the order, to a ſtrict obſervance of certain eſtabliſhed rules.

They pretended to know all ſciences, and chiefly medicine; whereof they publiſhed themſelves the reſtorers—They pretended to be maſters of abundance of important ſecrets; and among others, that of the philoſopher's ſtone; all which they affirmed to have received by tradition from the ancient Egyptians, Chaldeans, the Magi, and Gymnoſophiſts. See Philosopher's *ſtone*.

Their chief was a German gentleman, educated in a monaſtery, where he learnt the languages—In 1378 he went to the Holy Land, where falling ſick at Damaſcus, he conſulted the Arabs, and other Eaſtern philoſophers, by whom he was ſuppoſed to be initiated into this wonderful art—At his return into Germany, he formed a ſociety, to whom he communicated the ſecrets he had brought with him out of the Eaſt, and died in 1484.

They have been diſtinguiſhed by ſeveral names, accommodated to the ſeveral branches of their doctrine—Becauſe they pretended to protract the period of human life, by means of certain noſtrums, and even to reſtore youth; they were called *immortales*.

As they pretended to know all things, they have been called *illuminati*; and becauſe they have made no appearance for ſeveral years, but have kept altogether incognito, they have been called the *inviſible brothers*.

Their ſociety is frequently ſignified by the letters F. R. C. with ſome among them interpret *fratres roris cocti*, it being pretended that the matter of the philoſopher's ſtone is dew concocted, exalted, *&c.*

Some, who are no friends to free maſonry, make the preſent flouriſhing ſociety of free maſons a branch of *Roſicrucians*; or rather the *Roſicrucians* themſelves under a new name, or relation; *viz.* as retainers to building—And it is certain, there are ſome free maſons who have all the characters of *Roſicrucians*; but how the æra and original of maſonry, as traced by Mr. Anderſon, and that of *Roſicrucianiſm*, here fixed from Naudæus, who has wrote expreſly on the ſubject, conſiſt, we leave others to judge. See Masonry.

ROT, a diſeaſe, which in moiſt years is incident to ſheep, in the ſame ground where in drier years they are free from it; which, yet, ariſes, not only from the moiſture, but from a certain principle of putrefaction, both in the air and the graſs. See Putrefaction.

ROTA, in mechanics. See the article Wheel.

Rota *Ariſtotelica*, *Ariſtotle's wheel*, is the name of a celebrated problem in mechanics, founded on the motion of a wheel about its axis; thus called, becauſe firſt, that we know of, taken notice of by Ariſtotle.

The difficulty is this—While a circle makes a revolution on its centre, advancing at the ſame time in a right line along a plane; it deſcribes, on that plane, a right line equal to its circumference. Now if this circle which we may call the *deferent*, carry with it another ſmaller circle concentric with it, and which has no motion but what it receives from the deferent; which is the caſe of the nave of a coach-wheel carried along by the wheel; this little circle, or nave, will deſcribe a line in the time of the revolution, equal, not to its own circumference, but to that of the wheel: for that its centre advances in a right line, as faſt as that of the wheel does; as being in reality the ſame therewith.

The matter of fact is certain—But how it ſhould be, ſeems a myſtery—It is obvious, that the wheel advancing during the revolution, muſt deſcribe a right line equal to its circumference; but how ſhould the nave, which revolves like the wheel, deſcribe a right line ſo much greater than its circumference?

The ſolution Ariſtotle gives is no more than a good explication of the difficulty—Galileo, who next attempted it, has recourſe to an infinity of infinitely little vacuities in the right line deſcribed by the two circles; and imagines that the little circle never applies its circumference to thoſe vacuities; but in reality only applies it to a line equal to its own circumference; though it appears to have applied it to a much larger.

But it is evident this is all gratis dictum—The vacuities are imaginary; and why does not the great circle apply its circumference to them? laſtly, the magnitude of theſe vacuities muſt be augmented or diminiſhed according to the different proportion of the two circles.

F. Tacquet will have it that the little circle making its rotation more ſlowly than the great one, does on that account deſcribe a line longer than its circumference; yet without applying any point of its circumference to more than one point of its baſe—But this is no more allowable than the former.

The attempts of ſo many great men proving vain; M. Dortous de Meyran, a French gentleman, had the good fortune to hit on a ſolution, which he ſent to the royal academy of ſciences; where being examined by Meſſ. de Louville and Saulmon, appointed for that purpoſe, they made their report that it was ſatisfactory—The ſolution is to this effect. The wheel of a coach is only acted on, or drawn in a right line: its circular motion, or rotation ariſes purely from the reſiſtance of the ground whereon it is applied. Now this reſiſtance is equal to the force wherewith the wheel is drawn in the right line; inaſmuch as it defeats that direction: of conſequence the cauſes of the two motions, the one right, the other circular, are equal, and therefore their effects, *i. e.* the motions are equal. And hence, the wheel deſcribes a right line on the ground, equal to its circumference.

For the nave of the wheel, the caſe is otherwiſe—It is drawn in a right line by the ſame force as the wheel, but it only turns round, becauſe the wheel turns, and can only turn with it, and at the ſame time therewith. Hence it follows that its circular velocity is leſs than that of the wheel, in the ratio of the two circumferences; and therefore its circular motion is leſs than its rectilinear one.

Since then it neceſſarily deſcribes a right line equal to that of the wheel, it can only do it by ſliding, or what they call the motion of *raſion*—That is, a part of the circular nave cannot be applied to a part of a right line greater than itſelf, but by ſliding along that part; and that more or leſs, as the part of the nave is leſs than that of the circle. See Rolling and Sliding.

Rota, is alſo uſed for a particular court or juriſdiction in Rome, eſtabliſhed for taking cognizance of beneficiary matters, &c. See Benefice, &c.

The *rota* conſiſts of twelve doctors, choſen out of the four nations of Italy, France, Spain, and Germany; three of them being Romans, one a Florentine, one a Milaneze, one of Bologna, one of Ferrara, one a Venetian, one a Frenchman, two Spaniards, and one a German; each having four clerks or notaries under him.

Their office is to judge of all beneficiary cauſes, both within Rome, and throughout the ſtate of the church, in caſe of appeal; and of all civil proceſſes for above 500 crowns.

They are alſo called *chaplains* of the pope, as ſucceeding the ancient judges of the ſacred palace, who held their court in his chapel. See Chaplain.

The denomination *rota*, *wheel*, ſome will have derived hence, that they officiate by rotation; others, becauſe the moſt important affairs of the Chriſtian world turn upon them—Du Cange derives it from *rota porphyretica*, becauſe the pavement of the chamber where they formerly ſate was of porphyry; and faſhioned like a wheel.

ROTATION, Rolling, in mechanics. See Rolling, Rota, &c.

Rotation, in geometry, the circumvolution of a ſurface round an immoveable line, called the *axis of rotation*. See Axis.

By ſuch *rotation* of planes, ſolids are formed or generated. See Genesis, Solid, &c.

The method of cubing ſolids, generated by ſuch *rotation*, is laid down by M. de Moivre, in his ſpecimen of the uſe of the doctrine of fluxions—For the fluxions of ſuch ſolids take the product of the fluxion of the abſciſſa, multiplied by the circular baſe; and ſuppoſe the ratio of a ſquare to the circle inſcribed, be as $\frac{n}{1}$: the equation expreſſing the nature or property of any circle, whoſe diameter is d; is $yy = dx - xx$. Therefore $\frac{4dx\dot{x} - x2\dot{x}}{n}$ is the fluxion of a portion of the ſphere, and conſequently, the portion itſelf $4\frac{1}{2}dxx - x\frac{1}{3}x^3$, and the circumſcribed cylinder is $4\frac{dxx - x^3}{n}$ therefore the portion of the ſphere is to the circumſcribed cylinder, as $\frac{1}{2}d - \frac{1}{3}x$ to $d - x$. *Philoſ. Tranſact.* N°. 216.

Rotation, Revolution, in aſtronomy. See Revolution.

Diurnal Rotation. See Diurnal *Rotation* and Earth.

Rotation, in anatomy, the action of the *muſculi rotatores*; or the motion which they give to the parts they are fixed to. See Rotator.

There are two muſcles, the great and the little obliquus, to perform the *rotation* of the eye—The obturator internus and externus effect the *rotation* of the thighs. See Eye, &c.

ROTATOR, in anatomy, a name given the oblique muſcles of the eye; called alſo from the direction of the fibres, *circulares*, and from the effect of their action, *amatorii*. See Amatorii, Obliquus and Eye.

ROTHER-beasts, a word uſed in old ſtatutes, and ſtill in the northern parts of England, for horned beaſts; as oxen, cows, ſteers, heifers, &c.

Whence *rother-ſoil*, in Herefordſhire, is taken for the dung or ſoil of ſuch cattle.

Rother-nails, are ſuch as have a very full head, and are uſed to faſten the rudder-irons in ſhips. See Nail.

ROTONDO, Rotundo, in architecture, a popular term for any building that is round both within and without ſide; whether it be a church, a ſalon, a veſtible, or the like. See Building, &c.

The moſt celebrated *rotondo* of antiquity is the pantheon at Rome, dedicated to Cybele and all the gods, by Agrippa, ſon-in-law of Auguſtus; but ſince conſecrated by pope Boniface IV. to the virgin and all the ſaints, under the title of *Sta. Maria della rotonda*. See Pantheon.

The chapel of the Eſcurial, which is the burying place of the kings of Spain, is alſo a *rotondo*; and in imitation of that of Rome, is alſo called *pantheon*. See Escurial.

ROTTENNESS, *Putredo*. See Putrifaction.

ROTULA, in anatomy. See the article Patella.

ROTULI *magni ingroſſator*. See Ingrossator.

ROTULORUM *cuſtos*. See the article Custos.

ROTULUS, a *roll*. See the article Roll.

Rotulus *contrarientium*—The earl of Lancaſter taking part with the barons againſt king Edward II. it was not thought fit, in reſpect of their power, to call them rebels or traytors, but only *contrarients*: accordingly, we have a record of thoſe times called *rotulus contrarientium*.

Rotulus *wintoniæ*, an exact ſurvey of all England, by counties, hundreds, and tithings; made under king Alfred; not unlike that of *domes-day*. See Domes-day.

It was thus called, becauſe anciently kept at Wincheſter, among other records of the kingdom.

ROTUNDO. See the article Rotondo.

ROTUNDUS, in anatomy, a name given to ſeveral muſcles, from the roundneſs of their body. See Muscle.

Such are the *rotundus major*, called alſo *teres major*; and the *rotundus minor*, called alſo *teres minor*, and *tranſverſalis*—See *Tab. Anat.* (*Myol*) *fig.* 2. *n.* 13. *fig.* 6. *n.* 12, 13. *fig.* 7. *n.* 14, 34 *and* 35. See alſo Teres, &c.

Pronator radii Rotundus. See Pronator.

ROUAGE. *Battery en* Rouage. See Battery.

ROUGE-*croſs*, q. d. *red-croſs*. See Poursuivants.

Rouge-*dragon*, q. d. *red-dragon*. See Poursuivants.

ROUGH, Roughness, in mechanics. See Friction and Resistence.

Rough *caſting*. See Plaistering and Mortar.

Rough *diamond*. See the article Diamond.

Rough *emerald*. See the article Emerald.

Rough *leaved plants*. See the article Plant.

Rough *taſte*. See Taste, Acerb, Austere, &c.

ROUL, Roll, or Rowl, in the military art—Officers of the ſame rank, who mount the ſame guards, and take their turns in relieving one another, are ſaid to *roul* or *roll*. See Guard.

ROULADE, in muſic, a trilling or quavering. See Quavering.

ROUND, Rotundus, in geometry. See Circle, Globe, Sphere, &c.

Round, in anatomy. See the article Rotundus.

Round, in muſic—The Italians call b *round*, what we call a *flat*; and the French b *mol*; and b *ſquare*, what we call a *ſharp*. See Flat and Sharp, &c.

Round, is alſo a military term, ſignifying a walk or turn which an officer, attended with ſome ſoldiers, takes in a garriſon or fortified place, *around* the ramparts, in the night-time; to liſten if any thing be ſtirring without the works, and to ſee that the centries are watchful, and do their duty, and all things in good order. See Counter *round*.

In ſtrict garriſon, the *rounds* go every quarter of an hour, that the rampart may be always furniſhed—The centuries are to challenge at a diſtance; and to reſt their arms as the *rounds* paſs, and let no one come near them.

When the *round* is near the corps de garde, the centry calls aloud, *who comes there?* and when the anſwer is, *the rounds*, he ſays, *ſtand*; then calls for the corporal of the guard, who draws his ſword, and calls alſo, *who comes there?* and when it

Golden Rose, is a roſe which the pope bleſſes at maſs on the firſt ſunday in Lent, while they ſing lætare Jeruſalem; and which, after maſs, he carries in proceſſion; and then ſends it as a preſent to ſome ſovereign prince.

The factions of the red and white Rose, are famous in our Engliſh hiſtories—They had their riſe in 1454, under Henry VI. between the houſes of York and Lancaſter, and ended in Henry VII. who united the two branches—The houſe of Lancaſter had for its badge a *white roſe*; that of York a *red* one. See Faction.

Rose-wood, *lignum rhodium*, or *aſpalathum*. See Aspalath.

Rose, in architecture and ſculpture, an ornament cut in reſemblance of a *roſe*—See *Tab. Archit. fig.* 54. *fig.* 26. *lit. b.* See alſo Ornament.

It is chiefly uſed in frizes, corniches, vaults of churches, and particularly in the middle of each face of the corinthian abacus. See Abacus—And in the ſpaces between the modillions; under the plafonds of corniches. See Modillion.

Rose *nails*. See the article Nail.

Rose *diamond*. See the article Diamond.

Rose-noble, an ancient Engliſh gold coin, firſt ſtruck in the reign of Edward III. and then called the *penny of gold*; ſince called *roſe-noble*, becauſe ſtamped with a *roſe:* It was current at 6 *s.* 8 *d.* See Noble and Coin.

ROSEMARY, Rosmarinus, a medicinal plant, whoſe flower, called *anthos*, is of conſiderable uſe in the preſent practice. See Anthos.

Roſemary flowers are eſteemed the principal aromatic of our growth—Dr. Quincy ſpeaks of them as good in moſt nervous complaints, eſpecially ſuch as ariſe from too great moiſture and cold, as they are hot and drying—In epilepſies, apoplexies, palſies, &c. they are rarely omitted in preſcription, under one form or other. See Aromatic.

They abound with a ſubtile detergent oil, which makes them deobſtruent and opening, whence their uſe in uterine obſtructions, the jaundice, &c.

They are the baſis of the celebrated Hungary water; with a ſmall quantity of which, diluted in common water, the confectioners make conſerve of *roſemary* flowers, eſſence of *roſemary*-water, &c. See Hungary-*water*.

ROSICRUCIANS. See the article Rosycrucians.

ROSIN, Resina, in pharmacy. See Resina.

Rosin, is particularly uſed for a reſinous matter prepared from the juice of the pine-tree; in ordinary uſe for the making of wax, &c.

Mr. Bent in the *Phil. Tranſ.* N°. 243, gives us the manner of preparing this coarſe drug, in the ſouthern parts of France; thus—The bark being pared off the pine, to make the ſap run down into a hole made at bottom to receive it; as the juice runs it leaves a cream or cruſt a-top; which being tempered with water, is ſold, by a cheat, for white bees-wax. See Wax.

When they have got a quantity of the juice they ſtrain it through a baſket, and what runs through is the common turpentine. See Turpentine.

What ſtays behind, they mix with water, and diſtilling it in an alembic, the matter that riſes is the oil of turpentine; and the calx that remains is the common *roſin*.

ROSOLIS, or Ros-solis, popularly, Rosa-solis, *ſun-dew*, an agreeable ſpirituous liquor, chiefly taken after meals, by way of dram, to aid digeſtion: being compoſed of burnt brandy, ſugar, cinnamon, and milk-water, and ſometimes perfumed with a little muſk.

It had its name, becauſe anciently prepared wholly of the juice of the plant *ros ſolis*; but that plant is no longer any ingredient therein.

The beſt is that of Turin—The French have a particular kind not called *ros ſolis*, but *du roy*; becauſe uſed with good effect by the late king Lewis XIV.—It is compoſed of Spaniſh wine, wherein are infuſed aniſe, fennel, aneth, coriander, &c. for three weeks.

ROSTING. See the articles Dressing, Food, &c.

ROSTRA, in antiquity, a part of the Roman forum, wherein orations, pleadings, funeral harangues, &c. were delivered. See Forum.

The *roſtrum* was a kind of chapel, taken out of the forum, and furniſhed with a ſuggeſtum, or eminence called more particularly the *roſtra*, where the orators ſtood to ſpeak.

It was adorned, or, as Livy ſays, built, with the beaks of ſhips taken from the people of Antium, in a naval engagement; whence the name. See Rostrum.

ROSTRALIS *corona*, Rostral *crown*, in antiquity. See Crown.

Rostralis *columna*, Rostral *column*. See Column.

ROSTRI-FORMIS *proceſſus*, in anatomy, the ſame as coracoides. See Coracoides.

ROSTRUM litterally denotes the beak or bill of a bird. See Bird.

Hence the word is alſo figuratively applied to the beak, or fore-part of the head of a ſhip. See Head, Prow, Ship, &c. See alſo Rostra.

Rostrum, in chymiſtry, ſignifies the noſe, or beak of the common alembic, which conveys the liquor diſtilled into its receiver. See Alembic, Receiver, Distillation, &c.

Rostrum, is alſo a ſort of crooked ſciſſars, which the ſurgeons in ſome caſes make uſe of for the dilation of wounds.

ROSYCRUCIANS, Rosicrucians, or *brothers of the* Rosy-cross, a name aſſumed by a ſect or cabal of hermetical philoſophers; who aroſe, or at leaſt became firſt taken notice of in Germany, in the beginning of the laſt century. See Hermetical.

They bound themſelves together by a ſolemn ſecret, which they ſwore inviolably to preſerve; and obliged themſelves at their admiſſion into the order, to a ſtrict obſervance of certain eſtabliſhed rules.

They pretended to know all ſciences, and chiefly medicine; whereof they publiſhed themſelves the reſtorers—They pretended to be maſters of abundance of important ſecrets; and among others, that of the philoſopher's ſtone; all which they affirmed to have received by tradition from the ancient Egyptians, Chaldeans, the Magi, and Gymnoſophiſts. See Philosopher's *ſtone*.

Their chief was a German gentleman, educated in a monaſtery, where he learnt the languages—In 1378 he went to the Holy Land, where falling ſick at Damaſcus, he conſulted the Arabs, and other Eaſtern philoſophers, by whom he was ſuppoſed to be initiated into this wonderful art—At his return into Germany, he formed a ſociety, to whom he communicated the ſecrets he had brought with him out of the Eaſt, and died in 1484.

They have been diſtinguiſhed by ſeveral names, accommodated to the ſeveral branches of their doctrine—Becauſe they pretended to protract the period of human life, by means of certain noſtrums, and even to reſtore youth; they were called *immortales*.

As they pretended to know all things, they have been called *illuminati*; and becauſe they have made no appearance for ſeveral years, but have kept altogether incognito, they have been called the *inviſible brothers*.

Their ſociety is frequently ſignified by the letters F. R. C. with ſome among them interpret *fratres roris cocti*, it being pretended that the matter of the philoſopher's ſtone is dew concocted, exalted, &c.

Some, who are no friends to free maſonry, make the preſent flouriſhing ſociety of free maſons a branch of *Roſicrucians*; or rather the *Roſicrucians* themſelves under a new name, or relation; *viz.* as retainers to building—And it is certain, there are ſome free maſons who have all the characters of *Roſicrucians*; but how the æra and original of maſonry, as traced by Mr. Anderſon, and that of *Roſicrucianiſm*, here fixed from Naudæus, who has wrote expreſly on the ſubject, conſiſt, we leave others to judge. See Masonry.

ROT, a diſeaſe, which in moiſt years is incident to ſheep, in the ſame ground where in drier years they are free from it; which, yet, ariſes, not only from the moiſture, but from a certain principle of putrefaction, both in the air and the graſs. See Putrefaction.

ROTA, in mechanics. See the article Wheel.

Rota *Ariſtotelica*, *Ariſtotle's wheel*, is the name of a celebrated problem in mechanics, founded on the motion of a wheel about its axis; thus called, becauſe firſt, that we know of, taken notice of by Ariſtotle.

The difficulty is this—While a circle makes a revolution on its centre, advancing at the ſame time in a right line along a plane; it deſcribes, on that plane, a right line equal to its circumference. Now if this circle which we may call the *deferent*, carry with it another ſmaller circle concentric with it, and which has no motion but what it receives from the deferent; which is the caſe of the nave of a coach-wheel carried along by the wheel; this little circle, or nave, will deſcribe a line in the time of the revolution, equal, not to its own circumference, but to that of the wheel: for that its centre advances in a right line, as faſt as that of the wheel does; as being in reality the ſame therewith.

The matter of fact is certain—But how it ſhould be, ſeems a myſtery—It is obvious, that the wheel advancing during the revolution, muſt deſcribe a right line equal to its circumference; but how ſhould the nave, which revolves like the wheel, deſcribe a right line ſo much greater than its circumference?

The ſolution Ariſtotle gives is no more than a good explication of the difficulty—Galileo, who next attempted it, has recourſe to an infinity of infinitely little vacuities in the right line deſcribed by the two circles; and imagines that the little circle never applies its circumference to thoſe vacuities; but in reality only applies it to a line equal to its own circumference; though it appears to have applied it to a much larger.

But it is evident this is all gratis dictum—The vacuities are imaginary; and why does not the great circle apply its circumference to them? laſtly, the magnitude of theſe vacuities muſt be augmented or diminiſhed according to the different proportion of the two circles.

F. Tacquet will have it that the little circle making its rotation more ſlowly than the great one, does on that account deſcribe a line longer than its circumference; yet without applying any point of its circumference to more than one point of its baſe—But this is no more allowable than the former.

The attempts of ſo many great men proving vain; M. Dortous de Meyran, a French gentleman, had the good fortune to hit on a ſolution, which he ſent to the royal academy of ſciences; where being examined by Meſſ. de Louville and Saulmon, appointed for that purpoſe, they made their report that it was ſatisfactory—The ſolution is to this effect. The wheel of a coach is only acted on, or drawn in a right line: its circular motion, or rotation ariſes purely from the reſiſtance of the ground whereon it is applied. Now this reſiſtance is equal to the force wherewith the wheel is drawn in the right line; inaſmuch as it defeats that direction: of conſequence the cauſes of the two motions, the one right, the other circular, are equal, and therefore their effects, *i. e.* the motions are equal. And hence, the wheel deſcribes a right line on the ground, equal to its circumference.

For the nave of the wheel, the caſe is otherwiſe—It is drawn in a right line by the ſame force as the wheel, but it only turns round, becauſe the wheel turns, and can only turn with it, and at the ſame time therewith. Hence it follows that its circular velocity is leſs than that of the wheel, in the ratio of the two circumferences; and therefore its circular motion is leſs than its rectilinear one.

Since then it neceſſarily deſcribes a right line equal to that of the wheel, it can only do it by ſliding, or what they call the motion of *raſion*—That is, a part of the circular nave cannot be applied to a part of a right line greater than itſelf, but by ſliding along that part; and that more or leſs, as the part of the nave is leſs than that of the circle. See Rolling and Sliding.

Rota, is alſo uſed for a particular court or juriſdiction in Rome, eſtabliſhed for taking cognizance of beneficiary matters, &c. See Benefice, &c.

The *rota* conſiſts of twelve doctors, choſen out of the four nations of Italy, France, Spain, and Germany; three of them being Romans, one a Florentine, one a Milaneze, one of Bologna, one of Ferrara, one a Venetian, one a Frenchman, two Spaniards, and one a German; each having four clerks or notaries under him.

Their office is to judge of all beneficiary cauſes, both within Rome, and throughout the ſtate of the church, in caſe of appeal; and of all civil proceſſes for above 500 crowns.

They are alſo called *chaplains* of the pope, as ſucceeding the ancient judges of the ſacred palace, who held their court in his chapel. See Chaplain.

The denomination *rota*, *wheel*, ſome will have derived hence, that they officiate by rotation; others, becauſe the moſt important affairs of the Chriſtian world turn upon them—Du Cange derives it from *rota porphyretica*, becauſe the pavement of the chamber where they formerly ſate was of porphyry; and faſhioned like a wheel.

ROTATION, Rolling, in mechanics. See Rolling, Rota, &c.

Rotation, in geometry, the circumvolution of a ſurface round an immoveable line, called the *axis of rotation*. See Axis.

By ſuch *rotation* of planes, ſolids are formed or generated. See Genesis, Solid, &c.

The method of cubing ſolids, generated by ſuch *rotation*, is laid down by M. de Moivre, in his ſpecimen of the uſe of the doctrine of fluxions—For the fluxions of ſuch ſolids take the product of the fluxion of the abſciſſa, multiplied by the circular baſe; and ſuppoſe the ratio of a ſquare to the circle inſcribed, be as $\frac{n}{1}$: the equation expreſſing the nature or property of any circle, whoſe diameter is d; is $yy = dx - xx$. Therefore $\frac{4dx\dot{x} - x2\dot{x}}{n}$ is the fluxion of a portion of the ſphere, and conſequently, the portion itſelf $4\frac{1}{2}dxx - x\frac{1}{3}x^3$, and the circumſcribed cylinder is $4\frac{dxx - x^3}{n}$ therefore the portion of the ſphere is to the circumſcribed cylinder, as $\frac{1}{2}d - \frac{1}{3}x$ to $d - x$. *Philoſ. Tranſact.* N°. 216.

Rotation, Revolution, in aſtronomy. See Revolution.

Diurnal **Rotation**. See Diurnal *Rotation* and Earth.

Rotation, in anatomy, the action of the *muſculi rotatores*; or the motion which they give to the parts they are fixed to. See Rotator.

There are two muſcles, the great and the little obliquus, to perform the *rotation* of the eye—The obturator internus and externus effect the *rotation* of the thighs. See Eye, &c.

ROTATOR, in anatomy, a name given the oblique muſcles of the eye; called alſo from the direction of the fibres, *circulares*, and from the effect of their action, *amatorii*. See Amatorii, Obliquus and Eye.

ROTHER-beasts, a word uſed in old ſtatutes, and ſtill in the northern parts of England, for horned beaſts; as oxen, cows, ſteers, heifers, &c.

Whence *rother-ſoil*, in Herefordſhire, is taken for the dung or ſoil of ſuch cattle.

Rother-nails, are ſuch as have a very full head, and are uſed to faſten the rudder-irons in ſhips. See Nail.

ROTONDO, Rotundo, in architecture, a popular term for any building that is round both within and without ſide; whether it be a church, a ſalon, a veſtible, or the like. See Building, &c.

The moſt celebrated *rotondo* of antiquity is the pantheon at Rome, dedicated to Cybele and all the gods, by Agrippa, ſon-in-law of Auguſtus; but ſince conſecrated by pope Boniface IV. to the virgin and all the ſaints, under the title of *Sta. Maria della rotonda*. See Pantheon.

The chapel of the Eſcurial, which is the burying place of the kings of Spain, is alſo a *rotondo*; and in imitation of that of Rome, is alſo called *pantheon*. See Escurial.

ROTTENNESS, *Putredo*. See Putrifaction.

ROTULA, in anatomy. See the article Patella.

ROTULI *magni ingroſſator*. See Ingrossator.

ROTULORUM *cuſtos*. See the article Custos.

ROTULUS, a *roll*. See the article Roll.

Rotulus *contrarientium*—The earl of Lancaſter taking part with the barons againſt king Edward II. it was not thought fit, in reſpect of their power, to call them rebels or traytors, but only *contrarients*: accordingly, we have a record of thoſe times called *rotulus contrarientium.*

Rotulus *wintoniæ*, an exact ſurvey of all England, by counties, hundreds, and tithings; made under king Alfred; not unlike that of *domes-day*. See Domes-day.

It was thus called, becauſe anciently kept at Wincheſter, among other records of the kingdom.

ROTUNDO. See the article Rotondo.

ROTUNDUS, in anatomy, a name given to ſeveral muſcles, from the roundneſs of their body. See Muscle.

Such are the *rotundus major*, called alſo *teres major*; and the *rotundus minor*, called alſo *teres minor*, and *tranſverſalis*—See *Tab. Anat.* (*Myol*) *fig.* 2. *n.* 13. *fig.* 6. *n.* 12, 13. *fig.* 7. *n.* 14, 34 *and* 35. See alſo Teres, &c.

Pronator radii **Rotundus**. See Pronator.

ROUAGE. *Battery en* Rouage. See Battery.

ROUGE-*croſs*, q. d. *red-croſs*. See Poursuivants.

Rouge-*dragon*, q. d. *red-dragon*. See Poursuivants.

ROUGH, Roughness, in mechanics. See Friction and Resistence.

Rough *caſting*. See Plaistering and Mortar.

Rough *diamond*. See the article Diamond.

Rough *emerald*. See the article Emerald.

Rough *leaved plants*. See the article Plant.

Rough *taſte*. See Taste, Acerb, Austere, &c.

ROUL, Roll, or **Rowl**, in the military art—Officers of the ſame rank, who mount the ſame guards, and take their turns in relieving one another, are ſaid to *roul* or *roll*. See Guard.

ROULADE, in muſic, a trilling or quavering. See Quavering.

ROUND, Rotundus, in geometry. See Circle, Globe, Sphere, &c.

Round, in anatomy. See the article Rotundus.

Round, in muſic—The Italians call b *round*, what we call a *flat*; and the French b *mol*; and b *ſquare*, what we call a *ſharp*. See Flat and Sharp, &c.

Round, is alſo a military term, ſignifying a walk or turn which an officer, attended with ſome ſoldiers, takes in a garriſon or fortified place, *around* the ramparts, in the night-time; to liſten if any thing be ſtirring without the works, and to ſee that the centries are watchful, and do their duty, and all things in good order. See Counter *round*.

In ſtrict garriſon, the *rounds* go every quarter of an hour, that the rampart may be always furniſhed—The centuries are to challenge at a diſtance; and to reſt their arms as the *rounds* paſs, and let no one come near them.

When the *round* is near the corps de garde, the centry calls aloud, *who comes there?* and when the anſwer is, *the rounds*, he ſays, *ſtand*; then calls for the corporal of the guard, who draws his ſword, and calls alſo, *who comes there?* and when it is anſwered, *the rounds*, he that has the word advances and delivers it to the corporal, who receives it with his ſword pointed at the giver's breaſt. See WORD.

Way of the ROUNDS. See the article WAY.

Counter-ROUNDS. See COUNTER-*round*.

Quarter-ROUND. See the article QUARTER-*round*.

ROUNDS, among maſons, denotes the broken pieces of ſtatues.

ROUND-*heads*. See WHIG and TORY.

ROUND-*head nails*. See the article NAIL.

ROUND-HOUSE, in a ſhip, is the uppermoſt room or cabin on the ſtern of a ſhip, where the maſter lies. See SHIP and STERN.

ROUND-*houſe* alſo denotes a kind of priſon, for the nightly-watch to ſecure perſons in, till they can be carried before a magiſtrate. See WATCH.

ROUND *niche*	See the articles	NICHE.
ROUND *roof*		ROOF.
ROUND *table*		TABLE.

ROUND, in the academies, denotes a circular piſte or tread. See PISTE.

To ROUND *a horſe*, is a general term for all ſorts of manages upon a volt, or circular tread. See VOLT—Hence to *round* a horſe upon a trot, gallop, *&c.* is to make him carry his ſhoulders and haunches roundly or compactly, upon a large or ſmaller circle, without traverſing or bearing to a ſide.

ROUNDELAY*, or ROUNDO, a kind of ancient poem, thus called, according to Menage, from its form; and becauſe it ſtill turns back again to the firſt verſe, and thus goes round. See LAY.

* The word is formed from *round* and *lay*—The French call it *rondeau*. The Spaniards *gloſes*.

The common *roundelay* conſiſts of thirteen verſes, eight whereof are in one rhyme, and five in another—It is divided into couplets; at the end of the ſecond and third whereof, the beginning of the *roundelay* is repeated; if poſſible, in an equivocal or punning ſenſe.

The *roundelay* is a popular poem among the French, but little known among us—Marot and Voiture have ſucceeded the beſt in it.

Rapin obſerves, that if the *roundelay* be not very exquiſite, it is ſtark nought—In all the ancient *roundelays*, Menage obſerves, the verſe preceeding has a compleat ſenſe; and yet joins agreeably with that of the cloſe; without depending neceſſarily thereon. This rule well obſerved makes the *roundelay* more ingenious; and is one of the fineſſes of the poem.

ROUNDELET. See the article RUNDLET.

ROUNDNESS, ROTUNDITY, in phyſics. See SPHERICITY.

ROUNDO, or ROUNDELAY, in muſic, a kind of burden or ritornello; where the beginning of each couplet is repeated at the end thereof. See RITORNELLO.

ROUPIA, or RUPEE. See the article RUPEE.

ROUSE *up a hart*, among hunters. See HUNTING.

To ROUSE, among falconers, is when a hawk lifts up and ſhakes himſelf. See HAWK and HAWKING.

To ROUSE *a hawſer*, or *cable*, in the ſea phraſe, ſignifies to hale in part of the hawſer or cable, which lies ſlack in the water. See CABLE, *&c.*

ROUT*, ROUTE, a public road, highway, or courſe; eſpecially that which military forces take. See ROAD.

* The word is French, *route*, formed from the Latin, *rupta*, or *ruta*; or the French, *roux*, an old word for horſe; or rather from the old Celtic, *rout*, road.

Sanſon and Ogilby have made maps of the *routs* and poſt-roads of France and England: ſoldiers are prohibited going out of their *routs*—*Routs* are frequently cut in parks, foreſts, *&c.* both for ornament and the conveniencies of hunting. See HUNTING.

Some uſe *rout* for a path cut a-croſs a wood; in oppoſition to *way*, which is a great road. See WAY.

ROUT, in navigation. See the article COURSE.

ROUT is alſo uſed for the defeat and flight of an army — The ſerjeants endeavour to rally the ſoldiers in a *rout*. See RALLYING.

ROUT, in law, is an aſſembly or combination of three, or more perſons, going forcibly to commit an unlawful act; though they do not actually perform it. See ASSEMBLY.

If they go, ride, or move forwards, after their meeting, it is a *rout*, though they do not put their purpoſe in execution; if they do, it is a *riot*.

A *rout*, therefore, ſeems to be an unlawful aſſembly; and a riot the diſorderly fact committed thereby. See RIOT.

Two things, however, there are in common to *rout*, *riot*, and *unlawful aſſembly*: the one, that there be at leaſt three perſons together; the other, that, being together, they diſturb the peace, either by words, ſhew of arms, turbulent geſture, or actual violence. See UNLAWFUL *aſſembly*.

ROUT *of wolves*, among hunters, denotes a herd of theſe wild beaſts. See HERD.

ROUTIER, in navigation. See WAGGONER.

ROWEL, among farriers, a kind of iſſue, made by drawing a ſkain of ſilk, thread, hair, or the like, through the nape of the neck, or other part of an horſe; anſwering to what in chirurgery is called a *ſeton*. See SETON.

The ROWELLING *of horſes* is a method of cure frequently had recourſe to in inward ſtrains, eſpecially about the ſhoulders or hips; as alſo for hard ſwellings not eaſy to be reſolved.

The operation is thus—A little ſlit being made through the ſkin, about a handful below the part aggrieved, big enough to put a ſwan's quill in; the ſkin is raiſed from the fleſh, the end of the quill put in, and the ſkin blow'd from the fleſh upwards, and all over the ſhoulder—Then the hole being ſtopped with the finger, the place blown is beaten with a hazel-ſtick, and the wind ſpread with the hand all over; then let go.

This done, horſe-hair, or red ſarſenet, half the thickneſs of the little finger, is put in a *rowelling* needle ſeven or eight inches long; the needle is put into the hole, and drawn through again ſix or ſeven inches higher; then the needle is drawn out, and the two ends of the *rowel* tied together: anointing it every day, as well as before the putting it in, with ſweet butter and hog's greaſe, and drawing it backwards and forwards in the skin, to make the putrid matter diſcharge itſelf more plentifully.

Others, diſliking theſe *rowels*, as making too great a ſore and ſcar, uſe the French *rowel*, which is a round piece of ſtiff leather, with a hole in the midſt; laying it flat between the fleſh and skin, the hole of the *rowel* juſt againſt that in the skin; ſowing it with a needle and thread drawn through the hole and the skin; cleaning it once in two or three days, and anointing it a-freſh.

ROWING. See OAR, BOAT, *&c.*

ROWS *of trees*. See the article PARALLELISM.

ROYAL*, REGAL, ſomething relating to a king. See KING.

* The word is French, formed from the Latin, *regalis*, of *rex* king.

In this ſenſe we ſay, the *royal family*, the *royal blood*, *royal line*, &c.

In England the prince and princeſs of Wales, the king's brother, *&c.* are addreſſed under the title of *royal highneſs*. See PRINCE and HIGHNESS—The ducheſs of Savoy is called *madame royale*.

ROYAL *abby*, denotes an abby founded by a king, or by a prince who is ſucceeded by a king. See ABBY.

ROYAL *academy of ſciences*, &c. See ACADEMY, *&c.*

ROYAL *antler*, among hunters, expreſſes the third branch of the horn of a hart or buck, that ſhoots out from the rear or main horn above the back antler. See ANTLER, HEAD, ATTIRE.

ROYAL *army*, is an army marching with heavy cannon, capable of beſieging a ſtrong, well fortified city—It is uſual to hang up a governor who has the aſſurance to hold out a petty place againſt a *royal army*.

ROYAL *aſſent*, is that aſſent or approbation which the king gives to a thing done by others; as the election of a biſhop by dean and chapter; or a bill paſſed in both houſes of parliament. See KING, *&c.*

The *royal* aſſent in parliament being given, the bill is endorſed with theſe words, *Le roy le veult*; that is, it pleaſes the king—If he refuſes it, thus, *Le roy s'aviſera*, q. d. the king will adviſe upon it. See BILL, PARLIAMENT, *&c.*

ROYAL *boroughs*. See the article BOROUGH.

ROYAL *crown*, is that worn by kings. See CROWN.

This they alſo call an *imperial crown*, being cloſed a-top.

The Engliſh crown is cloſed by ſemi-circles of gold meeting at the monde or globe, on which the croſs ſtands; and thoſe ſemi-circles adorned with croſſes and fleur-de-liſes: the whole embelliſhed with precious ſtones.

ROYAL *charter*. See the article CHARTER.

ROYAL *African company*. See the article COMPANY.

ROYAL *Exchange*, the burſe or meeting place of the merchants in London. See EXCHANGE.

It was firſt built in 1566, at the charge of Sir Thomas Greſham; and in a ſolemn manner, by herald with ſound of trumpet, in preſence of queen Elizabeth, proclaimed the *royal exchange*—'Till that time the merchants met in Lombard-ſtreet.

It was built of brick; yet then eſteemed the moſt ſplendid burſe in Europe—An hundred years after its building, at the great fire, it was burnt down; but ſoon raiſed again, in a ſtill more magnificent manner; the expence thereof amounting to 50000 *l.*

One half of this ſum was diſburſed by the chamber of London, the other by the company of Mercers; who, to reimburſe themſelves, let to hire 190 ſhops above ſtairs, at 20 pounds each; which with other ſhops, &c. on the ground, yield a yearly rent of above 4000 pounds, yet the ground it ſtands on does not exceed ½ of an acre: whence it is obſerved to be much the richeſt ſpot of ground in the world.

It is built quadrangular, with walks a-round, wherein the merchants of the reſpective countries aſſociate themſelves. In the middle of the area or court, is a fine marble ſtatue of king Charles II. in the habit of a Roman Cæſar; erected by the ſociety of merchant adventurers; the workmanſhip of Grinlin Gibbons. Around are the ſtatues of the ſeveral kings ſince the Norman conqueſt, ranged.

ROYAL *fiſhes*, are whales and ſturgeons, and, ſome add, porpoiſes too, which the king, by his prerogative, is to have whenever caſt on ſhore, or wrecked, in all places of the realm, unleſs granted to ſubjects by expreſs words. See FISHES.

ROYAL *Foot*. See the article FOOT.

ROYAL *Fort*. See the article FORT.

ROYAL *franchiſe*. See the article FRANCHISE.

ROYAL *hoſpital*. See the article HOSPITAL.

The ROYAL *oak* is a fair ſpreading tree at Boſcobel in the pariſh of Donnington in Staffordſhire, the boughs whereof were all covered with ivy; in the thick of which king Charles II. ſat in the day time with colonel Careleſs, and in the night lodged in Boſcobel-houſe: ſo that they are miſtaken who ſpeak of it as an old hollow oak; it being then a gay flouriſhing tree, ſurrounded with many more—The poor remains hereof are now fenced in with a handſome wall, with this inſcription over the gate, in gold letters — *Fœliciſſimam arborem quam in aſylum potentiſſimi regis Caroli II. Deus op. max. per quem reges regnant, hic creſſere voluit*, &c. Philoſoph. Tranſact. Nº. 310.

ROYAL *officers*. See the article OFFICER.

ROYAL *Parapet*, or *parapet of the rampart*, in fortification, is a bank about three fathoms broad, and ſix foot high, placed upon the brink of the rampart, towards the country; to cover thoſe who defend the rampart. See RAMPART and PARAPET.

Port ROYAL. See the article PORT *royal*.

ROYAL *Society*, is an academy, or body of perſons of eminent learning; inſtituted by king Charles II. for the promoting of natural knowledge. See ACADEMY.

This illuſtrious body had its original in an aſſembly of ingenious men, who before the reſtauration met weekly in Wadham-college, in Oxford, at the lodgings of Dr. Wilkins. Afterwards, from about the year 1658, many of them living in London, held meetings at Greſham-college; till they were at length taken notice of by the king, who was pleaſed to grant them an ample charter, dated the 22d of April, 1663; whereby they were erected into a corporation, *conſiſting of a preſident, council, and fellows, for promoting the knowledge of natural things, and uſeful experiments.*

Their manner of electing fellows is by balloting. Their council are in number 21, eleven of which are continued for the next year, and ten more added to them, all choſen on St. Andrew's day.

Each member at his admiſſion ſubſcribes an engagement, that he will endeavour to promote the good of the ſociety; from which he may be freed at any time, by ſignifying to the preſident, that he deſires to withdraw.

The charges are 40 *s.* paid to the treaſurer at admiſſion; and 13 *s.* per quarter, ſo long as the perſon continues a member.

Their deſign is to " make faithful records of all the works " of nature or art, which come within their reach; ſo " that the preſent as well as after ages may be enabled to " put a mark on errors which have been ſtrengthened by " long preſcription, to reſtore truths that have been ne" glected; to puſh thoſe already known to more various " uſes; to make the way more paſſable to what remains " unrevealed, &c.

To this purpoſe they have made a great number of experiments and obſervations on moſt of the works of nature; eclipſes, comets, meteors, mines, plants, earthquakes, inundations, ſprings, damps, ſubterraneous fires, tides, currents, the magnet, &c.—Alſo, numbers of ſhort hiſtories of nature, arts, manufactures, uſeful engines, contrivances, &c.

The ſervices they have been of to the public, are very great —They have improved naval, civil, and military architecture; advanced the ſecurity and perfection of navigation; improved agriculture; and put not only this kingdom, but alſo Ireland, the Plantations, &c. upon planting.

They have regiſtered experiments, hiſtories, relations, obſervations, &c. reduced them into one common ſtock; have from time to time publiſhed ſome of the moſt immediate uſe, under the title of *Philoſophical Tranſactions*, &c. and laid the reſt up in public regiſters, to be nakedly tranſmitted to poſterity, as a ſolid ground-work for future ſyſtems. See TRANSACTIONS.

They have a library adapted to their inſtitution; towards which the late earl-marſhal contributed the Norfolcian library; and a muſæum, or repoſitory of natural and artificial rarities, given them by Daniel Colwal, Eſq;—Their motto, *Nullius in Verba.*

ROYAL *Spaniſh academy*. See the article ACADEMY.

ROYAL *ſugar*. See the article SUGAR.

ROYALTIES, REGALTIES, the rights of the king; otherwiſe called the *king's prerogative*, and the *regalia*. See PREROGATIVE and REGALIA.

Of theſe, ſome the king may grant to common perſons; others are inſeparable from the crown. See KING, GRANT, &c.

RUBARB, RHABARBARUM, in medicine. See RHUBARB.

RUBBING. See ATTRITION and FRICTION.

RUBIA *Tinctorum*, a root or drug popularly called *madder*. See MADDER.

RUBIFYING*, in chymiſtry, &c. the act of turning a thing red by force of fire, &c. See RED and RUBY.

* The word is formed of the Latin *rubens*, ruddy, and *fio*, I become.

Red arſenic is ſuppoſed to be no more than the common orpiment *rubified* by fire, with the addition of nut or olive-oil. See ARSENIC.

RUBIGALIA, or ROBIGALIA, in antiquity, a feaſt celebrated by the Romans in honour of the god Rubigus, or the goddeſs Rubigo; and to engage thoſe deities to preſerve the corn from blaſting, and mildews. See FEAST.

The *rubigalia* were inſtituted by Numa in the eleventh year of his reign; and were held on the 7th of the calends of May, which is our 25th of April; being the time when the blight or mildew, called by the Latins *rubigo*, uſes to attack the corn. See RUBIGO.

Varro fixes it to the time when the ſun enters the 16th degree of Taurus—Indeed the true time ſeems rather to have been on the eighteenth day before the equinox; and the true reaſon, becauſe then canicula, or the little dog, ſets; which is eſteemed a malific conſtellation.

Hence they ſacrificed a dog to rubigo: Ovid ſays, the entrails of a dog, and thoſe of a ſheep: Columella, only a ſucking puppy. Feſtus inſinuates, that the victim muſt be red.

RUBIGO, or ROBIGO, a diſeaſe incident to corn, popularly called *mildew*. See SMUT and MILDEW.

The *rubigo* is a ſpecies of blight. See BLIGHT.

RUBRICK, RUBRICA, in the canon law, denotes a title or article in certain antient law-books; thus called, becauſe wrote, as the titles of the chapters in our antient bibles are, in red letters. See TITLE—You'll find ſuch a law under ſuch a *rubrick*.

RUBRICKS, alſo denote the rules and directions given at the beginning, and in the courſe of the liturgy; for the order, and manner wherein the ſeveral parts of the office are to be performed. See LITURGY.

There are *general rubricks*, and *ſpecial rubricks*, a *rubrick for the communion*, &c.—In the Romiſh miſſal and breviary are *rubricks* for mattins, for lauds, for tranſlations, beatifications, commemorations, &c.

They are called *rubricks*, from the Latin, *ruber*, *red*; becauſe formerly printed in *red-ink*, to diſtinguiſh them from the reſt of the office, which was in black; as they ſtill are in the Romiſh miſſal, &c.

The great *rubrick* for the celebration of Eaſter, preſcribed by the Nicene council, is to this purpoſe—Eaſter-day to be the Sunday which falls upon, or next after, the firſt full moon which immediately ſucceeds the vernal equinox. See EASTER. —Dr. Wallis has a particular diſcourſe on the ancient *rubricks* for the feat of Eaſter; in the *Philoſoph. Tranſactions*.

RUBY, RUBINUS, a red coloured, ſparkling gem, of the firſt rank among precious ſtones. See GEM and STONE.

There are but two places in the Eaſt where the *ruby* is found: The kingdom of Pegu, and the iſle of Ceylon—The mine in Pegu, where it is found in greateſt plenty, is in the mountain Capelan, 12 days journey from Siren, the reſidence of the king of that country—The fineſt *rubies* brought hence do not exceed three or four carats; the king reſerving all the larger to himſelf.

In Ceylon, the *rubies* are found in a river which deſcends from the mountains towards the middle of the iſland: Some few are alſo found in the ground—The *rubies* of Ceylon are uſually brighter and more beautiful than thoſe of Pegu; but they are rare; the king of Ceylon prohibiting his people to gather them, or traffick with them.

There are *rubies* alſo found in Europe, particularly in Bohemia and Hungary; eſpecially the former, wherein is a mine of flints of divers ſizes, which upon breaking, are ſometimes found to contain *rubies* as fine and hard as any of the Eaſtern ones.

The Greeks call the *ruby* απυρωτος, *q. d.* reſiſting the fire —The ancients out of their credulity and ſuperſtition attributed many virtues to the *ruby*; as, that it expels poiſons, cures the plague, abates luxury and incontinence, baniſhes ſorrow, &c. See GEM.

Lapidaries uſually diſtinguiſh three kinds of *rubies*; the *rocky*, *balaſs*, and *ſpinell*: Some add a fourth kind, *viz.* the *rubacelle*. It is the different degree of colour which makes their different value and beauty—The *balaſs ruby* is of a crimſon colour with a caſt of purple: The *ſpinell ruby* is of a bright roſy red.

It is ſaid the inhabitants of Pegu have the art of heightening the redneſs and brilliant of *rubies*, by laying them in the fire, and giving them a proper degree of heat.

The *ruby* is formed in a ſtony ſubſtance or marcaſite of a roſe colour, called *mother of ruby*; it has not all its colour and luſtre at once; but comes to it by degrees—At firſt it grows whitiſh, and as it approaches to maturity, becomes red. Hence we have white *rubies*, others half white, half red; and others blue and red, called *ſapphire rubies*.

When a *ruby* exceeds twenty carats, it may be called a *carbuncle*, the name of an imaginary ſtone, whereof the ancients and moderns have given us ſo many deſcriptions. See CARBUNCLE.

They have ſeveral manners of counterfeiting *rubies*; and have carried the imitation to that length, that the moſt able lapidaries are ſometimes over-ſeen.

Furetiere aſſures us, though the thing ſurpaſſes all belief, that there have been *rubies* in France of 240 carats—Tavernier tells us, he ſaw one in the Indies of fifty carats, which he had a mind to have bought. He adds, that the king of France has finer and larger *rubies* than any in the poſſeſſion of the Great Mogul.

The value of *rubies* from one carat, or four grains, to ten carats, is thus given us in the *dictionaire de commerce*, from a good hand:

	l.	*s.*	*d.*
A *ruby* of one carat, is worth	1	15	0
Of two C.	9	00	0
Of three C.	22	10	0
Of four C.	33	15	0
Of five C.	45	00	0
Of ſix C.	67	10	0
Of ſeven C.	84	00	0
Of eight C.	106	00	0
Of nine C.	150	00	0
Of ten C.	216	00	0

Sapphire RUBY. See the article SAPPHIRE.

RUBY, in chymiſtry, is a name given to ſeveral preparations of natural bodies, becauſe of their red colour; as, *ruby of arſenic*, &c. See RUBIFYING.

RUBY, in heraldry, denotes the red colour wherewith the arms of noblemen are blazoned; being the ſame which in the arms of others not noble, is called *gules*. See COLOUR, GULES, &c.

RUCTATION, *belching*, a ventoſity ariſing from indigeſtion, and diſcharging itſelf at the mouth, with a diſagreeable noiſe. See FLATUS.

There are belches owing to repletion, and others to inanition, or emptineſs. See REPLETION, &c.

Dr. Quincy ſays, hypochondriac and hyſteric people are particularly liable to this diſorder—They are rather to be cured with proper ſtomachics, than carminatives and hot liquors—Burnet recommends the iliac pills of Rhaſis againſt *ructation*.

RUDDER, in navigation, a piece of timber turning on hinges in the ſtern of a ſhip, and which oppoſing ſometimes one ſide to the water, and ſometimes another, turns or directs the veſſel this way or that—See *Tab. Ship*, *fig.* 2. *n.* 106. See alſo SHIP.

The *rudder* of a ſhip is a piece of timber hung on the ſtern-poſts, by four or five iron hooks called *pintles*; ſerving, as it were, for the bridle of a ſhip; to turn her about at the pleaſure of the ſteer's-man. See STEERING.

The *rudder* being perpendicular, and without ſide the ſhip, another piece of timber is fitted into it at right angles, which comes into the ſhip; by which the *rudder* is managed and directed—This latter is properly called the *helm*, or *tiller*; and ſometimes, tho' improperly, the *rudder* itſelf. See HELM and TILLER.

The power of the *rudder* is reducible to that of the lever. See LEVER.

As to the angle the *rudder* ſhould make with the keel; the author of a late book on the working of ſhips, ſhews, that, in order to ſtay or bear up the ſooneſt poſſible, the tiller of the *rudder* ought to make an angle of near 55° with the keel. See WINDMILL.

A narrow *rudder* is beſt for a ſhip's ſailing, provided ſhe can feel it, that is, be guided and turned by it; for a broad *rudder* will hold much water when the helm is put over to any ſide: yet if a ſhip have a fat quarter, ſo that the water cannot come quick and ſtrong to her *rudder*, ſhe will require a broad *rudder*.

The aft-moſt part of the *rudder* is called, the *rake* of the *rudder*.

RUDDLE, RUBRICA, a ſort of dusky red chalk or earth found in divers parts of England; chiefly in iron mines, of which mineral it has a copious mixture. See REDDLE.

This ſome take for the ancient lapis hæmatites. See HÆMATITES.

RUDENTED *column*. See the article COLUMN.

RUDENTURE, in architecture, the figure of a rope or ſtaff, ſometimes plain, ſometimes carved, wherewith a third part of the flutings of columns are frequently filled up. See FLUTE.

It is thus called from the Latin, *rudens*, *cable*; whence ſome call it a *cabling*, and the columns whoſe flutings are thus filled, *rudented*, or *cabled columns*. See COLUMN, CABLED, &c.

There are alſo *rudentures* in relievo, laid on the naked of pilaſters not fluted; an inſtance of which we have in the church of St. Sapienza at Rome.

RUDERATION, RUDERATIO, in building, a term uſed by Vitruvius for the laying a pavement with pebbles or little ſtones. See PAVEMENT.

To perform the *ruderation*, it is neceſſary the ground be firſt well beaten, to make it firm, and prevent its cracking—Then a ſtratum of little ſtones is laid, to be afterwards bound together with mortar made of lime and ſand, called by Vitruvius, *ſtatumen*.

If the ſand be new, its proportion to the lime may be as 3 to 1; if dug out of old pavements or walls, as 5 to 2. See MORTAR, &c.

RUDERATION, Daviler obſerves, is alſo uſed by Vitruvius, lib. 7. cap. 1. for the coarſeſt and moſt artleſs kind of maſonry; where a wall is, as it were, cobled up. See MASONRY.

RUDIARIUS, in antiquity, a veteran gladiator, who had got a diſcharge from the ſervice. See GLADIATOR.

He was thus called, becauſe as a mark of diſmiſſion a rod was put into his hand called *rudis*. See RUDIS.

The *rudiarii* were alſo called *ſpectatores*. See SPECTATOR.

RUDIMENTS, RUDIMENTA, the firſt principles or grounds of any art or ſcience; called alſo the *elements* thereof. See ELEMENTS.

RUDIS, a knotty rugged ſtick, which the prætor among the Romans, gave the gladiators, as a mark of their freedom and diſmiſſion. See GLADIATOR.

Hence the Latin phraſe, *rude donare*, to make a gladiator free, to diſcharge him from fighting any more—They were hence called *rudiarii*. See RUDIARII.

RUE, RUTA *hortenſis*, a medicinal plant, much uſed in the preſent practice—Schroder commends it as an alexipharmic, and cephalic; ſays it reſiſts poiſons and malignities, and is therefore to be uſed in fevers; and that it is good in all convulſive caſes.

It is replete with a fat viſcous juice, and by that means yields little to any purpoſe in diſtillation, unleſs where firſt digeſted in a ſpirituous menſtruum—Hence its ſimple water in the ſhops, according to Dr. Quincy, is nothing worth, though others are of a very different opinion. It ought to be raiſed with a ſpirituous liquor, or uſed in conſerve; or which is beſt of all, the plant eat alone freſh gathered, with bread and butter. It is of ſervice in nervous caſes, particularly ſuch as ariſe from the womb, as it deterges the glands, and by its viſcidity, bridles thoſe inordinate motions, which frequently begin there, and affect the whole conſtitution See HYSTERIC, UTERINE, &c.

RUELLE, a French term, lately introduced into our language: it is a diminutive of *rue*, ſtreet; and ſignifies, literally, a *little-ſtreet*.

Its uſe among us, is for an alcove, or other genteel apartment, where the ladies receive viſits either in bed or up—The poets go reading their works from *ruelle* to *ruelle*, to beſpeak the approbation and intereſt of the ladies.

RUFF-TREES. See the article ROOF-TREES.

RUFTER-HOOD, among falconers, a plain leather-hood, large and open behind, to be worn by an hawk, when ſhe is firſt drawn. See HOOD, HAWK, HAWKING, &c.

RUINS, a term particularly uſed for magnificent buildings fallen to decay by length of time; and whereof there only remains a confuſed heap of materials. See ANTIQUITY.

Such are the *ruins* of the tower of Babel, or tower of Belus, two days journey from Bagdat, in Syria, on the banks of the Euphrates; which are now no more than a heap of bricks, cemented with bitumen; and whereof we only perceive the plan to have been ſquare.

Such, alſo, are the *ruins* of a famous temple or palace near Schiras in Perſia; which the antiquaries will have to have been built by Ahaſhuerus; and which the Perſians now call Tchelminar, or Chelminar, q. d. the forty columns; becauſe there are ſo many columns remaining pretty entire, with the traces of others; a great quantity of baſſo relievo's, and unknown characters, ſufficient to ſhew the magnificence of the antique architecture. See CHELMINAR.

RULE, or RULER, REGULA, a very ſimple inſtrument, ordinarily of hard wood, thin, narrow, and ſtrait; ſerving to direct the drawing of right lines. See LINE.

The *rule* is of principal uſe in all the mechanical arts—To prove whether or no it be juſt; draw a line by it on paper; then turn the *rule* about, the right end to the left; and apply the ſame edge this way to the line: if the edge now agree exactly with the line, the *ruler* is true.

Deſmarets has a fine poem on the amours of the *rule* and compaſs—The ſtone-cutters-*rule* is uſually four foot long; and divided into feet and inches.

The Maſon's *rule* is 12 or 15 foot long, and is applied under the level, to regulate the courſes, to make the piedroits equal, *&c.*

Parallel RULE, or RULER. See PARALLEL.

RULE is alſo applied to certain inſtruments which have other conſiderable uſes beſide that of drawing lines.—Such are the carpenters *joint-rule*, Everard's, and Coggeſhal's *ſliding-rules*, &c.

Carpenters joint-RULE, is an inſtrument uſually of box, 24 inches long, and one and a half broad; each inch being ſubdivided into eight parts—On the ſame ſide with theſe diviſions, is uſually added Gunter's line of numbers.

On the other ſide are the lines of timber and board-meaſure; the firſt beginning at 82, and continued to 36, near the other end: The latter is numbered from 7 to 36, four inches from the other end.

Uſe of the carpenters joint-RULE—The application of the inches in meaſuring lengths, breadths, *&c.* is obvious—That of the Gunter's line, ſee under GUNTER'S *line*—The uſe of the other ſide is all we need here meddle with.

1. *The breadth, of any ſurface, as board, glaſs,* &c. *being given; to find how much in length makes a ſquare foot*—Find the number of inches the ſurface is broad, in the line of board meaſure; and right againſt it is the number of inches required.

Thus if the ſurface were 8 inches broad, 18 inches will be found to make a ſuperficial foot.

Or, more readily thus:—Apply the *rule* to the breadth of the board or glaſs; that end marked 36 being even with the edge; the other edge of the ſurface will ſhew the inches and quarters of inches which go to a ſquare foot.

2. *Uſe of the table at the end of the board meaſure*—If a ſurface be one inch broad, how many inches long will make a ſuperficial foot? Look in the upper row of figures for one inch, and under it in the ſecond row is 12 inches, the anſwer to the queſtion.

3. *Uſe of the line of timber meaſure*—This reſembles the former; for having learnt how much the piece is ſquare, look for that number on the line of timber-meaſure: The ſpace thence to the end of the *rule* is the length, which at that breadth, makes a foot of timber—Thus, if the piece be 9 inches ſquare, the length neceſſary to make a ſolid foot of timber, is 21 $\frac{1}{3}$ inches—If the timber be ſmall, and under 9 inches ſquare, ſeek the ſquare in the upper rank of the table; and immediately under it is the feet and inches that make a ſolid foot—Thus, if it be 7 inches ſquare, 2 foot 11 inches will be found to make a ſolid foot.

If the piece be not exactly ſquare, but broader at one end than another; the method is to add the two together, and take half the ſum for the ſide of the ſquare—For round timber, the method is to girt it round with a ſtring, and to allow the fourth part for the ſide of the ſquare—But this method is erroneous; for hereby you loſe above $\frac{1}{5}$ of the true ſolidity. See TIMBER.

Caliber-RULE. See CALIBER-*meaſure.*

Everard's ſliding-RULE. }
Coggeſhal's ſliding-RULE. } See the article { SLIDING-*rule.*

RULE, REGULA, alſo denotes a certain maxim, canon, or precept, to be obſerved in any art or ſcience. See CANON, MAXIM, *&c.*—Thus we ſay, the *rules* of grammar, of logic, of philoſophizing, *&c.* See GRAMMAR, LOGIC, PHILOSOPHIZING, *&c.*

School philoſophers diſtinguiſh two kinds of *rules*, viz. *theoretical*, or *rules of knowing*, which relate to the underſtanding; being of uſe in the diſcovery of truth. (See UNDERSTANDING, CRITERION, and TRUTH)—And *practical*, or *rules of acting*, which relate to the will, and ſerve to direct it to what is good and right. See GOOD and RECTITUDE.

For the management and application of theſe two Sorts of *rules*, there are two diſtinct arts; *viz. logic* and *ethics.* See LOGIC, ETHICS, and MORALITY, *&c.*

RULES *of knowing, regulæ ſciendi*, are ſuch as direct and aſſiſt the mind, in perceiving, judging, and reaſoning. See PERCEPTION, JUDGMENT, and REASONING.

RULES *of acting, regulæ agendi*, are thoſe whereby the mind is guided in her deſires, purſuits, *&c.* See WILL.

Authors are extremely divided about the regard to be had to the RULES of *poetry* fixed by the antients, Ariſtotle, Horace, Longinus, *&c.* and admitted by the modern critics, as Boſſu, *&c.* ſome contended that they muſt be inviolably obſerved; others pleading for liberty to ſet them aſide on occaſion—*Rules*, it is complained, are fetters; rank enemies to genius; and never religiouſly obſerved by any, but thoſe who have nothing in themſelves to depend on. Voiture frequently neglected all the *rules* of poetry; as a maſter who ſcorned to be confined by them. See POETRY.

The theatre has its particular *rules*; as the *rule* of 24 hours, the unities of action, time, and place, *&c.* See UNITY. See alſo THEATRE.

If it be true, ſays Moliere, that plays conducted according to the *rules*, do not pleaſe; but thoſe which are not, do: The *rules* muſt be naught—For myſelf, when a thing hits and diverts me, I do not enquire whether I have done amiſs; nor whether Ariſtotle's *rules* forbid me to laugh. See LAW.

RULES of *philoſophizing*. See PHILOSOPHIZING.

RULE, in arithmetic, denotes a certain operation with figures to find ſums or numbers unknown; and to facilitate computations, mercantile, aſtronomical, *&c.* See ARITHMETIC, NUMBER, *&c.*

Each *rule* in arithmetic has its particular name, according to the uſe for which it is intended—The four firſt, which ſerve as the foundation of the whole art, are called *addition*, *ſubſtraction*, *multiplication*, and *diviſion*; each whereof ſee under its proper article ADDITION, *&c.*

From theſe ariſe ſeveral other *rules*: as the *rule of three*, or *of proportion*; called alſo, *the golden rule*; and diſtinguiſhed into *direct*, and *inverſe*, *ſimple*, and *compound.*—Alſo, the *rule of five numbers*—*rule of fellowſhip*, *ſimple*, and *with time*—*rule of allegation*, *medial* and *alternate*—*rule of exchange*—*rule of falſe poſition*, *ſingle and double.*—To which add, *approximation*, *barter*, *combination*, *equation*, *exchange*, *extraction*, *involution*, *progreſſion*, *rebate*, *reduction*, &c. See FELLOWSHIP, ALLIGATION, POSITION, *&c.*

RULE *of three*, or *of proportion*, commonly called the *golden-rule*, is a rule which teaches how to find a fourth proportional number, to three others given. See PROPORTION.

As, if three degrees of the equator contain 70 leagues, how many do 360 degrees, the circumference of the earth, contain?

The *rule* is this—*Multiply the ſecond term* 70, *by the third* 360; *divide the product* 25200, *by the firſt term* 3: *the quotient* 8400 *is the fourth term required.*

The uſe of this *rule* is of vaſt extent, both in common life, and the ſciences; but has no place, except where the proportion of the given numbers is known—Suppoſe, *e. gr.* a large veſſel full of water to empty itſelf by a little aperture; and ſuppoſe 3 gallons to flow out in 2 minutes: and it were required to know in what time 100 gallons would be thus evacuated?—Here indeed are three terms given, and a fourth required: But, as it is evident from experience, that water flows faſter at firſt than afterwards, the quantity of flowing water is not proportional to the time; and therefore the queſtion does not come under the *rule of three.*

The things which come under commerce are proportionable to their prices; twice as much of any commodity coſting twice as much money, *&c.* The price, therefore, of any quantity of a commodity being given, the price of any other quantity of the ſame, or the quantity of the commodity anſwering to any other given ſum, is found by the *rule of three*—*e. gr.* If 3 pounds coſt 17 *s.* what will 30 pounds coſt? Since, as 3 pounds are to 30 pounds, ſo is the value of the former 17 *s.* to the value of the latter. The queſtion ſtands thus:

3 *lb.*——30 *lb.*——17 *s.*
17
———
3)510(170 *s.* 8 *l.* 10 *s.*

Again; if 3 pounds be bought for 17 *s.* how many will 170 *s.* buy? Since as 17 *s.* is to 170 *s.* ſo are 3 pounds to the pounds required: The number will be found thus:

17 *s.*——170 *s.*——3 *lb.*
3
———
17)510(30 *lb.*
51
———
00

If the given terms be heterogeneous, *i. e.* have broken numbers among them, they do not bear the ſame proportion to each other which the things they expreſs bear—They muſt therefore be reduced to homogeneous ones; or to the ſame denomination, as pounds into ſhillings, ſhillings into pence, *&c.* hours into minutes, *&c.* See REDUCTION.

E. *gr.* If 3 pounds and 4 ounces coſt 2 *s.* 4 *d.* what will 2 pounds coſt? The operation will be thus:

3 *lb.* 4 ʒ——— 2 *lb.*——— 2 *s.* 4 *d.*
16 16 12
52 32 28
28
256
64
52)896(17 *d.* $\frac{12}{52}$ of a penny.
52
376
364
12

In many caſes of commerce and accounts, we have more compendious ways of working queſtions that come under the *rule of three*, than by the *rule* itſelf; which, by reaſon of their expediting practice, are called *practice*; and conſtitute a particular *rule* of themſelves. See PRACTICE.

RULE *of three inverſe*, is where the natural order of the terms is inverted—As, if 100 workmen build a houſe in 2 years, in how long time will 200 workmen build the ſame?

This is uſually conſidered by the writers of arithmetic, and taught in the ſchools, as a particular *rule*: being wrought by multiplying the firſt term 100 by the ſecond 2, and dividing the product 200 by the third term 200; the quotient 1 is the number required.

But there is no neceſſity for making a particular *rule* for the matter; this coming naturally enough under the former, by only ranging the terms as the nature of the queſtion requires. Thus it is evident, that as the number of men 200, is to 100, ſo is the ſpace 2 years, wherein 100 build the houſe, to the ſpace wherein 200 will build the ſame—For the leſs time, the more hands are required. The queſtion then will ſtand thus:

200 M.———100 M.———2 Y.
2
200)200(1 year.

RULE *of five numbers*, or *compound rule of three*, is where two rules of three are required to be wrought, before the number ſought be found—As if 300 *l.* in 2 years yield 30 *l.* intereſt, how much will 1000 *l.* yield in 12 years?

Here the firſt thing to be done is to find by the *rule of three*, what intereſt 1000 *l.* will give in 2 years; and then by the ſame *rule* what it will give in 12 years?

This is conſidered by the writers, &c. of arithmetic, as a particular *rule*, but without any neceſſity; a double operation ſolving it better, as in this example:

300 *l.*———1000 *l.*———30 int.
30
3|00)300|00(100 int.
2 Y.———12———100 *l.*
12
2)12000(600 int.

But in queſtions of this kind a ſingle *rule of three* may do the buſineſs: for 300 *l.* give the ſame intereſt in two years, which twice 300 give in one year; and twelve times 1000 *l.* give the ſame intereſt in one year that 1000 give in 12: omitting therefore the circumſtances of time, ſay, if twice 300 (that is, 600) give 36 *l.* intereſt, (in one year) what will 12 times 1000 (that is, 12000) give (in one year)?

600———12000———36
36
72000
36000
6|00)4320|00(720 *l.* int.

Central RULE. See the article CENTRAL.

RULE, in a monaſtic ſenſe, is a ſyſtem of laws or conſtitutions, whereby religious houſes are eſtabliſhed and regulated; and which the religious make a vow to obſerve at their entrance. See RELIGIOUS, MONASTERY, VOW, &c.

The monaſtic *rules* are all to be approved of by the pope, to make them valid—The *rule* of St. Benedict, is by ſome authors called the *holy rule.* See BENEDICTIN.

Thoſe of St. Bruno, and St. Francis, are of all others the moſt auſtere. See CARTHUSIANS, &c.—When a religious cannot ſupport the auſterities of his *rule*, he ſues for a diſpenſation.

RULE, in the canon law—The RULE, *de veriſimili notitia, of probable notice*, renders all proviſions to a benefice vacant by death, null; if it appear that from the day of the deceaſe, to the day of the date of the proviſions, or to the day when the courier arrives from Rome, there has not been time ſufficient for regular notice of the perſon's deceaſe to be conveyed to the pope. See PROVISION.

Proviſions are even null if it be proved the courier ſet out before the perſon was deceaſed—This *rule* is ſtrictly obſerved in France; in other countries the pope finds frequent occaſions to diſpenſe with it.

RULE *of twenty days, regula viginti dierum.* By this *rule*, if an eccleſiaſtic reſign his benefice; to make the reſignation valid, the reſigner muſt ſurvive its admiſſion in the court of Rome twenty days—If he die before the expiration of the twenty days, the reſignation is void; and the benefice becomes vacant by death.

This *rule* does not hold of the proviſions of ordinary collators, nor of ſimple and pure reſignations into the hands of the ordinary; but only in caſe of proviſions of the pope, diſpatched on reſignations *in favorem.* See RESIGNATION.

This *rule* antiently extended to ſuch as reſigned in time of health as well as of ſickneſs—Pope Boniface reſtrained it to the latter; whence it is commonly called, *regula de infirmis reſignantibus.*

RULE *de publicandis*—By this *rule* the reſignee of a benefice, if he have a proviſion from the court of Rome, is obliged to publiſh the reſignation and take poſſeſſion within ſix months; or if he have it from the ordinary collator within one month. Otherwiſe, if the reſigner die, the reſignation becomes null.

RUM*, a ſpecies of brandy, or vinous ſpirit, drawn by diſtillation from ſugar canes. See SUGAR, SPIRIT, DISTILLATION, &c.

* The word *rum* is the name it bears among the native Americans.

Rum is very hot and inflammable; and is in the ſame uſe among the natives of the ſugar countries, as brandy among us. See BRANDY.

RUMB, RUM, or RHUMB, in navigation. See RHUMB.

RUMB-*Line*, or *loxodromia.* See RHUMB-*Line.*

RUMEN, the firſt ſtomach of animals which chew the cud, hence called *ruminants.* See STOMACH, RUMINANT, and RUMINATION.

The food is tranſmitted into the *rumen* without any other alteration in the mouth, than being a little rowled and wrapped up together. See FOOD.

The *rumen* or paunch is much the largeſt of all the ſtomachs; as being to contain both the drink, and the whole crude maſs of aliment, which there lie and macerate together; to be thence remitted to the mouth, to be re-chewed and comminuted, in order to their farther digeſtion in the other ventricles. See DIGESTION.

In the *rumen*, or firſt ventricle of camels, are found divers ſacculi, which contain a conſiderable quantity of water: an admirable contrivance for the neceſſities of that animal, which living in dry countries, and feeding on dry hard food, would be in danger of periſhing, but for theſe reſervoirs of water. See DRINK, THIRST, &c.

RUMINANT, RUMINANS, in natural hiſtory, an animal which chews over again what it has eat before; popularly called *chewing the cud.* See RUMINATION.

Joah. Con. Peyer has an expreſs treatiſe *de ruminantibus & ruminatione*, where he ſhews, that there are ſome animals which do really *ruminate*; ſuch are oxen, ſheep, deer, goats, camels, hares, and ſquirrels: whereas others only appear to *ruminate*; which he calls *ruminantia ſpuria*; of which number are moles, crickets, bees, beetles, crabs, mullets, and ſeveral other fiſhes.

This latter claſs, he adds, have their ſtomachs compoſed of muſcular fibres, by means whereof the food is ground up and down, much as in real *ruminants.*

Ruminants, Mr. Ray obſerves, are all quadrupedal, hairy, and viviparous; ſome with hollow and perpetual horns, others with deciduous ones. See QUADRUPED, HAIR, HORN, &c.

The horned *ruminants* have all four ſtomachs, appropriated to the office; *viz.* 1°. The κοιλια μεγαλη of Ariſtotle, the *rumen, venter magnus*, or what we call the *paunch* or *inward*, which receives the meat ſlightly chewed, retains it a-while, and then delivers it back again into the mouth, which is what we call the *cud*, to be re-chewed—2°. The κεκρυφαλος or *reticulum*, which we call the *honey-comb*, from its internal coat being divided into cells, like honey-combs—3°. The εχινος, which Mr. Ray thinks hath been wrong tranſlated, *omaſus*; and which he chuſes to call the *echinus*: This being difficult to clear, our people throw it away, and call it the *manifold*—4. The ηνυστρον of Ariſtotle, by Gaza called the *abomaſus*, among us the *maw.* See RUMEN, OMASUS, ABOMASUS, &c.

Again, all the horned *ruminant* animals want the *dentes primores*, or broad teeth in the upper jaw; and have that kind of fat, called *ſuet, ſebum*, Στεαρ, which is harder and firmer, and leſs liquifiable in them, than the adeps of other animals. See FAT, ADEPS, &c.

RUMINATION, RUMINATIO, an action peculiar to a claſs of animals called *ruminants*; whereby they return the food they have formerly ſwallowed, to be chewed over-again, and rendered more fit for chyle. See RUMINANT and RUMEN.

Peyer defines *rumination*, a natural motion of the ſtomach, mouth, and other parts; by means of which the food eaten, at firſt, haſtily, is returned back again to the mouth; where it is re-chewed and ſwallowed a ſecond time; and that much to the benefit of the animal. See FOOD, CHYLE, MASTICATION, &c.

Burnet, in his *Theſaur. med.* gives ſeveral inſtances of men that *ruminated*, from Salmuth, Rhodius, &c.—Dr. Slare in the *Philoſ. Tranſact.* gives us a freſher inſtance in one of our own countrymen, living at Briſtol. His account, as it is curious, and may let us ſee a little how it fares with *ruminating* animals, we ſhall here add.

“He begins to chew his meat over again within a quarter of an hour after meals, if he drink with it; if not, ſomewhat later. His chewing after a full meal laſts about an hour and a half: and if he go to bed preſently after meals, he cannot ſleep till the uſual time of chewing be over. The victuals, upon the return, taſte ſomewhat more pleaſantly than at firſt. Bread, meat, cheeſe, and drink, return much of ſuch colours as they would be of were they mixed together in a mortar. Liquids, as ſpoon-meat, return to his mouth all one as dry and ſolid food. The victuals ſeem to him to lie heavy till they have paſſed the ſecond chewing; after that they paſs clean away. If he eat variety of things, that which paſſes down firſt, comes up again firſt. If the *ruminating* faculty chance to leave him, it ſignifies ſickneſs; and it is never well with him till it returns. He is about twenty years of age, and was always thus ſince he can remember. His father does the like, ſometimes; but in ſmall quantities.

RUMMAGE*, in the ſea language, ſignifies to clear a ſhip's hold, or remove goods or luggage from one place to another. See HOLD.

* The Word is probably derived from the Saxon, *raum*, room, or ſpace.

RUN *of a ſhip*, ſo much of her hull as is always under water; growing thinner and lanker by degrees, from the floor timber to the ſtern-poſts. See SHIP.

This is alſo called the *ſhip's way aftward*.

A ſhip is ſaid to have a *good run*, when it is long, and the water paſſes cleverly to her rudder, her tuck not lying too low, which is of great importance to her ſailing—If the water do not come ſtrongly to her rudder, by reaſon of her being built too broad below, ſhe cannot ſteer well; and a ſhip that cannot ſteer well, cannot keep a good wind, nor will have any freſh way through the ſea, but will ſtill be falling to leeward. See RUDDER, STEERING, &c.

And yet a ſhip with a large and good *run*, loſes much ſtowage, becauſe made narrow below. See HOLD, BURTHEN, &c.

RUNDLES, or ROUNDLES, in heraldry, the ſame as balls or pellets. See PELLET, &c.

RUNDLET, RUNLET, or ROUNDLET, a ſmall veſſel, containing an uncertain quantity of any liquor, from three to twenty gallons. See MEASURE, &c.

RUNIC, a term applied to the language and letters of the antient Goths, Danes, and other northern nations.

Some have been of opinion that Gulphilas, or Ulphilas, a Gothic biſhop about the year 370 was the firſt inventor of the *runic character*: but Olaus Wormius ſhews at large that Ulphilas could only be the firſt who taught it to foreigners; for that the *runæ* or characters themſelves were older than he. See Wormius *de liter. run.* c. 4. citante Becman, *Hiſt. orb. terr.* c. 9. ſect. 3. §. 15. See alſo CHARACTER.

In reality, Ulphilas, according to other authors, was ſo far even from teaching the Character, that he invented an Alphabet of his own, on purpoſe to put the runic characters which had been made ſubſervient to the ſuperſtitions of heatheniſm, out of uſe. *V. Sherringh. de Anglor. Gent. Orig.* p. 174.

It is ſuppoſed they were called *runic*, as being myſterious and ſcientifical; like the Egyptian hieroglyphics. See Wormius *de literatura runica*; and Hicks's *Theſaurus* of the antient northern languages.

There are ſome *runic* medals in the cloſets of the curious; and ſome modern Daniſh and Engliſh medals, the inſcriptions whereof are Latin, and the character *runic*. See TALISMAN.

RUNNER, in the ſea language, a rope belonging to the garnet, and to the two bolt tackles.—It is reeved in a ſingle block ſeiſed to the end of a pennant, and has at one end a nooſe to hitch into any thing, and at the other end a double block, into which is reeved the fall of the tackle or the garnet, by which means it purchaſes more than the tackle or garnet could allow—See *Tab. Ship. fig.* 1. *n.* 39, 73, 82, 110.

To *overhale the runner*, is to pull down the hooked end, and hitch it into the ſling.

RUNNET, or RENNET, an acid juice, found in the ſtomachs of calves that have fed on nothing but milk, and are killed before the digeſtion be perfected. See MILK.

It is this *runnet* is chiefly uſed to curdle or turn milk for cheeſe. See CURDLING, CHEESE, &c.

Its proper place is the abomaſus—The like matter is alſo ſaid to be found in goats and hares. See ABOMASUS.

The longer the *runnet* is kept, the better it is—Though it readily coagulates milk: yet if put into it when already coagulated, it diſſolves it. See COAGULATION and DISSOLUTION.

If ſalt be put in the milk, before the *runnet* be applied, it prevents its coagulation—If the ſalt be put in afterwards it hardens the coagulum. See SALT.

Ariſtotle will have the *runnet* to be the proper ſubſtance of the milk; but he is miſtaken when he ſays it is found in all animals which give milk, eſpecially all ruminants. See RUMINANT.

RUNNING *of goods*, a clandeſtine landing of goods without paying the legal cuſtoms or duties for the ſame. See SMUGGLING, OWLER, DUTY, CUSTOM, &c.

RUNNING-*ſaddle*. See the article SADDLE.

RUPEE, ROUPIA, or ROUPIAS, a coin very current in the territories of the Great Mogul, and ſeveral other parts of the Eaſt-Indies. See COIN and MONEY.

Rupees are ſtruck both of gold and ſilver; and both the one and the other have their diminutions; as *half-rupees*, *quarter-rupees*, &c.

The gold *rupee* is worth 1 *s.* 6 *d.* ſterl. The value of the ſilver *rupee* is various, according to its quality, and the place where it is coin'd. A general obſervation is, that the *rupees* are always current for more at the place where they are ſtruck, than elſe-where; and the new *rupees* for more than the old ones.—The reaſon of this laſt difference is, that the Indians being very fond of ſilver, to ſave it, uſe, as ſoon as they have got a few *rupees* together, to hide them under ground. To prevent which inconvenience, tending to drain the ſtate of current monies, the princes and rajas ſtrike new *rupees* every year, ſtill augmenting the value thereof, without any augmentation of the weight.

Beſides this difference of new and old *rupees*, the Indians make three other claſſes—The firſt called *rupees ſiceas*, which at Bengal are worth 2 *s.* 11 *d.* ſterl. The ſecond, *rupees of Surat*, worth 2 *s.* 6 *d.* ſterl.—The third *rupees of Maderas*, worth 2 *s.* 5 *d.* ſterl. All which is to be underſtood of the new *rupees*.

As to the old ones, thoſe of Maderas are only current at 1 *s.* 11 *d.* ſterl. Thoſe of Surat at 2 *s.* and the Siceas at 2 *s.* 4 *d.* Yet in other places, the order and prices vary: at Surat, thoſe ſtruck there have the firſt place; the Siceas the ſecond; and thoſe of Maderas the third. Along the coaſt of Coromandel, the Maderas have the firſt place, and the Siceas the ſecond, &c.

RUPTURE, in medicine, called alſo *hernia*, and popularly *burſtneſs*; is when the rim, thin film, or caul which holds up the inteſtines, is broken, or over-ſtrained or ſtretch'd, ſo as the guts fall down either into the groin, cod, or flank. See HERNIA.

According as the *rupture* happens in the abdomen, or inguen, ſcrotum, it is called *exomphalus*, *hernia inguinalis*, or *hernia ſcroti*. See EXOMPHALUS, &c.

RURAL*, or RUSTIC, ſomething that relates to the country. See RUSTIC.

* The word is form'd of the Latin *rus*, *ruris*, country.

RURAL *dean*, in the antient church was a temporary dean appointed by the biſhop or archbiſhop, for ſome particular miniſtry, without canonical inſtitution. See DEAN.

The *rural* dean is the ſame with what in the laws of Edward the confeſſor, is called *decanus epiſcopi*, the *biſhop's dean*.—In ſome places theſe deans ſeem to have been called *chorepiſcopi*. See CHOREPISCOPUS.

Heylin obſerves that each dioceſe has in it one or more archdeaconries for diſpatch of eccleſiaſtical buſineſs; and each archdeaconry is ſubdivided into *rural deanaries*, fewer or more according to the extent thereof; the deans whereof were alſo called *archipresbyteri*, and *decani chriſtianitatis*. See ARCHPRIEST, &c.

RUSSIA-*company*. See the article COMPANY.

RUST *of a metal*, the flowers or calx thereof; procured by corroding and diſſolving its ſuperficial parts by ſome menſtrous fluid. See METAL, CALX, FLOWER, MENSTRUUM, &c.

Water is the great inſtrument or agent in producing *ruſt*; the air apparently ruſts bodies, but it is only in virtue of the water it contains. See AIR.

Hence, in a dry air, metals remain a long time without contracting *ruſt*; and hence oils and other fatty bodies ſecure metals from *ruſt*; water being no menſtruum to oil, &c. and therefore not able to make its way through it. See WATER, &c.

All metals are liable to *ruſt*; even gold itſelf, though generally held incapable thereof, grows *ruſty* if expoſed to the fumes of ſea-ſalt. See GOLD.

The reaſon why gold is ſo rarely found to *ruſt*, is that ſea-ſalt, which is the only ſalt that will prey upon it, is of a very fixed nature, and therefore little of its effluvia or exhalations are found floating in the air. See GOLD, AQUA *Regia*, VOLATILISATION, *&c.*

Ruſt is uſually ſuppoſed a corruption of the metal, but without much foundation: it is the very metal itſelf, only under another form; and accordingly we find that *ruſt* of copper may be again turned into copper.

The *ruſt* of copper, called *ærugo*, makes what we call *verdigreaſe*. See VERDEGREASE—Ceruſs is made of lead converted into *ruſt* by vinegar. See CERUSS—Iron, in time, turns wholly into *ruſt*, unleſs preſerved from the air by paint or varniſh. See IRON, PAINTING, *&c.*

RUSTIC *gods*, in antiquity, *dii* RUSTICI, were the gods of the country; or thoſe who preſide over agriculture, *&c.* See GOD, *&c.*

Varro invokes the twelve *dii conſentes*, as the principal among the *ruſtic* Gods; *viz.* Jupiter, Tellus, the Sun, Moon, Ceres, Bacchus, Rubigus, Flora, Minerva, Venus, Lympha, and Good Luck—Beſides theſe twelve arch-*ruſtic*-gods, there were an infinity of leſſer ones: as, Pales, Vertumnus, Tutelina, Fulgor, Sterculius, Mellona, Jugatinus, Collinus, Vallonia, Terminus, Sylvanus, and Priapus—Struvius adds, the Satyrs, Fauns, Sileni, Nymphs, and even Tritons; and gives the empire over all the *ruſtic* gods to the god Pan. See SATYR, FAUN, NYMPH, DRYADES, *&c.*

RUSTIC, in architecture, expreſſes a manner of building in imitation of ſimple or coarſe nature, rather than according to the rules of art. See BUILDING and ARCHITECTURE.

RUSTIC *faſti*. See the article FASTI.

RUSTIC *fountain*. See the article FOUNTAIN.

RUSTIC *freeze*. See the article FREEZE.

RUSTIC *quoins*, by Vitruvius, called *lapides minantes*. See *Ruſtic* QUOIN.

RUSTIC *work*, is where the ſtones in the face, *&c.* of a building, inſtead of being ſmooth, are hatched or picked with the point of a hammer.

RUSTIC *order*, is an order decorated with *ruſtic* quoins, *ruſtic* work, *&c.* See ORDER.

Felibien ſays, it is properly where the ſeveral parts, of the five orders are not exactly obſerved; but this confounds *ruſtic* with *Gothic*. See GOTHIC.

RUT, in hunting, *&c.* a term uſed for the venery or copulation of deer—*For the terms which obtain in reſpect of other beaſts of game, with the noiſe they make during the act.* See HUNTING.

The *rutting*-time with the hart begins about the middle of September, and holds two months; the older they are, the better, and the more beloved by the hinds, and the earlier do they go to *rut*—At this time they will turn head, and furiouſly make at any living creature. It is eaſy killing them now; their whole buſineſs being to ſcent and purſue the track of the females; ſcarce feeding at all. The young herd are forced to fly with great precipitancy when the hart comes in ſight of his mate. If there be any other of bulk, they will diſpute it very hotly with their horns—As the ſeaſon expires, they withdraw and dig themſelves holes wherein to lie to aſſwage the ſtrong ſavour of their luſt: when become a little ſweet, they return to their paſture, and live in herds. See *Hart*-HUNTING.

The *rutting* or tourning-time of the roe-buck begins in October, and only laſts 12 or 15 days. This over, he caſts his horns. See HEAD—After the hind is filled, ſhe keeps no more company with the male till ſhe be delivered—But the doe always accompanies her paramour, till her time approaches; when ſhe retires, for the ſafety of her young, which he would otherwiſe kill. See *Roe-buck* HUNTING.

RYAL. See the article RIAL.

RYME. See the article RHYME.

RYPTICKS, in medicine. See RHYPTICKS.

RUYSCHIANA. See TUNICA.

S.

S, A conſonant, and the eighteenth letter of the alphabet. See LETTER and ALPHABET.

S is accounted one of the three hiſſing conſonants; the other two being Z and J.—It alſo held a ſemi-vowel, as forming a kind of imperfect ſound, without the aſſiſtance of any vowels.

Some of the Ancients avoided all uſe of the S very ſtudiouſly; particularly Pindar, who has whole poems without once mentioning it. And hence alſo in Plautus, and ſome others of the Latin poets, we find it cut abruptly off, as in *dignu'*, *omnibu'*, &c.—Others, on the contrary, affected the uſe of it every where, inſerting it where 'twas not wanted; as *Caſmenæ* for *Camenæ*, *duſmoſæ* for *dumoſæ*, *cæſna* for *cæna*, &c. Of all others, the S is neareſt a-kin to the R; whence it was frequently changed, by reaſon of its diſagreeable ſound, into R.—Thus the *Valerii*, *Furii*, &c. were at firſt call'd *Valeſii*, *Fuſii*, &c. and what we now call *ara*, *arena*, *carmen*, *feriæ*, *lares*, &c. were antiently wrote *aſa*, *aſena*, *caſmen*, *feſiæ*, *laſes*, &c. Add to this, that the Latin nouns now terminated in *or*, as *arbor*, *labor*, &c. antiently ended in *s*, as *arbos*, *labos*, &c. See R.

In the inflections of nouns, S is variouſly changed; ſometimes into *rs*, as *flos*, *floris*; ſometimes into *n*, as *ſanguis ſanguinis*, ſometimes into *d*, as *pes pedis*; ſometimes into *t*, as *nepos nepotis*.—On the contrary, in verbs, it is frequently put for other letters; for *b*, as in *jubeo juſſi*; for *c*, as in *parco parsi*; for *d*, as in *ludo luſi*; for *g*, as in *ſpargo ſparsi*, &c. See B, D, *&c.*

The Latins alſo frequently changed the Greek *s* into *l*, as Αννιβας Annibal; into *d*, as μισσον *medium*, &c.—The double *s* was frequently changed into *x*, as πισσα *pix*; and ſometimes even the ſingle one, as Αιας Ajax.

The old and the new orthography of the French, differ chiefly on the uſe of the *s*; the latter omitting it in writing, where it is not heard in the pronunciation, and the former retaining it: thus the followers of the one, particularly the academy in their dictionary, write *tempeſte*, *huiſtre*, *fluſte*; thoſe of the other, *tempête*, *huître*, *flûte*, &c. See ORTHOGRAPHY.

S was a numerical letter among the Ancients, ſignifying ſeven: according to the verſe,

S vera ſeptenos numeratos ſignificabit.

S, in books of navigation, &c. ſignifies South.—S. E. South-Eaſt.—S. W. South-Weſt.—S. S. E. South South-Eaſt, &c. See WIND.

S ſometimes alſo ſtands for *ſocius*, fellow, member, and ſometimes for *ſocietas*: as R. S. S. *regiæ ſocietatis ſocius*, fellow of the royal ſociety.

S. A. in medicinal preſcriptions is an abbreviature of *ſecundum artem*, according to the rules of art; chiefly uſed where ſome uncommon care or dexterity is required.

SABÆANS *, SABÆI, the adherents to *Sabaiſm*; a ſect of idolaters, much ancienter than Moſes and the Jewiſh law. See SABAISM.

* The word is ſometimes alſo written *Sabians*, *Sabaites*, *Zabæans*, *Zabians*, *Zabaites*, *Tſabæans* *Tſabians* and *Tſabaiſts*.

The Sabæans were very numerous throughout the eaſt: in later times they have mixed ſomething of chriſtianity with their ſuperſtition. They ſet a great value on the baptiſm of St. John; whence they have been alſo denominated *chriſtians of St. John*. See CHRISTIANS *of St. John*.

Some, indeed, doubt whether the *Sabæans* be the ſame with the chriſtians of St. John; but Father Angelo de St. Joſeph, a Carmelite miſſionary, and Maracci, in his notes on the Alcoran, aſſert it expreſly. Be this as it will, Mahomet, in his Alcoran, and the Arabian authors ſince him, make frequent mention of them. Beidavius, in his comment on the Alcoran, repreſents them as a kind of mean between the Chriſtians and the Maguſians, who are the followers of the Magi, among the Perſians: he adds, that they pretend to be of the religion of Noah.—Keſſæus notes, that they pretend to be in poſſeſſion of the books of Seth and Enoch; though they own none of the books of ſcripture.

Some charge them with worſhipping the ſtars; and others, the angels, or dæmons. Maimonides attributes both to them; as is obſerved under the Article SABAISM.

Abu Joſeph Aſchæus, and Keſſæus place the *Sabæans* about Charan, or Charres, and Ghezira in Meſopotamia; which opinion is confirmed by this, that their books are in the Chaldee tongue, though in a character very different from the Chaldee.

Hottinger ſets aſide the common derivation of *Sabæan* from צבא *militia*, *hoſt*; and will not have it the name of a ſect of religion, but of a people in Arabia Felix, the deſcendants of *Saba*, Grandſon of Cham.—But the criticks, to a man, conſpire againſt this opinion.

SABAISM, an ancient kind of idolatry; the firſt that ever entered into the world. See IDOLATRY.

Sabaiſm conſiſted in the worſhip and adoration of the ſtars; or as the ſcriptures call them צבא שמים *tſeba ſchamaim*, i. e. hoſt, or militia of heaven; whence ſome Moderns formed the word *Sabaiſm*, to denote the worſhip of the heavenly bodies, and that of *Sabæans* for the worſhippers. See SABÆANS. But as the Hebrew word, whence theſe are formed, is wrote with a צ *tzade*, which ſome expreſs in the modern tongues by an *s*, ſome by a *z*, others by *ts*, and others by *tz*; hence ariſes a great many different manners of writing the word among different authors. Some *e. gr.* writing *Sabæans*, others *Zabians*, or *Zabæans*, or *Zabæiſts*, as Buxtorf; others *Tſabians*, others *Tſabæans*, &c. Maimonides makes frequent mention of this idolatry in his *More Nevochim*: it was very general, he obſerves, in the time of Moſes. The retainers hereto taught, that God was the ſpirit of the ſphere, that is the ſoul of the world. Abraham, he adds, was brought up in the doctrine of the *Sabæans*, who admitted no other gods but the ſtars, and who in their books, many of which have been tranſlated into Arabic, maintain expreſly, that the fixed ſtars and planets, are inferior gods, and the ſun and moon the ſuperior ones. Abraham at length, he tells us, oppoſing theſe errors, firſt aſſerted the exiſtence of a creator diſtinct from the ſun. The king of the Cuthæans clapt him up in priſon; but he ſtill perſiſting, that prince, from an apprehenſion of his diſturbing the ſtate by teaching a new religion, confiſcated his goods, and baniſhed him to the extremities of the eaſt.—This relation, he tells us, is found in a book intitled, הצבורה הנבטיה *The religion of the* Nabathæans.

He adds, That the *Sabæans*, to the adoration of the ſtars, joined a great reſpect for agriculture; ſet a high value on cattle and ſheep; and taught, that it was unlawful to kill them. He even adds, that they worſhipped dæmons, under the form of goats, and eat the blood of animals, (tho' they judged it unclean,) merely becauſe they imagined it was the food of dæmons.

This is a ſummary of what the Rabbin gives us concerning *Sabaiſm*; from whence, it is eaſy judging of what ſome people tell us, that *Sabaiſm* is a mixture of Judaiſm, Chriſtianity, Mahometaniſm, and Paganiſm. The Truth is, the worſhip of the ſtars was eſtabliſhed long before not only Chriſtianity, but even before the law of Moſes. Not but ſome of the later *Sabæans* have given into divers articles of almoſt all religions. See SABÆANS.

SABBATARIANS, a ſect of Anabaptiſts, in the XVIth century; thus called, becauſe they obſerved the Jewiſh or ſaturday-ſabbath, from a perſuaſion that it was never abrogated in the New Teſtament by the inſtitution of any other. See SABBATH, ANABAPTIST, *&c.*

SABBATH *, SABBATUM, the ſeventh day of the week, held as a feaſt among the Jews, in memory of God's reſting on the ſeventh day of the creation. See WEEK.

* The word is pure Hebrew, שבת, and ſignifies *ceſſation* or *reſt*. Philo calls it, Τȣ κοσμȣ γενεσιον, The world's birth-day.

The Sabbath was appointed from the beginning, by God himſelf, Gen. ii. 2, 3. and by him ſet apart for the commemoration of the great work of the creation; and when it had fallen into neglect after the flood, was re-eſtabliſhed by him, upon his ſettling the Jewiſh polity after the return out of Egypt. The Chriſtians alſo apply the word *Sabbath* by extenſion, to the firſt day of the week, popularly called *Sunday*, or the *Lord's-Day*; as inſtituted by the apoſtles to take place of the Jewiſh *Sabbath*, and by us obſerved in remembrance, not of the creation, but of the work of redemption's being compleated by our Saviour's reſurrection on that day. See SUNDAY.

Thoſe who diſpute the divine appointment of a Chriſtian *Sabbath*, yet allow the moral neceſſity thereof as a wiſe deſignation of time for the recruiting of our bodies, and at the ſame time, keeping up a ſenſe of the great benefits we have received from God, and a ſpiritual temper of mind. By allowing ſix days to labour, the poor has time to earn his bread, and the man of buſineſs time to diſpatch his affairs. Had more time been allotted to labour and buſineſs, and none to reſt; our bodies would have been too much fatigued and waſted, and our minds too long engaged about worldly matters, ſo as to have forgotten divine things. Greedy people, without ſuch an injunction, would ſcarce have ſpared their own bodies, much leſs their ſervants, ſlaves, cattle, &c.—The creation, therefore, would have ſuffered, had it not been provided for by the inſtitution of a *Sabbath*. See SUNDAY.

The Jews had alſo their SABBATICK YEAR, which was every ſeventh year; wherein they were obliged to ſet their ſlaves at liberty, and to let their lands lie idle. See JUBILEE.

SABBATH, is alſo uſed for a nocturnal aſſembly which Witches are ſuppoſed to hold on ſaturdays, where the devil appears in form of a goat, around whom they make ſeveral dances, and magick ceremonies, amply deſcribed in the books of Dæmonomania.

To prepare themſelves for this meeting, it is pretended, they take certain ſoporific drugs; after which they are ſaid to fly up the chimney, and to be ſpirited through the air to the *Sabbath* on a ſwitch.

SABBATH-*day's-journey*, is a Jewiſh itinerary meaſure, fixed by criticks to the ſpace of 750 paces; or of 2000 Jewiſh cubits. See MEASURE.

SABBATIANS, SABBATIANI, a ſect of hereticks thus called from *Sabbatius*, their leader, who lived under Diocleſian, was firſt a Jew, then converted, and made a prieſt by Marcion; but afterwards left the ſect of Marcionites, on account of the celebration of Eaſter, which he would have to be on the fourteenth day of the moon; whence he, and his adherents, were called *Quartodecimans*. See QUARTODECIMAN.

The *Sabbatians* are recorded by eccleſiaſtical hiſtorians, as having a great abhorrence of the left-hand; ſo as to make it a point of religion, not to receive any thing with it.—This cuſtom, which is now become a piece of manners among us, was then eſteemed ſo ſingular, that the *Sabbatians* were thence denominated Αριϛεροι, *q. d. ſiniſtri*, or left-handed.

SABELLIANS, a ſect of antient hereticks in the eaſt, who reduced the three perſons in the Trinity, to three ſtates or relations; or rather reduced the whole Trinity to the one perſon of the Father; making the Word and the Holy Spirit to be only virtues, emanations, or functions thereof. See TRINITY and PERSON.

Sabellius, their chief, firſt broached this doctrine, in the third century, in a city of Lybia, called Ptolemais: he taught, that he, who in heaven is the Father of all things, deſcended into the virgin, became a child, and was born of her as a Son; and that, having accompliſhed the myſtery of our ſalvation, he diffuſed himſelf on the apoſtles, in tongues of fire; and was then denominated the Holy Ghoſt.

Epiphanius tells us, that the God of the *Sabellians*, whom they called the Father, reſembled the ſun, and was a mere ſubſtratum; whereof the Son was the illuminative virtue or quality, and the Holy Spirit the warming virtue.

The Word, they taught, was ſhot or darted forth like a divine ray, to accompliſh the work of redemption; and that, being re-aſcended to heaven, as the ray returns to its ſource, the warmth of the Father was communicated, after a like manner, to the apoſtles.

The council of Antioch, held by the Euſebians in 345, tells us, that, at Rome, they were called *Patripaſſians*, who, in the eaſt, were called *Sabellians*. See PATRIPASSIAN.

SABLE *, in heraldry, the black colour, in the arms of gentlemen. See COLOUR.

* The name is borrowed from the little animal called *Sable*, which is of a black colour.

In thoſe of nobility, it is called *Diamond*; and in the coats of ſovereign princes, *Saturn*. See DIAMOND.

It is expreſſed in engraving by perpendicular and horizontal hatches drawn a-croſs each other—as repreſented in *Tab. Heral. fig.* 27.

SABRE *, a kind of cutting ſword, or ſcimiter, having a very broad, heavy blade; thick at the back, and a little crooked towards the point. See SWORD.

* The word is formed from the German *Sabel*, which ſignifies the ſame, of the Sclavonic *Sabla*, a ſword or hanger.

The Turks are very expert in the uſe of the *Sabre*, which is the weapon they ordinarily wear by their ſide, &c.—With this, it is ſaid, they can cleave a man quite down, at a ſingle ſtroke.

SAC *, or SAK, SACA, or SACHA, in law, a royal privilege which a lord of a manor claims in his court, of holding plea in cauſes of debate ariſing among his tenants and vaſſals, and of impoſing and levying fines and amercements touching the ſame. See SOC.

* The word is Saxon, Sac, and literally ſignifies *cauſe, conteſt*, &c. Raſtal defines *Sac* by the forfeiture or amercement itſelf.

SACÆA, ΣΑΚΑΙΑ, in antiquity, a feaſt which the ancient Babylonians, and other Orientals, held annually in honour of the god Anaitis.

The Sacæa were in the eaſt what the *Saturnalia* were at Rome, *viz.* a feaſt for the ſlaves. One of the ceremonies hereof, was to chuſe a priſoner condemned to death, and allow him all the pleaſures and gratifications he could wiſh, ere he were carried to execution. See SATURNALIA.

SACCADE, in the manage, a jerk or violent check which the cavalier gives his horſe, by drawing both the reins very ſuddenly; uſed when the horſe bears too heavy on the hand, or obſtinately arms himſelf. See HORSE.

The Saccade is a kind of correction rarely to be uſed; for fear of ſpoiling the horſe's mouth.

SACCHARUM, or SACCHAR. See SUGAR.

SACCOBENITTO, or SACO BENITO. See SAN-BENI.

SACCOPHORI *, a ſect of ancient hereticks, thus called, becauſe they always went cloathed in ſackcloth, and affected a world of auſterity and penance.

* The word is Greek, Σακκοφοροι; formed of σακκος, a ſack or bag, and Φερω, I bear.

We know but little of their tenets: in all probability they were the ſame with the Maſſalians. See MASSALIAN.—The emperor Theodoſius made a law againſt the *Saccophori*, and Manichees.

SACCULUS, a diminutive of *Saccus*; uſed in anatomy, to expreſs ſeveral parts of the body, bearing ſome reſemblance to bags; as,

SACCULUS *Chyliferus*, or *Roriferus*, a paſſage which makes the beginning of the thoracic duct: called alſo *receptaculum chyli*. See RORIFERUS, THORACIC, and RECEPTACULUM.

SACCULUS *Cordis*, the pericardium. See PERICARDIUM.

SACCULUS *Lacrymalis*, a little membranous bag, into which the puncta lacrymalia of the eye open; and which is, itſelf, the entrance of a canal, by which the liquor ſeparated in the glandula lacrymalis, is diſcharged into the cavity of the noſe. It is the ulceration of this *Saccus*, that makes the fiſtula lacrymalis. See FISTULA.

SACCULI *Adipoſi*, little cells or veſicles, in the membrana adipoſa, wherein the fat of the body is contained. See ADIPOSE and FAT.

SACCULUS *Medicinalis*, denotes a topical medicine, applied to the ſide, ſtomach, or other painful part; conſiſting of herbs, or drugs incloſed in a linen bag.

SACCULUS *Medicinalis*, is alſo a name given to a bag of ingredients ſuſpended in a liquor, in making diet-drinks; called alſo *Nodule*. See NODULE.

SACER, or SACER DORSI, in anatomy, a muſcle ariſing from the hind-part of the os ſacrum, and running along under the longiſſimus dorſi—With its ſeveral tendons, it lays hold on the ſpine, and every tranſverſe proceſs of the loins, and the loweſt of the back.—It aſſiſts in erecting the trunk. See MUSCLE.

SACER *Ignis*, } See the articles { ERYSIPELAS.
SACER *Morbus*, } See the articles { EPILEPSY.

SACERDOTAL *, SACERDOTALIS, ſomething belonging to the prieſthood. See PRIEST.

* The word is formed from the Latin, *Sacerdos* prieſt, of *Sacer* holy.

SACERDOTAL *Benefices*, are ſuch as cannot be legally held by any but perſons in holy orders; ſuch as are all cures of ſouls, biſhopricks, &c. See BENEFICE.

The SACERDOTAL *Ornaments*, are thoſe wherewith the prieſts are cloathed, when they officiate, &c.

SACK *of Wool*, is a determinate quantity, containing juſt 26 ſtone; and every ſtone 14 pounds. 14 *E.* 3. Stat. 1. c. 2. See STONE and WOOL.

In Scotland, a *Sack* is 24 ſtone; each ſtone containing 16 pounds.

A SACK *of Cotton Wool*, is a quantity from an hundred and half to 400 weight.

SACKS *of Earth*, SACS *a Terre*, in fortification, are canvaſs bags full of earth, the largeſt about a cubic-foot wide, and the leſſer ſomewhat more than half a foot.

They are alſo called *Earth-bags* and *Canvaſs-bags*, and are uſed on ſeveral occaſions; particularly for making retrenchments in haſte, to place on parapets, or the head of the breaches, &c. or to repair them when beaten down.

They are of good uſe alſo, where the ground is rocky, and affords not earth to carry on the approaches, becauſe they can eaſily be brought on, and carried off.

The ſame bags, on occaſion, are uſed to carry powder in, of which, they hold about fifty pounds a-piece.

SACBUT, a muſical inſtrument of the wind kind; being a kind of a trumpet, though different from the common trumpet both in form, and ſize.

The Sacbut is very fit for playing baſs; and is contrived ſo as to be drawn out or ſhortened, according to the gravity or acuteneſs of the tones.—The Italians call it *Trombone*, the Latins, *Tuba Ductilis*.

It takes aſunder into four pieces, or branches; and hath frequently a wreath in the middle; which is the ſame tube, only twiſted twice, or making two circles in the middle of the inſtrument; by which means, it is brought down one fourth lower than its natural tone. It has alſo two pieces or branches on the inſide, which do not appear, except when drawn out by means of an iron bar, and which lengthen it to the degree requiſite to hit the tone required.

The Sackbut is uſually eight foot long, without being drawn out, or without reckoning the circles. When extended to its full length, it is uſually fifteen foot. The wreath is two foot nine inches in circumference. It ſerves as baſs in all concerts of wind muſick.

There are *Sackbuts* of different ſizes, ſerving to execute different parts; particularly a ſmall one, called by the Italians, *Trombone picciolo*, and by the Germans, *Cleine alt-poſaune*, proper for a counter-tenor. The part aſſigned it, is uſually called *Trombone primo*, or I°. There is another large, called *Trombone maggiore*, which may ſerve as a tenor: its part is uſually called *Trombone ſecondo*, or II°. or 2°. There is a third ſtill bigger, called *Trombone groſſo*; its part is called *Trombone terzo*, or III°. or 3°. Laſtly, there is another which exceeds all the reſt, and which is much heard in the muſic, eſpecially in the baſs; its part is called *Trombone quarto*, or IV°. or 4^{to}. or ſimply *Trombone*. It has uſually the key of *F*, *ut*, *fa* on the fourth line; though frequently alſo on the fifth line from the top, by reaſon of the gravity or depth of the ſounds.

SACRA *Arteria*, a branch of the aorta deſcendens, which deſcends through the middle of the os ſacrum to the pelvis. See AORTA and ARTERY.

Sacra *Vena*, a vein ariſing from the os ſacrum, and terminating uſually in the iliac vein; ſometimes in the place where the two iliacs meet the aſcending aorta. See **Vein**.

SACRAMENT *, **Sacramentum**, in the general, denotes a ſign of a holy, or ſacred thing. See **Sign** and **Symbol**.

* The word is formed from the Latin, *Sacramentum*, which ſignified an oath, particularly that which the ſoldiers took to be true to their commanders; the words whereof according to Polybius, were *Obtemperaturus ſum & facturus quicquid mandabitur ab imperatoribus juxta vires.*

In which ſenſe, the word includes both the *Sacraments* of the law of nature, as ſound morality, the mannner of offering the bread and wine practiſed by Melchiſedech, &c. and thoſe of the law of Moſes, as the circumciſion, the paſchal lamb, purifications, order of prieſthood, &c. See **Type**.

Sacrament, with regard to the Chriſtian church, is defined, a viſible ſign of a ſpiritual grace annexed to the uſe thereof. See **Grace**, &c.

There are two objects in a *Sacrament*; the one a material ſign, the object of the ſenſes; the other the thing ſignified, which is the object of faith.—Thus it has pleaſed God to give as it were a body or ſubſtance to ſpiritual myſteries, that our faith might have the aſſiſtance of ſenſible ſigns.

Roman Catholicks own ſeven *Sacraments*, viz. baptiſm, confirmation, the euchariſt, penance, extreme unction, ordination and marriage. See each under its proper article.—The Proteſtants admit of only two, *viz.* baptiſm and the euchariſt, or Lord's ſupper. See **Baptism**, &c.

The Romaniſts, however, call the euchariſt, by way of eminence, the *Holy Sacrament*.—Thus to expoſe the *H. Sacrament*, is to lay a conſecrated hoſt on the altar to be adored.

The proceſſion of the *H. Sacrament*, is that wherein it is carried about the church, or about the town. See **Procession**.

In a like ſenſe they ſay, the feaſt of the *H. Sacrament*, the congregation of the *H. Sacrament*, &c.

Sacrament, was alſo uſed in the Roman law, for a pledge or gage of money, which both the plaintiff and defendant, in a real action, laid down in court, to be forfeited by him who ſhould loſe the cauſe.—This was particularly called, *Sacramento provocare, rogare, ſtipulari*, &c.

SACRAMENTARIANS, a general name given to all ſuch as have publiſhed, or held erroneous doctrines of the ſacrament of the ſupper.

The term is chiefly applied among Roman Catholicks, by way of reproach, to the Lutherans, Calviniſts, and other Proteſtants.

SACRAMENTARY, **Sacramentarium**, an ancient church-book, comprehending all the prayers and ceremonies practiſed at the celebration of the ſacraments.

Pope Gelaſius was the firſt author of the *Sacramentarium*: it was afterwards reviſed, corrected and abridged by St. Gregory.—It was the ſame with what the Greeks now call *Euchologium*. See **Euchologium**.

SACRED, **Sacer**, ſomething holy, or, that is ſolemnly offered, and conſecrated to God with ceremonies, benedictions, unctions, &c. See **Consecration**.

Kings, prelates, and prieſts, are held *ſacred* perſons; abbots are only bleſſed.—The deaconhood, ſub-deaconhood, and prieſthood, are *ſacred* orders, and impreſs a *ſacred*, indelible character. See **Order**.

The cuſtom of conſecrating kings with holy oil, is derived, according to Gutlingius, from the Hebrews; among whom, he agrees with Grotius, it was never uſed but to kings who had not an evident right by ſucceſſion. He adds, that the Chriſtian emperors never uſed it before Juſtin the younger; from whom he takes it to have paſſed to the Goths, &c. See **Unction**, **King**, &c.

Sacred, is alſo applied to things belonging to God, and the church. See **Holiness**.

Church lands, ornaments, &c. are held *ſacred*.—The *ſacred* college is that of the cardinals. See **Cardinal**.

Sacred *Majeſty*, is applied to the emperor, and the king of England; yet Loyſeau ſays it is blaſphemy. See **Majesty**.

The Ancients held a place ſtruck with a thunder-bolt as *ſacred*. See **Thunder-bolt**.

In the civil law, *ſacred* place chiefly denotes that, where a perſon deceaſed, has been interred. See **Tomb**, &c.

SACRIFICE, **Sacrificium**, an offering made to God on an altar, by means of a regular miniſter, as an acknowledgment of his power, and a payment of homage. See **Altar**.

Sacrifices differ from mere oblations, in that in a *Sacrifice* there is a real deſtruction or change of the thing offered; whereas an oblation is only a ſimple offering or gift, without any ſuch change at all. See **Oblation**.

Divines divide *Sacrifices* into *bloody*, ſuch as thoſe of the old law; and *bloodleſs*, ſuch as thoſe of the new law.

They alſo divide them again into *impetratory*, which are thoſe offered, to obtain ſome favour of God, or to thank him for ſome already received: and *propitiatory*, which are thoſe offered to obtain forgiveneſs of ſins. See **Propitiation**.

The Phœnicians are uſually held the firſt authors of *Sacrifices*: Porphyry, indeed, attributes the invention to the Egyptians; who, he ſays, firſt offered the firſt-fruits of their grounds, to the gods; burning them upon an altar of turf. At length they came to burn perfumes, and at laſt ſacrificed animals; obſerving that they firſt eat ſome herbs, or fruits, regularly offered on the altars.—He adds, that libations were very frequent ere *Sacrifices* of beaſts got footing. See **Libation**.

Ovid obſerves, that the very names *victim* and *hoſtia* import, that they were not ſlain, till ſuch time as victories were obtained over enemies: indeed, while men lived on herbs and pulſe, it is no wonder they abſtained from *Sacrifices* of beaſts: ſince the law of *Sacrifices* required, that they ſhould eat ſome part thereof. In effect, it is ſuppoſed to be this that firſt introduced fleſh as a food, and made man a carnivorous animal. See **Carnivorous**.

The truth is, in all antiquity, both ſacred and profane, *Sacrifices* were ordinarily nothing elſe but holy banquets. See **Feast**, **Epulo**, &c.

The ſcriptures furniſh us a ſomewhat different account; Noah certainly *ſacrificed* animals at his coming out of the ark; and it is even ſuggeſted, that Abel himſelf *ſacrificed* the beſt and fatteſt of his flocks: though Grotius thinks it more probable, he contented himſelf with making a mere oblation of his lambs, &c. to God without *ſacrificing* them.

Macrobius tells us, that the Egyptians, long accuſtomed to bloodleſs *Sacrifices*, being at length obliged to admit the worſhip of Serapis and Saturn, to whom *Victims* were to be *ſacrificed*; would not allow their temples to be built in the cities.

Theſe *Victims*, however, or bloody *Sacrifices*, at length obtained, in excluſion of almoſt all the reſt: the moſt uſual among the Ancients, were bulls, oxen, cows, ſheep and lambs, in regard theſe were the moſt ordinary food of man.

The manner of *ſacrificing* among the ancient Hebrews, is amply deſcribed in the books of Moſes. That in uſe among the Romans, is as follows.—In the choice of the *Victims*, care was taken it were without blemiſh or imperfection, its tail not too ſmall at the end; the tongue not black, nor ears cleft; and the bulls ſuch as had never been yoked. The *Victim* pitched upon, they gilt his forehead and horns, eſpecially if a bull, heifer, or cow. The head they alſo adorned with a woollen infula, whence hung two rows of chaplets, with twiſted ribbons; and on the middle of the body a kind of ſtole, pretty large, hung down on both ſides: the leſſer *Victims* were only adorned with bundles of flowers and garlands, together with white tufts or garlands.

The *Victims* thus made ready, were brought before the altar; the leſſer were not led in a ſtring, but driven to the place: the greater were conducted in an halter; if they made any ſtruggle, or refuſed to go, the reſiſtance was taken for an ill augury, and the *Sacrifice* ſet aſide.—The *Victim* thus brought before the altar, was examined very circumſpectly, to ſee if there were no defect in it: then the prieſt, being clad in his ſacerdotal habit, and accompanied with the *Sacrificers* and other attendants, and being waſhed and purified according to the ceremonies preſcribed, began the *Sacrifice*, with making a loud confeſſion of his unworthineſs, acknowledging himſelf guilty of divers ſins; for which he begged pardon of the gods, hoping they would be pleaſed to grant his requeſts.—Theſe confeſſions were like thoſe of the Hebrews; with this difference, that the Pagans confeſſed the frailty of mankind, and owned their faults; the Jews confeſſed chiefly the greatneſs of God, accompanying it with hymns and muſical inſtruments.

The confeſſion over, the prieſt cried aloud, *hoc age*, i. e. compoſe yourſelves, and mind your buſineſs; and preſently an uſher, holding a rod in his hand, called *Commentaculum*, went through the temple, and made all thoſe withdraw, who were not initiated in the myſteries of religion, or ſuch as were excommunicated.

The cuſtom of the Greeks, from whom the Romans borrowed theirs, was, that the prieſt coming to the altar, ſhould aſk aloud, Τις τι δε? Who is here? The people anſwered, Πολλοι ϗ αγαθοι, Many good perſons: then the uſher went through the temple, crying, Ἑκας, ἑκας, εςε βεϐηλοι, that is, Out with the wicked. The Romans commonly uſed the words, *Nocentes, profani, abſcedite.*—All thoſe who were driven out of the temples among the Greeks, were comprehended under theſe general words, βεϐηλοι, αμυητοι, ακαθαροι. The profane being withdrawn, they cried, *Favete linguis*, or *animis*, and *Paſcite linguam*, to require ſilence, and attention during the *Sacrifice.*

Theſe ceremonies ended, the chief *Sacrificer* being ſate down, and the reſt of them ſtanding, the magiſtrates or private perſons, who offered *Sacrifice*, came before him, and preſented him with the firſt-fruits and victim, and ſometimes made a ſhort diſcourſe, by way of compliment; as we find Homer makes Ulyſſes do, when he preſented the high-prieſt with Iphigenia to be *ſacrificed*.—As any perſon came to preſent his offering, he waſhed his hands in a place appointed in the temple for that purpoſe.

Laſtly, when the offering was made, the prieſt that officiated, perfumed the victim with incenſe, and ſprinkled it with luſtral water; and having waſhed his hands, and got up again to the altar, he prayed to the god to whom he preſented the

Sacrifice, with a loud voice, that he would accept of thoſe offerings, and be pleaſed with the victim he *ſacrificed* to him for the publick good, and for ſuch and ſuch things in particular.—In the cloſe of the offertory and prayer, made by the prieſt to the gods, he came down the ſteps of the altar, and from the hand of one of his aſſiſtants, received the ſacred paſte, called *mola ſalſa*, made of barley or wheat flour, mixed with ſalt and water, which he threw upon the head of the victim, ſprinkling a little wine upon it, which was called *immolatio.*—Servius ſays, the prieſt ſcattered little bits of this paſte upon the head of the victim, the altar where the ſacred fire burned, and the knives, by way of conſecration.

He then took wine in a veſſel called *ſimpulum*, and having taſted it himſelf firſt, and made his aſſiſtants do the ſame, to ſhew that they partook of the *Sacrifice*, he poured it between the horns of the victim, pronouncing theſe words of the conſecration, *Mactus hoc vino inferis eſto*; Let this victim be improved and honoured by this wine. This done, he pulled off the hairs from between the horns, and threw them into the fire; and commanded the victimarius (who aſked him, *Agon'*, Shall I ſtrike?) to knock down the victim with a blow on the head with an hammer or ax; upon which, another aſſiſtant, named *Popa*, preſently thruſt a knife into his throat; whilſt a third received the blood, wherewith the prieſt ſprinkled the altar.

When the victim was ſlain, they flead him, if it was not a burnt-offering; (for then they burned ſkin and all,) took the fleſh off the head, and adorning it with garlands and flowers, faſtened it to the pillars of temples, as well as the ſkins, as enſigns of religion; carrying them about in proceſſion in publick calamities.—Not but that the prieſts oft wore the ſkins, and others went to ſleep upon them in the temples of Æſculapius and Faunus, that they might receive favourable reſponſes in their dreams, or be cured of their maladies.

They then opened the victim's entrails, and after circumſpectly viewing them, to draw preſages therefrom, according to the art of the aruſpices, they flowered them with meal, and ſprinkled them with wine, and made a preſent of them to the gods, *reddebant exta diis*, by throwing them into the fire in ſmall bits, boiled or parboiled; and hence the entrails were called *porricæ.*

The entrails being burned, and the other ceremonies finiſhed, they believed the gods to be ſatisfied; and that they could not fail to find their vows accompliſhed, which they expreſſed by the word *litare*, *q. d.* all is finiſhed, and well done; whereas *non litare*, on the contrary, intimated there was ſomething wanting to the perfection of the *Sacrifice*, and that the gods were not appeaſed.—The prieſt afterwards diſmiſſed the people with theſe words, *Ilicet*.

Hence it may be obſerved, that the *Sacrifices* conſiſted of four principal parts; the firſt called *libatio*, or the pouring a little wine upon the victim; the ſecond *immolatio*, when, after they had ſcattered the crumbs of ſalted paſte thereon, they killed it; the third *redditio*, when they offered the entrails to the gods; and the fourth *litatio*, when the *Sacrifice* was perfected, and accompliſhed without any fault.

SACRILEGE, SACRILEGIUM, the crime of profaning ſacred things, or things devoted to God; or of alienating to laymen, or common purpoſes, what was given to religious perſons, and pious uſes. See PROFANATION, &c.

Our fore-fathers were ſo tender in this caſe, that, when the order of knights templars was diſſolved, their lands, &c. were all given to the knights hoſpitallers of Jeruſalem, for this reaſon, *Ne in pios uſus erogata, contra donatorum voluntatem, in alios uſus diſtraherentur.* See TEMPLAR, &c.

SACRISTA, or SACRISTAN, a church officer, otherwiſe called *Sexton*. See SEXTON.

SACRISTY, SACRISTIA, a place or apartment in a church, where the veſſels and other utenſils, and ornaments of the church, are preſerved; and where the miniſters dreſs and undreſs themſelves before and after ſervice.

The Sacriſty is alſo called in ancient authors, *Secretarium.*—Among us *Veſtry*. See VESTRY.

SACROLUMBARIS, or SACROLUMBUS, in anatomy, a muſcle, that ariſes fleſhy from the ſuperior part of the os ſacrum, poſterior part of the ilium, and from all the ſpines and tranſverſe proceſſes of the vertebræ of the loins.—It gives a ſmall tendon to the poſterior part of each rib near its root, where a ſmall bundle of fleſhy fibres ariſes and unites with each aſcending tendon, to the third, fourth, fifth, and ſixth vertebræ of the neck.—See *Tab. Anat.* (Myol.) *fig* 6. *n.* 30. 30. *fig.* 7. *n.* 16. 16.

This with the ſerratus poſticus inferior, and triangularis, help to contract the ribs in expiration. But they are but of ſmall force; and ſeem only to accelerate the motion of the ribs, which fall down chiefly by their own gravity, and the elaſticity of the ligaments, by which they are tied to the vertebræ. See MUSCLE.

SACRUM OS, in anatomy, the lower extremity of the ſpina dorſi; being that part whereon we ſit.—See *Tab. Anat.* (Oſteol.) *fig.* 3. *n.* 15. *fig.* 7. *n.* 20. See alſo the article SPINE.

It is doubted whence this name ſhould ariſe: ſome think it is becauſe the Ancients offered it in ſacrifice to the gods; others, becauſe it is very large; and others, becauſe it incloſes the natural parts.

Its figure is triangular: it is hollow within-ſide, and by that means contributes to the forming of the cavity at the bottom of the hypogaſtrum, called the *pelvis*. Its fore-part is ſmooth, by which means, the parts it contains are ſecured from being wounded: its hind-part rough, that the muſcles may faſten the better to it.

It has three different articulations: the firſt is with the laſt of the vertebræ of the loins, and is like that of the other vertebræ: the ſecond, with the os coccygis, by ſynchondroſis: the third, with the bones of the hips.

The *os ſacrum* is uſually divided into five parts, which are ranked among the number of vertebræ: the higheſt is the greateſt; the reſt growing leſs as they go lower. Theſe vertebræ are eaſily ſeparated in children, by reaſon the cartilages which join them, are not yet oſſified. But in adults, they are ſo firm, that they only make one bone. See VERTEBRA.

It is in the *os ſacrum*, that the cavity which contains the ſpinal marrow, terminates. See MEDULLA *Spinalis*.

SADDLE, in the manage, a kind of ſtuffed ſeat, laid on the back of a horſe, for the convenience of the rider. See HORSE, &c.

The origin of the *Saddle* is not well known: Gorop. Becanus attributes its invention to the Salii, a people among the ancient Franks; and hence, ſays he, came the Latin *Sella* ſaddle.

It is certain, the ancient Romans were unacquainted with the uſe either of *Saddle* or ſtirrups; whence Galen obſerves in ſeveral places, that the Roman cavalry, in his time, were ſubject to ſeveral diſeaſes of the hips and legs, for want of having their feet ſuſtained on horſe-back. And long before him, Hippocrates had noted, that the Scythians, who were much on horſe-back, were troubled with defluxions in their legs, becauſe of their hanging down.

The firſt time we hear of *Saddles* among the Romans, was *Anno* 340; when Conſtantius, endeavouring to deprive his brother Conſtantine of the empire, made head againſt his army, and entering the ſquadron where he himſelf was, threw him off his *Saddle*, as we are informed by the hiſtorian Zonaras.—Before, they made uſe of ſquare pannels; ſuch as we ſee in the ſtatue of Antoninus in the capitol.

The uſe of *Saddles* was firſt eſtabliſhed in England, by a law of Henry VII. whereby the nobility were obliged to ride on *Saddles.*—It is but very lately that the Iriſh have taken to it.

There are various kinds of *Saddles*; as the

Running SADDLE, a very ſmall one, with round ſkirts.

Burford SADDLE, which has the ſeat and ſkirts plain.

Pad SADDLE, of which there are two kinds; the one made with burs before the ſeat, the other with bolſters under the thighs.

French Pad SADDLE, the burs whereof, came all round the ſeat.

Portmantua SADDLE furniſhed with a cantle behind the ſeat, to keep a carriage off the rider's back.

War SADDLE, furniſhed with a cantle, and a bolſter both behind and before.

SADDLE-GALLED, is when a horſe's back is hurt, or fretted with the *Saddle*.

It is cured by bathing the part with urine, or warm wine: when the ſore is large, they bathe it with aqua ſecunda, ſtrewing over it the powder of old ropes of flax, and conſuming the proud fleſh with vitriol or colcothar.

SADDUCES, or SADDUCEES, SADUCÆI, a ſect among the ancient Jews, eſteemed as deiſts, or free-thinkers, rather than real Jews; though they aſſiſted at all the ceremonies of the worſhip in the temple. See JUDAISM.

St. Epiphanius will have the *Sadduces* to have taken their riſe from Doſitheus, a Samaritan ſectary; and Tertullian is of the ſame opinion. St. Jerom, and other writers add, that the *Sadduces* came near the Samaritans in many things; particularly in this, that they allowed no books of ſcripture, but the five books of Moſes. The Jeſuit Serrarius has alſo embraced this opinion, as ſeeming to be ſupported by the authority of Joſephus. But Joſephus ſays only this, that they admitted all that was written, *i. e.* all the books of ſcripture; intimating hereby, that they diſowned the unwritten traditions of the Phariſees.—In effect, St. Epiphanius is forced to own, that the *Sadduces* were Jews, not Samaritans; inaſmuch, as they aſſiſted at the worſhip and ſacrifices of the temple at Jeruſalem: whereas the Samaritans ſacrificed on Mount Gerizzim. See SAMARITANS.

Some authors aſcribe the origin of this ſect to one Sadoc, a diſciple of Antigonus Sochæus, who frequently inculcated it on his ſcholars, that God is to be ſerved for his own ſake, and not out of view to any reward from him in the next world, as ſlaves ſerve their maſters merely for recompence.—Sadoc, add they, putting a falſe interpretation on theſe words of his maſter, publiſhed, that there was no reward allotted to good actions done in this world. And hence aroſe the ſect of *Sadduces*; thus denominated from their leader Sadoc.—Though St. Epiphanius, and ſome modern writers after him, take the *Sadduces* to have been thus called from the Hebrew, *Sadec*, juſt, or *Sedec*, juſtice, in regard of the great juſtice and equity they ſhewed in all their actions.

It is obſerved, Acts xxiii. 8. that the *Sadduces* ſay, there is no reſurrection, neither any angel or ſpirit; but that the Phariſees believe both the one and the other. Theſe words, *The one and the other*, ſeem to inſinuate, that angel and ſpirit are one and the ſame thing. But as the apoſtles, obſerves Oecumenius on that paſſage, do not always uſe the exacteſt terms, one may underſtand by ſpirit, all ſpiritual ſubſtances; as if the *Sadduces* had believed that God himſelf was corporeal.—This, however, is not Oecumenius's opinion: he aſks, why the ſcripture ſays, *The one and the other*, though it ſpoke of three things, reſurrection, angel, and ſpirit? and he anſwers, that it is either becauſe angel and ſpirit are the ſame thing; or that *one and the other*, which is only properly underſtood of two things, is, perhaps, here ſpoke of three: exact propriety of words not being to be required in books wrote by ſimple illiterate fiſhermen. It is true, in explaining what goes before, he obſerves, that the *Sadduces*, being very ignorant, might poſſibly diſbelieve the exiſtence of a God; and on that account, might be repreſented as denying a reſurrection, &c. But he does not ſay, that by ſpirit, they might mean all ſpiritual ſubſtance. It is probable, all meant by it, is the immortality of the ſoul; it being the opinion of the *Sadduces*, that there is nothing immortal in man.

It is certain, they denied all reſurrection; and allowed of no happineſs but what is enjoyed in this life; believing, that every thing told of the other world, had been invented by the Phariſees.—Hence, alſo, they denied a divine providence, and attributed all things to free-will; in which, they oppoſed the opinion of the Phariſees, who admitted a kind of deſtiny, or fatality, in all our actions. See PHARISEES.

SAFE-CONDUCT, SALVUS CONDUCTUS, a ſecurity given by the prince under his great ſeal, to a ſtranger, for his quiet coming in and paſſing out of the realm.

The *Safe-Conduct* is granted to enemies, the paſſport to friends. See PASSPORT.

Judges ſometimes give *Safe-Conducts* to delinquents, or priſoners, to enable them to act in their affairs.

SAFE-GUARD, SALVA GUARDIA, in a law ſenſe, a protection given by the king to a perſon fearing the violence of ſome other, for ſeeking his right by courſe of law.

SAFE-GUARD, at ſea, denotes a rope which ſaves, and ſecures any thing: for inſtance, that whereby perſons walk ſecurely over the bolt-ſprit.

SAFE-GUARD *of the Helm*, is a rope which goes through the helm, and is faſtened to the futtocks of the ſhip. See HELM, &c.

SAFE-PLEDGE, SALVUS PLEGIUS, in law, a ſecurity given for a man's appearance on a day aſſigned. See PLEDGE.

SAFFRON*, CROCUS, a plant which produces a flower of the ſame name; whence, alſo, a drug called *Saffron* or *Crocus* is gathered. See CROCUS.

* The word is formed from the Arabic, *Zapheran*, which ſignifies the ſame. Botaniſts call the plant Crocus autumnalis ſativus.

The root which produces the *Saffron*, is a kind of bulb, or onion, covered with ſeveral bulbous cartilages: its graſſy leaves are long, narrow, thick and ſoft to the touch: its flower, which appears ſometimes before the leaves, and ſometimes after them, is a pale purple, ſtreaked with whitiſh lines: but towards the bottom of the petala the purple is deeper. From the middle of the flower ariſe three long flame-coloured ſtamina or chives, crowned with their apices. Under theſe is the ovary or vaſculum ſeminale, by ſome called the Piſtil of the plant: it is divided into three capſulæ, wherein the ſeeds are formed. From the upper part of the ovarium ariſes the ſtylus, a long ſlender tube incloſed within the fiſtular part of the flower, where it is of a whitiſh colour, but changes into a yellow before its diviſion, which is into three parts, oppoſite to the tops of the ſtamina: 'tis theſe three parts only that make the true *Saffron* of the ſhops, for the ſake of which alone the plant is cultivated. They are of a yellow colour juſt at the beginning from the ſtylus, but afterwards are all of a deep red colour, only their jagged extremities tipp'd with white inclining to yellow. See a figure and deſcription of the plant by Dr. Douglas in Phil. Tranſ. Nº 380. p. 441.

As ſoon as the flower is gathered, they ſeparate the ſtylets and lay them on hurdles, or in large ſieves, or on a little kiln for that purpoſe, with a little coal-fire underneath to dry them. When dry, the *Saffron* is in its perfection, and fit for uſe.

It is obſerved, that five pounds of freſh ſtyles, which ſome miſtakenly call the *chives*, only make one pound of dry *Saffron*.

The good qualities of *Saffron* are, that its ſtyles be long and broad, that they be velveted over with a fine red, of an agreeable ſmell, free of yellow threads, and very dry.

The beſt *Saffron* in Europe is that of England, chiefly about Walden in Eſſex: that brought from Spain is good for nothing; becauſe of the oil the Spaniards mix with it to make it keep.

Saffron is uſed both in food and medicine, to chear, fortify, and reſolve. It is the greateſt cordial in medicine; and a ſure promoter of a diaphoreſis.—It is alſo uſed by illuminors, to make a golden yellow colour.

SAFFRON is alſo a name given to ſeveral chymical preparations, from the reſemblance of their colour to that of vegetable *Saffron*, but more uſually called *Croci*. Such are

SAFFRON *of Venus*. See COPPER and VENUS.

SAFFRON *of Mars*. See CROCUS MARTIS.

SAFFRON *of Gold*. See AURUM *Fulminans*.

SAGAPENUM, Σαγαπηνον, a medicinal gum, whoſe ſmell comes very near that of the pine; whence its name.

It flows by inciſion, from the trunk of a ferulaceous plant growing in Perſia: the beſt is in bright tranſparent tears, of a ſtrong, pungent, porraceous ſmell; and the whiter and freer of dirt, the better. Sometimes it is found as white, both within and without ſide, as milk; though this is very rare. It is eſteemed aperitive and purgative, proper in the epilepſy, aſthma and palſy; and is alſo uſed externally to aſſuage pains, and reſolve tumours.

SAGATHEE*, in commerce, a ſlight woollen ſtuff; being a kind of ſerge, or ratteen; ſometimes mixed with a little ſilk.—It is manufactured chiefly at Amiens; though we have our ſhare in England.

* The word is formed from the French, *Sayette*, a diminutive of *Saye*, *Say*. See SAY.—The French name *Sayette*, again is derived from that of the thread uſed herein, which is chiefly prepared and ſpun in Flanders, about Turcoing, &c. and called *Fil de Sayette*.

SAGE, SALVIA, a medicinal herb of an agreeable, aromatic taſte; eſteemed an excellent cephalic of the detergent kind; and on that ſcore likewiſe uſed as a vulnerary and diuretic.

There are ſeveral kinds of *Sage*; thoſe uſed and cultivated by us are the *Tea-Sage*, or *Sage of Virtue*, the *Red Sage*, and the common or *Wormwood Sage*.

The firſt, *ſalvia virtutis*, or *ſalvia hortenſis minor*, has the moſt agreeable flower; and on that ſcore is cut when young and full of ſap, dried, and kept for tea.—The Dutch dry and prepare their *Sage* like other teas, and carry it to the Indies as a very precious thing. They there find a good market for it; the Chineſe preferring it to the beſt of their Indian teas; and for every pound of *Sage* tea, giving in exchange four pounds of theirs, which they ſell again very dear in Europe. See TEA.

The common or wormwood *Sage*, *ſalvia hortenſis major*, is eſteemed of the moſt efficacy in medicine, and is that alone uſed in the ſhops.—It makes an excellent gargariſm, eſpecially if ſharpened with a little acid. Its decoction is very grateful and cooling, with the addition of a little lemon-juice. It is both detergent and abſorbent, and as ſuch, finds place in diet-drinks, and medicated ales, intended for ſweetners and cleanſers of the blood.

The ſchool of Salernum recommend *Sage* as a remedy in all diſeaſes: hence the verſe,

Cur moriatur homo, cui ſalvia creſcit in horto?

Sage, when viewed with a microſcope, appears covered all over with little ſpiders, which are ſeen to walk, &c. about.—It yields, by diſtillation, a very agreeable, aromatic oil, of ſome uſe in the ſhops.

SAGITTA, in aſtronomy, the arrow or dart, a conſtellation of the northern hemiſphere near the eagle. See CONSTELLATION. The ſtars in the conſtellation *Sagitta*, in Tycho's catalogue, are five, and as many in Ptolemy's. In Mr. Flamſteed's catalogue they are twenty-three; the longitudes, latitudes, &c. whereof are as follow:

Names and ſituation of the ſtars.	Signs.	Longitude	Lat. Nort.	Magn.	
		° ′ ″	° ′ ″

Sagitta, in botany, ſignifies the top of any ſmall twig, cyon, or graft of a tree. See **Graft**, &c.

Sagitta, in geometry, is a term which ſome writers uſe for the abſciſſe of a curve. See **Absciss**e.

Sagitta, in trigonometry, &c. is the ſame as the verſed ſine of any arch; and is ſo called by ſome writers, becauſe it is like a dart, or arrow, ſtanding on the chord of the arch. See **Sine**.

SAGITTAL, **Sagittalis**, **Sutura**, in anatomy, the ſecond of the genuine *Sutures* of the Cranium.—See *Tab. Anat.* (Myol.) *fig.* 1. *lit. f. fig.* 2. *lit. i.* See alſo **Suture**. It reaches the whole length of the head; and has its name from the Latin, *Sagitta*, as being ſtreight, like an arrow.—Whence it is alſo called *Recta*, and ſometimes alſo *Rhabdoides*. See **Rhabdoides**.

SAGITTARIUS, in aſtronomy, the *archer*, one of the ſigns of the zodiac; the ninth in order. See **Sign**.

The ſtars in the conſtellation *Sagittarius*, in Ptolemy's catalogue are thirty-one; in Tycho's ſixteen; in the Britannic catalogue fifty. The longitudes, latitudes, magnitudes, &c. whereof are as follow:

SAGO, a medicinal ſimple brought from the Eaſt-Indies; of conſiderable uſe in diet, as a nouriſhment, and reſtorative.

Sago is a ſort of bread procured from a tree called *Landan*, growing in the Molucco's.

When a tree is felled they cleave it into two in the middle, and dig out the pith, which is even eatable when it comes freſh out of the tree. They pound it very ſmall in a mortar, till ſuch time as it is reduced into a kind of powder ſomewhat like meal. This done, they put it in a ſearce made of the bark of the ſame tree, and place the ſearce over a ciſtern made of its leaves, pouring water upon it, and by this means ſeparating the pure part of the powder from the veins of wood wherewith the pith abounds.

The flour thus filtrated, they call *Sagu*: they make it into paſte, and bake it in earthen furnaces; and this they do with ſo much expedition, that in three or four hours a man makes as much bread as will feed an hundred perſons a day.

From the ſame tree they alſo draw a liquor, as agreeable to drink as our wines.

The leaves, when they are young, are covered with a kind of cotton, whereof they make their cloth; and as they grow older they ſerve them to tile their houſes. The larger veins of theſe leaves ſerve them for ſtakes in building; and of the ſmaller they make a kind of hemp, wherewith they make very good ropes.

SAGUM, in antiquity, a military garment wore by the Greeks, Romans and Gauls, in manner of a cloak or caſſock; covering the ſhoulders and back, as low as the hips; where it was faſtened to the cuiras.

It was made of coarſe wool, and ſquare.—They had one for the winter, and another lighter for ſummer.

SAICK, or **Saique**, a Turkiſh veſſel, very proper for the carriage of merchandizes. See **Vessel**.

It has ſquare ſails on the middle-maſt; without either mizzen, top-gallant, or ſhrouds: only a main-maſt, with a main top-maſt, both very high; with a bolt-ſprit, and a little mizzen-maſt.

The height of the main-maſt makes the *Saicks* viſible at a great diſtance: their make renders it impoſſible for them to go with a ſide-wind; but when they have the wind behind them, nothing can out-go them.—The generality of them carry no guns.

SAIGNER, in fortification, a French term, ſignifying to bleed or drain.

Hence *ſaigner la foſſe*, is to empty or drain the water out of the moat, by conveyances under ground; that it may be paſſed over the more eaſily; by laying hurdles or ruſhes on the mud remaining. See **Ditch**.

SAIL, in navigation, an aſſemblage of ſeveral breadths of canvas, or ſtrong hempen cloth, ſewed together by the liſts, and edged around with a cord; faſtened to the yards and ſtays of a veſſel, to make it drive before the wind which bears thereupon. See **Ship**.

There are two kinds of *Sails*; the one ſquare, generally uſed in high-bottomed veſſels.—This has various names, according to the various maſts it is faſtened to; as the *Main-ſail*, *Fore-ſail*, the *Mizzen-ſail*, the *Sprit-ſail*, &c. See **Mast**, &c.

The others are triangular, called *Smack-ſails*, and by ſome *Latin-ſails*, becauſe chiefly uſed in Italy, and in flat-bottomed veſſels; though they are alſo uſed on the mizzen-maſts and ſtays of other veſſels.—They need but few ropes, and little wind; but are dangerous, and not to be uſed in foul weather.

There are ordinarily ten *Sails* in large veſſels; which number is increaſed at bottom by the addition of bonnets, and at the ſides by *Caſe-ſails*.—See *Tab. Ship. fig.* 1. *n.* 2, 17, 20, 44, 65, 67, 86, 107, 109, 126, 138.—See alſo the articles **Bonnet**, &c.

A veſſel is ſaid to ſet *ſail*, to go with full *ſail*, to make all her *ſail*, that is, to open all her *Sails*. To be under *ſail*, is to be ready to ſet *ſail*, &c.

Sails, alſo denote the vanes of windmills; or the arms or flights, whereby the wind has its effect on windmills.—Theſe are either horizontal or perpendicular. See **Windmill**.

Sails, in falconry, denote the wings of an hawk. See **Hawk**, **Wing**, &c.

SAILING, in a general ſenſe, is uſed for the art, or act of navigating; or of determining all the caſes of a ſhip's motion, by means of ſea-charts. See **Navigation**.

Of this there are three kinds, *plain*, *Mercator's*, and *circular*.

Plain **Sailing**, is that performed by means of rhumbs drawn on a plain chart. See *Plain* **Chart**, and **Rhumb**.

Mercator's **Sailing**, is that performed by rhumbs drawn on a *Mercator's* chart. See **Mercator's** *Chart*.

Circular **Sailing**, is that performed by the arch of a great circle; which, of all others, where practicable, is the ſhorteſt. See **Circular** and **Globular** *Chart*.

Doctrine of plain and Mercator's **Sailing**.—I. *The longitude and latitude of two places given; to find the departure, or miles of longitude.*

In plain Sailing. 1°. If both places be more eaſterly than the firſt meridian, ſubtract the leſs longitude from the greater, the remainder is the difference of meridians. If one of the places be more eaſterly, and the other more weſterly than the firſt meridian, add the longitude of the more eaſterly to the complement of the longitude of the more weſterly to a whole circle; the ſum is the difference of meridians. 2° Divide the difference of meridians into ſo many parts as there are degrees in the difference of latitude: or, if the difference of latitude be greater than that of the meridians, into ſo many fewer. 3°. Reduce the minutes of longitude anſwering to one part, into miles of the ſeveral parallels, in the former caſe; or into miles of the parallel, which is an arithmetically mean proportional between the two, in the latter caſe. 4°. The aggregates of theſe parts collected into one ſum, exhibit the departure, or miles of longitude.

E. gr. Suppoſe the longitude of the one place 35°. and that of the other 47°. the difference of meridians is 12°. Suppoſe the latitude of the firſt 4°. and that of the latter 8°. the difference will be 4°. conſequently we have *ſailed* from the 4th to the 8th parallel. Therefore divide 12 by 4, and reduce the quotient 3°. into miles in the ſeveral parallels 4, 5, 6, and 7. (ſee DEGREE) the ſeveral quotients will be 43°. 71′. 43°. 68′. 43°. 65′. 43°. 59′. the ſum of which is 174, the departure or miles of longitude required.

In Mercator's Sailing. The reduction is much more commodiouſly performed in Mercator's charts; wherein the arch intercepted between the two meridians, is applied to an arch of the meridian intercepted between the two parallels; and the diſtance it there meaſures, gives the departure, or miles of longitude required. See DEPARTURE and LONGITUDE.

II. *The longitude and latitude of two places, to and from which, a ſhip is to ſail, being given; to find the rhumb to be ſailed on, and the diſtance to be run.*

In plain Sailing. 1. Find the departure by the laſt caſe. 2. From the departure, and difference of latitudes, find the loxodromic angle or rhumb-line; which is done by this proportion: as the difference of latitude is to the departure, ſo is the whole ſine to the tangent of the angle of the rhumb-line. The diſtance then, to be run on this rhumb, is to the departure, as the whole ſine to the ſine of the angle of the rhumb. See RHUMB.

In Mercator's Sailing. 1. Apply the center of the mariner's compaſs on the place ſailed from, on the Mercator's chart, as *a*, (*Tab. Navigation*, *fig.* 7.) and ſo as that the north and ſouth line thereof be parallel to ſome of the meridians. 2. Mark the rhumb of the compaſs, wherein the place ſailed to, as *b*, is placed. For this is the rhumb to be ſailed on. 3. The ſame rhumb is likewiſe found by drawing a right line from *a* to *b*; and with a protractor, finding the angle the rhumb makes with any meridian it cuts. 4. The quantity or diſtance *a b* is found by applying the part *a* 1 to I K, 1 2 to *k l*, 2 *b* to *l m*.

Note, the rhumb and diſtance may alſo be found after the ſame manner on a plain chart.

The ſame may likewiſe be found by loxodromic tables; thus, 1. Chuſe a rhumb at pleaſure, and under the ſame, in the tables, find the longitudes correſponding to the given latitudes. The difference whereof, if it coincide with the difference of the given longitudes, the rhumb is well choſen; otherwiſe another muſt be pitched on, either more or leſs oblique, till the tabular difference agree with the given difference. 2. The rhumb thus found, the diſtances anſwering to the given latitudes, muſt be taken from the tables, and the leſs ſubtracted from the greater; the remainder is the diſtance ſought.

III. *The rhumb at diſtance ſailed being given; to find the longitude and latitude of the place arrived at.*

In plain Sailing. 1. From the data, find the difference of latitude of the two places: (by the proportion delivered under the article RHUMB-*line*.) This difference added to the latitude of the place ſailed from, or ſubtracted from the ſame, the ſum, or the remainder, leaves the latitude of the place ſailed to. 2. From the ſame, find the departure; and thence the latitudes of the place ſailed to (as directed under RHUMB-*line*.)

In Mercator's Sailing. 1. Place the mariner's compaſs on the chart, with the center over the place *a*; and the meridian, and north or ſouth line, parallel to the meridian thereof. 2. From the point *a*, draw a right line, as *a b*, for the ſhip's courſe. Take the diſtance by parts, in parts of the meridian I K, K I, &c. and ſet it off upon the right line *a b*; *e. gr.* from *a* to *c*; then will *c* be the place the ſhip is arrived at; the longitude and latitude whereof are given by the chart. See CHART.

By the loxodromic tables. 1. Under the given rhumb, ſeek the diſtance anſwering to the latitude of the place ſailed from; and either add it to, or ſubtract it from the given diſtance; as the latitude of the place ſailed to is greater, or leſs than that ſailed from. 2. Under the ſame rhumb, aſcend or deſcend further, till you meet with the diſtance corrected. 3. The latitude anſwering thereto in the firſt column, is the latitude of the place ſailed to. 4. From the ſecond column of the table take the longitudes correſponding to the latitudes of the places ſailed to and from. Their difference is the difference of longitude of the places ſailed to and from.

IV. *The latitudes of the places ſailed to and from, together with the rhumb ſailed in, being given; to find the diſtance and difference of latitudes.*

In plain Sailing. From the difference of latitude and the rhumb given, find the diſtance; and from the ſame data, the departure. See RHUMB. This converted into degrees of a great circle (ſee DEGREE) exhibits the difference of longitudes ſought.

In Mercator's Sailing. 1. Place the compaſs on the chart, as in the preceding caſe. From the place ſailed from, *a*, draw the rhumb-line *a b*, ſailed in; till it cut the parallel of the given latitude. 2. The point of interſection will be the place arrived in. 3. Hence its longitude is eaſily found; and the diſtances. See RHUMB.

By the tables. Take both the longitudes and the diſtances anſwering to the latitudes of the given places, out of the tables; then ſubtract both the longitudes and the diſtances from each other. The firſt remainder is the difference of longitude, the latter the diſtance of the places.

V. *The latitudes of the places ſailed from, and to, with the diſtance given; to find the rhumb and the difference of longitude.*

In plain Sailing. From the difference of latitude, and the diſtance, find the rhumb, and from the ſame data find the departure; which may be alſo determined from the rhumb now found, and the difference of latitude, or from the rhumb and the diſtance run. Laſtly, from the departure find the difference of longitude. See RHUMB.

In Mercator's Sailing. On the map draw the parallel the ſhip arrives at, C D. Reduce the diſtance run into parts proportional to the degrees of the map. The diſtance reduced, being *a* 2; from *a* deſcribe an arch touching the parallel C D in 2: then will 2 be the place in the map; whoſe longitude accordingly is eaſily found.

By the tables. Subtract the given latitudes from each other; and in the tables ſeek the rhumb; under which, the diſtance run anſwers to the given difference of latitude. Subtract the longitude under the rhumb, anſwering to the latitude of the place ſailed to; and that under the ſame rhumb againſt the latitude of the term ſailed to, from each other; the remainder is the difference of longitude ſought.

VI. *The difference of longitudes of the places ſailed to, and from, with the latitude of one of the places, and the diſtance run, being given; to find the rhumb, and the latitude of the other.*

In plain Sailing. Convert the difference of longitudes into miles of longitude for the departure; from the given departure and diſtance run, ſeek the rhumb: and from the ſame, and the rhumb, ſeek the difference of latitude; which, and the latitude of one place being had, the latitude of the other readily follows. See RHUMB.

In Mercator's Sailing. Through the given place *a* in the map, draw a right line E F parallel to the meridian I H; and make F L equal to the difference of longitudes. From F draw L M parallel to E F, which will be the meridian the ſhip is arrived at. Then from *a*, with the interval of the diſtance run, *a c*, deſcribe an arch interſecting the meridian M L; the place ſought will be in *c*. If then a compaſs be placed on the map, as before directed, the rhumb-line will fall in with *a c*; and conſequently the rhumb will be known. Laſtly, if through *c* be drawn N O, parallel to A B; N A will be the latitude of the place required.

By the tables. Take a rhumb at pleaſure, and under the ſame in the tables, find the longitude, and the diſtance anſwering to the given latitude. Add the given diſtance to the diſtance found in the tables, if the veſſel ſailed from the equator; or ſubtract it therefrom, if it ſailed towards the ſame. With the ſame ſum, or the difference, enter the tables; and the longitude found againſt it, ſubtract or add from that juſt found. If the remainder be found the given difference of longitudes, the rhumb is well taken. Otherwiſe, it muſt be changed for a more or leſs oblique one, till the ſame operation being repeated, the remainder be found the difference of longitudes; then the latitude in the firſt column, correſponding to the diſtance, will be the latitude of the other place.

VII. *The difference of longitude, and the latitude of one of the places, being given, together with the rhumb; to find the diſtance run, and the latitude of the other place.*

In plain Sailing. Reduce the difference of longitude into miles of longitude, or departure, as under the firſt caſe. From the departure and the rhumb, find the diſtance run. (See RHUMB.) And from theſe, or from the rhumb, and the diſtance run, find the difference of latitude. This done, as the latitude of the one is already had, that of the other is ſo too.

In Mercator's Sailing. Place the compaſs on the chart as before; and by the given rhumb, draw the rhumb-line, *a b*. Draw a meridian E F through the given place *a*; and with the interval of the difference of longitude F L, draw another, L M, for that the veſſel is arrived at. Where this interſects the rhumb-line, is the place *c* that the veſſel is arrived at. Wherefore, if through *c* be drawn N O parallel to A B; N A will be the latitude of the place. The diſtance run *a c* is eaſily reduced into miles by the ſcale.

By the tables. Under the given rhumb, ſeek the diſtance run, and the difference of longitude anſwering to the given latitude. If the veſſel had ſailed towards the pole, the difference of longitude is to be added to the given difference of longitude; if towards the equator, it is to be ſubtracted from the ſame. In the former caſe, deſcend in the table, and in the latter, aſcend; till in the firſt, the aggregate, in the latter, the difference be ſeen in the column of longitude. The latitude anſwering hereto in the firſt column,

lumn, is that ſought. And from the diſtance anſwering to this latitude in the firſt caſe, the tabular diſtance is to be ſubtracted; or in the latter caſe, that diſtance to be ſubtracted from the tabular diſtance. What remains, is the diſtance run.

From the ſolution of theſe caſes in *Sailing*, it is evident, ſome are more eaſily performed by the charts than the tables; and that the Mercator's charts are preferable to the plain ones; ſince in the latter, the diſtance is not reduced by the map, but by a particular ſcale for that purpoſe.

Doctrine of circular SAILING.—I. *The latitude and longitude of the places ſailed to, and from, being given; to find the angle* M (fig. 8.) *which a ſhip's way* M O *proceeding in a circular courſe, includes with the meridian* P M *of the place ſailed from.*

Since in the triangle P M N, we have P M and P N, the complements of the given latitudes H M, and I N, together with the angle M P N, meaſured by the arch H T, the difference of the given longitudes H and T; the angle P M N is found by ſpherical trigonometry. See TRIANGLE.

II. *The latitude* H M, *and the longitude* H, *of the place ſailed from,* M, *with the diſtance run, and the latitude of the place* L S *the ſhip in a circular voyage arrives at, being given; to find the longitude of the place* L, *and the angle* P L M *comprehended between the ſhip's way* M L, *and the meridian* P S.

In the triangle PML, we have given P M the complement of the latitude H M, and P L the complement of the latitude L S. Wherefore, if the ſhip's way M L be turned into degrees of the equator; we ſhall find the angle M P L, which is equivalent to the difference of longitudes H S; and likewiſe the angle P L M by ſpherical trigonometry. See *Spherical* TRIANGLE.

After the like manner may other problems be ſolved; but as it is eaſier and better *Sailing* by rhumbs, than by circles, and as this latter way is but very little in uſe; we chuſe to paſs them over. See GLOBULAR *Chart*.

SAILING, in a more confined ſenſe, is the art of conducting a veſſel from place to place, by the working or handling of her ſails and rudder: though, what is done by means of this latter, is more properly called *Steering*. See STEERING.

To bring *Sailing* to certain rules, M. Renau computes the force of the water, againſt the ſhip's rudder, ſtem, and ſide; and that of the wind againſt her ſails.—In order to this, he 1°. conſiders all fluid bodies, as the air, water, *&c.* as compoſed of little particles, which, when they act upon, or move againſt any ſurface, do all move parallel to one another, or ſtrike againſt the ſurface after the ſame manner. 2°. That the motion of any body, with regard to a ſurface on which it is to ſtrike, muſt be either perpendicular, parallel, or oblique. In the firſt caſe, the body ſtrikes with all its force, which will be greater or leſs, according as the body moves ſwifter or ſlower. In the ſecond caſe, the line of motion *a b*, (*Tab. Navigation, fig.* 3.) will not affect the ſurface at all, becauſe it is no way oppoſed to it; nor can the moving body ſtrike upon it, or touch it. In the third, if the line of motion, A D, be oblique to the ſurface D C, ſo that the angle of incidence be A D C, then the motion of the body in the line A D may be reſolved into two directions, *viz.* into A E, or B D, and into A B. But the direction or line of motion A E being parallel to the ſurface D C, cannot affect it at all; ſo that the whole motion of the body A in that oblique manner of ſtriking on the ſurface, will be expounded by the perpendicular line, A B. And if D A be made the radius of a circle, whoſe center is at D, B A will be the ſine of the angle of incidence, A D C.

Hence it is deduced, that the force of a particle of air or water, as A, ſtriking againſt the ſurface D C, which may repreſent, either a ſail or the rudder of a ſhip, in the oblique direction A D, will be to the perpendicular force thereof, as B A is to D A: that is, as the ſine of the angle of incidence is to the radius.

And ſince what is thus true of one particle, ſingly conſidered, will be true of all the particles of any fluid body collectively; it will follow, that the force of the air or water ſtriking perpendicularly upon a ſail or rudder, to the force of the ſame, in any oblique impingency, will be, as the ſquare of the radius, to the ſquare of the ſine of the angle of incidence: and conſequently, that all oblique forces of the wind againſt the ſails, or of the water againſt the rudder, will be to one another, as the ſquares of the ſines of the angles of incidence.

If the different degrees of velocities be conſidered, it will be found, that the forces will then be as the ſquares of the velocities of the moving air or water; that is, a wind that blows thrice as ſtrong, or moves thrice as ſwift as another, will have nine times the force upon the ſail.—And it being alſo indifferent, whether you conſider the motion of a ſolid in a fluid whoſe particles are at reſt; or of thoſe particles moving all parallel againſt a ſolid that is at reſt; the reciprocal impreſſions being always the ſame; if a ſolid be moved with different velocities in the ſame fluid matter (as ſuppoſe water) the different reſiſtances which it will receive from that water, will be in the ſame proportion, as the ſquares of the velocities of that body.

Let H M (fig. 4.) repreſent a ſhip, C D the poſition of the ſail, and A B the courſe of the wind blowing towards B. Draw B G perpendicularly to the ſail, and G K perpendicular to the line of the keel produced H M K. By what is ſaid above, the ſail C D, will be driven by the wind A B, according to the direction of the line B G. So that if ſhe could divide the water every way with the ſame facility, as ſhe doth with her head, the ſhip would go directly to the point G, along the line B G. And if H K repreſent her direct courſe, ſhe would have got forward the length B K, and ſideways ſhe would have gone the quantity G K. But as her length is much greater than her breadth, ſo ſhe will divide the water, or make her way in it with more difficulty with her ſide, than with her head or ſtern; on which account, ſhe will not run ſideways ſo far as K G, but fall ſhort of it in proportion to the ſaid difficulty of dividing the water with her ſide, that is, if the reſiſtance ſhe finds in her paſſing through the water ſideways, be to that of paſſing lengthways, ſuppoſe, as ten to one, then will not the ſhip get ſideways above a tenth part of the line G K.

Wherefore, if K G be found to G L, in the ratio of the reſiſtance of the ſide to that of the ſtern, and the line B L be drawn; the ſhip will go to the point L, along the line, B L, in the ſame time as it would have gone to G, if it could have divided the water every way equally.—This part, K L, is called the *drift*, or *lee-way* of a ſhip, and the angle K B L is her degrees of lee-way; as the angle ABK, expreſſes how near the wind ſhe lies.

After this, the author proceeds to demonſtrate, that the beſt poſition or ſituation of a ſhip, ſo as ſhe may make the beſt lee-way, but go to wind-ward as much as poſſible, is this: that, let the ſail have what ſituation it will, the ſhip be always in a line biſſecting the complement of the wind's angle of incidence upon the ſail; that is, ſuppoſing the ſail in the poſition B C (fig. 5.) the wind blowing from A to B, and conſequently, the angle of the wind's incidence on the ſail A B C, and its complement C B E; then muſt the ſhip be put into the poſition B K, or move in the line BK, biſſecting the angle C B E.

He ſhews farther, that the angle which the ſail ought to make with the wind, *i. e.* the angle A B C, ought to be but 24 degrees; that being the moſt advantageous ſituation to go to wind-ward, the moſt that is poſſible. And in order to bring this to bear in practice, he directs to put marks to the ſheets, braces, and bow-lines of the lower ſails, to know when they are in their beſt ſituation; and then, even in the night, when the marks of a brace or of a ſheet ſhall come to the cleat, one may be pretty well aſſured, that the ſail trims well.

To this might be added, many curious things from Borelli *de Vi Percuſſionis* concerning the different direction given to a veſſel from the rudder, when ſailing with a wind, or floating without ſails in a current; in the former caſe, the head of the ſhip always coming to the rudder, and in the latter always flying off from it.

SAILORS, the elder ſeamen, who are employed in working or managing the ſails, the tackle, ſteering, *&c.*

SAINTS, SANCTI, in the Romiſh church, holy perſons deceaſed, and ſince their deceaſe, canonized by the pope; after ſeveral informations and ceremonies. See CANONIZATION.

One of the points wherein the Roman Catholicks and Proteſtants differ, is, that the former addreſs, invoke, ſupplicate ſaints, *&c.* to intercede for them; whereas the latter hold it ſufficient to propoſe their good examples for their imitation. See LATRIA.

The number of *Saints*, allowed as ſuch, in the Romiſh church, is prodigious: Father Papebroche reckons ſeventeen or eighteen hundred to have died on the firſt of June, only. Indeed, the crowd of *Saints* wherewith their martyrologies are ſtocked, is ſcandalous, [illegible] to the more ſober of their own communion. Father Mabillon, in an expreſs diſſertation on the worſhip of unknown *Saints*, obſerves, that honours are given to *Saints*, who, perhaps, were not Chriſtians; and whoſe names were never known. Hence, being under a neceſſity of giving them names, they are therefore called *Baptized Saints*. He adds, that they every day beſeech *Saints* to intercede for them with God; when, it is much doubted, whether they themſelves be in heaven. See RELICK, MARTYR, *&c.*

Father Papebroche and his aſſociates have been a long time employed in writing the lives and acts of the *Saints*: they range them each on the day of the year wherein they died: for the firſt ſix months they have publiſhed twenty-four volumes in folio; and ſince Papebroche's death, in 1714, his ſucceſſors have publiſhed two more. See ACT, and BOLLANDIST.

SAKER, a ſmall ſort of cannon; whereof there are three ſpecies: *extraordinary*, *ordinary*, and *leaſt ſized*.

SAKER *Extraordinary*, is about four inches diameter at the bore, 1800 pound weight, 10 foot long; its load 5 pounds, ſhot 3 inches and half diameter, and ſomething more than 7 pound and a quarter weight; its level range is 163 paces.

SAKER *Ordinary*, is a ſize leſs, 3 inches 3 quarters bore, 9 foot long, 1500 weight; its charge, 4 pounds of powder; bullets diameter 3 inches and a half, weight 6 pounds, its level range 160 paces.

SAKER *of the leaſt Size*, is 3 inches and a half diameter at the bore, 1400 pound weight, 8 foot long, its load near 3 pounds and a half; ſhot 4 pounds 3 quarters weight, and 3 inches and a quarter diameter. See CANNON, and ORDNANCE.

SAL, in chymiſtry, *&c.*	See	SALT.
SAL *Armoniac*, or *Ammoniac*,		ARMONIAC.
SAL *Petræ*, or *Nitri*,		SALT-PETRE, & NITRE.
SAL *Prunellæ*,		PRUNELLÆ.
SAL *Tartari*,		TARTAR.
SAL *Polychreſtum*,		POLYCHREST.
SAL *Gemmæ*,		GEMMA.

SAL *Volatile Oleoſum*, is the name of an aromatic volatile ſalt, firſt prepared by Sylvius de la Boe, and found a very notable medicine, chiefly as a cephalic, and cordial.

It is made thus: to an ounce of volatile ſalt of ſal ammoniac, diſtilled with ſalt of tartar, and dulcified with ſpirit of wine, put a dram and half of ſome aromatic oil, or eſſence, drawn from ſome generous aromatic vegetable, as cinnamon, cloves, roſemary, balm, *&c.* And when the ſpirit and oil are well ſtirred and incorporated together, draw off the volatile ſalt and ſpirit in a cucurbit. Some, inſtead of this, mix all the ingredients together at firſt, *viz.* the ſal ammoniac, ſal tartari, ſpirit of wine and powder of cinnamon or cloves, *&c.* and diſtill off the volatile ſpirit and ſalt at once; but the former way is preferred. See VOLATILE.

SALADINE, a tax, impoſed in England and France, in the year 1188, to raiſe a fund for the cruzade undertook by Richard I. of England, and Philip Auguſtus of France, againſt Saladin ſultan of Egypt, then going to beſiege Jeruſalem.

The *Saladine*-tax was thus laid: that every perſon who did not enter himſelf a croiſe, was obliged to pay a tenth of his yearly revenue, and of the value of all his moveables, except his wearing apparel, books and arms.

The Carthuſians, Bernardines, and ſome other religious, were exempted from the *Saladine*.

SALAMANDER'S BLOOD, a term which chymiſts give to the red vapours, which in diſtilling ſpirit of nitre, riſe towards the latter end, and fill the receiver with red clouds.

They are the moſt fixed, and ſtrongeſt part of the ſpirit; and nothing but nitre yields a red vapour in diſtillation. See NITRE.

SALARY, SALARIUM, a ſtipend, or wages allowed any perſon in conſideration of his pains, induſtry, or ſervice in another man's buſineſs.

SALET*, SALLET, or SALADE, in war, a light covering, or armour for the head, anciently wore by the light horſe; only differing from the caſk, in that it had no creſt, and was little more than a bare cap. See CASK.

* Nicod derives the word from *Sila*, which had the ſame ſignification among the Latins: others from *Saladinus*, alledging, that it was borrowed from the orientals; others from the Italian *Celeta*, as if the head were hid hereby. Others from the Spaniſh *Celada*, a little caſk, *&c.*

SALIANT*, in fortification, denotes *projecting*.

* The word is formed from the French *Saillant*, which ſignifies the ſame thing; of *ſailler*, to project, advance outwards, and that, of the Latin *ſalire*, to leap.

There are two kinds of angles; the one *Saliant*, which are thoſe that preſent their points outwards.—The other *Re-entering*, which have their points inwards. Inſtances of both kinds, we have in tenailles, and ſtar-works. See ANGLE.

SALIENT, SALIANT, or SAILLANT, in heraldry, is applied to a lion, or other beaſt, when its fore-legs are raiſed in a leaping poſture.

A lion *Saliant* is that which is erected bend-ways: ſtanding ſo as that his right fore-foot is in the dexter chief point, and his hinder left-foot, in the ſiniſter baſe point of the eſcutcheon.—By which it is diſtinguiſhed from rampant. See RAMPANT.

SALIC*, or SALIQUE *Law*, *Lex* SALICA, an ancient and fundamental law of the kingdom of France, uſually ſuppoſed to have been made by Pharamond, or at leaſt by Clovis; in virtue whereof males only are to inherit. See SUCCESSION.

* Some, as Poſtellus, would have it to have been called *Salic*, *q. d. Gallic*, becauſe peculiar to the Gauls. Cenal takes the reaſon to be, that the law was only ordained for the royal *ſalles*, or palaces: Claud. Seiſſel ſays, it was thus called, becauſe of the *ſalt* and the prudence it abounds withal: Fer Montanus inſiſts, it was becauſe Pharamond was at firſt called *Salicus* Others, with the abbot Uſperg, derive its name from *Salogaſt*, Pharamond's principal miniſter; and others from the frequent repetition of the words *Si aliqua*, at the beginning of the articles. Genebrard ſays, it was called *Salic* for *Salomonic*, by reaſon Solomon ſet the firſt example of it. Daviſon derives it from the German words, *Salts* and *Lick*, *q. d.* like to ſalt.—The moſt probable opinion is, that which derives the word from the ancient Franks, who were called *Sali*, *Salici*, and *Salingi*, on account of the river Sala, a river of ancient Germany: this is the ſentiment of Rhenanus and Æmilius, who are followed by ſeveral others; among the reſt, Menage, Paſquier, Borel, and Juncker. Bouteroue gives another plauſible origin of the word: he ſays, it comes from the word *Salich*, which, in the old Teutonic language, ſignified *ſalutary*; and that the French in this law imitated the policy of the ancient Romans, who made ſalutary laws, which the magiſtrates were to have before them when they adminiſtred Juſtice. This he confirms from a curious figure taken out of the *Notitia Imperii*, where the book is repreſented covered with gold, with this Inſcription, *Leges Salutares*.

Du Haillan, after a critical examination of the *Salic Law*, declares it to have been an expedient of Philip the Long, in 1316, for the excluſion of the daughter of Louis Hutin, from inheriting the crown. Father Daniel, on the other hand, maintains, that it is quoted by authors more ancient than Philip the Long; and that Clovis is the real author of it. The ſtyle, which is ſcarce intelligible, and which is in a latinized dialect, is a mark of its antiquity.

This law has not any particular regard to the crown of France: it only imports in the general, that in *Salic* land, no part of the inheritance ſhall fall to any female; but the whole to the male ſex. *De terra Salica nulla portio hæreditatis mulieri veniat; ſed ad virilem ſexum tota terræ hæreditas perveniat.*—So that it is a popular error to ſuppoſe, that the *Salic Law* was eſtabliſhed purely on account of the ſucceſſion to the crown: ſince it extends to private perſons as much as to thoſe of the royal family.

Part of it ſeems to have been borrowed by our Henry I. in compiling his laws, *cap.* 89. *Qui hoc fecerit ſecundum legem Salicam moriatur.*

By *Salic* lands or inheritances were anciently denoted all lands, by whatever tenure held, whether noble or baſe, from the ſucceſſion whereto, women were excluded by the *Salic Law*; and admitted to inherit nothing but moveables, and purchaſes; whenever there were any males.—Indeed M. Fenelon obſerves, that there were originally *Salic* lands, diſtinguiſhed from all others, and deſtined for the military people of the nation; and to theſe, it is ſuppoſed, the law was originally intended to be confined.

M. Eccard, a Hanoverian, is ſaid to have recovered an ancient MS. of this famous law, containing a third part thereof, much more amply than any yet diſcovered, with a very curious chronology of the ſame law, hitherto unknown.

SALII, in antiquity, prieſts of Mars, whereof there were twelve, inſtituted by Numa; wearing painted, parti-coloured garments, and high bonnets, with a ſteel cuiraſſe on the breaſt.

They had their name *Salii* from *ſaltare*, to dance; becauſe, after aſſiſting at ſacrifices, they went dancing about the ſtreets with ancylia, or bucklers in the left-hand, and a rod in the right, ſtriking muſically on one another's bucklers with their rods, and ſinging hymns in honour of the gods. See ANCYLE, *&c.*

There were two companies or colleges of *Salii*: The ancient eſtabliſhed by Numa, called *Palatini*; the latter by Tullius Hoſtilius, called *Collini*, and *Agonales*. Though Servius tells us, there were two kinds inſtituted by Numa, the *Collini* and *Quirinales*; and two others by Tullus, the *Pavorii* and *Palorii*.

In ſinging, they uſed a peculiar ancient ſong, called *Saliare Carmen*; and after the ceremony, were entertained with a feaſt: whence *Saliares Epulæ*, and *Saliares Dapes*, paſſed into a proverb for good eating.

Their chief, called *Præſul*, and *Magiſter Saliorum*, was one of their number: it was he led the band, and begun the dance; the reſt imitating all his ſteps and motions.—The whole company was called *Collegium Saliorum*.

Sext. Pompeius makes mention of *Salian Maids*, *Virgines Saliares*, hired for the purpoſe, and joined with the *Salii*, wearing a kind of military garb, called *Paludamentum*, with high round bonnets like the *Salii*, and, like them, performing ſacrifices with the pontifices in the palaces of kings.

M. Patin takes it, there is a figure of one of the *Salii* on a medal of the Saquinian family; who, beſides the buckler in one hand, holds the caduceus in the other.—But his look appears too grave, and ſedate: and beſides, the buckler he holds, does not ſeem to be an ancyle, as being quite round, and not indented any where. And again, why ſhould a prieſt of Mars, the god of war, be repreſented with a caduceus, the emblem of peace? It is probable therefore, this is no figure of any *Salius*, as Patin imagines.

SALIVA, *ſpittle*, a thin, pellucid humour, ſeparated from the arterial blood by the glands about the mouth and fauces; and conveyed by proper ſalival ducts into the mouth, for ſeveral uſes. See SALIVAL *Ducts*.

It conſiſts of a great deal of water or phlegm, and a volatile ſalt; ſome add, a ſulphurous ſpirit.

The *Saliva*, Boerhaave obſerves, is void both of taſte and ſmell; does not harden by heat; is more copious, fluid, ſharp, penetrating, and detergent, as a perſon has faſted longer; and is ſeparated from the pure arterial blood.

The glands wherein the *Saliva* is ſeparated from the blood, are the parotides; the maxillary glands; the ſublinguales, or thoſe under the tongue; the amygdalæ, or almonds of the ears, and the palatinæ, or glands of the palate. See each under its proper article, PAROTIDES, *&c.*

The great uſe of the *Saliva*, is in maſticating and diluting the food, and making the firſt digeſtion thereof. The other uſes are to moiſten the tongue, to render its motion more quick and eaſy; to lubricate the throat and oeſophagus, in order to facilitate deglutition; to prevent thirſt; and to aſſiſt in the ſenſation of taſtes, by diſſolving the ſalts. See MASTICATION, DEGLUTITION, DIGESTION, *&c.*

Some imagine it to do the office of a menſtruum, by mixing the oily and aqueous parts of the food more intimately, diſſolving the ſaline parts, and procuring a fermentation in the ſtomach. But Dr. Drake will not allow it fit for that purpoſe. Were the *Saliva*, ſays he, acrimonious enough for this, it would be impoſſible but it muſt offend the ſtomach; eſpecially, conſidering the quantities of it that many ſwallow, even upon an empty ſtomach. See MENSTRUUM, FERMENTATION, *&c.*

M. Gaſtaldy, in a theſis on the *Saliva*, obſerves, that it takes its name from the ſalt it contains; which ſalt he will have to be partly a volatile acid, and partly alcalious. He adds, that it contains ſome oleaginous parts, and a little earth. By being compounded of ſo many different kinds of parts, it becomes a diſſolvent proper for all the different kinds of foods whereof we live.—Its natural and laudable ſtate, is to be a little more viſcid than common water, and much leſs ſo than milk. It is preſerved in this ſtate by the application of the ſpirits, and of the particles of air which inſinuate into it.

According to all appearance, the *Saliva* is derived from the blood of the arteries: part of the arterial blood brought to the ſalival glands, ſerves to feed them; another part is returned into the veins, and continues the circulation; and a third part, which is the ſerum, receiving a ſub-acid quality from them, is converted into *Saliva.*

Some authors have imagined, that the nervous juice contributed to the compoſition of the *Saliva*; the rather becauſe larger and more numerous twigs of nerves are communicated to theſe glands, than to moſt other parts, which yet have a more exquiſite feeling than theſe. But Dr. Nuck has refuted this opinion by ſeveral experiments.

Too great an excretion of *Saliva*, Boerhaave obſerves, diſorders the firſt digeſtion; and hence cauſes thirſt, drineſs, a black bile, conſumption, atrophy.—On the contrary, if no *Saliva* be diſcharged into the mouth, or leſs than ordinary, it ſpoils both the manducation of the food, and its taſte, ſwallowing, and digeſtion; and withal, occaſions thirſt. See THIRST, *&c.*

SALIVAL, or SALIVARY *Ducts*, in anatomy, certain little lymphatic canals lately diſcovered; whereby the ſaliva falls into the mouth. See SALIVA and DUCT.

The *Lower Salival Duct* comes from the maxillary glands, ſituate under the lower jaw, and terminated behind the dentes inciſores.—It was firſt deſcribed by our Dr. Wharton, in his treatiſe of the glands, in 1656.

The *Upper Salival Duct* was diſcovered by Nicolas Steno, in 1660.—It comes from the parotid glands; whence perforating the buccinator, it terminates near the third upper grinder.

Caſp. Bartholine, in 1682, diſcovered another *Salival Duct*, coming from the glands ſituate on the ſide of the tongue; though Rivinus, a phyſician of Leipſic, had mentioned it before, in a diſſertation printed in 1679.

Ant. Nuck, profeſſor at Leyden, diſcovered a fourth *Salival Duct*, ariſing from a gland ſituate in the orbit of the eye, between the muſculus abductor, and the upper part of the os jugale.

Theſe ducts are all double, there being one of each kind on either ſide.—But it is pretended, the two laſt are only found in ſome brutes, and not in man.

As the demand of ſaliva is greateſt in maſtication, deglutition, talking, *&c.* the diſpoſition of the *Salival Ducts*, to favour the diſcharge on thoſe occaſions, is very remarkable: thus the ducts of the parotides paſs cloſe over the muſculi maſſeteres, and through the buccinatores: the *Salival Ducts* of the maxillary glands paſs cloſe under the mylohyoideus, where the ſublingual glands are placed; by means whereof, the intumeſcence of the maſſeters, in chewing, accelerates the ſpittle in the parotid *Salival Ducts*: as the mylohyoideus does in the action of deglutition, by drawing the hyoides upwards.—The agitation of the cheeks and lips, is ſufficient to promote the diſcharge from the glands of the lips, *&c.*

SALIVATION, SALIVATIO, in medicine, a promoting of the flux of ſaliva, by means of medicines; chiefly mercury. See MERCURIALS.

The chief uſe of *Salivation* is in diſeaſes belonging to the glands, and the membrana adipoſa; principally in the cure of the venereal diſeaſe. Though it is ſometimes alſo uſed in epidemic diſeaſes.

The body is prepared for *Salivation* by a copious and continued uſe of attenuating, diluting, ſoftening decoctions; as of ſcabious, pellitory, china, ſarſaparilla, ſaſſaſras, and ſantal.

Salivation is either *partial* or *univerſal.* By the firſt, only, the humours of ſome part of the body are to be diſcharged; as in catarrhs, tooth-ach, *&c.*—By the ſecond, the whole maſs of blood is to be purged.

The firſt is raiſed either by a ſlow continued chewing of ſome tenacious matter, as maſtich, wax, myrrh; eſpecially if other ſharp things be mixed with them, as pyrethrum, ginger, or pepper: or by drawing in ſharp irritating vapours, as thoſe of tobacco, roſemary, thyme, marjoram, *&c.*

The latter is effected by the action of ſuch medicines as create ſome ſlight but conſtant nauſea; as ſtibium not quite fixed, nor yet quite emetic; a little common vitriol, *&c.*—But chiefly by ſuch as diſſolve all the parts of the maſs of blood, turn them into lympha, and thus cauſe a ptyaliſm: ſuch are crude quickſilver, cinnabar, a ſolution of quickſilver in aqua-fortis, white and red precipitate, turbith mineral, ſweet ſublimate of mercury, *&c.* See APOPHLEGMATIZANT.

Mercurial SALIVATION, is now a very uſual method of cure; eſpecially in venereal, ſcrophulous, and hypochondriac caſes. In effect, it proves the ſureſt remedy yet diſcovered for the Gallic lues; though the diſcovery hereof, as that of moſt other remedies, is owing to chance. Jac. Carpi, a phyſician of Bologna, having read in Avicenna, and Meſve, two Arab authors, that mercury applied externally, was proper for the lepra, and ſome kinds of puſtules, particularly the ſcabies or itch; had a mind to try it in a pocky itch: a *Salivation* was hereupon unexpectedly raiſed, and the patient was cured not only of his itch, but of his pox.—The ſame method he afterwards uſed for the pox itſelf; and meeting with great ſucceſs therein, others were induced to follow him; and thus did it arrive at its preſent height. See VENEREAL.

There are two manners of applying mercury to raiſe a *Salivation:* the one external, or in the way of unction; by mixing it up with ſome unguent, plaiſter, or perfume, and then rubbing it on the joints, *&c.*—The other internal, where it is taken at the mouth.

In each caſe, the mercury inſinuates itſelf into the maſs of blood, and mixing with the venereal poiſon, the two bodies thus locked together, are drawn, with the ſeroſity, into the ſalival glands, where they are ſeparated and diſcharged, as finding the pores of the glands proportioned to their figures, and proper to receive them.—But for the manner wherein the mercury acts to raiſe the *Salivation*, ſee further ander MERCURIALS.

Dr. Quincy will have the internal to be much the ſafer and better method: the mineral globules, he thinks, being intimately combined with ſalts, in the preparations given inwardly, will, by the irritation thereof, be eaſily and fully thrown off by the ſecretory organs, till the blood is quite diſcharged of its load.—Whereas, in mercurial frictions, it is poſſible, ſome of the heavy particles may be left lodged in the interſtices of the fibres, or cells of the bones. Add to this, that by computing the proportion of mercury in all the doſes neceſſary to promote a ſpitting, internally; and the weight of the ſame mineral uſed when it is done by unction; the quantity uſed in the latter caſe, far exceeds that in the former; conſequently, the ill effects apprehended from that dangerous medicine, ſhould be more ſenſible in the one caſe than the other.

The external application, therefore, is only to be allowed of, where either the caſe will bear the violence of ſuch a management; or outward ulcers and tumours require a particular cure by liniments. Thus Quincy.

But a learned French Phyſician, M. Chicoyneau, chancellor of the univerſity of Montpellier, has lately done ſome diſcredit to the practice of ſalivating in any manner; and that, in a little treatiſe lately publiſhed, where he endeavours to prove, that the *Salivation* itſelf contributes nothing to the cure, but is rather prejudicial thereto: that the ſalutary effects of the mercury are independent of any evacuation at all; and that it acts purely as a ſpecific. It is without reaſon, therefore, he urges, that venereal patients are put to the torture of a *Salivation*, ſince the full effect of the medicine may be had without carrying matters to that extremity. The *Salivation* is only an accident to the cure; which is effectually obtained by a mercurial unguent rubbed on the joints in ſuch quantities, and at ſuch intervals, as not to raiſe any *Salivation.* He ſupports the whole by the experience of forty or fifty cures wrought in one year, by the new method. The ſame method, it ſeems, has been lately, too, tried in England, and with ſucceſs; as appears from a tranſlation of Chicoyneau's piece lately publiſhed with notes, by an Engliſh phyſician.

SALLET *, or SALLAD, a diſh of eatable herbs ordinarily accompanying roaſt-meat, compoſed chiefly of crude, freſh herbage, ſeaſoned with ſalt, oil, and vinegar.

Some add muſtard, hard eggs, and ſugar; others, pepper, and other ſpices, with orange-peel, ſaffron, *&c.*

* Menage derives the word from the Latin, *Salata*, of *Sal* ſalt; others from *Salcedo:* Du Cange from *Salgama*, which is uſed in Auſonius, and Columella in the ſame ſenſe.

Some define *Sallet* more generally, a compoſition of plants and roots, of ſeveral kinds, to be eaten either raw or green, blanched or candied, by themſelves, or mixed with others; and even, occaſionally, boiled, pickled, or otherwiſe prepared and diſguiſed, to render them more grateful to the palate.—But this definition includes pot-herbs, *&c.* which the generality of authors deny to be any proper *Salleting*.

The principal SALLET-*herbs*, and thoſe which ordinarily make the baſis of our Engliſh *Sallets*, are lettice, ſellery, endive, creſſes, radiſh, and rape, *&c.* Along with which, by way of furniture, or additionals, are uſed purſlane, ſpinage, ſorrel, tarragon, burnet, corn-ſallet, and chervil.

The different taſtes of mankind will not allow any certain mixture of theſe to be preſcribed as moſt agreeable; but, ſtill, in mixing them, the reliſh of the ſeveral herbs is to be conſidered: thoſe, for inſtance, which are moſt hot and biting; as creſſes, muſtard, ſellery, tarragon, chervil, *&c.* with thoſe that are more cool and inſipid to the taſte; as turnips, rape, ſpinage, lettice, corn-ſallet, purſlane, *&c.* by this means the herbs may be ſo judiciouſly mixed, that the too ſtrong taſte of one kind may not over-power all the reſt; and the inſipid kinds be diſcreetly uſed to moderate and qualify the heat and pungency of the others, as the ſeaſon of the year is more hot or cold; ſo as every *Sallet* may not only be agreeable to the taſte, but alſo phyſic to the body.

The gardeners call *ſmall herbs*, in *Sallets*, thoſe which ſhould always be cut while in the ſeed leaf; as creſſes, muſtard, radiſh, turnip, ſpinage, and lettice; all which are raiſed from ſeeds ſown in drills or lines, from mid-February to the end of March, under glaſſes or frames, and thence to the middle of May, upon natural beds, warmly expoſed; and during the ſummer-heats, in more ſhady places; and afterwards, in September, *&c.* as in March, *&c.* and laſtly, in the rigour of the winter, in hot beds. If they chance to be frozen in very froſty weather, putting them in ſpring-water two hours, ere they be uſed, recovers them.

In gathering ſmall-herbs, the beſt way is to pull them up by the roots from the hot beds. If the roots be left, and a ſecond crop of *Salleting* ſown on the ſame bed, it will not proſper.—In ſowing ſecond crops, it is alſo to be obſerved, that ſeeds of the ſame kind be not ſown in the ſame place; but the ground is to be eaſed by varying its burden, putting hot ſeeds where cold ones grew before, *&c.* Another rule is, that no plant be placed in the ſame ſpot where the ſame kinds have grown before.

Winter-*Sallets* are greatly improved by blanched ſellery, which is a hot herb, of a very rich flavour; raiſed from ſeed ſown in March, and April, in a well-expoſed place, and tranſplanted, ſix weeks after its firſt appearance, into beds, where it remains till the middle of June, and then planted in trenches eight or ten inches wide, and as many deep, firſt pruning off the tops and roots. As they grow large, they are earthed up within four or five inches of the top, which is repeated ſeveral times, till they be fit for uſe.—Endive blanched is much uſed in winter *Sallets*, though it have neither taſte nor flavour; it is cultivated much after the ſame manner as ſellery.—Of lettice there are various kinds, the beſt are the Roman, Dutch brown, Imperial, and Sileſia-kinds, all which cabbage well. They are all commonly ſown with other crops in March, for ſummer *Sallets*; and in Auguſt, to be tranſplanted; or September, to ſtand the winter; either to be cut for winter *Sallets*, or to cabbage early next ſpring for ſeeds. See SEEDS.

For the additional, or ſecondary SALLET-*herbs:* Burnet is a cool perennial herb, whoſe tender leaves, mixed with other herbs in winter, give the agreeable flavour of a cucumber: It is propagated by ſeed ſown in March. Corn-ſallet, raiſed at the ſame time, and in the ſame manner, makes a good winter-*Sallet* furniture; purſlane, an inſipid, yet cooling herb, is admired by ſome in ſummer-*Sallets:* it is raiſed by ſeeds ſown in March in a warm place.—Sorrel is chiefly uſed in the ſpring, when the young leaves are very agreeable. It is raiſed from ſeeds ſown in March, uſually in rows or drills. Spinage is a neceſſary ingredient in raw *Sallets*, to be cut in the ear-leaf; but it is better for boiled *Sallets* in the winter and ſpring. It is ſown in March, April, and May; and again in Auguſt, in a place well expoſed to the ſun, that the leaves may be large enough for boiling in the winter.—Tarragon, of all others, ſhould never be wanting; it is a cordial herb, though not the moſt agreeable taſted: yet a few leaves, or three or four of the tender tops, give a *Sallet* a good reliſh. It is propagated from ſlips, taken from the root, and planted in March.—Note, in the ſpring dandelion blanched, which is gathered in almoſt every ploughed field, makes an excellent *Sallet* mixed with other herbs. Some likewiſe gather violet flowers, cowſlips, and bloſſoms of burrage, as a part of the *Sallet* furniture; others, fennel, and parſley.

Dreſſing of SALLETS.—The ſellery and endive are to have their hollow, green ſtem, or ſtalk, ſtripped of all its outſide leaves, and ſliced in the blanched part, cutting the root into four parts. The other ingredient herbs being exquiſitely culled and cleanſed, of all faulty leaves, *&c.* are waſhed rather by ſprinkling, than ſobbing them in ſpring-water; laid to drain of all ſuperfluous moiſture, then ſhook and ſqueezed together gently, in a coarſe cloth, to diſpoſe them to receive the ſeaſonings, *viz.* the ſalt, vinegar, oil, *&c.* The oil not to be yellow, or high-coloured, but of a pale olive green, without either taſte or ſmell. See OIL. The vinegar perfectly clear, neither ſour nor palled. See VINEGAR. The ſalt to be the beſt ordinary bay-ſalt, clean, bright, and dry. See SALT.

Some indeed recommend the eſſential ſalts and ſpirits of vegetables, or thoſe of the alcalizate and fixed kind, extracted from the calcination of balm, roſemary, wormwood, *&c.* and affirm, that, without eating the groſs *ſallet*-herbs themſelves, we might have healing, cooling, generous *ſallets*, wholly out of the ſalt-ſeller.

Note, in the proportion of the ſalt, pepper, and vinegar, regard is to be had to the ſeaſon, conſtitution, *&c.* the two firſt being beſt for cold, the ſecond for hot ſtomachs and ſeaſons.—For a moderate oxaline, or *ſallet*-vehicle, to three parts of oil, put one of vinegar, or lemon, or orange-juice, and in the mixture, ſteep ſlices of horſe-radiſh with a little ſalt; occaſionally, add a little Guinea pepper, and muſtard, with the yolks of two eggs boiled, ſqueezed, and bruiſed into a maſh therein. Pour the whole on the herbs, ſtirring and mingling them till they be thoroughly imbibed.

SALLY, in architecture, from the French *Saillie*, is what we more uſually call *Projecture*. See PROJECTURE.

SALLY, in the military art, the iſſuing out of the beſieged from their town or fort, and falling upon the beſiegers to cut them off, nail their cannon, hinder the progreſs of their approaches, deſtroy their works, *&c.*

We ſay, *to make a Sally*, *to repulſe a Sally*, &c.

To cut off a Sally, is to get between thoſe who made it and the town.

SALON, or SALOON, in architecture, a grand, lofty, ſpacious ſort of hall, vaulted at top, and uſually comprehending two ſtories, with two ranges of windows.

The *ſalon* is a grand room in the middle of a building, or at the head of a gallery, *&c.* Its faces, or ſides, are all to have a ſymmetry with each other; and as it uſually takes up the height of two ſtories, its ceiling, Daviler obſerves, ſhould be with a moderate ſweep.

The *ſalon* is a ſtate-room: it is much uſed in the palaces in Italy; and from thence the mode came to us. Embaſſadors, and other great viſitors, are uſually received in the *ſalon*.

It is ſometimes built ſquare, ſometimes round or oval, ſometimes octogonal, as at Marly, and ſometimes in other forms.

SALT, SAL, in chymiſtry, a ſimple, acid ſubſtance, which enters the compoſition of all bodies, and is held one of the five principles, or elements thereof; only to be extracted by fire. See PRINCIPLE.

Salt, M. Homberg obſerves, is an ingredient in all animal, vegetable, and mineral bodies, excepting perhaps ſome metals, and ſtones. In vegetables and mineral bodies, that have undergone a fermentation, the *ſalt* riſes firſt in the alembic, then the phlegm: if the mixt have undergone a fermentation, the *ſalt* riſes after the phlegm. See ANALYSIS.

Salts are diſtinguiſhed, with regard to the manner of extracting them, *&c.* into *volatile*, *fixed*, and *eſſential*.

Volatile SALTS, are thoſe light, ſubtile ones, which riſe eaſily upon diſtillation, or are even exhaled by the noſe, and rendered ſenſible to the ſmell. See VOLATILE.

Fixed SALTS, are ſuch as, being more groſs and material, reſiſt and ſuſtain the fire; and are not raiſed by it, but remain, after calcination, or diſtillation, in the earthy part, at the bottom. —For the manner of extracting them, *&c.* See FIXT *ſalt*.

Eſſential SALTS, are thoſe drawn from vegetables, without the uſe of fire; as by cryſtallization, and other eaſy, natural means. See ESSENTIAL *ſalts*.

Volatile ſalts become diſtinguiſhable to the noſe, tongue, and brain, by their tenuity and briſkneſs: *fixed ſalts* by their bitterneſs, and heat in the mouth. To theſe may be added an intermediate kind of *ſalt*, under the title of

Mixed SALTS, which are thoſe reſulting from a mixture of a *volatile* with a *fixed ſalt*.

SALTS again are of different kinds, according to the different matters wherewith they are found mixed: ſome are mixed bodies themſelves, and their mixture ſeparable by fire, and lixivation.—Such are all eſſential *ſalts* of plants, and all foſſile *ſalts*, &c. but theſe are no proper chymical principles.

There are others which we are ſenſible are mixed, and whoſe mixture we know pretty nearly, though we are not yet able to decompound them: it is theſe make the chymical principle *ſalt*; for our analyſes will not render them more ſimple, which is the character of a principle.—And in this ſenſe, *ſalt* is defined, a matter diſſoluble by water, and unchangeable by fire; to which ſome add, of a pungent taſte. There are three kinds, or claſſes, of *ſalts*, which come under this definition; two whereof are *volatile*, and the third *fixed*.—The *volatile* ones, are acid *ſalts*, and urinous *ſalts:* the *fixed*, are thoſe drawn by a lixivium after calcination, and called *Lixivious ſalts*. Nature produces none of theſe *ſalts* ſimple and unmixed; but we eaſily extract them by art, from the mixts wherein ſhe has placed them.

The principal natural *ſalts* may be reduced to *Salt-petre*, *Sea-*

Sea-Salt, and *Vitriol*. Each whereof has its different kinds; of the various combination whereof, with different oily matters, all the natural *Salts*, we know of, are compounded.

Theſe *Salts* are found, by chymical analyſes, to conſiſt of aqueous, earthy, oily, ſulphurous, and acid particles.—The acid matter is the pure *Salt*, or *Saline* principle, and is the baſe of all the reſt. This M. Homberg obſerves, is pretty uniform, and nearly the ſame in all *Salts*, before the particular determination to form this or that *Salt*, by the particular admixture of the ſulphur, *&c.* See ACID.

Salt-petre, *Sea-Salt*, and the reſt, therefore are not principles; but the acid *Salts* diſtilled from them are: and the water wherein theſe *Salts* ſwim, and the earth, or fixed *Salt* remaining in the retort after diſtillation, are other chymical principles. See PHLEGM, and EARTH.

The principle *Salt* is held a mean between the active and paſſive principles. The pure acid, though accompanied with its ſulphurous determinating matter, never becomes ſenſible but when lodged either in ſome earthy matter, or artificially in ſome ſimple aqueous matter. In the firſt caſe, it appears, under the form of a chryſtallized *Salt*, as *Salt-petre*, &c. In the ſecond caſe, it appears in the form of an acid ſpirit, which, according to the determination of the ſulphur that accompanies it, is either ſpirit of nitre, or ſpirit of common *Salt*, or ſpirit of vitriol.—And what we have here obſerved of the three ſimple, or foſſile *Salts*, may be applied to all other more compound *Salts* of plants, animals, *&c.* with this difference, that when in form of a concrete *Salt*, theſe laſt always have a greater quantity of earthy matter, and when in form of an acid ſpirit, a greater quantity of aqueous matter, than the ſimple ones. Whence it follows, that the acid ſpirits of compound *Salts* are always weaker, lighter, and leſs penetrating than thoſe of foſſile *Salts*; and after diſtillation leave a greater quantity of earthy matter behind them. See SPIRIT.

We do not know preciſely what figures the three *Salt*-principles, acid, urinous, and lixivial, muſt have: But to judge by their effects, one would conclude, the acids to be pointed, only the points ſheathed in ſome ſulphurous matter; the urinous *Salts* to be ſpunges, containing ſome of the acid, and ſome of the fœtid oil of the animal or plant: and the lixivious *Salts* to be ſpunges only containing the remainder of the acid, which the calcining fire could not expel. See LIXIVIOUS and URINOUS.

Acid ſpirits may be conceived as pure, and without any mixture; in which caſe all acids will be found of the ſame nature: but if we conſider them as diſtillation gives them, we ſhall always find them accompanied with ſome ſulphurous matter, which we cannot ſeparate from them, and which gives the degree of activity to the acid ſpirits. It is this ſulphurous matter which characterizes them, and makes all the difference we find between acid ſpirits. M. Homberg ranges all the kinds of acid ſpirits under three different claſſes, according to the different ſulphurous matters which accompany them.—The firſt claſs is of thoſe which contain animal or vegetable ſulphur; under which come all acids, diſtill'd from plants, fruits, woods, *&c.* as alſo ſpirit of nitre.

It is eaſy to conceive, that the acids of plants may have retained a part of the oil of the plant, which is their ſulphur; ſince in reducing theſe acids into *Salts*, we always find a little oil therein; which can be nothing elſe but that of the plants themſelves. And for *Salt-petre*, as this is always drawn from earths moiſtened with the excrements of animals, or from old walls, plaiſter, *&c.* full of the ſulphurous matters of the animals that lived within them, the ſoot, *&c.* it is thence, doubtleſs, *Salt-petre* borrows its ſulphur. See SALT-PETRE.

The ſecond claſs is of thoſe which contain a bituminous ſulphur: under which come the acids of vitriol, common ſulphur, and alum. For thoſe are all uſually drawn from the ſame mineral ſtone, wherein the bituminous matter, which makes one of the principal parts of common ſulphur, predominates. See SULPHUR.

The third claſs is of thoſe which contain a more fixed mineral, ſulphurous matter; approaching nearer the properties of a metaline ſulphur: under which claſs come the acids drawn from ſeveral kinds of *Sea-Salts*, *Rock-Salts*, &c. For the *Rock-Salt*, or *Sal-Gemmæ*, is always found in places near metallic mines; and *Sea-Salt*, in all appearance, is nothing but *Rock-Salt*, the quarries whereof have been penetrated by the ſea-water, which has extracted all the ſaltneſs therefrom. See *Sea*-SALT.

The ſulphurous matters of the firſt claſs of acids being very light, and taking up a deal of ſpace, muſt augment the bulk of the points of the acids to which they are joined. And hence theſe acids become diſabled from penetrating very compact bodies; but their ſurface being increaſed from the ſame cauſe, the flame will have the greater hold to impel them: And hence the acids of this claſs act more ſwiftly than any of the reſt.

The bituminous ſulphur is the leaſt active of all the ſulphurs we know, as being loaden with a great quantity of earthy matter, which ſerves it as a matrix. Hence it unites more difficultly with ſaline matters than any of the other ſulphurs; ſo that a leſs quantity of it may be conceived to adhere to the acids of this, than of either of the other claſſes.—Accordingly we find, that the acids of this claſs, uſed alone, ſcarce diſſolve any metals; but mixed with the others, partake of their ſulphur, and thereby become enabled to diſſolve all metals.

The metalick-ſulphur is of all others the moſt fixed; that is, its parts are the ſmalleſt, and moſt compact. See FIXITY. Hence the points of this claſs of acids will not be much ſwelled by it, and of conſequence will be able to inſinuate themſelves into the moſt compact bodies, or thoſe whoſe pores are the ſmalleſt. And for the ſame reaſon they will not give much hold to the flame that agitates them, and will therefore act with leſs violence than thoſe of the firſt claſs of *Salts*.

Acids joined to fixed *Salts*, compoſe mixed *Salts*: thus ſpirit of nitre, with *Salt* of tartar, make *Salt-petre*; and ſpirit of *Salt*, with ſalt of tartar, make a true common *Salt*; and ſpirit of vitriol, with *Salt* of tartar, a true vitriol.

However, the two ingredient *Salts* ſtill remain, the one fixed, the other volatile: acids joined with urinous *Salts*, compoſe another kind of *Salts*, called *Sales Ammoniaci*, which are always volatile. See ARMONIAC.

Lixivial and urinous *Salts* are called *Alcalies*; the firſt a fixed alcali, the ſecond a volatile alcali. See ALKALY.

Theſe alcalies are uſually eſteemed antagoniſts to the acid *Salts*, becauſe their mixtures always occaſion a ſudden ebullition. But it is more probable this ebullition is not the effect of a combat, but rather a proper junction and union of two matters which had been naturally united together, and only ſeparated by the fire, and now re-place themſelves in the ſame parts whence the flame had tore them off. Hence, the one are compared to ſheaths, and the other to points, fit to be ſheathed therein. Now, the precipitation wherewith the points of the acids enter the pores of the alcalies, tears aſunder their contexture, and reduces them into minute parts inviſible to the eye; and thus is the buſineſs of diſſolution accounted for. See DISSOLUTION.

Thus far will the mere doctrine of alcali and acid go towards accounting for ſome of the great phænomena of nature. But the theory is made vaſtly more compleat and adequate, by Sir Iſaac Newton's principle of attraction, for which we refer the reader to the articles ACID, MENSTRUUM, *&c.* where the operation of *Salts*, or acid ſpirits, are perhaps more ſatisfactorily accounted for.

The principal chymical *Salts* of uſe in medicine are; *Salt* of urine, of lavender, of viper, of human blood, of wormwood, of guaiac, of quinquina, of tobacco, of rhubarb, of roſemary, of ſage, of juniper, of vitriol, of amber, of ſaturn, *&c.* moſt of which, with many others, are explained under the articles of the reſpective drugs, *&c.* whence they are drawn: to which the reader may have recourſe.

SALT, in its popular ſenſe, denotes a kind of ſaline cryſtallization; or a ſharp, pungent, detergent and aſtringent ſubſtance, uſed to ſeaſon fleſh, fiſh, butter, hides, and other things that are to be kept; as alſo to give a reliſh to meats, *&c.*

This we uſually call *Common Salt*, in contra-diſtinction to the chymical *Salt*.

M. Guglielmini, in an expreſs diſſertation *de Salibus*, lays it down as a fundamental, that the firſt principles of common *Salt*, *Salt-petre*, vitriol, *&c.* had their figures unalterably fixed at their firſt creation, and are indiviſible as to any created force. That of common *Salt* he maintains to be a little cube; that of *Salt* of vitriol, a parallelepiped; that of *Salt-petre* a priſm whoſe baſe is an equilateral triangle, *&c.*

Common *Salt* is of three kinds, *viz.* *Sea-Salt*, *Foſſile* or *Rock-Salt*, and *Salt* drawn from briny ſprings, and wells.

For *Sea-Salt*, the greateſt and beſt part is made in France; little in England.—*Foſſile*, or *Rock-Salts*, are chiefly found in Poland, Hungary, and Catalonia.—For *Salt* ſprings, they are conſiderable in Cheſhire, Worceſterſhire, Hampſhire, Northumberland, Franche Comte, Lorrain, Tirol, and ſome other places.

The great *property* of SALT is, that it is incapable of corruption, and that it even preſerves meats, *&c.* ſeaſoned therewith, or ſteeped in ſolutions thereof. It endures the fire, and even comes purer out of it, as being thereby freed of its humidity. In very hot fires it fuſes, and is converted into corroſive waters.

It gives fertility to lands, and promotes the fuſion of all metals; yet, we read of princes, who, as a mark of their indignation, ſowed grounds with *Salt* to render them barren. Plutarch obſerves, that the Egyptians believed *Salt* to be the ſpittle, or foam of the giant Typhon, the great enemy of their gods: and hence, adds he, they held it in the greateſt horror.

Salt is found to have two oppoſite qualities: by its ſubtile, penetrating acidity, it breaks and diſſolves the hardeſt and moſt compact minerals and metals; and by a contrary property, it coagulates liquid bodies, as milk, blood, *&c.* Some of its ſpirits, mixed in a certain proportion with water, produce an exceſſive heat; yet, when mixed in a leſs quantity augment its coldneſs: as *Salt-petre* in ſnow, *&c.*

Though all *Salts* diſſolve by moiſture, yet water only diſſolves, *&c.* a certain quantity. However, when impregnated with any *Salt*, as much as it can bear, it will ſtill diſſolve a quantity of another *Salt*, whoſe particles are of different figures, proper to inſinuate into the remaining vacuities of the water: thus, after *Common Salt* will no longer diſſolve in it, alum will, and after alum, *Salt-petre*, then *Sal-Armoniac*, &c.

The uſe of *Salt* is ſo univerſal, and the traffic thereof ſo very important in the places where nature has produced the different *Salts*, and ſo neceſſary for thoſe which have not that advantage; that a detail of the preparation, commerce, *&c.* of the ſeveral kinds, cannot fail of being acceptable.

Sea-SALT is made of ſea-water, thickened by frequent evaporations, and at length cryſtallized.—Of *Sea-Salt* there are two kinds: that which requires the ſun's rays to give it its conſiſtence, called, from its own brown colour, *Bay-Salt*; and that which receives its conſiſtence from the heat of a fire, called *White-Seal.*

They uſe either this or that manner of preparation, according to the diſpoſition of the coaſts, where it is made: if the coaſts riſe in downs or hills of ſand, the *Salt* is made by fire, in copper or leaden veſſels.—If the coaſts be flat, and low; eſpecially, if the bottom be a little clayey, the *Salt* is cryſtalized wholly by the action of the ſun.

We have nothing very conſiderable of either kind in England: ſome indeed we have of the latter, at Shields in Northumberland; and of the former in the iſle of May. France is the principal place for theſe *Salts*; more being made there than in all Europe, perhaps in all the world beſide; and it is hence that we are chiefly furniſhed therewith. We ſhall therefore deliver the method of making it, as it is practiſed there.

The chief coaſts for *Bay-Salt* are thoſe of Bretagne, Saintonge, and the Pays d'Aunis. The chief *Salt*-works, in the two latter places, are Brouage, Maran, and the iſle of Rhe. Thoſe in Bretagne are in the bay of Borneuf, Guerand, and Croiſil: for *White-Salt*, it is chiefly made on the coaſts of Normandy. In the bay of Borneuf alone, are computed above twenty thouſand conſiderable *Salt*-works.

Manner of making Bay-SALT.—Low marſhy-grounds, diſpoſed by nature for the reception of the ſea-waters when the tide ſwells, and provided with banks and ſluices to retain the ſame, are called a *Salt-marſh.*

Theſe *Salt*-marſhes, the bottoms whereof they ram with a deal of care, are divided into ſeveral ſquare pits or baſons, ſome greater, others leſs, ſeparated by little dikes 13 or 14 inches broad: and into theſe baſons, when the ſeaſon is at hand, they let in the ſea-water.

The *Salt* ſeaſon is from the middle of May to the end of Auguſt; in which time the days being long, and the ſun's rays ſtrongeſt, the *Salt* is raiſed and cryſtallized better than in any other ſeaſon. Ere they let in the water, they take care the baſons be well cleared of what had been left in them during the winter to keep them in order. The water is admitted to the height of about ſix inches, after having firſt let it reſt, and warm two or three days in huge reſervoirs, without the works, that it may come in luke-warm. The water admitted, the ſluices are ſhut, and the reſt of the work left to the wind and the ſun.

The ſurface of the water being ſtruck, and agitated by the direct rays of the luminary, thickens, at firſt, imperceptibly, and becomes, at length, covered over with a ſlight cruſt, which hardening by the continuance of the heat, is wholly converted into *Salt*. The water, in this condition, is ſo hot, that the hand cannot be put into it without ſcalding it. When the *Salt* has received its full coction, they break it with a pole, upon which it ſinks to the bottom, whence being dragged out again, they leave it ſometime in little heaps, about the edge of the pit, to compleat the drying; and at length in greater heaps, containing ſeveral thouſand muids, which they cover over with ſtraw, or ruſhes, to ſecure them from the rain.

Eight, ten, or at moſt fifteen days, having thus perfected the cryſtallization of the *Salt*, they open the ſluices, when the tide is riſing, for a freſh ſtock of water; and thus they continue alternately, taking in water, and gathering the *Salt*, till the ſeaſon be over. Rainy weather is very pernicious to the work; for rain-water, mixing in any quantity with the ſea-water, renders it uſeleſs, ſo that new water muſt be called in.

The *Salt* is brown when taken out of the pits, and is uſually thus ſold, without farther preparation: indeed in ſome places they make it into *White-Salt* by refining. They refine it by boiling it in large flat caldrons, which not only takes away its acrimony, but is found to increaſe the quantity.

Method of making White Sea-SALT.—The *White-Salt* of Normandy is not made by refining the *Bay-Salt*, but has this colour naturally when taken out of the pits.—To make it, they gather a muddy ſand on the flats of the ſhoar, which the riſing tide has covered and impregnated with its waters for ſeven or eight days. The ſand being removed into pits for the purpoſe, diſcharges itſelf by degrees of all its water, which filtrates through ſome ſtraw wherewith the bottom of the pit is filled, and trickles into veſſels ſet on purpoſe to receive it. Of this water it is that they make their *Salt.*

Their furnaces are of earth, and their boilers of lead: each furnace boils four leads. When the water wherewith they have filled the leads begins to boil, they take off the ſkim, which ariſes in abundance, and in proportion as it diminiſhes, throw in freſh water, which they continue to ſkim, as before. When it thickens, they keep it continually ſtirring, with a crooked ſtick, or ladle; and when the grain is formed, take it off the fire to purify it.

The purifying is performed by letting it ſtand in large oſier baſkets; where it drains itſelf of certain humidities that remained. When dry, it is laid in heaps, and thence carried into the magazines.

The commerce of *White-Salt* brings an immenſe profit to France, though more to the king than to the makers and ſellers: the duty is one fourth part of the price the *Salt* is ſold at. The Engliſh and Dutch, and (when they are at war with France) the Swedes and Danes, take off moſt of the *Salts* of the Comte Nantois; paying for it, *communibus annis*, from 20 to 35 livres the load. That of Guerande is preferred, by the Engliſh and Iriſh, to all the reſt, as the beſt and whiteſt. Yet that of Borneuf, though browner and heavier, is moſt uſed in France, as alſo throughout the Baltic; particularly in Poland, where, beſides the ordinary uſes, it ſerves in tilling the ground; being found to warm it, and to prevent little vermin from gnawing the grain.

The Engliſh and Dutch have oft ſtrove hard, in times of war, to do without the French *Salts*; and to that end, have endeavoured to take *Salts* from the Spaniſh and Portugueze; but there is a diſagreeable ſharpneſs and ſeroſity natural to them, which renders them very unfit for the ſalting of fleſh, fiſh, *&c.*—To remove this, they boil them with ſea-water, and a little French *Salt*, which they procure by means of neutral nations; which not only ſoftens them, but increaſes their quantity by one third. But it ſhould ſeem their refining does not ſucceed to their wiſh, by the eagerneſs wherewith they return to the *Salts* of Bretagne, *&c.* as ſoon as any treaty has opened the commerce.

Foſſile, or *Rock*-SALT, is called alſo SAL-*Gemmæ*, from a certain brightneſs it has, which gives it ſome reſemblance to gems. Indeed, it ſhould have ſomething of the gem in its nature; if there be nothing exaggerated in the account Dr. Ed. Brown, (who went down into the *Salt*-mines in Hungary) gives us thereof in his travels.

This *Salt* was intirely unknown to the ancients: Pliny, however, gives ſome curious things about *Salts* in Nat. Hiſt. lib. 30. c. 7. which we ſhould have tranſcribed hither, could we believe them as true as they are pretty. We ſhall here content ourſelves with what well-warranted relations we could get of the *Salt*-mines of Wiliſca in Poland; thoſe in the Upper Hungary, and thoſe in the mountains of Catalonia, which make a very conſiderable article of commerce in thoſe three ſtates; *Salt* being tranſported hence to the ſeveral neighbouring nations, who cannot be conveniently ſupplied with *Sea-Salt.*

SALT-MINES *of Poland*, *&c.*—The Poliſh-mines, in the village Wiliſca, five leagues from Cracow, were firſt diſcovered in 1251. Their depth and capacity are ſurprizing. Within them is found a kind of ſubterraneous republick, which has its polity, laws, families, *&c.* and even publick roads, and carriages; horſes, *&c.* being kept here to draw the *Salt* to the mouth of the quarry, where it is taken up by engines. Theſe horſes, when once they are down, never ſee the light again; but the men take frequent occaſions of breathing the village air. When a traveller is arrived at the bottom of this ſtrange abyſs, where ſo many people are interred alive, and where ſo many are even born and have never ſtirred out, he is ſurprized with a long ſeries of lofty vaults, ſuſtained by huge pilaſters cut with the chiſſel, and which, being themſelves *Rock-Salt*, appear, by the light of flambeaux which are inceſſantly burning, as ſo many cryſtals, or precious ſtones of various colours, caſting a luſtre, which the eye has much ado to bear.

The rocks of *Salt* are hewn in form of huge cylinders; the workmen uſing hammers, pick-axes, and chiſſels, much as in our ſtone quarries, to ſeparate the ſeveral banks of ſtone. As ſoon as the maſſive pieces are got out of the quarry, they break them into fragments fit to be thrown into the mill, where they are ground, and reduced into a coarſe farina or flour, which ſerves all the uſes of *Sea-Salt.*

In the *Salt*-mines of Wiliſca, there are two kinds of *Sal-Gemmæ*; the one harder and more tranſparent, and the cryſtallization whereof appears more perfect than that of the other: This is the real *Sal-Gemmæ* of the Druggiſts and Dyers. It cuts like cryſtal, and is frequently uſed for toys, chaplets, little vaſes, *&c.* the other is leſs compact, and only fit for kitchen uſes. One of the chief wonders of the place is, that through theſe mountains of *Salt*, and along the middle of the mine, there runs a rivulet of freſh water ſufficient to ſupply the inhabitants.

The SALT-*Mines in the Upper Hungary* are every whit as extraordinary. They are found in the mountains, two miles from Eperies, a city in the county of Sarax, on the river Tarhz. The depth is 180 fathoms. The mineral runs in huge veins, ſo that pieces are ſometimes dug not leſs than an hundred thouſand weight; which however, are afterwards reduced into ſquare pieces two foot long, and a foot thick, for the conveniency of drawing them out of the mine. When out, they are broke farther, and put to the mill to be ground. The colour of the ſtone is a little browniſh, and yet, when ground, becomes as white as if it had been refined. Some of the ſtones are found as hard and tranſparent as cryſtal; ſome white, yellow, blue, *&c.* fit for various works, whereon they engrave as on precious ſtones. The mine is cold and moiſt, whence there ariſes ſome difficulty in reducing the *Salt* into powder. Of the water drawn out of it and boiled, is made a blackiſh *Salt*, which fattens cattle.

The SALT-*Mines of Catalonia* are found in the mountains of the dutchy of Cardonna, and belong to the grandees of that name. It is the opinion of the country people, that the *Salt* grows again, and is re-produced, after ſeveral years, in the ſame places whence it had been dug. But the naturaliſts will ſcarce allow of ſuch a re-production. There is no doubt, however, but it vegetates, or grows ſometimes: M. Tournefort, and the ſpecimens he had of it in his cabinet, make it plain.

The *Salt* is of four kinds, white, bay, red, and brilliant: The firſt, is almoſt like our *Sea-Salt*, only that it is not granulated. The ſecond, of an iron and ſlate colour, has moſt of the qualities of the white. The third, of a conſerve roſe colour, only differing from the reſt by the mixture of ſome bole, or earth, which gives it this colour. The fourth is a brilliant *Salt*, yet tranſparent as cryſtal, which is the proper *Sal-Gemmæ* of the druggiſts.—Of this kind there is ſome blue, others green, orange, red, *&c.* but they all become white by grinding.

Theſe four kinds of *Salts* are found over each other in diſtinct ſtrata or beds: the commerce hereof is very conſiderable: The Engliſh, *&c.* when trade is prohibited with France, furniſh themſelves hence.

Sal-Gemmæ is to be choſen in large, bright, tranſparent pieces, eaſy to break, and dividing into little ſquare grains. It grows red-hot in the fire, like iron, but diſſolves eaſily in air: yet the druggiſts waſh it, to give it the greater luſtre, but they take care to wipe it dry again ſpeedily.

SALT *drawn from briny ſprings.*—Our method in England is thus: near the ſpring, or place of the brine, is built a ſaltern, or boiling-houſe, with a convenience for the conveyance of the brine within it. The ſaltern is uſually large enough to contain ſeveral huge flat pans, or boilers, each furniſhed with its grate and furnace.

At Shields, *&c.* on the eaſtern coaſt, where brine ſprings are wanting, they uſe ſea-water in its place; which at ſpring-tides is let into their ponds called *ſumps*, and from thence pumped into the pans.

The brine being in the pan, the fire is kindled; and after two hours time, the liquor begins to be ready to granulate: which is known by a thin ſkin riſing at the top; this they ſkim off into brine tubs, that the brine that goes with it may not be loſt: and whereas all brines contain, or yield ſand, which is ſuppoſed to petrify in boiling; for that if the liquor have been ſtrained before-hand through brown paper, yet upon boiling it, ſand will ariſe; and the pan boiling violently in the middle, the ſand is caſt towards the corners, where it falls to the bottom of the pan, before the *Salt* precipitates; therefore, they rake it to one corner of the pan, with a broad rake, and then take it out with ladles, and put it into wooden veſſels, open at one end, placed on ſtands.

The ſand being removed, that the *Salt* floating in the liquor may precipitate, they ſhut up the vent-holes, and door, and let the fire go out; and in twelve hours time the *Salt* falls to the bottom, and grows hard; a liquor called the *bittern*, remaining at top, which being again boiled away, yields more *Salt.*—To make the *Salt* precipitate more readily, after the liquor is ſcummed, *&c.* they frequently uſe ſome beef-ſuet, and wine-lees, of each a like weight, melting and mixing them together; and putting an ounce of this mixture on the end of a ſlice, turn it round in the liquor till it be ſpent: then after two hours, at moſt, open the vent-holes and door, quicken the fire, and lade away the liquor in a good meaſure, and ſo is the *Salt* found lying at the bottom, fit to be removed.

It is now raked up to one ſide, taken out and put into cribs, or veſſels, like hay-racks, with looſe ribs on each ſide, ſo cloſe to one another, that an half crown will ſcarce go between: here, after eight hours draining, it is found an hard granulated *Salt*, and may be taken away; but yet continues dripping three weeks, and afterwards, if not often moved, will become rocky: the liquor in the pan, called *bittern*, is to be all taken out, except a little to keep the pan from burning; drained from the *Salt*, and caſt away, or reſerved for *Salt-petre* makers; and the pan immediately filled with freſh brine, for another boiling.

A pan of brine, of moderate ſtrength, in eight hours time will be compleatly made into *Salt*, with the expence of about a buſhel and half of coals, which will make a pan of *Salt* from two buſhels and half to four buſhels, or more, according as the liquor is in ſtrength.

This *Salt* they ſometimes mould into the form of ſugar-loaves, in which ſtate it will keep dry without fire, and that for a long time. At Nantwich, they bake the loaves twice or thrice, in an oven, and keep them in a ſtove, or the chimney-corner.

SALT *from brine raiſed by the ſun.*—In ſome parts of England, as at Limington, Port-ſea, *&c.* they uſe water raiſed by the ſun, and then boiled, which they find preferable to the natural brines of ſprings; thoſe being always found either too weak, or too ſtrong.

To this end, they have ſeveral ponds, or ciſterns, called *ſun-ponds*, built with mud, and well-expoſed to the ſun, with little channels, to convey the brine from them all to a large ſhallow reſervoir, called the *common-ſun-pan*, not exceeding ſeven or eight inches in height. Here the liquor is left to mellow, from twelve to twenty-four hours, or till the liquor will bear a hen's egg new laid; and when it has attained a ſufficient ſtrength, it is from thence derived by channels into the ciſterns, where the rain and ſun breed red worms which cleanſe and purify the liquor, which ripens by age, and is rendered fitter for boiling, which is performed after the ſame manner as is already deſcribed.

SALTIER, SALTEER, or SALTIRE, in heraldry, an ordinary in form of a St. Andrew's croſs; anciently called the *Croſs of Burgundy.* See CROSS.

The *Saltier* may be ſaid to be compoſed of a bend dexter and ſiniſter, croſſing each other in the centre of the eſcutcheon. See *Tab. Herald. fig.* 35. See alſo the article BEND.

Its ordinary breadth, when alone, is one third of the eſcutcheon. It is ſometimes bore alaisé, and ſometimes in number, placed in different parts of the field: Sometimes charged, countercharged with the field, accompanied, raguled, engrailed, indented, quarterly-quartered, *&c.*

The *Saltier* was anciently a piece of the knight's harneſs; being faſtened to the ſaddle, and ſerving him for a ſtirrup to mount upon; and it was hence it had its name *Saltier*, by the French *Sautoir*, from *Sauter*, to leap.—It was made of ſilk cord, or ſome other kind of cord, covered with ſome rich ſtuff.

Others will have it, that the original *Saltier* was a kind of paliſade, ſerving to fence parks, woods, *&c.* where wild beaſts were incloſed. Though Spelman ſays, it was an inſtrument for the taking them, thus called, *Quod ſit in uſu in Saltu.* Laſtly, others aſſure us, that *Saltier* was anciently the figure of an engine, which being full of pins, was uſed in the ſcaling of the walls of a beſieged place: whence its origin from *Sauter*, as it helped the ſoldiers to leap over the wall.

SALTNESS, SALSEDO, the quality of ſomething that is impregnated with ſalt; or that yields a ſaline taſte. See SALT and TASTE.

The *Saltneſs* of the ſea, lakes, *&c.* is a thing that has long perplexed the philoſophers to account for. Some take it to be the effect of the dry, aduſt, and even ſaline exhalations, which the ſun raiſes from the earth, and the winds, and rains diſcharge into the ſea: and hence, ſay they, it is, that the ſea is found more brackiſh near the ſurface, than towards the bottom.—Others contend, that the ſun being continually extracting the pureſt and ſubtileſt parts from the water; the coarſer parts remaining, being exalted and concocted by this heat, acquire by little and little, their degree of *Saltneſs.*—Others, as father Bouhours, will have it, that the Creator gave the waters of the ocean their *Saltneſs* at the beginning, not only to prevent their corruption, but alſo to enable them to bear greater burdens.—Bernier ſeems to be nearer the matter, when he aſcribes the *Saltneſs* of the ocean to the foſſile or mineral ſalts brought into it by the rivers, and diſſolved in the water.

The Count de Marſigli obſerves, that in Provence, the bottom of the ſea is wholly ſtony, and nothing but a continuation of the mountains of the Cevennes; being even found to conſiſt of ſeveral ſtrata; among which, are ſalt, and pit-coal: and hence he derives the *Saltneſs* and bitterneſs of the ſea-water.

Dr. Halley, in an expreſs diſcourſe of the *Saltneſs* of the ocean, in the Philoſophical Tranſactions, obſerves, that all the lakes in the world are *ſaline*, ſome more, ſome leſs, than the ocean; which, in this caſe, may be eſteemed a great lake itſelf: and that all the vapours exhaled by the ſun from lakes, are perfectly freſh; ſo that all the ſaline particles brought in by the rivers remain behind, while the freſh evaporate. Hence it is evident, their *Saltneſs* muſt be continually augmented. Now if this be the true reaſon of the *Saltneſs* of lakes, it is probable the *Saltneſs* of the ocean itſelf ariſes from the ſame cauſe: and hence we are furniſhed with a method of eſtimating the age of the world, by obſerving the increaſe of *Saltneſs* in the waters of lakes; and computing in how long time the ocean might, at that rate, arrive at its preſent *Saltneſs.* See LAKE, *&c.*

SALT-PETRE, SALPETRA, *nitre*; a bitter, ſulphurous or inflammable kind of ſalt; of great uſe in chymical preparations, the compoſition of gun-powder, dying, the glaſs-manufacture, making aqua-fortis, &c.

All the *Salt-petre* we now have, M. Homberg obſerves, is drawn either from earths moiſtened, and manured with the excrements of animals; or from old walls, and the plaiſter of ruined buildings, which have been filled with ſulphurous matters as well from the animals which inhabited them, as the ſoot penetrating them, and the air incompaſſing them. See SALT.

However, we uſually make a diviſion of *Salt-petre* into *natural* and *factitious*.

Of native SALT-PETRE there are two kinds: the firſt formed by a natural cryſtallization of ſaline ſulphurous juices diſtilling in caverns, or along old walls.—This is what they call *Salt-petre of the rocks*; the ſame with the aphronitre of the ancients. See APHRONITRE.

The ſecond is furniſhed by the water of a dead lake in the territory of Terrana in Egypt, called the *Nitrian Waters*, exalted and concocted by the heat of the ſun, much after the manner of our bay-ſalt.—This is the natrum or anatrum of the ancients, which our druggiſts call *natron*; now little uſed but in the bleaching of linens. See NATRON and ANATRON.

Artificial, or factitious SALT-PETRE, is alſo of two kinds: the firſt, called, by ſome, *Mineral Salt-petre*, is procured in ſeveral places in the kingdom of Pegu, and about Agra, in villages anciently populous, but now deſart: alſo, in ſome places along the banks of the Wolga, that famous river, which after watering a good part of Muſcovy, empties itſelf into the Caſpian ſea.

The *Salt-petre* is here drawn from three different kinds of mineral earths, black, yellow, and white. The beſt is that procured from the black; as being freeſt from common-ſalt, and needing no purifying after it comes to us, to fit it for making of gun-powder; as the reſt do. See GUN-POWDER.

The method of working it is thus: two flat pits are dug; one of which they fill up with the mineral earth, turning water upon it for ſome time; and then tread it with their feet into the conſiſtence of pap, letting it ſtand two days for the water to imbibe, and extract all the ſalt therein. They then paſs the water into another pit, where ſtanding ſome time, it ſhoots and cryſtallizes into *Salt-petre*. This they boil once, or twice, as they would have it more or leſs white and pure, ſcumming it continually, and filling it out into pots, holding 25 or 30 pounds each, and expoſing theſe to the air in clear nights; by which means, if there be any impurity, it ſinks to the bottom: they then break the pots, and dry the ſalt in the ſun.

The ſecond kind of artificial or factitious *Salt-petre*, is that prepared from nitrous matters collected in old buildings, dove-houſes, the middle of ancient ruins, &c. by means of lixiviums, or lyes made of wood-aſhes, and ſometimes of thoſe of herbs.

Of this there are great quantities made in France, particularly in the arſenal at Paris, where there is a corporation of *Salt-petre makers* appointed for the purpoſe.—The *Salt-petre* gained thus, they refine, by boiling it three or four times, and paſſing it ſucceſſively through ſeveral lyes.

Some naturaliſts pretend, that the earths, which have already ſerved for *Salt-petre*, may be re-animated, and made fit to ſerve again, by keeping them covered for twelve or fourteen years, and watering them with the ſcum, &c. of the *Salt-petre*, and even with brine.

Good common *Salt-petre* ſhould be well cleanſed, white, dry, and as free from common ſalt as poſſible: the beſt refined *Salt-petre*, is that whoſe cryſtals are the longeſt, largeſt, and fineſt.

Philoſophers generally allow the air to be impregnated with a volatile nitre, or *Salt-petre*, which is thence communicated to plaiſter, mortar, &c. It is probable it may derive it from ſoot and ſmoak, which are actually found to abound with volatile ſalt of a nitrous nature. Dew and rain are ſuppoſed to fertilize the ground principally by their bringing down this nitre. See AIR.

Salt-petre has a property of rarifying, or expanding itſelf to a prodigious degree. It is hence gun-powder derives its force, whereof *Salt-petre* is the principal ingredient. It is computed, that when inflamed, it takes up above ten thouſand times the ſpace it poſſeſſed before. See GUN-POWDER.

There are abundance of chymical preparations made with *Salt-petre*, as ſpirit of nitre, aqua-regalis, aqua-fortis, cryſtal-mineral, ſal-polychreſt, butter of nitre, &c. each of which ſee under its proper article, AQUA-*Fortis*, &c.

SALTS, or SAULTS, in the manage, denote the leaps, or high airs and vaults of a horſe: from the French *Saut*, of the Latin *Saltus*, a leap, dance, &c.

A *ſtep and a Salt* is a high air, wherein the horſe riſing, makes a curvet between two *Salts*, or caprioles; ſo as to mount before, and fling back with his hind-feet.

Two ſteps and a Salt is a motion compoſed of two curvets, ending with a capriole.

SALTUARIUS, in antiquity, an officer, or ſervant among the Romans, who had the care and cuſtody of a country-houſe, with lands and woods, and who was to look to the fruit, the fences, &c. See FOREST, &c.

In Nehemiah, chap. ii. 8. mention is made of an officer of this kind; *cuſtos ſaltus regis*, which the Engliſh tranſlators interpret, keeper of the king's foreſt; but he was more; having not only the keeping of a foreſt, but of a houſe with a foreſt; *Saltus* being here uſed as *horti* for a houſe of pleaſure; becauſe gardens are the principal part.

In the laws of the Lombards, *Saltuarius* is an officer who has the guard of the frontiers.

SALTUM. *Ordination per* SALTUM. See ORDINATION.

SALTUS, in law books, a high, thick wood. See WOOD, and BOSCAGE.

SALVAGE *Money*, is a recompence allowed both by the ſtatute and civil law, to ſuch perſons as have aſſiſted in ſaving merchandizes, ſhips, &c. periſhing in wrecks, or by pirates, or enemies.

This uſually was a tenth part of the value of the things ſaved. See WRECK.

SALVATELLA, in anatomy, a famous branch of the axillary vein, paſſing over the back of the hand, between the ring finger and the little finger. See AXILLARY, and VEIN.

Several phyſicians, in imitation of the Arabs, recommend bleeding in the *Salvatella*, as proper in tertian and quartan agues, and moſt hypochondriac diſeaſes.

SALVE *Regina*, among the Romaniſts, the name of a Latin prayer, or ſequence addreſſed to the virgin, and ſung after complines; as alſo upon the point of executing a criminal. Durandus ſays, it was compoſed by Peter biſhop of Compoſtella.—The cuſtom of ſinging the *Salve Regina*, at the cloſe of the office, was begun by order of St. Dominic; and firſt, in the congregation of Dominicans at Bologna, about 1237. Gregory IX. firſt appointed it to be general. St. Bernard added the concluſion, *O dulcis! O pia*, &c.

SALVER, a flat diſh, commonly of ſilver or other precious metal, uſed to ſet glaſſes on to ſerve wines, and other liquors.

The French call it *Sous-couppe*, under-cup.—The Italians uſe to preſent a *Salver*, with ſeveral kinds of wines, with this compliment, *Si non e buono, fatte lo:* If it be not good, make it ſo.

SALUTATION, the act or ceremony of ſaluting, greeting, or paying reſpect, or reverence to any one.

There is a great variety in the forms of *Salutation*: we *ſalute* God by adorations, prayers, &c. kings, by genuflexion, &c. In England, we *ſalute* one another by uncovering the head, inclining the body, &c. The orientals *ſalute* by uncovering their feet, laying their hands on the breaſt, &c.

The pope makes no reverence to any mortal but the emperor of Germany, to whom he ſtoops a very little, when he admits him to kiſs his mouth.

In the army, the officers *ſalute* by certain orderly, ſtudied motions of the half-pike, &c.

It was believed by the ancients, that the ſtatue of Memnon, in a temple of Egypt, *ſaluted* the ſun every morning at his riſing: the cheat conſiſted in this, that the ſtatue being hollow, when the warmth of the morning began to rarify the included air, it was driven out through a narrow duct in the mouth: thus making a gentle murmur, which the prieſts interpreted a *Salutation*.

At ſea, they *ſalute* by a diſcharge of cannon, which is greater or leſs, with ball or without, according to the degree of reſpect they would ſhew.

Ships always *ſalute* with an odd number of guns; galleys with an even one.—A veſſel under the wind of another, is always obliged to *ſalute* firſt.

To *ſalute with muſquets*, is to fire one, two or three volleys; which is a method of *Salutation* that ſometimes precedes that of the cannon; and is chiefly uſed on occaſion of feaſts.

After the cannon, they ſometimes alſo *ſalute* or hale with the voice, that is, a joint ſhout of all the ſhip's company three times; which *Salutation* alſo occaſionally obtains where they carry no guns, or do not care to diſcharge any.

Saluting with the flag, is performed two ways; either by holding it cloſe to the ſtaff, ſo as it cannot flutter; or by ſtriking it ſo as it cannot be ſeen at all, which is the moſt reſpectful *Salutation*.

Saluting with the Sails, is performed by hovering the topſails half way of the maſts.—Only thoſe veſſels which carry no guns, *ſalute* with the ſails.

When there are ſeveral ſhips of war together, the commander alone *ſalutes*.

Father Fournier has an expreſs treatiſe of *ſea-ſalutes* and ſignals. See SIGNAL.

Angelical SALUTATION, is an addreſs which the Romaniſts make to the virgin; containing the formula wherein the angel ſaluted her, when he acquainted her with the myſtery of the incarnation. See ANNUNCIATION and AVE MARIA.

SALZ, SULZ, SALTZ, or SULTZ, a ſort of brine or pickle made of ſalt, diſſolved by the coldneſs, or moiſture of a cellar.

SAMARITANS, an ancient ſect among the Jews; ſtill ſubſiſting in ſome parts of the Levant, under the ſame name. See JUDAISM.

Its origin was in the time of Rehoboam; under whoſe reign, a diviſion was made of the people of Iſrael into two diſtinct kingdoms. One of theſe kingdoms, called Judah, conſiſted of ſuch as adhered to Rehoboam, and the houſe of David; the other retained the ancient name of Iſraelites, under the command of Jeroboam.—The capital of the ſtate of theſe latter was Samaria; and hence it was they were denominated *Samaritans*.

Salmanazar, king of Aſſyria, having conquered Samaria, led the whole people captive into the remoteſt parts of his empire; and filled their place with colonies of Babylonians, Cutheans, and other idolaters. Theſe finding themſelves daily deſtroyed by wild beaſts, deſired an Iſraelitiſh prieſt to inſtruct them in the ancient laws and cuſtoms of the land they inhabited. This was granted them; and they thenceforth ceaſed to be incommoded with any beaſts.—However, with the law of Moſes, they ſtill retained ſomewhat of their ancient idolatry. The Rabbins ſay, they adored the figure of a dove on mount Gerizim.

Be this as it will, it is certain, the modern *Samaritans* are far from idolatry: ſome of the moſt learned among the Jewiſh doctors own, that they obſerve the law of Moſes more rigidly than the Jews themſelves.—They have a Hebrew copy of the Pentateuch, differing in ſome reſpects from that of the Jews; and written in different characters, commonly called *Samaritan* characters; which Origen, Jerom, and other fathers and criticks, ancient and modern, take to be the primitive character of the ancient Hebrews; though others maintain the contrary. The point of preference, as to purity, antiquity, *&c.* of the two Pentateuchs, is alſo diſputed by the modern criticks. See HEBREW, PENTATEUCH, CHARACTER, *&c.*

The *Samaritans* are now few in number; though it is not very long, ſince they pretended to have prieſts deſcended directly from Abraham. They were chiefly found at Gaza, Neapolis, (the ancient Sichem) Damaſcus, Cairo, *&c.* They had a temple, or chapel on mount Gerizim, where they performed their ſacrifices.

Joſeph Scaliger, being curious to know their uſages, wrote to the *Samaritans* of Egypt, and to the high prieſt of the whole ſect, who reſided at Neapolis. They returned two anſwers to Scaliger, dated in the year 998 of the Hegira of Mahomet. Theſe anſwers never came to the hands of Scaliger. They are now in the French king's library, and have been tranſlated into Latin by father Morin, prieſt of the oratory; and printed in the collection of letters of that father in England, 1682, under the title of *Antiquitates Eccleſiæ Orientalis*. M. Simon has inſerted a French tranſlation in the firſt edition, of *Ceremonies & Coutumes des Juifs*, by way of ſupplement to Leo de Modena.

In the firſt of theſe anſwers, wrote in the name of the aſſembly of Iſrael in Egypt, they declare, that they celebrate the paſſover every year, on the fourteenth day of the firſt month, on mount Gerizim; and that he who then did the office of high prieſt, was called Eleazar, a deſcendant of Phineas, ſon of Aaron.—At preſent they have no high prieſt.

In the ſecond anſwer, which is in the name of the high prieſt Eleazar and the ſynagogue of Sichem, they declare, that they keep the Sabbath in all the rigour wherewith it is enjoined in the book of Exodus; none among them ſtirring out of doors, but to the ſynagogue. They add, that on that night they do not lie with their wives; that they begin the feaſt of the paſſover with the ſacrifice appointed for that purpoſe in Exodus; that they ſacrifice no where elſe but on mount Gerizim; that they obſerve the feaſts of harveſt, the expiation, the tabernacles, *&c.* They add further, that they never defer circumciſion beyond the eighth day; never marry their nieces, as the Jews do; have but one wife; and, in fine, do nothing but what is commanded in the law: whereas the Jews frequently abandon the law to follow the inventions of their rabbins.

At the time when they wrote to Scaliger, they reckoned 122 high prieſts; affirmed that the Jews had no high prieſts of the race of Phineas; and, that the Jews belied them, in calling them Cutheans, whereas they are deſcended from the tribe of Joſeph, by Ephraim.

The truth is, the Jews impoſe abundance of things on the *Samaritans*: they frequently confound them with the Sadduces, as if they were infected with their errors.—Rabbi Benjamin, who lived in the XIIth century, confirms the beſt part of what we have ſaid of the *Samaritans*: he obſerves, they had prieſts of the tribe of Aaron, and who never married with any but thoſe of the ſame tribe: that they ſacrificed on mount Gerizim, where they had an altar of ſtone raiſed by the Iſraelites after paſſing over Jordan. He adds, that they are of the tribe of Ephraim; that they change their habit to go to the ſynagogue, and waſh ere they put it on.

SAMARITAN *Characters*, or *Letters*. See LETTER and HEBREW.

SAMARITAN *Medals*.—In the cabinets of antiquaries we find ſome medals, uſually called *Samaritan Medals*; the inſcriptions and legends whereof are Hebrew; but the character different from the Hebrew of our bibles, which is the ſquare Hebrew, or Chaldee: and it is hence, *viz.* from the character, not from being ſtruck by the *Samaritans*, that they are denominated *Samaritan*. See MEDAL.

Theſe medals have been infinitely canvaſſed by the criticks, both Jewiſh and Chriſtian; particularly rabbi Alaſcher, rabbi Bartenora, rabbi Azarias, rabbi Moſes, father Kircher, Villalpandus Waſerus, Conringius, Hottinger, father Morin, Walton, Hardouin, Spanheim, *&c.*

The learned jeſuit Souciet, in an expreſs diſſertation on the *Samaritan* medals, rejects all Hebrew medals, whoſe inſcriptions are in Chaldee characters, as ſpurious; and allows of none to be genuine but the *Samaritan*.—Of theſe there are four kinds.

The firſt bear expreſly the name of *Simon*, and the ſubject for which they were ſtruck, *viz.* the deliverance of Jeruſalem. The ſecond kind have not the name *Simon*, but only the deliverance of Sion, or Jeruſalem. The third kind have neither Simon, nor the deliverance of Sion; but only the epocha's, firſt year, ſecond year, *&c.* The fourth claſs have neither any inſcriptions, nor any thing whence one may judge of the time when they were ſtruck.

The three firſt kinds were certainly ſtruck after the return from the Babyloniſh captivity, and in the time of Simon Maccabeus, after Jeruſalem had been freed from the yoke of the Greeks. But though ſtruck after the captivity, father Souciet obſerves, their character ſhews itſelf to be that of the ancient Hebrew, which was uſed before the captivity, and the uſe whereof was loſt by the people, during their ſojourn in Babylon and Chaldea; but reſtored after their return, on the ſame footing as before. He adds, that the inſcriptions are pure Hebrew, ſuch as it was ſpoke before the captivity; that the character, therefore, is the true ancient Hebrew character: that it was the cuſtom to write each language in its proper character: that if they had departed from this rule, they had doubtleſs uſed the new character they brought with them from Babylon: that there could be no other reaſon, but that of ſettling all things on the ſame foundation they were on before the deſtruction of Jeruſalem, that could have induced them to uſe this character on their coins. And, laſtly, that theſe medals were not ſtruck by the *Samaritans*, but by the Jews, and in Jeruſalem.

F. Souciet is very full on all theſe points, and, to the proofs drawn from medals, adds two others foreign thereto: the firſt drawn from the reſemblance of the Greek letters, introduced by Cadmus the Phœnician, with this Hebrew character; which was the ſame with that of the Phœnicians, as the language of thoſe people was the ſame with that of the Hebrews.—The ſecond drawn from ſeveral various readings in the ſcriptures, which cannot be well accounted for otherwiſe, than by ſuppoſing, that the books wrote before the captivity, were in the ſame character with theſe medals, and which ſhew, that it is the conformity which certain letters have in that character, that has deceived the copiſts. From the whole, he concludes, that this character of the medals is the true ancient Hebrew character; and, that to judge of the various readings of the Hebrew text, and the differences of the ancient Greek and Latin tranſlations, either from themſelves, or from the Hebrew text, recourſe muſt be had to this character. See HEBREW.

SAMARITAN *Pentateuch*. See PENTATEUCH.

SAMBUCUS, an ancient muſical inſtrument of the wind kind, reſembling a kind of flute; probably thus called becauſe made of elder, which the Latins call *Sambucus*.

SAMBUCUS was alſo the name of an ancient engine of war, uſed by Marcellus in beſieging the city of Syracuſe.

It was ſo big, that Plutarch, in the life of that general, obſerves, two ſhips were required to carry it.

SAMIAN *Earth*, *Terra* SAMIA, a kind of bole or aſtringent earth brought from the iſland of Samos, in the Ægean ſea. See EARTH.

The beſt is called by Dioſcorides, *Collyrium*, becauſe uſed in the medicines of that name: it is white, very light, ſoft, friable, well-taſted, and a little glutinous on the tongue. There is another kind, harder, fouler, and more glutinous, called *Aſter-Samius*, in regard little ſhining ſtraws are frequently found in it, diſpoſed like little ſtars.

Each kind is eſteemed very aſtringent, proper to dry, and draw wounds; having much the ſame qualities with the Armenian bole. See ARMENIAN and BOLE.

There is alſo a SAMIAN *Stone*, λιθος Σαμιος, taken out of the mines in the ſame iſland.—It is white, and ſticks to the tongue when applied to it: it is held aſtringent, and cooling; and is alſo uſed by the goldſmiths to burniſh their gold, and give it a greater luſtre.

SAMOSATENIAMS, SAMOSATENI, a ſect of ancient Antitrinitarians, thus called from their leader, Paulus * Samoſatenus, biſhop of Antioch, under the emperors Aurelian and Probus.

He renewed the hereſy of Artemonius, and had ſeveral ſentiments in common with Sabellius, *&c.* though he differed from them in the manner of explaining them.—He owned, that the Father, Son, and Holy Ghoſt were but one God; but denied that the Son, and Holy Spirit had any real ſubſtance. According to him, they only ſubſiſted in the Father, as the word of man ſubſiſts in his underſtanding.

---

* They are alſo called by St. Auguſtin *Pauliani*, and by the fathers of the council of Nice, Παυλιανιζαντες.

St. Epiphanius will have the *Samoſatenians* to be real Jews, without any thing more than the name of Chriſtians; adding, that they uſe the ſame arguments againſt the myſtery of the trinity that the Jews do; pleading againſt it, with them, on pretence of maintaining the unity of the godhead; though they do not obſerve the ceremonies of the law.

Their chieftain was condemned by a council held at Antioch, in 272, whereat aſſiſted about ſeventy biſhops; and was depoſed from his biſhoprick.

SAMPSEANS, SAMPSÆI, ancient ſectaries; the ſame, according to St. Epiphanius, with the Elceſaites. See ELCESAITES.

The *Sampſeans* were not properly either Jews, Chriſtians, or Gentiles; though they took their name from the Hebrew, *Semes*, ſun; as if they adored the ſun.

They acknowledged one only God; waſhed themſelves often, and were attached, in almoſt every thing, to the religion of the Jews.—Many among them abſtained from eating of fleſh.

Scaliger, after Epiphanius, will have the *Sampſeans* to be the ſame with the *Eſſeni*. In effect, the *Elceſaites*, *Sampſeans*, *Maſſalians*, and *Eſſeni*, appear to be no more than ſo many different names for the ſame ſect; unleſs, perhaps, the firſt added ſomething to the opinions of the laſt. See ESSENI.

SAN BENITO, or SACO BENITO, a kind of linen garment; born as a badge, by perſons condemned by the inquiſition. See INQUISITION, and ACT *of Faith*.

The *San Benito* is in form of a ſcapular; being a broad piece of cloth hanging down before, and behind; with two St. Andrew's croſſes on it: it is of a yellow colour, and painted over with devils, and flames.

It is ſuppoſed to be an imitation of the ancient ſackcloth, uſed by publick penitents in the primitive church. See PENITENT.

SANCTIFICATION, the act of *ſanctifying*, or making a thing holy, and ſeparate to God. See HOLINESS and SACRED.

The reformed divines define *Sanctification* an act of God's grace, whereby a man is renewed inwardly, his deſires and affections alienated from the world, and the man put in a courſe of dying to ſin, and living to righteouſneſs.

The *ſanctifying of the ſabbath*, among the Jews, is of divine right, or inſtitution.—By *ſanctifying* the ſabbath, is meant, the ſpending it in prayer, praiſe, *&c.* not in worldly concerns.

The firſt petition in the Lord's Prayer is, *Hallowed*, i. e. *ſanctified, be thy name:* but which is meant, let thy name be ever accompanied with bleſſing, and praiſe.

SANCTION*, SANCTIO, the authority given to a judicial act; or that, whereby it becomes legal, and authentic.

* The word is formed from the Latin *ſancire*, to eſtabliſh.

The royal aſſent gives the *ſanction* of ſtatutes, to all bills in parliament that have paſſed each houſe thrice. See ASSENT, and PARLIAMENT.

Pragmatical SANCTION. See PRAGMATICAL.

SANCTI-VITI *Chorea*. See CHOREA *Sancti-Viti*.

SANCTUARY, among the *Jews*, was the holieſt and moſt retired part of the temple of Jeruſalem; wherein was preſerved the ark of the covenant; and into which nobody was allowed to enter but the high prieſt, and that only once a year, to intercede for the people.

The *ſanctuary*, called alſo *ſanctum ſanctorum*, or *holy of holies*, is ſuppoſed to be a type, or figure of heaven, and of Jeſus Chriſt the true high prieſt, who is aſcended thither to make interceſſion for us.

Some will have it, that the whole temple was called the *ſanctuary*; and that the *ſanctum ſanctorum*, where the ark was kept, was only a little chapel or oratory therein. See TEMPLE.

To try or examine a thing by the *weight of the* SANCTUARY, is to examine it by a juſt, and equal ſcale; in regard among the Jews, it was the cuſtom for the prieſts to keep ſtone weights, to ſerve as ſtandards for regulating all weights by; though theſe did not differ from the royal, or profane weights. See STANDARD, WEIGHT, SHEKEL, *&c.*

SANCTUARY, in our ancient cuſtoms, denotes an aſylum, or place privileged by the prince, for the ſafeguard of mens lives, who are guilty of capital crimes. See ASYLUM.

In Scotland they call the *Sanctuary*, *Girtholl*, or *Gyrthol.*

The Saxons alſo called it *Frodmortel* and *Fridſtoll.*

Till Henry the VIIIth, all our churches and church-yards were *ſanctuaries*; and protected traitors, murderers, *&c.* if within forty days they acknowledged their fault, and ſubmitted themſelves to baniſhment; and during that time, if any lay-man expelled them, he was excommunicated; if a clerk, he was made irregular: after forty days no man might relieve them. See ABJURATION.

St. John's of Beverly had an eminent *ſanctuary*, called by the Saxons, *a ſeat of Peace*: ſo had St. Martin's le Grand, in London. Rippon had the like granted by Whitlaſe, king of the Mercians: ſo had St. Buriens in Cornwal, granted by king Athelſtan, *Anno* 936; and Weſtminſter the like, granted by Edward the Confeſſor. See FRIDSTOLL.

SANCTUARY, is alſo uſed in the Romiſh church for the chancel, or that part of the church wherein the altar is placed, incompaſſed with a rail or balluſtrade. See CHANCEL.

SANCTUM SANCTORUM. See SANCTUARY.

SAND, a fine, hard, gravelly ſort of earth, or rather ſtones, divided into ſmall grains; of great uſe in building, and many other arts, and manufactures; as glaſs-making, plumbery, foundery, *&c.* See EARTH.

There are three kinds of *ſands*, diſtinguiſhed by the places whence they are drawn, *viz. pit-ſand*, *river-ſand*, and *ſea-ſand*.

The uſe of *ſand* in building, is an ingredient in mortar: See MORTAR.—For this purpoſe, *pit-ſand* is of all others the beſt; and of *pit-ſand*, the whiteſt is always the worſt. Of *river-ſand*, that found in the falls of waters is beſt, becauſe moſt purged. *Sea-ſand* is the worſt.

Pit-ſand, as being fat and tough, is moſt uſed in walls and vaults.—*River-ſand* ſerves for rough-caſting.

All *ſand* is good in its kind, if when ſqueezed and handled it crackles; and if being put on a white cloth, it neither ſtains nor makes it foul.—That *ſand* is naught, which, mixed with water, makes it dirty and muddy, and which has been long in the air; for ſuch will retain much earth and rotten humour.—Hence ſome maſons waſh their *ſand* ere they uſe it.

The *ſand* of Puzzuolo, de Lorme obſerves, is the beſt in the world; eſpecially for maritime buildings. See POZZOLANE.

Some diſtinguiſh a *male ſand*, which is of a deeper colour than another ſort in the ſame bank or bed, called *female ſand*.

The *ſand* whereof glaſs is made, is white, and gritty, full of little ſparkling grains. See GLASS.

The *ſand* uſed by founders, is foſſile: it is properly a yellow fat earth, whereof they make their moulds, for the caſting of ſmall work; whence it is they ſay, *Caſting in ſand*. See FOUNDERY.

The plumbers alſo uſe *ſand* to mould ſeveral of their works, particularly large ſheets.—To prepare the *ſand* for theſe ſheets, they wet it lightly, ſtir and work it with a ſtick, then beat and plain it. See PLUMBERY.

Sands may be divided into *ſharp* and *ſoft*.

Sharp, or *rag-ſand*, is that compoſed of ſmall tranſparent pebbles naturally found in the mountains.

Of this, again, there is ſome *fine* and white, or grey, rediſh or brown; others *coarſe*, either of grieſly, or brown colour.

Soft or *ſmooth ſand*, is that mixed with flat particles from lime-ſtone, with micæ or glittering particles, either ſilver-like, as the *ſea-ſand* about the Scilly iſlands; or gold-like, as in Cleveland.

SAND, in agriculture, denotes one of the three uſual kinds of ſoil; which are *ſand*, *clay*, and *earth*, or *loam*. See GROUND, CLAY, EARTH, LOAM, *&c.*

M. de la Quintinie attributes all the difference we find in ſoils, to the different quality of the *ſands* mixed in them—. *Soft ſands*, according to him, make a ſoft, gentle earth: *unctuous ſands*, a ſtiff earth: *coarſe ſands*, a rough untractable earth, *&c.* See SOIL.

SAND is alſo applied to dry, crumbling earths, which, wanting any fatneſs to bind them together, the wind eaſily breaks into duſt, and carries them away.

In this ſenſe it is that travellers tell us, the caravans in Africa are frequently loſt, and buried under clouds of *ſand*, torn up by whirlwinds; and ſometimes heaped into mountains.—The deſarts of Lybia are mere *ſands*; and hence their ſterility. See DESART.

SANDAL, SANDALIUM, Σανδαλιον, in antiquity, a rich kind of ſlipper, or wear for the feet, made of gold, ſilk, or other precious ſtuff; uſed by the Roman and Greek ladies; conſiſting of a ſole, with a hollow at one extreme to embrace the ancle; but leaving the upper-part of the foot bare.

Terence ſpeaks of this *ſandal*, *Utinam tibi commitigari videam* ſandalio *caput:* I wiſh ſhe would break your head with her *ſandal.*

Apollo was ſometimes called *ſandaliarius*, *ſandal-maker*; the reaſon of which appellation has given great perplexity to the criticks: ſome derive it from a ſtreet called *ſandaliarius*, chiefly inhabited by *ſandal-makers*, wherein that god had a temple: but others, with more probability, derive the name of the ſtreet from that of the god, and take Apollo to have been thus called from his effeminate dreſs, as if he wore womens *ſandals*.

SANDAL is alſo uſed for the ſhoe or ſlipper wore by the pope, and other Romiſh prelates, *&c.* when they officiate; being ſuch as is ſuppoſed to have been worn by St. Bartholomew. Alcuin obſerves, that there was ſome difference between the *ſandals* of biſhops, prieſts, and deacons.—Monks were not allowed to wear *ſandals*, except in travelling; as is obſerved by Du Cange, Salmaſius, *&c.*

Sandal is alſo the name of a ſort of ſlipper ſtill worn by ſeveral congregations of reformed monks.

It conſiſts of no more than a mere leathern ſole, faſtened with latches or buckles, all the reſt of the foot being left bare.

The Capuchins wear *ſandals*, the Recollects, clogs: the former are of leather, the latter of wood.

SANDARAC, Sandaracha, in natural hiſtory, *&c.* a preparation of orpiment, made by fuſing it by a cloſe fire into a red friable maſs. See Orpiment.

Sandaracha is the ſame with what is otherwiſe called *Red Arſenic* and *Realgar*. See Arsenic and Realgar.

It is ſometimes alſo called *Sandaracha Græcorum*, in oppoſition to the gum *Sandarach*. Some diſtinguiſh two ſorts of Grecian *Sandarac:* the *natural* which is that above deſcribed; and the *factitious*, which is only ceruſs exalted by the fire, and burnt into a kind of minium. Both the one and the other is a poiſon. See Lead, Ceruss, and Sandyx.

Gum-**Sandarach**, or **Sandaracha** *Arabum*, a white gum oozing out of the trunk, and thick branches of the great juniper-tree, by inciſions made in the heats of the ſummer.

The ſmall or common juniper yields very little *Sandarach:* its fruit yields oils, waters, ſalts, ſpirits and extracts of ſome repute in medicine. See Juniper.

The *Gum-Sandarach* is an ingredient in varniſh. With this melted in oil of turpentine is made the fictitious varniſh now uſed by painters and cabinet-makers. See Varnish.—It is alſo reduced into an impalpable powder, and uſed to prevent paper from imbibing ink.

The beſt is in fine white tears, free of duſt: the Engliſh, Swedes, *&c.* drive a conſiderable trade therewith. Some will have it, that the gum of the juniper is not the right *Sandarach*, but that of the oxycedrus, or leſſer cedar.

SAND-BAGS, in fortification, are bags holding each about a cubic foot of earth, or ſand; uſed for raiſing parapets in haſte, or to repair what is beaten down. See Parapet.

They are alſo of uſe when the ground is rocky, and affords not earth to carry on the approaches; becauſe they can be eaſily brought on, and off at pleaſure.

There are a leſſer ſort, which hold half what the former do, and are placed upon the upper talus of the parapet, to cover thoſe who are behind, and who fire through the embraſures, or intervals, that are between them.

SANDEVER, or **Sandiver**, the droſs of glaſs; or the ſcum that ariſes from the aſhes of the herb kali, uſed in the making of glaſs. See Glass.

Some alſo uſe *ſandever* for the kali, or glaſs-wort itſelf. See Kali.

SAND-HEAT, or **Sand-Bath**, denotes one of the chymiſts fires; conſiſting of hot ſand, wherein herbs, flowers, *&c.* are infuſed in a cucurbit. See Bath.

The *ſand-heat* is eſteemed gentle, digeſtive, and alterative. See Heat and Fire.

SANDIVER. See the article Sandever.

SANDYX, a kind of minium, made of ceruſs, or rather lead, calcined and rubified; called alſo *factitious ſandarac.* See Lead and Sandarac.

It is of little uſe in painting; the real minium, or vermilion, to which it is ſubſtituted, making a much better, brighter, and more durable colour. See Vermilion and Minium.

SANGUIFICATION, in the animal œconomy, the action whereby chyle is converted into blood. See Chyle and Blood.

Sanguification ſucceeds chylification, and is followed by nutrition. See Chylification and Nutrition.

Sanguification is thus effected. The chyle having paſſed the lacteals of the ſeveral kinds, is delivered into the blood at the ſubclavian; whence the two humours paſs together to the right ventricle of the heart, where being yet more intimately mixed, they circulate together through the whole body; till, after ſeveral circulations and depurations at the ſeveral colatures and ſtrainers of the body, they become aſſimilated, or, as the chymiſts call it, *cohobated*, ſo as only to make one uniform compound maſs, which appears to be nothing elſe but chyle altered by the artifice of nature, and exalted into blood.—In effect, it does not appear that any thing extraneous is mixed with the circulating liquor but chyle, excepting what was before ſeparated from it for particular occaſions; unleſs perhaps it ſhould receive ſome portion of air in the lungs, which is a point long diſputed, and yet ſcarce aſcertained. See Air and Blood.

Indeed, that there is a quantity of air mixed with the blood and circulating with it, is granted; but whether this be any more than what was at firſt contained in the bodies whereof the chyle was formed, is much doubted: the principal arguments for it, are, the neceſſity of reſpiration, and the florid colour the blood receives in the lungs, and firſt ſhews in the pulmonary vein.—But the firſt is ſatisfactorily accounted for another way. See Respiration.

The latter is chiefly ſupported by this experiment, that blood drawn by venæſection, and ſuffered to coagulate, upon turning up the bottom, which before was blackiſh, being now expoſed to the air, acquires a florid colour, like that we obſerve in the blood of the pulmonary vein.

The ancients were in great perplexity about the ſeat of *ſanguification*, or the place where, and the inſtrument whereby it is effected: whether in the heart, or the liver, or the lungs? but, according to the doctrine of the moderns, the heart, liver, veſſels, *&c.* contribute no otherwiſe to the changing of the chyle into blood, than the ſun does to the changing of the muſt into wine. See Heart, Liver, *&c.*

The ancients accounted for *ſanguification* from a plaſtic power.—In the laſt century, when chymiſtry was introduced, *ſanguification*, and almoſt every thing elſe, was to be effected by a ferment; and the phyſicians of thoſe times, were very ſollicitous as to the particular officina where this ferment was prepared and kept. Some would have it the liver, others the ſpleen, *&c.* but the very notion is now exploded.

Of *ſanguification* we may admit two degrees; the firſt amounting to no more than a confuſion, or ſuch an intimate mixture of parts, as ſuffices ſo to confound the different coloured liquors, as that the whiteneſs of the chyle ſhall be loſt or drowned in the redneſs of the blood, ſo as never more to appear in its own ſhape and colour.—This we ſuppoſe may be effected by repeated circulations alone: how many circulations are neceſſary thereto, it is difficult to determine.

The ſecond degree of *ſanguification*, is, when the parts of the chyle are ſo exalted, or comminuted and ſubtilized, as to loſe all tendency to a coagulatory ſeparation, ſuch as they have in chyle and milk.

To theſe two degrees may be added a third, wherein the fibres and filaments of the crude blood are ſo broken and blended with the ſerum, and not to be again ſeparable from them.—This is a morbid *ſanguification*, ſuch as happens in fevers, *&c.* attended with a bloody ſweat, purple ſpots, *&c.* All theſe degrees of *ſanguification*, Dr. Drake makes no doubt, are procured by reiterated circulations, wherein as well the inteſtine, as the progreſſive motion, conſpire to the mixing and comminuting of the adventitious parts. Doubtleſs they have their ſtated period, wherein they are in perfection; though where preciſely to fix it, we do not know.

SANGUINE, *bloody*; or a thing abounding in blood. See Blood.

Sanguine *Temperament*, or *Conſtitution*, is that where blood, and heat predominate. See Temperament.

Sanguine conſtitutions require a frequent uſe of phlebotomy. *Sanguine* people are uſually obſerved to be briſk, bold, daring, and even preſumptuous.—Hence *ſanguine* hopes, *i. e.* ſtrong, aſſured, *&c.* hopes.

Sanguine, in heraldry, the colour uſually called *Murrey*; being made of red lake, tinged with a little Spaniſh brown. See Murrey and Purpure.

It is repreſented in engraving, by tranſverſe hatches like purpure; and is moſtly uſed in the coats of knights of the Bath.

When borne by nobles, it is rather called *Sardonyx*; and in the coats of ſovereign princes *Dragon's Tail.*

Sanguine *Stone*, *Lapis* **Sanguinalis**, a kind of Jaſper, brought from New-Spain, of a dark brown colour, marked with ſpots of a blood-red. See Jasper.

The Indians cut it in form of a heart, and uſe it in hæmorrhages, immoderate menſes, and other fluxes of blood.—The patient applies it by graſping it in his right-hand, having firſt dipt it in water. It is ſometimes alſo hung on the part whence the blood flows. See Hæmatites.

SANGUINIS *Periodus*. See the article Periodus.

SANGUIS, in medicine, *&c.* See Blood.

Sanguis, in our ancient cuſtoms, denotes a right or power, which the chief lord of the fee anciently had to judge and determine caſes where blood was ſhed.—*De murderia & raptu, de igne, de* Sanguine, *&c.* Monaſt.

Sanguinem *Emere*, was an obligation which the inhabitants of ſome manors, as that of Grendon, were under, to buy and redeem their villain blood, or tenure, and make themſelves freemen. See Villenage.

Sanguis *Caprinus*, or *Hircinus*, the blood of the he-goat, either wild or tame, which is prepared, with great precaution, to be uſed in medicine, and ſuppoſed by many to have very extraordinary qualities.

The principal precautions are theſe: the goat is not to exceed four or five years of age; it is to be fed a conſiderable time with aromatic herbs, and eſpecially thoſe of the ſaxifrage kind; to be drawn out of the throat, or the teſticles, by cutting them; but neither what comes firſt, nor laſt, to be uſed, the former being too full of humidity, and the latter too thick; the operation to be only performed in July; and the blood put into earthern veſſels, and dried either in the ſun or the ſhade; and, laſtly, bottled up to be uſed occaſionally.

Among other ſpecific virtues attributed to goat's blood, the two moſt conſiderable are, that it cures the pleuriſy without bleeding; and that it diſſolves the ſtone in the bladder, by taking it in vehicles proper for thoſe diſeaſes.—To be good, it is to be extremely hard, and difficult to pulverize.

Sanguis *Draconis*, in pharmacy. See **Dragon's-Blood.**

SANHEDRIN*, or **Sanhedrim**, **Synedrium**, among the ancient Jews, the ſupreme council, or court of judicature of their republic; wherein were diſpatched all the great affairs both of religion, and policy.

* The word is derived from the Greek Συνεδριον, a council, aſſembly, or company of people ſitting together; from συν con. together, and ἑδρα ſeat.

Many of the learned agree, that it was inſtituted by Moſes, Numbers ch. xi. and conſiſted at firſt of ſeventy perſons, all inſpired of the Holy Ghoſt, who judged finally of all cauſes and affairs; and that it ſubſiſted, without intermiſſion, from Moſes to Eſdras.—Others will have it, that the council of ſeventy elders, eſtabliſhed by Moſes, Numb. ch. xi. was temporary, and did not hold after his death; adding, that we find no ſign of any ſuch perpetual and infallible tribunal throughout the whole Old Teſtament.

The Jews, however, contend ſtrenuouſly for the antiquity of their great *ſanhedrin*: M. Simon backs and defends their proofs, and M. le Clerc attacks them.—Be the origin and eſtabliſhment of the *ſanhedrim* how it will, it is certain it was ſubſiſting in the time of our Saviour; that it was held at Jeruſalem; and that the deciſion of all the moſt important affairs belonged to it.—The preſident of this aſſembly was called *Naſi*.

There were ſeveral inferior *ſanhedrim* in Paleſtine, all depending on the great *ſanhedrin* at Jeruſalem. The inferior *ſanhedrim* conſiſted each of twenty-three perſons; and there was one in each city and town. Some ſay, that to have a right to hold a *ſanhedrin*, it was requiſite there were one hundred and twenty inhabitants in the place. Where the inhabitants came ſhort of the number of one hundred and twenty, they only eſtabliſhed three judges.

Into the great as well as the inferior *ſanhedrim* were admitted prieſts, levites, and laymen, of all the tribes, provided they were of noble extraction, rich, wiſe, without any blemiſh of body, and expert in magick; which laſt was eſteemed a neceſſary qualification, to enable them to obviate and deſtroy it: very old people and eunuchs were excluded.

In each *ſanhedrin* there were two ſcribes; the one to write down the ſuffrages of thoſe who were for condemnation; the other to take down the ſuffrages of thoſe who were for abſolution.

Selden has a learned work on the ſubject of the Jewiſh *ſanhedrim*, *de Synedriis*, printed at London in 1635, in three volumes, quarto.

SANIES, in medicine, a thin, limpid, ſerous matter; iſſuing out of wounds, and ulcers: by the Greeks called Ιχωρ. See **Ichor.**

Galen compares it to whey: it differs from *pus*, which is thicker and whiter. See **Pus.**

SANTALUM, **Saunders**, a hard, heavy, odoriferous, medicinal wood, brought from the Eaſt-Indies, of ſome repute, as a drier, abſorbent, and ſweetner.

There are *ſantals* of three different colours; *citrine*, *white*, and *red*. The trees whence they are taken are all of the ſame kind; and it is ſuppoſed their different colours only ariſe from the difference of climates where they grow; ſome ſay from the different parts of the tree they are taken from.

They are all held to be a little aſtringent, to ſtrengthen the heart and brain, and to ſtop vomiting; and are frequently uſed in diet-drinks, and medicated ales, againſt ſcorbutick complaints.

The tree is about the height of the European walnut-tree: its leaves reſemble thoſe of the lentiſcus; its flowers blue, bordering on black; its fruit of the ſize of our cherry, green at firſt, but blackening as it ripens, and of a faint taſte.

The *citrine-ſantal* is eſteemed the beſt: it is brought from China, and Siam; is yellow, heavy, and of a good ſmell; uſed in medicine, as alſo by the perfumers.

The *white-ſantal* is leſs odoriferous; it is brought from the iſle of Timor.

The *red* has the leaſt ſmell of the three; but is the moſt aſtringent; it is brought from the iſland Tamaſſarin, and the coaſt of Coromondel.

SAP*, in ſpeaking of plants, denotes *juice*. See **Juice, Plant, Vegetation,** *&c.*

* The word is formed from the Saxon *Sæpe*, which ſignifies the ſame; and that according to Mylius from the Greek ὀπὸς, *ſuccus*, juice.—Whence alſo the Latin *Sapa*, uſed for an inſpiſſated juice. See **Rob.**

Circulation of the **Sap.** See **Circulation** *of the Sap.*

Procurement of the **Sap** *for œconomical uſes.* See **Tapping.**

Sap, or **Sapp**, in building. To *ſap* a wall, *&c.* is to dig or open a hole in the ground at the foot of a wall, *&c.* to bring it down all at once for want of ſupport.

To *ſap*, according to Daviler, is to undermine a work with hammers, pickaxes, mattocks, *&c. viz.* a bank, or hillock, by propping it up, digging underneath it, and then burning the props, or ſtays; or a rock, by digging a mine underneath it.

To demoliſh the thick, firm walls of old caſtles, *&c. ſapping* is much the readieſt way.

Sap, in the military art, denotes a work carried on under ground, to gain the deſcent of a ditch, counterſcarp, or the like.

It is performed by digging a deep trench, deſcending by ſteps from top to bottom, under a corridor; carrying it as far as the bottom of the ditch, when that is dry, or the ſurface of the water when wet.

When the covert-way is well defended by muſketeers, the beſiegers make their way down into it by *ſapping*. *V. Tab. Fortif. fig.* 21. *n.* 5. When they are got near the foot of the glacis, the trench is carried on directly forwards; the workmen covering themſelves with blinds, wool-packs, ſand-bags, and mantelets upon wheels. They alſo make epaulements, or traverſes, on each ſide, to lodge a good body of men.

The *ſap* is uſually made five or ſix fathom from the ſaliant angle of the glacis, where the men are only covered ſideways; for which reaſon they lay planks over-head with hurdles, and earth above them.

When they have forced the enemy to quit the covert-way, the pioneers immediately with ſand-bags, wool-packs, or other fences, make a lodgment, and cover themſelves as well as they can, from the fire of the oppoſite baſtion.

SAPATA. See the article **Zopata.**

SAPHENA, in anatomy, a vein which ariſing over the malleolus internus, up along the leg, and the inner part of the thigh, diſcharges itſelf, near the groin, into the crural vein. See *Tab. Anat. Angeiol. fig.* 6. *n.* 44.

It is this vein they uſually open when they bleed in the foot, for ſuppreſſion of the menſes.

It has its name, probably, from σαφης, *manifeſtus*, as lying plain in ſight.

SAPHETA, in architecture, is the board over the top of a window, placed parallel and oppoſite to the window-ſtool at the bottom.

SAPIENTIAL, **Sapientialis**, an epithet applied to certain books of ſcripture, calculated for our inſtruction and improvement in prudence, or moral wiſdom; thus called, in contra-diſtinction to the hiſtorical and prophetical books. See **Bible,** *&c.*

The *ſapiential* books are Proverbs, Canticles, Eccleſiaſtes, the Pſalms, and Job; though ſome reckon this laſt among the hiſtorical books. See **Hagiographer.**

SAPIENTIÆ *Dentes*, the two laſt or inmoſt of the dentes molares of the upper jaw, one on each ſide; thus called becauſe they appear not till perſons are grown. See **Tooth.**

SAPP. See the article **Sap.**

SAPPHIC, in poetry, a kind of verſe much uſed by the Greeks, and Latins; denominated from the inventreſs *Sappho*.

The *Sapphic* verſe conſiſts of eleven ſyllables, or five feet; whereof the firſt, fourth, and fifth, are trochees, the ſecond a ſpondee, and the third a dactyl, as in

Integer vitæ ſcelerisq; purus,
Non eget Mauri jaculis nec arcu. Hor.

Three verſes of this kind, cloſed with an Adonic verſe, conſiſting of a dactyl and ſpondee, uſually make a ſtrophe. —Though we have ſome chorus's in the ancient tragic poets, containing a much greater number of *Sapphicks* ſucceſſively.—They generally run rough, unleſs they have the cæſure after the ſecond foot.

SAPPHIRE, or **Sapphyr**, **Sapphirus**, a precious ſtone of a beautiful azure, or ſky-blue colour.

The *ſapphire* is tranſparent, yet exceedingly hard, ſo as ſcarce to bear being engraven.

Different colours conſtitute different kinds thereof; the deepeſt blues being eſteemed males, and the whiteſt females.

The *ſapphires* of Pegu are the moſt eſteemed. They are found in the ſame mines with the rubies. There are ſome alſo brought from the kingdom of Calecut, Cananor, and Ceylon; from which laſt place we ſhould be furniſhed with abundance, if the king of the iſland did not prohibit all commerce thereof with foreigners.

The ſoft *water-ſapphires* of Bohemia and Sileſia are of ſome account, though far inferior to the oriental ones, both in the brightneſs of their blue, and the firmneſs of their texture.

Many people value the *ſapphire* beyond the ruby; and give it the ſecond place among precious ſtones, *viz.* that next the diamond: others give that place to the ruby.

Some authors affirm, that a *ſapphire* being heated to a certain degree, between two crucibles luted together, loſes all its colour, and becomes perfectly white; ſo as to deceive even the jewellers themſelves, and make it paſs for a diamond.

Our druggiſts ſell two kinds of *ſapphires* uſed in the confection of hyacinth; the one red, the other blackiſh. The laſt, by reaſon of the deep tincture they give that medicine, are very improperly uſed there: the former are little reddiſh ſtones, of the ſize of pins-heads, very hard, and difficult to pulverize.

Some rank the cat's eye, *oculus cati*, in the number of *ſapphires*. This is a gem remarkable for a fine diverſity of colours, as well as for its hardneſs, which bears a poliſh equal with that of the true *ſapphire*.

The chymiſts make ſeveral preparations of *ſapphire*; as a ſalt, a tincture, an eſſence, a water, an oil, *&c.* and there are few diſeaſes but they pretend themſelves able to cure by remedies compoſed thereof.

The ſuperſtitious attribute ſtill more ſtrange virtues to this ſtone; as, that it grows foul, and loſes its beauty, when wore by a perſon that is letcherous, *&c.*

The rabins hold, that Moſes's rod, and the tables he received on mount Sinai, were of *ſapphire.*—The reaſon is, that in the Hebrew the fineſt things are all called *ſapphires*; whence, in ſcripture, the throne of God is ſaid to reſemble a *ſapphire.*

Sapphire-Rubies, are certain precious ſtones, between blue and red; which, in effect, are nothing but rubies, whoſe colour is not yet perfectly formed. See Ruby.

SARABAITES *, Sarabaitæ, a name anciently given to vagabond and ſtrolling monks. See Monk.

* The word is derived from the Hebrew סרב *ſarab*, to rebel.

St. Benedict gives a frightful idea of theſe *Sarabaites* in the firſt chapter of his rule: Caſſian does not ſpeak a whit more favourably of them in his fourteenth conference; nor St. Jerom in his letter to Euſtochium.

Caſſian calls them, *Renuitæ*; *quia jugum regularis diſciplinæ renuunt.*

SARABAND, a muſical compoſition in triple time; being, in reality, no more than a minute, whoſe motions are ſlow, and ſerious.

Saraband is alſo a dance to the ſame meaſure, uſually terminating when the hand riſes; whereby it is diſtinguiſhed from the courant, which ends when the hand that beats time, falls.

The *ſaraband* is ſaid to be derived originally from the Saracens, as well as the chacone: it had its name, according to ſome authors, from a comedian called *Sarabande*, who firſt danced it in France. Others derive the name from the Spaniſh *ſarao*, a ball; it is uſually danced to the ſound of the guitarre, or caſtanettes.

SARCASM, Sarcasmus, in rhetorick, a keen, bitter irony, whereby the orator ſcoffs, and inſults his adverſary. See Irony.

Such was that of the Jews to our Saviour: *Thou who deſtroyeſt the temple, and raiſeſt it in three days, ſave thyſelf,* &c. and again, *He ſaved others, himſelf he cannot ſave.* Or that of Turnus to a Trojan ſlain by him, in Virgil.

En agros, & quam bello, Trojane, petiſti
Heſperiam metire jacens! Hæc præmia qui me
Ferro auſi tentare ferunt: ſic mœnia condunt!

SARCOCELE *, Σαρκοκηλη, in medicine, a fleſhy, ſcirrhous excreſcence, very hard, yet indolent; riſing up by little and little about the teſticles, or in the inner membrane of the ſcrotum.

* The word is formed from the Greek σαρξ, *caro*, fleſh, and κηλη tumor.

Sometimes indeed it is painful; in which caſe there is danger of its degenerating into a cancer.

It uſually owes its origin to ſome external cauſe, as a blow, a bruiſe, or contuſion. Such accidents occaſion the nutritious juices to ſtop, and to be collected in great quantities in the relaxed or compreſſed pores of thoſe parts, by which means is formed that kind of tumour called *ſarcocele*, by ſome *hernia carnoſa.*

It is a very troubleſome and obſtinate diſeaſe, and is frequently incurable by any other means than caſtration, or cutting off the teſticle. See Castration.

SARCOCOLLA, Σαρκοκολλα, a gum oozing out of a thorny tree, either with, or without inciſions.

Neither authors, nor merchants are agreed as to the place where it grows: ſome ſay it is in Perſia, others, in Arabia Deſerta.—It comes either in grains, or in tears of different colours; ſometimes white, ſometimes yellow, and ſometimes red, but all equally good, provided they be very dry.

Their taſte is bitter, accompanied with ſomewhat of a diſagreeable ſweetneſs.

It is eſteemed warm, and drying; very good to conſolidate and heal wounds; whence its name—from the Greek, σαρξ fleſh, and κολλα glue.

It is ſometimes alſo uſed in collyria to ſtop defluxions, and take off ſpecks in the eye.

SARCOLOGY, in anatomy, a diſcourſe on the fleſh, or the ſoft parts of the human body. See Flesh.

Anatomy is divided into two principal parts; *oſteology* and *ſarcology.* The firſt whereof treats of the bones, and cartilages; the ſecond of the fleſh and ſoft parts. See Anatomy.

SARCOMA, Σαρκωμα, in medicine, a fleſhy, fungous excreſcence ariſing in the noſtrils, or other parts; nearly reſembling a polypus. See Fungus.

The *ſarcoma* chiefly differs from the polypus, as the latter grows from the part by ſeveral roots; the former by one continued root, or without any roots at all. See Polypus.

Every polypus is a *ſarcoma*; but not *vice verſa.*—The *ſarcoma* frequently degenerates into a polypus.

SARCOMPHALUM *, Σαρκομφαλον, in medicine, *&c.* a fleſhy excreſcence of the navel.

* The word is formed from the Greek σαρξ fleſh, and ομφαλος navel.

SARCOPHAGUS, Σαρκοφαγος, in antiquity, a ſort of ſtone coffin, or grave, wherein the ancients laid thoſe they had not a mind to burn.

The word, as derived from the Greek, literally ſignifies, *fleſh-eater*; becauſe at firſt, they uſed a ſort of ſtones for the making of tombs, which quickly conſumed the bodies.—The quarries from whence they dug them were near a city of Troas, named *Aſſum.*—They had the faculty to waſte away a body to nothing, ſave the teeth, in forty days.

This ſtone reſembled a reddiſh pumice-ſtone, and had a ſaltiſh taſte; they alſo made veſſels of it to cure the gout, into which they put their feet, not ſuffering them to continue there too long.

SARCOTICKS *, Σαρκωτικα, in medicine, remedies proper to fill up wounds and ulcers with new fleſh; the ſame as incarnatives. Such are ſarcocolla, dragon's blood, frankincenſe, *&c.* See Incarnative and Epulotic.

* The word is formed from the Greek σαρξ fleſh.

SARDIAN, Sardoin, or *Lapis* Sardius, a precious ſtone of a blood colour, half tranſparent; the ſame with what we otherwiſe call a *Cornelian.* See Cornelian.

The moſt beautiful *Sardians*, are thoſe brought from about Babylon: thoſe of Sardinia, whence they take their name, are in the ſecond claſs. There are others, and thoſe no contemptible ones, found near St. Mauro in Albania; and other, very ſmall ones, about the Rhine, in Bohemia, Sileſia, *&c.*

To give them the greater luſtre, it is uſual in ſetting them, to lay ſilver-leaf underneath. The *Sardian* is moſt uſed for ſeals, as graving eaſily, yet taking a fine poliſh.

The author of the book falſely aſcribed to Albertus Magnus, attributes ſeveral wonderful virtues to this ſtone. See Agate, Gem, *&c.*

SARDONIAN *Laughter.* See Risus *Sardonius.*

SARDONYX, Σαρδονυξ, a kind of precious ſtone, partaking partly of the ſardian, and partly of the onyx.

It is ſemi-tranſparent, and reddiſh bordering on white, ſomewhat like the nail of the hand: in ſome, the red inclines to a yellow. It is brought from the Eaſt-Indies, Arabia, and Bohemia. It was anciently much uſed for fine veſſels. See Agate and Sardian.

SARPLAR * *of Wool*, Sarplera *Lanæ*, otherwiſe called a *pocket*, is half a ſack. See Sack.

* In Scotland, it is called *Serplaith.*

SARRASIN, or Sarrazin, in fortification, a kind of portcullice, otherwiſe called an *herſe*, which is hung with ropes over the gate of a town, or fortreſs, and let fall in caſe of a ſurprize. See Herse and Portcullice.

SARSAPARILLA, Salsaparilla, or Sarsa, a medicinal plant, growing in New Spain, Peru, *&c.* chiefly uſed in decoctions, and potions for the venereal diſeaſe; being eſteemed a great abſorbent and ſweetner; and, on that ſcore, ſometimes taken as a tea. See Root.

Its root, which is the part in uſe, divides itſelf into a great number of filaments, ſix or ſeven foot long; of the thickneſs of a quill: it is browniſh without ſide, and white within, only marked with two red ſtreaks. Its branches creep on the earth, or along the trunks of other trees, *&c.* as the ivy does.

To be good, it muſt be very dry, its filements long, eaſy to cleave; and, in cleaving, muſt not yield any duſt: when boiled in water, it muſt give it a red tincture.—Some phyſicians much doubt the medicinal virtue of this root; as it does not diſcover much, either in taſte, ſmell or tincture.

There is another kind of *ſarſa*, the filaments of whoſe root are thicker, growing in the iſland Marignan, on the coaſt of Braſil: this is not eſteemed ſo good as the former.

There is a third kind brought from Muſcovy, whoſe roots are ſtill bigger, but good for nothing but to burn.

SARTORIUS, in anatomy, the *Taylor's muſcle*; a muſcle thus called, becauſe ſerving to throw one leg a-croſs the other. See Muscle.

It is alſo called *Longus tibiæ*, and *Faſcialis*; and is an antagoniſt to the poplitæus. See *Tab. Anat.* (Myol.) *fig.* 1. *n.* 49. *fig.* 2. *n.* 38. See alſo the article Longus.

SASSAFRAS, a yellow, odoriferous wood, of a briſk, aromatic ſcent, ſomewhat reſembling fennel; the produce of a tree whereof there are whole foreſts grown in Florida, Virginia, *&c.* See Wood.

The natives call it *Pavama*, the Spaniards and French alſo *Cinnamon-Wood*; becauſe, at the conqueſt of that country, under Ferdinand Soto, in 1558, they imagined this to have been the true cinnamon-tree.

The lignum *Saſſafras*, chiefly its bark, wherein its principal virtue is ſuppoſed to reſide, was formerly ſold at an incredible price, to be uſed with ſarſaparilla and eſquilina, in the cure of the venereal diſeaſe. It is very drying and hot, though not quite ſo much as the guaiacum.

It is ſomewhat come into faſhion in families, as a common tea, which the ſhavings of it make agreeable enough; but the ſcandal of being good in venereal caſes, is a detriment to it, and prevents a deal of good being done by it.

It is eſteemed in the gout, ſciatica, and green-ſickneſs. Chuſe that covered with a thick bark, reddiſh, and rough, of a ſharp taſte, and a ſtrong aromatic ſmell.

SASSE, in ſome of our ſtatutes, denotes a kind of wear with flood-gates, commonly uſed in navigable rivers for the damming, and looſing the ſtream of water, as occaſion requires, for the better paſſing of boats, and barges to, and from. See WEAR.

This, in the weſt of England, is called a *Lock*; in the river Lee, a *Turn-pike*, and in other places a *Sluice*. See SLUICE.

SATELLITE, SATELLES, *Guard*; a perſon attending on another, either for his ſafety, or to be ready to execute his pleaſure. See GUARD, *&c.*

Among the eaſtern emperors, *Satellite* expreſſed the dignity or office of captain of the life-guard.

The term was afterwards applied to the vaſſals or lords; and afterwards, to ſuch as held fees, called *Sergeanties.* See SERGEANTY.

SATELLITES, in aſtronomy, certain ſecundary planets, moving round the other planets, as the moon does round the earth; thus called, becauſe always found attending them from riſing to ſetting, and making the tour of the ſun together with them. See PLANET.

The *Satellites* move round their primary planets, as their centres, by the ſame laws as thoſe primary ones do round their centre, the ſun.—For the phyſical cauſe of their motions, ſee GRAVITY: ſee alſo SYSTEM.

The words moon, and *Satellite*, are ſometimes uſed indifferently; and thus we ſay, either Jupiter's moons, or Jupiter's *Satellites*: but ordinarily we diſtinguiſh; reſtraining the term *moon*, to the earth's *Satellite*; and *Satellite* to the little moons lately diſcovered about Jupiter and Saturn. See MOON.

The *Satellites* were unknown till our time; as needing the aſſiſtance of the teleſcope to render them viſible. See TELESCOPE, and ASTRONOMY.

We do not know of any *Satellites*, beſides thoſe juſt mentioned; nor is there any great foundation to hope that more ſhall be diſcovered hereafter, as the longeſt, and the moſt exquiſite teleſcopes have already been applied.

SATELLITES *of Jupiter*, are four little ſecundary planets, performing their revolutions about Jupiter, as that planet does round about the ſun. See JUPITER.

Simon Marius, mathematician of the elector of Brandenburgh, about the end of November in 1609, obſerved three little ſtars moving round Jupiter's body, and proceeding along with him; and in January 1610, found a fourth.—In January 1610, Galileo obſerved the ſame in Italy; and the ſame year publiſhed his obſervations; from which time commenced the obſervation of the circumjovial *Satellites.*

Galileo, in honour of his patron, firſt called them *aſtra Medicæa*, Medicæan ſtars: Marius, the firſt diſcoverer, called that next Jupiter, *Mercurius Jovialis*, Jupiter's Mercury; the ſecond, *Venus Jovialis*, Jupiter's Venus; the third *Jupiter Jovialis*, and the fourth *Saturnus Jovialis*, Jupiter's Saturn.

Indeed, Anthony Maria Schyrlæus de Rheita, a capuchin of Cologne, imagined, that, beſides the four known *Satellites* of Jupiter, he had diſcovered five more, the 29th of December, *anno* 1642, and in honour of Urban VIII. the pope then reigning, denominated them *Sidera Urbanoctoviana.*—But upon Nauda's communicating the obſervation to Gaſſendus, who had obſerved Jupiter on the ſame day, he ſoon perceived that the monk had miſtaken five fixed ſtars, in the effuſion of the water of Aquarius, marked in Tycho's catalogue 24, 25, 26, 27 and 28, for *Satellites* of Jupiter: whence it is no wonder they ſhould appear to the diſcoverer to move a contrary way to that of the reſt, *viz.* from weſt to eaſt. See *Epiſt. Gaſſand. ad Gab. Naud. de novem ſtellis circa Jovem viſis.*

Phænomena and nature of Jupiter's SATELLITES.—1°. They all diſappear in a clear ſky, when Jupiter interpoſes between them and the ſun; that is, are eclipſed by him.

Hence it follows, that they are deſtitute of light, when the ſun's rays, which are propagated in right lines, are intercepted by Jupiter: and hence it follows, that they are opaque bodies like our moon, and are illumined by the ſun. —And hence, ſince Jupiter does not illumine his *Satellites* when placed behind him; he himſelf, in that ſide oppoſite to the ſun, is deſtitute of all light.

2°. When the *Satellites* are interpoſed between Jupiter and the ſun, a round macula or ſpot is obſerved in Jupiter's diſk; which is ſometimes found bigger even than the *Satellite* itſelf.

Hence, ſince the *Satellites* are opaque bodies, and are illumined by the ſun, and muſt therefore project a ſhadow, oppoſite to the ſun; the round ſpots ſeen in Jupiter, are the ſhadows of the *Satellites.*—Hence alſo, ſince the interſection of the ſhadow is a circle, the ſhadow itſelf is conical: and hence it follows, that the figure of the *Satellites*, at leaſt, as to ſenſe, is ſpherical.

3°. If when the earth is between Jupiter and the ſun, any of the *Satellites* happen to be between the ſame, its light diſappears, and is loſt in Jupiter's light.—Thus M. Maraldi tells us, that on the 26th of March 1707, through a teleſcope of thirty-four foot, he obſerved the fourth of Jupiter's moons paſſing over his body, in form of a dark ſpot; but it had no ſooner got off the diſk, than it reſumed its uſual brightneſs. A like ſpot he obſerved on the 4th of April, from an immerſion of the third *Satellite*; but, on the 11th of April, upon watching an immerſion of the ſame *Satellite*, he found it appeared wholly, without leaving any ſpot at all.—The ſame phænomenon was alſo obſerved at other times by M. Caſſini.

In effect, both Caſſini and Maraldi have frequently obſerved very ſurprizing changes in the apparent magnitudes of the *Satellites*, when there was nothing in their diſtance, either from the earth, ſun, or Jupiter, to occaſion ſuch variations.—*E. gr.* The fourth *Satellite*, which is frequently the leaſt of all, ſometimes appears the biggeſt: and the third, which is ordinarily the biggeſt, ſometimes only appears equal, and ſometimes leſs, than any of the reſt.

Hence, ſince Jupiter's *Satellites* are illumined by the ſun, even when immerged in the light of Jupiter, and yet, notwithſtanding this, ſometimes appear dark, and ſometimes diſappear; there muſt be ſome changes in their atmoſpheres, to prevent the equable reflection of the ſun's rays, from the ſeveral parts of the atmoſphere.—To the ſame cauſe it is owing that their ſhadows are ſometimes ſeen bigger than themſelves.

Periodical times of Jupiter's SATELLITES.—The periods, or revolutions of Jupiter's *Satellites* are found from their conjunctions with Jupiter, after the ſame manner as thoſe of the primary planets are found from their oppoſitions to the ſun. See PERIOD, *&c.*

By this method, Caſſini found the periods of the ſeveral *Satellites* to be as follow.

Firſt *Satellite*	1 Day	18 Hours	28 Min.	36 Seconds
Second *Satellite*	3	13	18	52
Third *Satellite*	7	3	59	40
Fourth *Satellite*	16	18	05	06

Diſtance of Jupiter's SATELLITES *from Jupiter.*—As in the primary planets, with regard to the ſun, ſo in the *Satellites*, with regard to their primaries, the ſquares of the periodical times are in a triplicate ratio of their diſtances therefrom.—To determine the diſtance by obſervation, they meaſure them with a micrometer, in ſemi-diameters of Jupiter.—Theſe diſtances, according to Caſſini, are as follow.

The firſt *Satellite* diſtant from Jupiter's centre,	$5\frac{2}{3}$ ſemi-diameters of Jupiter
The ſecond *Satellite*	9 ſemi-diameters
The third *Satellite*	14
The fourth *Satellite*	25 and one 3d.

Hence, as the ſemi-diameter of Jupiter is equal to $27\frac{8}{11}$ ſemi-diameters of the earth, the diſtance of the firſt *Satellite* from the centre of Jupiter is 166 ſemi-diameters of the earth; that of the ſecond 249 and a half; that of the third 388; and that of the fourth 884.

Eclipſes of Jupiter's SATELLITES. See ECLIPSE.

SATELLITES *of Saturn*, are five little ſtars revolving about Saturn. See SATURN.

The firſt was diſcovered by M. Huygens, *anno* 1655, March the 25th, by means of a teleſcope twelve foot long: the other four, at different times, by M. Caſſini, *viz.* thoſe two next Saturn, in March 1684, by help of Campani's Glaſſes, of one hundred, and one hundred and thirty-ſix foot long: the third in December 1672, by a teleſcope of Campani's, of thirty-five foot; and the fifth (that of Huygens being the fourth) in October 1671, by a teleſcope of ſeventeen foot. Moſt, perhaps all, of the phænomena obſerved of Jupiter's *Satellites*, are alſo found exhibited by thoſe of Saturn. Thus, they are found ſometimes bigger, and ſometimes leſs: the fifth is ſometimes, alſo, found eclipſed, *&c.* And hence, there is no doubt, but they are of the ſame nature, *&c.* See SATELLITES *of Jupiter.*

The periodical times of the SATELLITES *of Saturn, according to M. Caſſini, are as follow.*

Firſt *Satellite*	1 Day	21 Hours	18 Min.	31 Seconds.
Second *Satellite*	2	17	41	27
Third *Satellite*	4	13	47	16
Fourth *Satellite*	15	22	41	11
Fifth *Satellite*	74	7	53	57

The diſtances of Saturn's SATELLITES *from his centre, according to the ſame M. Caſſini, are as follow.*

	Semi-diam. of Saturn, or	Diameter of Saturn's ring.
Firſt *Satellite*	$4\frac{3}{8}$	1
Second *Satellite*	$5\frac{3}{4}$	$1\frac{1}{4}$
Third *Satellite*	8	$1\frac{2}{3}$
Fourth *Satellite*	18	4
Fifth *Satellite*	54	$10\frac{1}{2}$

The great diſtance between the fourth and fifth *Satellite*, gave occaſion to Huygens to ſuſpect that there might be ſome intermediate one; or elſe, that the fifth might have ſome other *Satellite* moving round it, as its centre.

Dr. Halley, in the Philoſophical Tranſactions, gives us a correction of the theory of the motion of the fourth or Huygenian *Satellite.*—Its true period he makes 15 days, 22 hours, 41 minutes, 6 ſeconds; its diurnal motion, 22° 34′ 38″ 18‴; its diſtance from the centre of Saturn, 4 diameters of the ring; and its orbit to be little or nothing diſtant from that of the ring, interſecting the orbit of Saturn under an angle of 23 ½ degrees.

SATIR and **SATIRE.** See the article SATYR.

SATISFACIENDUM *capias ad.* See CAPIAS.

SATRAPA, or SATRAPES, in antiquity, the governor of a province among the ancient Perſians.

King Darius uſually walked attended by his principal lords, and *ſatrapæ*, Q. Curtius. The kingdom of Perſia was divided into *ſatrapies*, or juriſdictions of *ſatrapæ*.

The word is originally Perſian, ſignifying, ſtrictly, admiral, or commander of a naval army; but was afterwards applied indifferently to all governors of provinces.—In which ſenſe it was alſo borrowed by the Greeks, who uſed σατραπης in the ſame ſignification.

We alſo meet with the word in ſome ancient Engliſh charters of king Ethelred; where the lords, who ſign next after the dukes, take the title of *ſatrapes* of the king.—Du Cange takes the word here to ſignify miniſters of the king.

SATTIN *, or SATIN, a kind of ſilken ſtuff, very ſmooth, and ſhining, the warp whereof is very fine, and ſtands out; the woof coarſer, and hid underneath: on which depends that gloſs, and beauty, which gives it its price.

* The word comes from the French *Satin*, which Menage derives further from the Latin *Seta*, a briſtle, or hair; others from the Hebrew *Sadin*; or from the old French *Sade* and *Sadinet*, handſome, genteel.

There are ſome *ſattins* quite plain, others wrought, ſome flowered with gold or ſilk, others ſtriped, &c.—All the varieties in the fabric of *ſattins* are made by uſing new warps, or woofs. The fineſt *ſattins* are thoſe of Florence and Genoa; yet, the French will not allow thoſe of Lyons any thing inferior thereto.—The *ſattins* of Bruges have their warp of ſilk, and their woof of thread.

India *ſattins*, or *ſattins* of China, are ſilken ſtuffs, much like thoſe manufactured in Europe.—Of theſe, ſome are plain, either white, or of other colours; others worked, either with gold, or ſilk, flowered, damaſked, ſtriped, &c. They are moſtly valued becauſe of their cleaning, and bleaching eaſily, without loſing any thing of their luſtre. In other reſpects they are inferior to thoſe of Europe.

F. le Comte obſerves, that the Chineſe prepare their *ſattins* in oil, to give them the greater luſtre; but this makes the duſt liable to hang to them.

SATTINET *, or SATTINADE, a very ſlight, thin ſort of ſattin, chiefly uſed by the ladies for ſummer night-gowns, &c. and ordinarily ſtriped.

* The word is a diminutive of *Sattin*.

SATURANTIA, is ſometimes uſed in the ſame ſenſe as *Abſorbents*. See ABSORBENT.

SATURDAY-STOP, a ſpace of time, in which of old it was not lawful to take ſalmons, in the north, *viz.* from even-ſong on Saturday, till ſun-riſing on Monday.

SATURN, in aſtronomy, one of the primary planets; being that which is furtheſt from the earth, and the ſun, and whoſe motion is the ſloweſt: thus characterized, ♄. See PLANET.

Saturn ſhines but with a feeble light, by reaſon of its diſtance, on which account, though the biggeſt of all the planets, it appears the ſmalleſt. See PLANET.

The period of *Saturn*, or the ſpace of time wherein he revolves round the ſun, which makes his year, according to Kepler, is 29 years, 174 days, 4 hours, 58 minutes, 25 ſeconds, and 30 thirds; whence his diurnal motion muſt be 2 minutes, 0 ſeconds, 36 thirds. Though de la Hire makes his diurnal motion 2 minutes 1 ſecond. See REVOLUTION.—The inclination of his plane to that of the ecliptick, Kepler makes 2°. 32′, de la Hire, 2°. 33′. See INCLINATION.—Its mean diſtance from the ſun is 326925 ſemi-diameters of the earth; and from the earth 210000 of the ſame. See DISTANCE.—Its ſmalleſt diameter, according to Huygens, is 30 ſeconds: the proportion of its diameter to that of the earth, as 20 to 1; of its ſurface to that of the earth, as 400 to 1; of its ſolidity to that of the earth, as 1 to 8000. See DIAMETER and SEMI-DIAMETER.

Dr. Halley obſerves, in the preface to his catalogue of the ſouthern ſtars, that he has found *Saturn* to have a ſlower motion than is aſſigned him in the tables: this irregularity, we may hope, is abundantly rectified in his own tables now in the preſs.

It is doubted whether or no *Saturn*, like the other planets, revolves on his axis: it does not appear from any aſtronomical obſervations that he does; and there is one circumſtance that ſhould ſeem to argue the contrary, *viz.* that whereas the earth, and other planets, which we know do revolve on their axis, have their equatorial diameter greater than their polar, nothing like this is obſerved in *Saturn.* See EARTH.

The diſtance of *Saturn* from the ſun being ten times greater than that of the earth from the ſame, it is found, that the apparent diameter of the ſun ſeen from him, will not exceed 3 minutes, which is but little more than twice the diameter of Venus.—The ſun's diſk, therefore, to an inhabitant of *Saturn*, will appear 100 times leſs than it does to us, and both its light and heat be diminiſhed in the ſame proportion. See SUN.

The phaſes of *Saturn* are very various and extraordinary, and long perplexed the aſtronomers, who could not divine the meaning of ſuch irregularity: thus Hevelius obſerved him to be ſometimes *monoſpherical*, ſometimes *triſpherical*, *ſpherico-anſated*, *elliptico-anſated*, and *ſpherico-cuſpidated.*—But Huygens plainly ſhews, that all theſe monſtrous appearances are owing to the imperfection of the teleſcopes that author had uſed. Huygens, upon obſerving him very attentively with much better glaſſes, reduced all his phaſes to three principal ones, *viz. round*, *brachiated*, and *anſated.* See PHASES, ANSÆ, &c.

One thing *Saturn* has peculiar to himſelf, *viz.* a ring which ſurrounds his middle like an arch, or like the horizon of a globe, without touching him any where; the diameter thereof more than double that of the planet which it ſurrounds; the former containing 45 diameters of the earth, the latter only 20. When raiſed enough to be out of the ſhadow of the body of *Saturn*, it reflects the light of the ſun very ſtrongly. The thickneſs of the ring, Dr. Keill obſerves, takes up one half of the ſpace between its outer or convex ſurface, and the ſurface of the planet.

This ring is found to be an opaque, ſolid, but ſmooth, and even body.—It was Galileo firſt diſcovered that the figure of *Saturn* was not round; but it was Huygens firſt found that its inequality was in form of a ring; the diſcovery of which he publiſhed in 1659, in his *Syſtema Saturnianum.*—It is doubted whether or no the ring revolves round the planet? its uſe and deſign are ſtill a myſtery.—For its phænomena, &c. See RING.

Saturn performs his courſe round the ſun, attended with five ſatellites, or ſecondary planets; the periods, diſtances, &c. whereof, ſee under SATELLITES.

SATURN, in chymiſtry, ſignifies lead; in regard that metal is ſuppoſed to lie immediately under the influence of this planet. See LEAD.

SATURN, in heraldry, denotes the black colour in the coats of arms of ſovereign princes; anſwering to diamond in the coats of noblemen; and ſable in thoſe of gentlemen. See SABLE, &c.

SATURNALIA, in antiquity, feaſts celebrated among the Romans, in honour of the god Saturn. See FEAST.

The *Saturnalia* held three days; beginning on the 16th, others ſay, the 17th, and others the 18th day of December.

During the ſolemnity the ſlaves were reputed maſters; they were allowed to ſay any thing; and in fine, were ſerved at table by the maſters themſelves.—Every thing run into debauchery and diſſoluteneſs, and nothing was heard or ſeen in the city of Rome, but the din, riot, and diſorder of a people wholly abandoned to joy, and pleaſure.

M. Dacier obſerves, that the *Saturnalia* were not only celebrated in honour of Saturn, but alſo to keep up the remembrance of the golden age, when all the world was on a level. It was a piece of religion not to begin any war, or execute any criminal during this feaſt.

The *Saturnalia* were not only obſerved at Rome, but alſo in Greece; and were, in reality, much older than Rome itſelf.—Some aſcribe their inſtitution to the Pelaſgi, who were caſt upon the iſland of Delos; others to Hercules, and others to Janus.—Goropius Becanus makes Noah the author of them. *Orig. lib.* 4. That patriarch, he tells us, in the ark, inſtituted a feaſt to be held in the tenth month, in memory of this, that in that month, the tops of the mountains began to appear above the water; and this he makes the origin of the *Saturnalia:* but it is very probable the year then begun in autumn, and of conſequence December could not be the tenth month. Voſſius goes ſtill higher, and will have it, that the Saturn, in honour of whom this feaſt was inſtituted, was Adam.

SATURNILLIANS. See the article SATURNINIANS.

SATURNINE, or SATURNIAN, a term applied to perſons of dark, ſullen, melancholic complections; as being ſuppoſed under the predominancy of Saturn, or at whoſe births Saturn was the aſcendant.

SATURNINIANS, or SATURNILLIANS, a ſect of ancient Gnoſticks; thus called from their chief *Saturnillus*, or *Saturninus*, a diſciple of Menander, the famous Gnoſtick. See GNOSTICK.

Saturnillus taught the ſame errors with his maſter, in Syria. See MENANDRIANS.

SATYR *, SATYRUS, ΣΑΤΥΡΟΣ, in the heathen theology, a fabulous kind of ſemi-god, who with the Fauns, and Sylvans, preſided over groves, and foreſts, under the direction of Pan. See GOD, HERO, &c.

* The word is uſually derived from *Sathe*, σαθη, which, in the ancient Greek, ſignified the virile member; theſe deities being ſuppoſed much addicted to laſciviouſneſs.

The *Satyrs* were painted half men, half goats: the upper part was human, excepting for horns on the head; the lower brutal, with the tail and legs of a goat; the whole covered with hair.

The poets uſually confound the *Satyrs*, Silvans, Sileni, Fauns, and Panes. See SILENI and FAUNS.

Nonnus, in his *Dionyſiaca*, makes the *Satyrs* the offspring of Mercury, and a Doric nymph, called Ypthima, and gives us the names of ſeveral, *viz.* Pæminius, Thyaſus, Hypſichorus,

chorus, Oriſtas, Apæus, Phlegræus, Lycon, *&c.*—Memnon, in his book againſt the tyrants of Heraclea, derives the *Satyrs* from Bacchus, and a Naiad, called Nicæa.

Satyrs made part of the dramatis perſonæ in the ancient Greek tragedies, which gave riſe to a new ſpecies of poetry, called *ſatyrical.* See the article following.

Satyr[*], **Satyra**, or **Satira**, in a literary ſenſe, ſignifies all manner of diſcourſe wherein any perſon is reprehended; but more particularly a poem, wherein mens follies, and vices are wittily expoſed, in order to their reformation.

Satyr bears a near affinity to raillery, ridicule, lampoon, libel, *&c.* and ſtands oppoſed to panegyric. See Libel, Panegyric, *&c.*—The reaſon why *ſatyrs* generally pleaſe, and panegyrics tire the readers, ſeems to be, becauſe the former are commonly true, and the latter falſe.—*V. Journ. des Scav.* T. 81. p. 294.

Horace calls his two books of *Satyrs*, indifferently either *Sermones*, or *Satyræ*, two words which at firſt ſight preſent very different ideas. See Sermones.

The chief *ſatyriſts* among the ancients are, Horace, Juvenal and Perſius; among the moderns, Regnier and Boileau in French; and Dryden, Oldham, Rocheſter, Buckingham, Pope, Young, *&c.* among the Engliſh.

A *ſatyr* ought to be lively, pleaſant, moral, and full of variety, wherein Juvenal and Horace excelled, though their *ſatyrs* ought not to be read without caution.—Among the qualifications requiſite in a *ſatyriſt*, one of the moſt eſſential is good-nature: all the ſentiments which are beautiful in this way of writing muſt proceed from that quality in the author. It is good-nature produces that diſdain of all baſeneſs, vice and folly, which prompts the poet to expreſs himſelf with ſmartneſs againſt the errors of men, but without bitterneſs towards their perſons. It is this quality keeps the mind in equanimity, and never lets an offence unſeaſonably throw a man out of his character. When Virgil ſaid, he that did not hate Bavius might love Mævius, he was in perfect good humour, and was not ſo much moved at their abſurdities, as paſſionately to call them ſots, or blockheads in a direct invective, but laughed at them with a delicacy of ſcorn, without any mixture of anger.—The beſt good man with the worſt-natured muſe, was the character among us of a gentlemen as famous for his humanity, as his wit. In reality, the ordinary ſubjects for *ſatyr* are ſuch as incite the greateſt indignation in the beſt tempers, and conſequently men of ſuch a make are beſt qualified for ſpeaking of them: ſuch men can behold vice and folly, when they injure perſons with whom they are wholly unacquainted, with the ſame ſeverity as others reſent the ills they feel themſelves.—In all the writings of Horace and Juvenal, there is not one ill-natured expreſſion; not one ſentence of ſeverity which does not apparently proceed from the contrary diſpoſition.—*V. Tatl.* N°. 242. T. 4. p. 219. *ſeq.*

Satyr may be divided with regard to the meaſure, and kind of verſe, as well as the manner of the poem, and the character, into *narrative*, *dramatick*, *mixed*, &c.

Narrative, is a ſimple narration or recital of abuſes in the poet's own perſon.—Such is the firſt of Juvenal.

Dramatic, is that wherein ſeveral perſons diſcourſe together; whether they be nameleſs, as in the firſt of Perſius; or have names, as of Catius and Damaſippus.

Mixt, is compounded of both the former; as that fine one of Horace, *Ibam forte via ſacra.*

Grave, and animated, which inveigh with warmth and earneſtneſs againſt corruption, and vice in every ſhape.—As thoſe of Juvenal and Perſius.

Sportive, and lighter, which ſeem to play with mens follies, but in playing omit no opportunity of making them feel the laſh.—Such are thoſe of Horace, hence ſaid to be *ſermoni propiora.*

The *grave* ſort brandiſhes a naked ſword; the *ſportive* preſents a thyrſus, like that of the ancient *Satyrs* ſurrounded with vine leaves, with which it ſtabs unawares.—The heat of the former ſometimes degenerates into fury, and indignation; and the calmneſs of the latter ſometimes ſinks to mere raillery. But between the two extremes are a great number of intermediate ſpecies and degrees. The former, eſpecially when dictated by paſſion, is much eaſieſt: nothing is more difficult than to make people of taſte laugh, even at the expence of others. The attaining of this muſt be the fruit of genius and talents, rather than rules: perhaps it may be unneceſſary to explain either; ſince vanity, ſelf-love, and even malice are maſters more than ſufficient for a poet who wants not wit, and judgment. Thus Juvenal: *Si natura negat, facit indignatio verſum*; and Boileau: *La colere ſuffit & vaut un* Apollon.—V. Mourg. *Trait. de la poeſ. Franc.* c. 4. *Mem. de Trev.* Nov. 1723. p. 2150.

In peruſing the writings of the two leaders of the two ſorts of *ſatyr* laſt mentioned, it may not be unneceſſary to conſider, that they lived in very different times: Horace was intimate with a prince of the greateſt goodneſs, and humanity; and his court was formed after his example: therefore the faults that poet falls upon were little inconſiſtencies in behaviour, falſe pretences to politeneſs, or impertinent affectations of what men were not fit for. Vices of a coarſer ſort could not come under his conſideration, or enter the palace of Auguſtus.—Juvenal, on the other hand, lived under Domitian, in whoſe reign every thing great and noble was baniſhed the habitations of the men in power. Therefore he attacks vice as it paſſes by in triumph, not as it breaks into converſation. The fall of empire, contempt of glory, and a general degeneracy of manners, are before his eyes in all his writings.—In the days of Auguſtus, to have talked like Juvenal had been madneſs, or in thoſe of Domitian, like Horace. Morality and virtue are every where recommended in Horace, as became a man in a polite court, from the beauty, propriety, and convenience of purſuing them: vice and corruption are attacked by Juvenal in a ſtyle which denotes, he fears he ſhall not be heard unleſs he calls to them in their own language, with a bare-faced mention of the villanies and obſcenities of his contemporaries.—*V. Tatl.* T. 4. N°. 242. p. 219. *ſeqq.*

The Italians divide *ſatyr* into *ſerious*, as that in common uſe; and *jocoſe*, *giocoſa*, which they alſo call *berneſca*, and we *burleſque.* See Burlesque.

Their chief *ſatyriſts* in the *ſerious* way are, Dante (whom they particularly call *Principe Satirico*) Arioſto, Aretine, Ercole Bentivoglio, Luigi Alamanni, Jacobo Soldani, Lorenzo Azzolino, Salvator Roſa, Lud. Adimari, and Benedetto Menzini[a].—Thoſe who have excelled in the *jocoſe* kind are, Franceſco Berni (the inventor of it) Mauro, Firenzuola, Caſa, Coppetta Varchi Laſca, Caporali[b], *&c.*—[a] V. Bianchin *della Satira Italiana*, P. I. p. 9. Giorn. *de Letter d'Ital.* T. 20. p. 306. [b] Id. ibid. P. II. p. 25. Giorn. p. 310. *ſeqq.*

---
